In this example, the FortiGate is configured with an explicit web proxy and an LDAP server. When an LDAP user is authenticated by an IP-based authentication method in WAD, the WAD user is considered to be in an active logon status. This WAD user is listed in the `diagnose wad user list` output. If the user is removed from WAD as an authenticated, such as when the IP-based authentication expires, then the user is considered to become inactive (logout status). The user is no longer listed in the `diagnose wad user list` output.

The WAD user's group membership information and their logon and logout timestamps are written into local files on the FortiGate's disk. There is one log file for each day, and the FortiGate can maintain up to 28 log files over a rolling period of 28 days (four weeks). This means after 28 days with 28 files stored, on the 29th day, the first file will be removed and a new file will be created for the 29th day.

This feature works on other configurations such as firewall authentication, transparent web proxy, ZTNA, and SSL VPN where an LDAP server is used.

To configure the FortiGate:**1. Enable the explicit web proxy on port1:**

```
config system interface
  edit "port1"
    set explicit-web-proxy enable
    set explicit-ftp-proxy enable
    set snmp-index 3
  next
end
```

2. Configure the LDAP server:

```
config user ldap
  edit "ldap-test"
    set server "172.16.200.98"
    set cnid "cn"
    set dn "dc=fortinetqa,dc=local"
    set type regular
    set username "CN=root,CN=Users,DC=fortinetqa,DC=local"
    set password *****
  next
end
```

3. Configure the authentication scheme:

```
config authentication scheme
  edit "basic-ldap"
    set method basic
    set user-database "ldap-test"
  next
end
```

4. Configure the authentication rule:

```
config authentication rule
  edit "basic-ldap"
    set srcaddr "all"
    set active-auth-method "basic-ldap"
    set web-portal disable
  next
end
```

5. Configure the user group:

```
config user group
  edit "ldap-group"
    set member "ldap" "ldap-test"
  next
end
```

6. Configure the proxy policy:

```
config firewall proxy-policy
  edit 1
    set proxy explicit-web
    set dstintf "port3"
    set srcaddr "all"
    set dstaddr "all"
```

```
        set service "web"
        set action accept
        set schedule "always"
        set groups "ldap-group"
        set utm-status enable
        set ssl-ssh-profile "deep-custom"
        set av-profile "av"
    next
end
```

When users pass through the explicit proxy and log in and out through LDAP, their login and logout records will be logged to the disk.

In this example, there are two LDAP users, test1 and test3, with the following activity:

1. test3 logs on at 22:30:22 on February 23, 2022, then logs out at 22:31:09 on the same day.
2. test1 logs on at 23:55:02 on February 23, 2022, then logs out at 00:05:02 on February 24, 2022.
3. test3 logs on at 16:29:44 on February 24, 2022, then logs out at 16:39:44 on the same day.

The logon and logout timestamp information, and the group membership information for users test1 and test3 will be logged into two local files on the log disk.

To view the active user logged information for two days back from February 24, 2022:

```
# diagnose user-device-store user-stats query 2022-02-24 2
```

Record #0:

```
'username' = 'test3'
'groupname' = 'CN=Domain Admins,CN=Users,DC=FORTINETQA,DC=local'
'groupname' = 'CN=FSSO,OU=QA,DC=FORTINETQA,DC=local'
'logon' = '2022-02-23 22:30:22'
'logout' = '2022-02-23 22:31:09'
```

Record #1:

```
'username' = 'test1'
'groupname' = 'CN=Domain Admins,CN=Users,DC=FORTINETQA,DC=local'
'groupname' = 'CN=FSSO,OU=QA,DC=FORTINETQA,DC=local'
'groupname' = 'CN=mytest-grp,OU=QA,DC=FORTINETQA,DC=local'
'logon' = '2022-02-23 23:55:02'
```

Record #2:

```
'username' = 'test1'
'groupname' = 'CN=Domain Admins,CN=Users,DC=FORTINETQA,DC=local'
'groupname' = 'CN=FSSO,OU=QA,DC=FORTINETQA,DC=local'
'groupname' = 'CN=mytest-grp,OU=QA,DC=FORTINETQA,DC=local'
'logon' = '2022-02-23 23:55:02'
'logout' = '2022-02-24 00:05:02'
```

Record #3:

```
'username' = 'test3'
'groupname' = 'CN=Domain Admins,CN=Users,DC=FORTINETQA,DC=local'
'groupname' = 'CN=FSSO,OU=QA,DC=FORTINETQA,DC=local'
'logon' = '2022-02-24 16:29:44'
'logout' = '2022-02-24 16:39:44'
```

Returned 4 records.

There is one record (logon) for test1 on 2022-02-23 because they remained active after midnight (until 00:05:02).
There is another record for 2022-02-24 with logon and logout timestamps for test1.

Configuring client certificate authentication on the LDAP server

Administrators can configure a FortiGate client certificate in the LDAP server configuration when the FortiGate connects to an LDAPS server that requires client certificate authentication.

```
config user ldap
  edit <ldap_server>
    set client-cert-auth {enable | disable}
    set client-cert <source>
  next
end
```

Example

In this example, the FortiGate is configured as an explicit web proxy. It connects to the Windows AD server through LDAPS, where the Windows server requires a client certificate to connect. The client certificate is configured in the CLI.

The endpoint PC connecting to the web server will first need to authenticate to the explicit web proxy before accessing the server.

While this example demonstrates an LDAP client certificate for an explicit proxy configuration, LDAP client certificates can be used in firewall authentication, transparent proxy, ZTNA, and where ever LDAP configurations are used on the FortiGate.

To configure a client certificate on the LDAP server:

1. Enable the explicit web proxy on port2:

```
config system interface
  edit "port2"
    set explicit-web-proxy enable
  next
end
```

2. Upload the client certificate to the FortiGate:

```
config vpn certificate local
  edit "Zach"
    set password *****
    set private-key <private key>
    set certificate <certificate>
  next
end
```

3. Configure the LDAP server settings:

```
config user ldap
  edit "ldaps"
    set server "172.16.200.57"
    set server-identity-check disable
    set cnid "CN"
    set dn "CN=Users,DC=ftnt,DC=com"
    set secure ldaps
    set port 636
    set client-cert-auth enable
    set client-cert "Zach"
  next
end
```

4. Configure the authentication scheme:

```
config authentication scheme
  edit "1"
    set method basic
    set user-database "ldaps"
  next
end
```

5. Configure the authentication rule:

```
config authentication rule
  edit "1"
    set srcintf "port2"
    set srcaddr "all"
    set dstaddr "all"
    set active-auth-method "1"
  next
end
```

6. Configure the user group:

```
config user group
  edit "test"
    set member "ldaps"
  next
end
```

7. Configure the proxy policy with the user group:

```
config firewall proxy-policy
  edit 1
    set proxy explicit-web
    set dstintf "port3"
    set srcaddr "all"
    set dstaddr "all"
```

```

set service "webproxy"
set action accept
set schedule "always"
set srcaddr6 "all"
set dstaddr6 "all"
set groups "test"
set utm-status enable
set ssl-ssh-profile "deep-inspection-clone"
set av-profile "av"

next
end

```

Testing and verification

When traffic from the endpoint PC matches a policy and triggers authentication, the FortiGate starts the LDAPS TLS connection handshake with the Windows AD. The LDAPS server requests a client certificate to identify the FortiGate as a client. The FortiGate provides a configured client certificate, issued to zach.com, to the LDAPS server.

The following communication between the FortiGate and the LDAPS server shows the client certificate is sent by the FortiGate:

No.	Time	Source	Destination	Protocol	Length	Info
21	9.090726	172.16.200.7	172.16.200.57	TCP	74	3626 → 636 [SYN] Seq=0 Win=14600 Len=0 MSS=1460 SACK_PERM=1 TSval=5627777 TSecr=0 WS=1024

RADIUS servers

Remote Authentication and Dial-In User Service (RADIUS) is a broadly supported client-server protocol that provides centralized authentication, authorization, and accounting functions. RADIUS clients are built into gateways that allow access to networks such as a VPN server, network access server (NAS), and a network switch or firewall that uses authentication.

RADIUS servers use UDP packets to communicate with the RADIUS clients on the network to authenticate users before allowing them access to the network, authorize access to resources by appropriate users, and account or bill for those resources that are used. RADIUS servers are currently defined by [RFC 2865](#) (RADIUS) and [RFC 2866](#) (RADIUS Accounting), and listen on either UDP ports 1812 (authentication) and 1813 (accounting), or ports 1645 (authentication) and 1646 (accounting) requests. RADIUS servers exist for all major operating systems.

The RADIUS server must be configured to accept the FortiGate as a client so it can use the authentication and accounting functions of the RADIUS server.

To secure RADIUS connections, consider using RADSEC over TLS. See [Configuring a RADSEC client on page 2291](#).

RADIUS authentication with a FortiGate requires the following:

- Configuring one or more RADIUS server profiles on the FortiGate.
- Assigning the RADIUS server profile to a user or user group.
- Applying the user or user group to a firewall policy.

RADIUS authentication can be applied to many FortiGate functions, such as firewall authentication, SSL and IPsec VPNs, administrator profiles, ZTNA, explicit proxy, wireless, 802.1X, and more.

The RADIUS server uses a shared secret key with MD5 hashing to encrypt information passed between RADIUS servers and clients. Typically, only user credentials are encrypted. Additional security can be configured through IPsec tunnels by placing the RADIUS server behind another VPN gateway.

The following topics provide more information about RADIUS servers:

- [Configuring a RADIUS server on page 2259](#)
- [Using multiple RADIUS servers on page 2261](#)
- [RADIUS AVPs and VSAs on page 2264](#)

- [Configuring a RADSEC client on page 2291](#)

Configuring a RADIUS server

A RADIUS server can be configured in the GUI by going to *User & Authentication > RADIUS Servers*, or in the CLI under `config user radius`.

Basic configuration

The following table summarizes the common RADIUS settings that can be configured in the GUI and CLI.

GUI field	CLI setting	Description
<i>Name</i>	<code>edit <name></code>	Define the RADIUS server object within FortiOS.

GUI field	CLI setting	Description
Authentication method	<code>set auth-type {auto ms_chap_v2 ms_chap chap pap}</code>	Specify the authentication method, or select Default / <code>auto</code> to negotiate PAP, MSCHAP_v2, and CHAP in that order.
NAS IP	<code>set nas-ip <IPv4_address></code>	Optional setting, also known as Calling-Station-Id. Specify the IP address the FortiGate uses to communicate with the RADIUS server. If left unconfigured, the FortiGate will use the IP address of the interface that communicates with the RADIUS server.
Include in every user group	<code>set all-usergroup {enable disable}</code>	Optional setting to add the RADIUS server to each user group. This allows each user group to try and authenticate users against the RADIUS server if local authentication fails.
Primary Server		
IP/Name	<code>set server <string></code>	Enter the IP address or resolvable FQDN of the RADIUS server.
Secret	<code>set secret <password></code>	Enter the password used to connect to the RADIUS server.

There is an option in the GUI to configure a second server, and a third server can be configured in the CLI (see [Using multiple RADIUS servers on page 2261](#)).

Advanced settings

Advanced settings for RADIUS servers can be configured in the CLI. The following are some commonly used settings.

To edit the port used to connect with the RADIUS server:

```
config system global
    set radius-port <integer>
end
```

To edit the default setting for password encoding and username case sensitivity:

```
config user radius
    edit <name>
        set password-encoding {auto | ISO-8859-1}
        set username-case-sensitive {enable | disable}
    next
end
```

<code>password-encoding {auto ISO-8859-1}</code>	Set the password encoding to use the original encoding or ISO-8859-1 (default = auto). The <code>auth-type</code> must be <code>auto</code> or <code>pap</code> to change this setting.
<code>username-case-sensitive {enable disable}</code>	Enable/disable case sensitive usernames (default = disable).

To configure a RADSEC client with TLS or TCP:

```

config user radius
  edit <name>
    set transport-protocol {udp | tcp | tls}
    set ca-cert <string>
    set client-cert <string>
    set tls-min-protocol-version {default | SSLv3 | TLSv1 | TLSv1-1 | TLSv1-2}
    set server-identity-check {enable | disable}
  next
end

```

transport-protocol {udp tcp tls}	Set the type of transport protocol to use: <ul style="list-style-type: none"> • udp: use UDP (default) • tcp: use TCP, but no TLS security • tls: use TLS over TCP
ca-cert <string>	Set the CA certificate of server to trust under TLS.
client-cert <string>	Set the client certificate to use under TLS.
tls-min-protocol-version {default SSLv3 TLSv1 TLSv1-1 TLSv1-2}	Set the minimum supported protocol version for TLS connections: <ul style="list-style-type: none"> • default: follow the system global setting • SSLv3: use SSLv3 • TLSv1: use TLSv1 • TLSv1-1: use TLSv1.1 • TLSv1-2: use TLSv1.2
server-identity-check {enable disable}	Enable/disable RADIUS server identity check, which verifies the server domain name/IP address against the server certificate (default = enable).

For RADSEC over TLS and RADSEC over TCP example configurations, see [Configuring a RADSEC client on page 2291](#).

Using multiple RADIUS servers

There are several ways to implement multiple RADIUS servers, and each has a different effect on user authentication. The three main options available are:

- [Add a second \(or third\) RADIUS server in the same profile.](#)
- [Add a second RADIUS server profile, and add both to the same user group.](#)
- [Use two RADIUS server profiles for two user groups \(one for each\).](#)

Adding a second server in a RADIUS profile

A second RADIUS server can be configured in the same RADIUS profile so in the event the first RADIUS server does not respond, the second server can be checked. If the first RADIUS server responds with an Access-Reject, no further servers are queried.

To add a second server in a RADIUS profile:

1. Go to *User & Authentication > RADIUS Servers* and click *Create New*.
2. Enter the following:

Name	<i>RADIUS_with_2ndary</i>
Authentication method	<i>Default</i>
Primary Server	
IP/Name	<i>1.1.1.1</i>
Secret	Enter the password used to connect to the RADIUS server.
Secondary Server	
IP/Name	<i>2.2.2.2</i>
Secret	Enter the password used to connect to the RADIUS server.

The screenshot shows the 'New RADIUS Server' configuration window. The 'Name' field is set to 'RADIUS_with_2ndary'. The 'Authentication method' is set to 'Default'. The 'NAS IP' field is empty. The 'Include in every user group' toggle is turned off. The 'Primary Server' section has 'IP/Name' set to '1.1.1.1' and 'Secret' masked with dots. The 'Secondary Server' section has 'IP/Name' set to '2.2.2.2' and 'Secret' masked with dots. On the right side, there are links for 'API Preview', 'Documentation', 'Online Help', and 'Video Tutorials'. At the bottom, there are 'OK' and 'Cancel' buttons.

3. Click *OK*.

Adding two RADIUS server profiles in the same user group

When two separate RADIUS profiles are added to a user group, the FortiGate sends an Access-Request simultaneously to both RADIUS servers, and authentication succeeds if either server sends back an Access-Accept. This example includes the settings from the previous example where one or more of the RADIUS server profiles has a secondary server configured. In this case, the secondary server in the *RADIUS_with_2ndary* profile, 2.2.2.2, is only checked if the primary server of this profile times out and the *fac_radius_server* profile does not return an Access-Accept.

To add two RADIUS server profiles in the same user group:

1. Go to *User & Authentication > RADIUS Servers*, click *Create New*, and configure the RADIUS servers as needed (refer to the [previous example](#)).
2. Go to *User & Authentication > User Groups* and click *Create New*.

3. Enter the following:

Name	<i>RADIUS_GROUP</i>
Type	<i>Firewall</i>

4. In the *Remote Groups* table, click *Add*.
 5. Select *RADIUS_with_2ndary* and click *OK*.
 6. Click *Add*, select *fac_radius_server*, then click *OK*.

7. Click *OK*.

Using separate RADIUS server profiles for separate user groups

In this example, the FortiGate first evaluates if the user belongs to the first listed group (*radius_group*) in the policy. If the user fails to authenticate to this group, then the FortiGate checks if the user can successfully authenticate to the second user group (*radius_group_2*). Refer to the first and second examples for detailed instructions.

To use separate RADIUS server profiles for separate user groups:

- Configure the RADIUS server profiles:
 - Go to *User & Authentication > RADIUS Servers* and click *Create New*.
 - Configure two RADIUS servers, *fac_radius_server* and *RADIUS_with_2ndary*, as needed (refer to the [previous example](#)).
- Configure the firewall groups:
 - Go to *User & Authentication > User Groups* and click *Create New*.
 - Configure two firewall groups, one named *radius_group* with remote server member *fac_radius_server*, and one named *radius_group_2* with remote server member *RADIUS_with_2ndary* (refer to the [previous example](#)).

Group Name	Group Type	Members	Ref.
radius_group	Firewall	fac_radius_server	1
radius_group_2	Firewall	RADIUS_with_2ndary	1

- Configure the firewall policy:
 - Go to *Policy & Objects > Firewall Policy* and click *Create New*.
 - For *Source*, click *User* then select *radius_group* and *radius_group_2*. Click *Address* and select *LAN address*.

c. Configure the other settings as needed.

d. Click OK.

Name	From	To	Source	Destination	Schedule	Service	Action	NAT
LAN to WAN	LAN (LAN)	WAN	radius_group radius_group_2 LAN address	all	always	ALL	ACCEPT	Enabled

RADIUS AVPs and VSAs

This topic describes RADIUS Attribute Value Pairs (AVPs) and Vendor-Specific Attributes (VSAs).

AVPs

RADIUS packets include a set of AVPs to identify information about the user, their location, and other information. The IETF defined a set of 255 standard attributes, which are well known and come in the form of Type, Length, Value (for more details, refer to [RFC 2865](#)). Of the standard 255, the FortiGate sends the following RADIUS attributes:

RADIUS attribute number	Name	Description
1	User-Name	Name of the user being authenticated by the RADIUS server.
4	NAS-IP-Address	IP address of the network access server (NAS) that is requesting authentication. The NAS is the FortiGate.
8	Framed-IP-Address	IP address to be configured for the user, by sending the IP address of a user to the RADIUS server in the Access-Request packet.
25	Class	Used in accounting packets and requests for firewall, WiFi, and proxy authentication. The attribute is returned in the Access-Accept message and is added to all accounting packets.
26	Fortinet-VSA	See VSAs .
32	NAS-Identifier	Identifier or IP address of the NAS that is requesting authentication. The NAS is the FortiGate.
42	Acct-Input-Octets	Number of octets received from the port over the course of this service being provided. Used to charge the user for the amount of traffic they used.
43	Acct-Output-Octets	Number of octets sent to the port while delivering this service. Used to charge the user for the amount of traffic they used.
44	Acct-Session-Id	Unique number assigned to each start and stop record to make it easy to match them, and to eliminate duplicate records.
55	Event-Timestamp	Records the time that the event occurred on the NAS. The timestamp is measured in seconds since January 1, 1970 00:00 UTC. Before the Event-Timestamp attribute can be sent in a packet, make sure that the correct time is set on the FortiGate.

VSAs

Some vendors want or need to send attributes that do not match any of the defined IETF attributes. This can be accomplished by using RADIUS attribute type 26, which allows a vendor to encapsulate their own specific attributes in this standard AVP.

In order to support VSAs, the RADIUS server requires a dictionary to define the VSAs. This dictionary is typically supplied by the client or server vendor.

The Fortinet RADIUS vendor ID is 12356 and contains the following attributes:

Attribute name	Attribute number	Attribute value format
Fortinet-Group-Name	1	String
Fortinet-Client-IP-Address	2	IP address
Fortinet-Vdom-Name*	3	String
Fortinet-Client-IPv6-Address	4	Octets
Fortinet-Interface-Name	5	String
Fortinet-Access-Profile	6	String
Fortinet-SSID	7	String
Fortinet-AP-Name	8	String
Fortinet-FAC-Auth-Status	11	String
Fortinet-FAC-Token-ID	12	String
Fortinet-FAC-Challenge-Code	15	String
Fortinet-Webfilter-Category-Allow	16	String
Fortinet-Webfilter-Category-Block	17	Octets
Fortinet-Webfilter-Category-Monitor	18	Octets
Fortinet-AppCtrl-Category-Allow	19	Octets
Fortinet-AppCtrl-Category-Block	20	Octets
Fortinet-AppCtrl-Risk-Allow	21	Octets
Fortinet-AppCtrl-Risk-Block	22	Octets
Fortinet-WirelessController-Device-MAC	23	Ether
Fortinet-WirelessController-WTP-ID	24	String
Fortinet-WirelessController-Assoc-Time	25	Date
Fortinet-FortiWAN-AVPair	26	String
Fortinet-FDD-Access-Profile	30	String
Fortinet-FDD-Trusted-Hosts	31	String

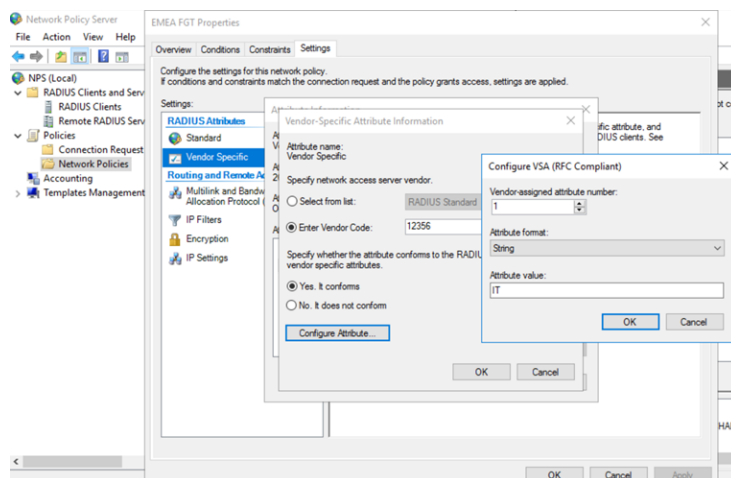

Attribute name	Attribute number	Attribute value format
Fortinet-FDD-SPP-Name	32	String
Fortinet-FDD-Is-System-Admin	33	String
Fortinet-FDD-Is-SPP-Admin	34	String
Fortinet-FDD-SPP-Policy-Group	35	String
Fortinet-FDD-Allow-API-Access	36	String
Fortinet-Fpc-User-Role	40	String
Fortinet-Tenant-Identification	41	String
Fortinet-Host-Port-AVPair	42	String

* For Fortinet-Vdom-Name, users can be tied to a specific VDOM on the FortiGate. Refer to the documentation provided by your RADIUS server for configuration details.

Restricting RADIUS user groups to match selective users on the RADIUS server

When a user group is configured in FortiOS to authenticate against a RADIUS server, it will allow any valid user account on the RADIUS server to match that user group. Sometimes you might want to specify which users on the RADIUS server should match a particular user group on the FortiGate. This can be accomplished using the RADIUS attribute value pair (AVP) 26, known as a Vendor-Specific Attribute (VSA). This attribute allows the Fortinet-Group-Name VSA to be included in the RADIUS response. In FortiOS, the user group must be configured to specifically match this group.

In the following example, a RADIUS [Network Policy Server \(NPS\)](#) has been configured to have the Fortinet-Group-Name be *IT*, and assumes that the user group, *RADIUS_IT* has been created, which authenticates to the *RADIUS_NPS* server.

To configure specific group matching in the GUI:

1. Go to *User & Authentication > User Groups* and edit the *RADIUS_IT* group.
2. In the *Remote Groups* table, select the *RADIUS_NPS* server and click *Edit*. The *Add Group Match* pane opens.
3. For *Groups*, select *Specify* and enter the group name configured on the RADIUS server (*IT*).

4. Click OK.

The screenshot shows the 'Add Group Match' dialog box. On the left, there's a sidebar with 'Edit User Group' and 'Add Group Match' tabs. The main area has 'Remote Server' set to 'RADIUS_NPS' and 'Groups' set to 'IT'. There are 'Any' and 'Specify' buttons. At the bottom, there are 'OK' and 'Cancel' buttons.

5. Click OK.

To configure specific group matching in the CLI:

```

config user group
    edit "RADIUS_IT"
        set member "RADIUS_NPS"
        config match
            edit 1
                set server-name "RADIUS_NPS"
                set group-name "IT"
            next
        end
    next
end

```

To change the matching back to any group, under `config match`, enter `delete 1`. Changing the `group-name` to "Any" will cause the FortiGate to match the Fortinet-Group-Name with the literal string, Any.

Configuring RADIUS SSO authentication

A common RADIUS SSO (RSSO) topology involves a medium-sized company network of users connecting to the Internet through the FortiGate and authenticating with a RADIUS server. The following describes how to configure FortiOS for this scenario. The example makes the following assumptions:

- VDOMs are not enabled.
- The `super_admin` account is used for all FortiGate configuration.
- A RADIUS server is installed on a server or FortiAuthenticator and uses default attributes.
- BGP is used for any dynamic routing.
- You have configured authentication event logging under *Log & Report*.

Example.com has an office with 20 users on the internal network who need access to the Internet. The office network is protected by a FortiGate-60C with access to the Internet through the wan1 interface, the user network on the internal

interface, and all servers are on the DMZ interface. This includes an Ubuntu sever running FreeRADIUS. This example configures two users:

User	Account
Pat Lee	plee@example.com
Kelly Green	kgreen@example.com

Configuring this example consists of the following steps:

1. [Configure RADIUS.](#)
2. [Configure FortiGate interfaces.](#)
3. [Configure a RSSO agent.](#)
4. [Create a RSSO user group.](#)
5. [Configure security policies.](#)
6. [Test the configuration.](#)

To configure RADIUS:

Configuring RADIUS includes configuring a RADIUS server such as FreeRADIUS on user's computers and configuring users in the system. In this example, Pat and Kelly belong to the `example.com_employees` group. After completing the configuration, you must start the RADIUS daemon. The users have a RADIUS client installed on their PCs that allow them to authenticate through the RADIUS server.

For any problems installing FreeRADIUS, see the [FreeRADIUS documentation](#).

To configure FortiGate interfaces:

You must define a DHCP server for the internal network, as this network type typically uses DHCP. The wan1 and dmz interfaces are assigned static IP addresses and do not need a DHCP server. The following table shows the FortiGate interfaces used in this example:

Interface	Subnet	Act as DHCP server	Devices
wan1	172.20.120.141	No	Internet service provider
dmz	10.11.101.100	No	Servers including RADIUS server
internal	10.11.102.100	Yes: x.x.x.110-250	Internal user network

1. Go to *Network > Interfaces*.
2. Edit wan1:

Alias	Internet
Addressing Mode	Manual
IP/Network Mask	172.20.120.141/255.255.255.0
Administrative Access	HTTPS, SSH
Enable DHCP Server	Not selected
Comments	Internet
Administrative Status	Up

3. Click *OK*.
4. Edit dmz:

Alias	Servers
Addressing Mode	Manual
IP/Network Mask	10.11.101.100/255.255.255.0
Administrative Access	HTTPS, SSH, PING, SNMP
Enable DHCP Server	Not selected
Listen for RADIUS Accounting Messages	Select
Comments	Servers
Administrative Status	Up

5. Click *OK*.
6. Edit internal:

Alias	Internal network
Addressing Mode	Manual
IP/Network Mask	10.11.102.100/255.255.255.0
Administrative Access	HTTPS, SSH, PING
Enable DHCP Server	Select
Address Range	10.11.102.110 - 10.11.102.250
Netmask	255.255.255.0
Default Gateway	Same as Interface IP
Comments	Internal network
Administrative Status	Up

To create a RADIUS SSO agent:

1. Go to *Security Fabric > External Connectors*.
2. Click *Create New*.
3. Under *Endpoint/Identity*, select *RADIUS Single Sign-On Agent*.
4. Enable *Use RADIUS Shared Secret*. Enter the RADIUS server's shared secret.
5. Enable *Send RADIUS Responses*. Click *OK*.

To create a RADIUS SSO user group:

1. Go to *User & Authentication > User Groups*.
2. Click *Create New*.
3. For *Type*, select *RADIUS Single Sign-On (RSSO)*.
4. In *RADIUS Attribute Value*, enter the name of the RADIUS user group that this local user group represents.
5. Click *OK*.

Configuring security policies

The following security policies are required for RADIUS SSO:

Sequence Number	From	To	Type	Schedule	Description
1	internal	wan1	RADIUS SSO	Business hours	Authenticate outgoing user traffic
2	internal	wan1	Regular	Always	Allow essential network services and VoIP
3	dmz	wan1	Regular	Always	Allow servers to access the Internet
4	internal	dmz	Regular	Always	Allow users to access servers
5	any	any	Deny	Always	Implicit policy denying all traffic that has not been matched

You must place the RADIUS SSO policy at the top of the policy list so that it is matched first. The only exception to this is if you have a policy to deny access to a list of banned users. In this case, you must put that policy at the top so that the RADIUS SSO does not mistakenly match a banned user or IP address.

You must configure lists before creating security policies.

Schedule

You must configure a `business_hours` schedule. You can configure a standard Monday to Friday 8 AM to 5 PM schedule, or whatever days and hours covers standard work hours at the company.

Address groups

You must configure the following address groups:

Name	Interface	Address range included
internal_network	internal	10.11.102.110 to 10.11.102.250
company_servers	dmz	10.11.101.110 to 10.11.101.250

Service groups

You must configure the service groups. The services listed are suggestions and you may include more or less as required:

Name	Interface	Description of services to be included
essential_network_services	internal	Any network protocols required for normal network operation such as DNS, NTP, BGP
essential_server_services	dmz	All the protocols required by the company servers such as BGP, HTTP, HTTPS, FTP, IMAP, POP3, SMTP, IKE, SQL, MYSQL, NTP, TRACEROUTE, SOCKs, and SNMP
user_services	internal	Any protocols required by users such as HTTP, HTTPS, FTP

The following security policy configurations are basic and only include logging and default AV and IPS. These policies allow or deny access to non-RADIUS SSO traffic. These are essential as network services including DNS, NTP, and FortiGuard require access to the Internet.

To configure security policies:

1. Go to *Policy & Objects > Firewall Policy*.
2. Click *Create New*.
3. Configure the policy as follows, then click *OK*:

Incoming Interface	Internal
Source Address	internal_network
Outgoing Interface	wan1
Destination Address	all
Schedule	always
Service	essential_network_services
Action	ACCEPT
NAT	ON
Security Profiles	ON: AntiVirus, IPS
Log Allowed Traffic	ON

Comments	Essential network services
-----------------	----------------------------

4. Click *Create New*, and configure the new policy as follows, then click *OK*:

Incoming Interface	dmz
Source Address	company_servers
Outgoing Interface	wan1
Destination Address	all
Schedule	always
Service	essential_server_services
Action	ACCEPT
NAT	ON
Security Profiles	ON: AntiVirus, IPS
Log Allowed Traffic	enable
Comments	Company servers accessing the Internet

5. Click *Create New*, and configure the new policy as follows, then click *OK*:

Incoming Interface	Internal
Source Address	internal_network
Outgoing Interface	dmz
Destination Address	company_servers
Schedule	always
Service	all
Action	ACCEPT
NAT	ON
Security Profiles	ON: AntiVirus, IPS
Log Allowed Traffic	enable
Comments	Access company servers

6. Click *Create New*, and configure the RADIUS SSO policy as follows, then click *OK*. This policy allows access for members of specific RADIUS groups.

Incoming Interface	Internal
Source Address	internal_network
Source User(s)	Select the user groups that you created for RSSO.
Outgoing Interface	wan1

Destination Address	all
Schedule	business_hours
Service	ALL
Action	ACCEPT
NAT	ON
Security Profiles	ON: AntiVirus, Web Filter, IPS, and Email Filter. In each case, select the default profile.

- Place the RSSO policy higher in the security policy list than more general policies for the same interfaces. Click **OK**.

To test the configuration:

Once configured, a user only needs to log in to their PC using their RADIUS account. After that, when they attempt to access the Internet, the FortiGate uses their session information to get their RADIUS information. Once the user is verified, they can access the website.

- The user logs on to their PC and tries to access the Internet.
- The FortiGate contacts the RADIUS server for the user's information. Once confirmed, the user can access the Internet. Each step generates logs that enable you to verify that each step succeeded.
- If a step does not succeed, confirm that your configuration is correct.

RSA ACE (SecurID) servers

SecurID is a two-factor system produced by the company RSA that uses one-time password (OTP) authentication. This system consists of the following:

- Portable tokens that users carry
- RSA ACE/Server
- Agent host (the FortiGate)

When using SecurID, users carry a small device or "token" that generates and displays a pseudo-random password. According to RSA, each SecurID authenticator token has a unique 64-bit symmetric key that is combined with a powerful algorithm to generate a new code every 60 seconds. The token is time-synchronized with the SecurID RSA ACE/Server.

The RSA ACE/Server is the SecurID system's management component. It stores and validates the information about the SecurID tokens allowed on your network. Alternately, the server can be an RSA SecurID 130 appliance.

The agent host is the server on your network. In this case, this is the FortiGate, which intercepts user logon attempts. The agent host gathers the user ID and password entered from the SecurID token and sends the information to the RSA ACE/Server for validation. If valid, the RSA ACE/Server returns a reply indicating that it is a valid logon and FortiOS allows the user access to the network resources specified in the associated security policy.

Configuring SecurID with FortiOS consists of the following:

1. Configure the RSA and RADIUS servers to work with each other. See RSA server documentation.
2. Do one of the following:
 - a. [Configure the RSA SecurID 130 appliance.](#)
 - b. [Configure the FortiGate as an agent host on the RSA ACE/Server.](#)
3. [Configure the RADIUS server in FortiOS.](#)
4. [Create a SecurID user group.](#)
5. [Create a SecurID user.](#)
6. [Configure authentication with SecurID.](#)

The following instructions are based on RSA ACE/Server 5.1 and RSA SecurID 130 appliance. They assume that you have successfully completed all external RSA and RADIUS server configuration.

In this example, the RSA server is on the internal network and has an IP address of 192.128.100.000. The FortiOS internal interface address is 192.168.100.3. The RADIUS shared secret is fortinet123, and the RADIUS server is at IP address 192.168.100.202.

To configure the RSA SecurID 130 appliance:

1. Log on to the SecurID IMS console.
2. Go to *RADIUS > RADIUS clients*, then select *Add New*.

RADIUS Client Basics

Client Name	FortiGate
Associated RSA Agent	FortiGate

RADIUS Client Settings

IP Address	Enter the FortiOS internal interface. In this example, it is 192.168.100.3.
Make / Model	Select <i>Standard Radius</i> .
Shared Secret	Enter the RADIUS shared secret. In this example, it is fortinet123.
Accounting	Leave unselected.
Client Status	Leave unselected.

3. Configure your FortiGate as a SecurID client:
4. Click **Save**.

To configure the FortiGate as an agent host on the RSA ACE/Server:

1. On the RSA ACE/Server, go to *Start > Programs > RSA ACE/Server*, then *Database Administration - Host Mode*.
2. From the *Agent Host* menu, select *Add Agent Host*.
3. Configure the following:

Name	FortiGate
Network Address	Enter the FortiOS internal interface. In this example, it is 192.168.100.3.
Secondary Nodes	You can optionally enter other IP addresses that resolve to the FortiGate.

For more information, see the RSA ACE/Server documentation.

To configure the RADIUS server in FortiOS:

1. Go to *User & Authentication > RADIUS Servers*, then click *Create New*.
2. Configure the following:

Name	RSA
Authentication method	Select <i>Default</i> .
Primary Server	
IP/Name	192.168.100.102. You can click <i>Test</i> to ensure the IP address is correct and that FortiOS can contact the RADIUS server.
Secret	fortinet123

3. Click *OK*.

To create a SecurID user group:

1. Go to *User & Authentication > User Groups*. Click *Create New*.
2. Configure the following:

Name	RSA_group
Type	Firewall

3. In *Remote Groups*, click *Add*, then select the RSA server.
4. Click *OK*.

To create a SecurID user:

1. Go to *User & Authentication > User Definition*. Click *Create New*.
2. Configure the following:

User Type	Remote RADIUS User
Type	wloman
RADIUS Server	RSA

Contact Info	(Optional) Enter email or SMS information.
---------------------	--

User Group	RSA_group
-------------------	-----------

3. Click *Create*.

You can test the configuration by entering the `diagnose test authserver radius RSA auto wloman 111111111` command. The series of 1s is the OTP that your RSA SecurID token generates that you enter for access.

Configuring authentication with SecurID

You can use the SecurID user group in several FortiOS features that authenticate by user group:

- [Security policy on page 2276](#)
- [IPsec VPN XAuth on page 2277](#)
- [PPTP VPN on page 2277](#)
- SSL VPN

Unless stated otherwise, the following examples use default values.

Security policy

The example creates a security policy that allows HTTP, FTP, and POP3 traffic from the internal interface to WAN1. If these interfaces are not available in FortiOS, substitute other similar interfaces.

To configure a security policy with SecurID authentication:

1. Go to *Policy & Objects > Firewall Policy*.
2. Click *Create New*.
3. Configure the following:

Incoming Interface	internal
Source Address	all
Source User(s)	RSA_group
Outgoing Interface	wan1
Destination Address	all
Schedule	always
Service	HTTP, FTP, POP3
Action	ACCEPT
NAT	On
Shared Shaper	If you want to limit traffic or guarantee minimum bandwidth for traffic that uses the SecurID security policy, enable and use the default shaper, guarantee-100kbps.
Log Allowed Traffic	Enable if you want to generate usage reports on traffic that this policy has authenticated.

4. Click *OK*.

IPsec VPN XAuth

In *VPN > IPsec Wizard*, select the SecurID user group on the *Authentication* page. The SecurID user group members must enter their SecurID code to authenticate.

PPTP VPN

When configuring PPTP in the CLI, set `usrgrp` to the SecurID user group.

SSL VPN

You must map the SecurID user group to the portal that will serve SecurID users and include the SecurID user group in the security policy's *Source User(s)* field.

To map the SecurID group to an SSL VPN portal:

1. Go to *VPN > SSL-VPN Settings*.
2. Under *Authentication/Portal Mapping*, click *Create New*.
3. Configure the following:

Users/Groups	RSA_group
Portal	Select the desired portal.

4. Click *OK*.

Support for Okta RADIUS attributes filter-Id and class

RADIUS user group membership information can be returned in the filter-Id (11) and class (25) attributes in RADIUS Access-Accept messages. The group membership information can be used for group matching in FortiGate user groups in firewall policies and for FortiGate wildcard administrators with remote RADIUS authentication.

In this example, a FortiAuthenticator is used as the RADIUS server. A local RADIUS user on the FortiAuthenticator is configured with two groups in the filter-Id attribute: *okta-group1* and *okta-group2*.

To create the RADIUS user and set the attribute type to override group information:

```

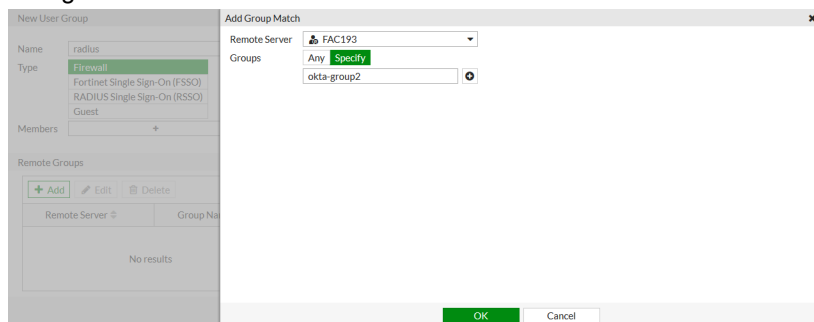

config user radius
    edit "FAC193"
        set server "10.1.100.189"
        set secret *****
        set group-override-attr-type filter-Id
    next
end

```

FortiOS will only use the configured filter-Id attribute, even if the RADIUS server sends group names in both class and filter-id attributes. To return group membership information from the class attribute instead, set `group-override-attr-type` to `class`.

To configure group match in the user group:

1. Go to *User & Authentication > User Groups*.
2. Click *Create New*.
3. Enter a name for the group, and set *Type* to *Firewall*.
4. In the *Remote Groups* table, click *Add*.
5. Set *Remote Server* to the just created RADIUS server, *FAC193*.
6. Set *Groups* to *Specify*, and enter the group name, *okta-group2*. The string must match the group name configured on the RADIUS server for the filter-Id attribute.

7. Click *OK*.
The remote server is added to the *Remote Groups* table.
8. Click *OK*.
9. Add the new user group to a firewall policy and generate traffic on the client PC that requires firewall authentication, such as connecting to an external web server.
10. After authentication, on the FortiGate, verify that traffic is authorized in the traffic log:
 - a. Go to *Log & Report > Forward Traffic*.
 - b. Verify that the traffic was authorized.

To use the remote user group with group match in a system wildcard administrator configuration:

1. Go to *System > Administrators*.
2. Edit an existing administrator, or create a new one.
3. Set *Type* to *Match all users in a remote server group*.

4. Set *Remote User Group* to the remote server.

5. Configure the remaining settings as required.

6. Click **OK**.

7. Log in to the FortiGate using the remote user credentials on the RADIUS server.

If the correct group name is returned in the filter-Id attribute, administrative access is allowed.

Sending multiple RADIUS attribute values in a single RADIUS Access-Request

A managed FortiSwitch can be configured to send multiple RADIUS attribute values in a single RADIUS Access-Request. This option is configured per RADIUS user, and is set to `none` by default.

The available service type options are:

login	User should be connected to a host.
framed	User use Framed Protocol.
callback-login	User disconnected and called back.
callback-framed	User disconnected and called back, then a Framed Protocol.
outbound	User granted access to outgoing devices.
administrative	User granted access to the administrative unsigned interface.
nas-prompt	User provided a command prompt on the NAS.
authenticate-only	Authentication requested, and no authentication information needs to be returned.
callback-nas-prompt	User disconnected and called back, then provided a command prompt.
call-check	Used by the NAS in an Access-Request packet, Access-Accept to answer the call.
callback-administrative	User disconnected and called back, granted access to the admin unsigned interface.

To configure a managed FortiSwitch to the RADIUS attributes login, framed, and authenticate-only all at the same time:

```
config user radius
  edit "Radius_Server"
    set switch-controller-service-type login framed authenticate-only
```

```

    . . . .
next
end

```

Traffic shaping based on dynamic RADIUS VSAs

A FortiGate can use the WISPr-Bandwidth-Max-Down and WISPr-Bandwidth-Max-Up dynamic RADIUS VSAs (vendor-specific attributes) to control the traffic rates permitted for a certain device. The FortiGate can apply different traffic shaping to different users who authenticate with RADIUS based on the returned RADIUS VSA values. When the same user logs in from an additional device, the RADIUS server will send a CoA (change of authorization) message to update the bandwidth values to $1/N$ of the total values, where N is the number of logged in devices from the same user.

This feature is not supported on NP hardware. NP offloading is automatically disabled on the policy if this feature is enabled.

When a user logs in to two devices through RADIUS authentication. The authentication and authorization flow is as follows:

1. The user logs in to a device and the authentication is sent to the FortiGate.
2. The FortiGate sends the Access-Request message to the RADIUS server.
3. The RADIUS server sends the Access-Accept message to the FortiGate. The server also returns the WISPr-Bandwidth-Max-Up and WISPr-Bandwidth-Max-Down VSAs.
4. Based on the VSA values, the FortiGate applies traffic shaping for the upload and download speeds based on its IP.
5. The user logs in to a second device and the authentication is sent to the FortiGate.
6. The FortiGate sends the Access-Request message to the RADIUS server.
7. The RADIUS server sends the Access-Accept message to the FortiGate. The server also returns the WISPr-Bandwidth-Max-Up and WISPr-Bandwidth-Max-Down VSAs at half the value from the first device.
8. Based on the VSA values, the FortiGate applies traffic shaping for the upload and download speeds on the second device based on its IP.
9. The RADIUS server sends a CoA message and returns WISPr-Bandwidth-Max-Up and WISPr-Bandwidth-Max-Down VSAs for the first device at half the value.

- Based on the VSA values, the FortiGate updates traffic shaping for the upload and download speeds on the first device based on its IP.

Example

In this example, the FortiGate is configured to dynamically shape user traffic based on the WISPr-Bandwidth-Max-Up and WISPr-Bandwidth-Max-Down VSAs returned by the RADIUS server when the user logs in through firewall authentication.

To configure traffic shaping based on dynamic RADIUS VSAs:

- Configure the RADIUS server users file to identify WISPr-Bandwidth-Max-Up and WISPr-Bandwidth-Max-Down:

The WISPr-Bandwidth is measured in bps, and the FortiOS dynamic shaper is measured in Bps.

```

WISPr-Bandwidth-Max-Up = 1004857,
WISPr-Bandwidth-Max-Down = 504857,
  
```

- In FortiOS, configure the RADIUS server:

```

config user radius
  edit "rad1"
    set server "172.16.200.44"
    set secret *****
    set radius-coa enable
    set acct-all-servers enable
    config accounting-server
      edit 1
        set status enable
        set server "172.16.200.44"
        set secret *****
      next
    end
  next
end
  
```

- Configure the RADIUS user group:

```

config user group
  edit "group_radius"
    set member "rad1"
  next
end
  
```

4. Configure the firewall policy with dynamic shaping and the RADIUS group:

```
config firewall policy
    edit 2
        set srcintf "port2"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all6"
        set dstaddr6 "all6"
        set action accept
        set schedule "always"
        set service "ALL"
        set dynamic-shaping enable
        set groups "group_radius"
        set nat enable
    next
end
```

Verification

After a client PC is authenticated by the RADIUS server, dynamic shaping is applied to the client based on the IP address.

Use the following commands to monitor the dynamic shaper:

```
# diagnose firewall shaper dynamic-shaper stats
# diagnose firewall shaper dynamic-shaper list {ip | ipv6 | user} <address or username>
```

Use case 1

User1 is paying for rate plan A that limits their maximum bandwidth to 10 Mbps download and 5 Mbps upload. User2 is paying for rate plan B that limits their maximum bandwidth to 5 Mbps download and 5 Mbps upload. The speeds in both plans are provided by best effort, so there is no guaranteed minimum bandwidth.

User1 logs in to pc1 with RADIUS authentication and IP-based dynamic shaping is applied. User2 logs in to pc2 with RADIUS authentication and IP-based dynamic shaping is applied.

To verify the dynamic shaping:

1. On pc1, verify the bandwidth and transfer speed:

```
root@pc1:~# iperf -c 172.16.200.44 -u -t 25 -b 20M
-----
Client connecting to 172.16.200.44, UDP port 5001
Sending 1470 byte datagrams
UDP buffer size: 208 KByte (default)
-----
[ 3] local 10.1.100.11 port 50510 connected with 172.16.200.44 port 5001
[ ID] Interval          Transfer      Bandwidth
[ 3] 0.0-25.0 sec    59.6 MBytes  20.0 Mbits/sec
[ 3] Sent 42518 datagrams
[ 3] Server Report:
[ 3] 0.0-25.3 sec   30.1 MBytes  9.99 Mbits/sec  15.651 ms 21058/42518 (50%)
```

2. On pc2, verify the bandwidth and transfer speed:

```

root@pc2:~# iperf -c 172.16.200.44 -u -t 25 -b 20M
-----
Client connecting to 172.16.200.44, UDP port 5001
Sending 1470 byte datagrams
UDP buffer size: 208 KByte (default)
-----
[  3] local 10.1.100.22 port 52814 connected with 172.16.200.44 port 5001
[ ID] Interval           Transfer     Bandwidth
[  3] 0.0-25.0 sec   59.6 MBytes  20.0 Mbits/sec
[  3] Sent 42518 datagrams
[  3] Server Report:
[  3] 0.0-25.3 sec   15.1 MBytes  5.03 Mbits/sec  15.652 ms 31710/42514 (75%)

```

3. In FortiOS, check the authentication list:

```

# diagnose firewall auth list
10.1.100.11, test-shaper1
    src_mac: **:***:***:***:***:***
    type: fw, id: 0, duration: 38, idled: 16
    expire: 562
    flag(814): hard radius no_idle
    server: rad1

```

Use case 2

A user logs in to a device (pc1, 10.1.100.11) and has a maximum bandwidth of 10 Mbps download and 5 Mbps upload. The same user logs in to a second device (pc2, 10.1.100.22) and the RADIUS server sends a CoA request with the WISPr-Bandwidth-Max to pc1. The maximum bandwidth on pc1 changes to 5 Mbps download and 2.5Mbps upload. On pc2, the maximum bandwidth is also 5 Mbps download and 2.5Mbps upload.

When the user logs out from pc1, the RADIUS server sends CoA request with the new WISPr-Bandwidth-Max for pc2. The FortiGate updates the authentication user list and dynamic shaper for pc2. The maximum bandwidth on pc2 changes to 10 Mbps download and 5 Mbps upload.

To verify the dynamic shaping:

1. Check the dynamic shaper list after the user logs in to pc1:

```
# diagnose firewall shaper dynamic-shaper list
addr: 10.1.100.11
bandwidth(original/reply): 1250000 Bps/625000 Bps
current bandwidth(original/reply): 0 Bps/0 Bps
allow packets(original/reply): 0/3
allow bytes(original/reply): 0/243
drop packets(original/reply): 0/0
drop bytes(original/reply): 0/0
life: 491
idle: 4/4
idle time limit: 86400 s
```

2. Check the dynamic shaper list after the user logs in to pc2:

```
# diagnose firewall shaper dynamic-shaper list
addr: 10.1.100.11
bandwidth(original/reply): 625000 Bps/312500 Bps
current bandwidth(original/reply): 0 Bps/0 Bps
allow packets(original/reply): 0/0
allow bytes(original/reply): 0/0
drop packets(original/reply): 0/0
drop bytes(original/reply): 0/0
life: 652
idle: 5/5
idle time limit: 600 s

addr: 10.1.100.22
bandwidth(original/reply): 625000 Bps/312500 Bps
```

```
current bandwidth(original/reply): 0 Bps/0 Bps
allow packets(original/reply): 0/3
allow bytes(original/reply): 0/243
drop packets(original/reply): 0/0
drop bytes(original/reply): 0/0
life: 3
idle: 3/3
idle time limit: 86400 s
```

3. Check the authentication list:

```
# diagnose firewall auth list
10.1.100.11, test
    src_mac: **:***:***:***:***:***
    type: fw, id: 0, duration: 171, idled: 11
    expire: 589, max-life: 589
    flag(814): hard radius no_idle
    server: rad1
    packets: in 0 out 0, bytes: in 0 out 0
    group_id: 15
    group_name: group_radius
10.1.100.22, test
    src_mac: **:***:***:***:***:***
    type: fw, id: 0, duration: 9, idled: 9
    expire: 86391
    flag(814): hard radius no_idle
    server: rad1
    packets: in 0 out 0, bytes: in 0 out 0
    group_id: 15
    group_name: group_radius
----- 2 listed, 0 filtered -----
```

4. Check the dynamic shaper list after the user logs out from pc1:

```
# diagnose firewall shaper dynamic-shaper list
addr: 10.1.100.22
bandwidth(original/reply): 1250000 Bps/625000 Bps
current bandwidth(original/reply): 0 Bps/0 Bps
allow packets(original/reply): 0/0
allow bytes(original/reply): 0/0
drop packets(original/reply): 0/0
drop bytes(original/reply): 0/0
life: 414
idle: 9/9
idle time limit: 600 s
```

5. Check the authentication list again:

```
# diagnose firewall auth list
10.1.100.22, test
    src_mac: **:***:***:***:***:***
    type: fw, id: 0, duration: 453, idled: 49
    expire: 551, max-life: 551
    flag(814): hard radius no_idle
    server: rad1
    packets: in 0 out 0, bytes: in 0 out 0
    group_id: 15
```

```
group_name: group_radius
----- 1 listed, 0 filtered -----
```

RADIUS Termination-Action AVP in wired and wireless scenarios

When authenticating with RADIUS in a wired or wireless scenario, the FortiGate can support proper handling of the Termination-Action AVP.

In a wired scenario, a hardware switch configured with 802.1X security authentication can read the Termination-Action attribute value from the RADIUS Access-Accept response. If the Termination-Action is 1, the FortiGate will initiate re-authentication when the session time has expired. During re-authentication, the port stays authorized. If the Termination-Action is 0, the session will be terminated.

In a wireless scenario, when a virtual AP is configured with WPA2-Enterprise security with RADIUS and has CoA enabled, it processes the RADIUS CoA request immediately upon receiving it and re-authenticates when the Termination-Action is 1.

Wired example

This example has a FortiGate configured with a hardware switch with two ports: port3 and port5. The hardware switch is enabled with 802.1X security and assigned to a RADIUS user group. Upon a successful authentication, the RADIUS server responds with an Access-Accept containing the authentication Session-Timeout and Termination-Action attributes. In this example, the Termination-Action value is 1, which informs the client to re-authenticate when the session time expires. During this time, the FortiGate keeps the client/port authorized while it initiates the re-authentication with the RADIUS server.

The message exchange is as follows:

To configure the RADIUS server and the FortiGate to handle the Termination-Action AVP:

1. On the RADIUS server, configure the Termination-Action AVP with the value `RADIUS-Request (1)` to indicate that re-authentication should occur upon expiration of the Session-Time.
2. On the FortiGate, configure the RADIUS server:

```

config user radius
  edit "rad1"
    set server "172.18.60.203"
    set secret ENC *****
    set radius-coa enable
    config accounting-server
      edit 1
        set status enable
        set server "172.18.60.203"
        set secret ENC *****
      next
    end
  next
end

```

3. Configure the RADIUS user group:

```

config user group
  edit "group_radius"
    set member "rad1"
  end
end

```

```
    next
end
```

4. Configure the hardware switch with 802.1X enabled.

a. Configure the virtual switch settings:

```
config system virtual-switch
    edit hw2
        set physical-switch "sw0"
    config port
        edit port3
            next
        edit port5
            next
        end
    next
end
```

b. Configure the interface settings:

```
config system interface
    edit hw2
        set vdom vdom1
        set ip 6.6.6.1 255.255.255.0
        set allowaccess ping https ssh
        set stp enable
        set security-mode 802.1X
        set security-groups "group_radius"
    next
end
```

```
WARNING: Changing 802.1X could interrupt network connectivity on affected interfaces.
Do you want to continue? (y/n)y
```

5. On the client device, initiate 802.1X authentication, then verify that the switch port shows as authorized:

```
# diagnose sys 802-1x status
Virtual switch 'hw2' (default mode) 802.1x member status:
port3: Link up, 802.1X state: unauthorized
port5: Link up, 802.1X state: authorized
```

6. After successful authentication, wait for the session to timeout.

7. The FortiGate will keep the 802.1X port authenticated, and initiate re-authentication with the same Acct-Session-Id to the RADIUS server. The 802.1X status of the port remains unchanged:

```
# diagnose sys 802-1x status
Virtual switch 'hw2' (default mode) 802.1x member status:
port3: Link up, 802.1X state: unauthorized
port5: Link up, 802.1X state: authorized
```

Wireless example

In this example, a virtual AP is configured with WPA2-Enterprise security with RADIUS and has CoA enabled. After a wireless user authenticates and connects to the wireless SSID, the RADIUS server triggers a CoA event with AVPs Session-timeout and a Termination-Action of 1. This signals the FortiGate to trigger re-authentication of the client, which the client immediately performs to stay connected to the wireless SSID.

The message exchange is as follows:

To configure the FortiGate to handle the Termination-Action AVP:

1. Configure the RADIUS server:

```

config user radius
  edit "peap"
    set server "172.16.200.55"
    set secret "*****"
    set radius-coa enable
  next
end

```

2. Configure the VAP:

```

config wireless-controller vap
  edit "wifi"
    set ssid "FWF-60E-coa"
    set security wpa2-only-enterprise
    set auth radius
    set radius-server "peap"
    set schedule "always"
  next
end

```

3. Verify that the wireless station connects to the SSID:

```
# diagnose wireless-controller wlacl -d sta online
vf=0 wtp=1 rId=1 wlan=wifi vlan_id=0 ip=10.10.80.2 ip6=: mac=**:**:**:**:**:** vci=
host=wifi-qa-01 user=test1 group=group1 signal=-28 noise=-95 idle=1 bw=0 use=6 chan=149
radio_type=11AC security=wpa2_only_enterprise mpsk= encrypt=aes cp_authed=no online=yes
mimo=2
```

4. From the RADIUS server, manually trigger a RADIUS CoA event.**a. RADIUS CoA sent to the FortiGate:**

```
Sent CoA-Request Id 7 from 0.0.0.0:54158 to 172.16.200.201:3799 length 39
User-Name = "test1"
Session-Timeout = 120
Termination-Action = RADIUS-Request
```

b. RADIUS CoA-ACK received from the FortiGate:

```
Received CoA-ACK Id 7 from 172.16.200.201:3799 to 0.0.0.0:0 length 44
Event-Timestamp = "Jan 5 2022 14:43:12 PST"
Message-Authenticator = 0x3311ba3b763d68da653ab34351b0308
```

5. On the wireless station console, verify that the re-authentication happens immediately:

```
root@wifi-qa-01:/home/wpa-test# wlan1: CTRL-EVENT-EAP-STARTED EAP authentication started
wlan1: CTRL-EVENT-EAP-PROPOSED-METHOD vendor=0 method=25
wlan1: CTRL-EVENT-EAP-METHOD EAP vendor 0 method 25 (PEAP) selected
EAP-TLV: TLV Result - Success - EAP-TLV/Phase2 Completed
wlan1: CTRL-EVENT-EAP-SUCCESS EAP authentication completed successfully
wlan1: PMKSA-CACHE-REMOVED **:**:**:**:**:** 0
wlan1: PMKSA-CACHE-ADDED **:**:**:**:**:** 0
wlan1: WPA: Key negotiation completed with **:**:**:**:**:** [PTK=CCMP GTK=CCMP]
```

Configuring a RADSEC client

FortiOS supports RADSEC clients in order to secure the communication channel over TLS for all RADIUS traffic, including RADIUS authentication and RADIUS accounting over port 2083. A FortiGate acting as a TLS client can initiate the TLS handshake with a remote RADIUS server. Administrators can specify a client certificate, perform a server identity check (enabled by default), and verify against a particular trust anchor (CA certificate). During a TLS handshake, the SNI check will use the RADIUS server FQDN if configured.

TCP connections are also supported, which use port 1812 for authentication and port 1813 for accounting.

```
config user radius
  edit <name>
    set transport-protocol {udp | tcp | tls}
    set ca-cert <string>
    set client-cert <string>
    set tls-min-proto-version {default | SSLv3 | TLSv1 | TLSv1-1 | TLSv1-2}
    set server-identity-check {enable | disable}
  next
end
```

```
transport-protocol {udp |
  tcp | tls}
```

Set the type of transport protocol to use:

- **udp:** use UDP (default)
- **tcp:** use TCP, but no TLS security

	<ul style="list-style-type: none"> • tls: use TLS over TCP
<code>ca-cert <string></code>	Set the CA certificate of server to trust under TLS.
<code>client-cert <string></code>	Set the client certificate to use under TLS.
<code>tls-min-protocol-version</code> {default SSLv3 TLSv1 TLSv1-1 TLSv1-2}	Set the minimum supported protocol version for TLS connections: <ul style="list-style-type: none"> • default: follow the system global setting • SSLv3: use SSLv3 • TLSv1: use TLSv1 • TLSv1-1: use TLSv1.1 • TLSv1-2: use TLSv1.2
<code>server-identity-check</code> {enable disable}	Enable/disable RADIUS server identity check, which verifies the server domain name/IP address against the server certificate (default = enable).

Examples

The following topology is used to demonstrate configurations using RADSEC over TLS and RADSEC over TCP.

Example 1: RADSEC over TLS

When using TLS, FortiOS uses port 2083 for RADIUS authentication and RADIUS accounting. There is no need to configure the RADIUS accounting separately.

Before configuring RADSEC over TLS, make sure that the CA certificate (which issues the remote RADIUS server certificate) is imported into the FortiGate trusted root store. If a customized local FortiGate client certificate is used, both the certificate and private key are imported into local FortiGate certificate store.

To configure RADSEC over TLS:

1. Configure the RADIUS server:

```

config user radius
  edit "radius-tls"
    set server "10.1.100.41"
    set secret *****
    set acct-interim-interval 600
    set radius-port 2083
    set auth-type pap
    set transport-protocol tls
    set ca-cert "CA_Cert_2"
    set client-cert "portal.fortinet-fsso"
    config accounting-server
      edit 1
    end
  end
end

```

```

        set status enable
        set server "10.1.100.41"
        set secret *****
    next
end
next
end

```

2. Enable `fnbamd` debug messages on the FortiGate to verify the RADIUS authentication triggered by client traffic requesting access to external networks, which requires user authentication by the firewall policy. Note the highlighted initial RADSEC TLS authentication, successfully completed TLS handshake, and RADIUS accounting using TLS over port 2083:

```

# diagnose debug application fnbamd -l
Debug messages will be on for 30 minutes.

# diagnose debug enable
...
[629] __fnbamd_cfg_add_radius_by_user-

[758] __rad_rxtx-Start rad conn timer.
...
```

Example 2: RADSEC over TCP

When using TCP, the default RADIUS ports remain same as with UDP: 1812 for authentication and 1813 for accounting.

To configure RADSEC over TCP:

1. Configure the RADIUS server:

```
config user radius
    edit "radius-tcp"
        set server "10.1.100.41"
        set secret *****
        set acct-interim-interval 600
        set transport-protocol tcp
        config accounting-server
            edit 1
                set status enable
                set server "10.1.100.41"
                set secret *****
            next
        end
    next
end
```

2. Enable fnbamd debug messages on the FortiGate to verify the RADIUS authentication triggered by client traffic requesting access to external networks, which requires user authentication by the firewall policy. Note the highlighted initial RADIUS authentication over TCP: 1812 and initial RADIUS accounting over TCP: 1813:

```
# diagnose debug application fnbamd -1
Debug messages will be on for 30 minutes.

# diagnose debug enable
...

TACACS+ servers

TACACS+ is a remote authentication protocol that provides access control for routers, network access servers, and other network devices through one or more centralized servers.

FortiOS sends the following proprietary TACACS+ attributes to the TACACS+ server during authorization requests:

Attribute	Description
service=<name>	User must be authorized to access the specified service.
memberof	Group that the user belongs to.
admin_prof	Administrator profile (admin access only).

Only `memberof` and `admin_prof` attributes are parsed in authentication replies.

You can configure up to ten remote TACACS+ servers in FortiOS. You must configure at least one server before you can configure remote users.

A TACACS+ server must first be added in the CLI to make the option visible in the GUI.

To configure TACACS+ authentication in the CLI:**1. Configure the TACACS+ server entry:**

```
config user tacacs+
  edit "TACACS-SERVER"
    set server <IP address>
    set key <string>
    set authen-type ascii
    set source-ip <IP address>
  next
end
```

2. Configure the remote user group:

```
config user group
  edit "TACACS-GROUP"
    set group-type firewall
    set member "TACACS-SERVER"
  next
end
```

3. Configure the remote user:

```
config system admin
  edit TACACS-USER
    set remote-auth enable
    set accprofile "super_admin"
    set vdom "root"
    set wildcard enable
    set remote-group "TACACS-GROUP"
  next
end
```

To configure a TACACS+ server in the GUI:

1. Go to *User & Authentication > TACACS+ Servers*.
2. Click *Create New*.
3. Configure the following settings:

Name	Enter the TACACS+ server name.
Authentication Type	Select the authentication type used for the TACACS+ server. Selecting <i>Auto</i> tries PAP, MSCHAP, and CHAP, in that order.
Server IP/Name	Enter the domain name or IP address for the primary server.
Server Secret	Enter the key to access the primary server.

4. Click *OK*.

SAML

The following topics provide information about SAML:

- [Outbound firewall authentication for a SAML user on page 2297](#)
- [SSL VPN with FortiAuthenticator as a SAML IdP on page 2298](#)
- [Using a browser as an external user-agent for SAML authentication in an SSL VPN connection on page 2299](#)
- [SAML authentication in a proxy policy on page 2303](#)
- [Configuring SAML SSO in the GUI on page 2306](#)
- [Outbound firewall authentication with Azure AD as a SAML IdP on page 2312](#)

Outbound firewall authentication for a SAML user

When you configure a FortiGate as a service provider (SP), you can create an authentication profile that uses SAML for firewall authentication.

You must use the identity provider's (IdP) remote certificate on the SPs.

The following example uses a FortiGate as an SP and FortiAuthenticator as the IdP server:

To configure firewall authentication:

1. Configure the FortiGate SP to be a SAML user:

```

config user saml
  edit "fac-firewall"
    set entity-id "http://10.2.2.2:1000/saml/metadata/"
    set single-sign-on-url "https://10.2.2.2:1003/saml/login/"
    set single-logout-url "https://10.2.2.2:1003/saml/logout/"
    set idp-entity-id "http://172.18.58.93:443/saml-idp/bbbbbbb/metadata/"
    set idp-single-sign-on-url "https://172.18.58.93:443/saml-idp/bbbbbbb/login/"
    set idp-single-logout-url "https://172.18.58.93:443/saml-idp/bbbbbbb/logout/"
    set idp-cert "REMOTE_Cert_3"
    set user-name "username"
    set group-name "group"
  next
end

```

2. Add the SAML user to the user group (optionally, you can configure group matching):

```

config user group
  edit "saml_firewall"

```

```

        set member "fac-firewall"
    config match
        edit 1
            set server-name "fac-firewall"
            set group-name "user_group1"
        next
    end
next
end

```

3. Add the SAML user group to a firewall policy:

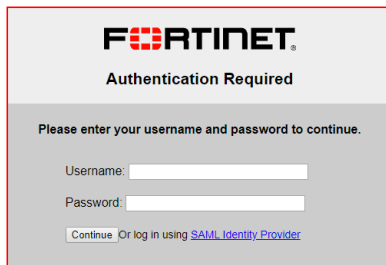

```

config firewall policy
    edit 2
        set srcintf "port3"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "pc4"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set fsso disable
        set groups "saml_firewall" "group_local"
        set users "first"
        set nat enable
    next
end

```

4. Configure the FortiAuthenticator IdP as needed.

5. Run HTTP/HTTPS authentication for a remote user. The SAML login page appears:

The image shows a web-based login page for Fortinet. At the top, the Fortinet logo is displayed in red and black, followed by the text "Authentication Required". Below this, a message states "Please enter your username and password to continue." There are two input fields: "Username:" and "Password:". At the bottom, there is a "Continue" button and a link that says "Or log in using [SAML Identity Provider](#)".

SSL VPN with FortiAuthenticator as a SAML IdP

A FortiGate can act as a SAML service provider (SP) that requests authentication from a FortiAuthenticator, which acts as a SAML identity provider (IdP). The FortiAuthenticator connects to the Windows AD using LDAP to authenticate user requests. The FortiAuthenticator also acts as a root CA to sign certificates for the SP, IdP, and SSL VPN portal.

For a detailed example configuration, see the [FortiGate SSL VPN with FortiAuthenticator as SAML IdP](#) section in the FortiAuthenticator Cookbook.

Using a browser as an external user-agent for SAML authentication in an SSL VPN connection

FortiClient can use a browser as an external user-agent to perform SAML authentication for SSL VPN tunnel mode, instead of the FortiClient embedded log in window. If a user has already done SAML authentication in the default browser, they do not need to authenticate again in the FortiClient built-in browser. FortiClient 7.0.1 and later is required.

The following CLI is used to set the SAML local redirect port on the FortiClient endpoint after successful SAML authentication:

```
config vpn ssl settings
    set saml-redirect-port <port>
end
```

Example

In this example, a user wants to use their default browser to connect to IdP for SAML authentication, without needing to separately authenticate in the FortiClient built-in browser. After authenticating in the browser, FortiClient obtains the authentication cookie directly from the browser.

The authentication process proceeds as follows:

1. The remote client uses FortiClient to connect to the FortiGate SSL VPN on 172.16.58.92:1443 with the *Use external browser as user-agent for saml user authentication* option enabled.
2. The SSL VPN redirects FortiClient to complete SAML authentication using the Identity Provider (IdP).
3. FortiClient opens the default browser to authenticate the IdP server.
4. After a successful authentication, the browser redirects to localhost:<port>, where the port is defined by the `saml-redirect-port` variable on the FortiGate.
5. FortiClient reads the authentication ID passed by the successful authentication, then requests that the SAML authentication process continues on the FortiGate with this ID.
6. The FortiGate continues with the remaining SSL-VPN host-check and other steps until it receives the authentication cookie. It then allow the SSL VPN user to connect using tunnel mode.

To configure the VPN:**1. Configure a SAML user:**

```
config user saml
  edit "sul"
    set cert "fgt_gui_automation"
    set entity-id "http://172.18.58.92:1443/remote/saml/metadata/"
    set single-sign-on-url "https://172.18.58.92:1443/remote/saml/login/"
    set single-logout-url "https://172.18.58.92:1443/remote/saml/logout/"
    set idp-entity-id "http://172.18.58.93:443/saml-idp/222222/metadata/"
    set idp-single-sign-on-url "https://172.18.58.93:443/saml-idp/222222/login/"
    set idp-single-logout-url "https://172.18.58.93:443/saml-idp/222222/logout/"
    set idp-cert "REMOTE_Cert_1"
    set user-name "Username"
    set group-name "Groupname"
    set digest-method sha1
  next
end
```

2. Add the SAML user to a user group:

```
config user group
  edit "saml_grp"
    set member "sul"
  next
end
```

3. Create an SSL VPN web portal:

```
config vpn ssl web portal
  edit "testportal1"
    set tunnel-mode enable
    set ipv6-tunnel-mode enable
    set web-mode enable
    ...
  next
end
```

4. Configure the SSL VPN:

```
config vpn ssl settings
  set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
  set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
  set port 1443
  set source-interface "port2"
  set source-address "all"
  set source-address6 "all"
  set default-portal "testportal1"
  ...
end
```

5. Configure a firewall policy for the SSL VPN and assign the SAML group and a local user to it:

```
config firewall policy
  edit 1
    set name "policy_to_sslvpn_tunnel"
    set srcintf "ssl.root"
    set dstintf "port1"
```

```

        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set nat enable
        set groups "saml_grp"
        set users "u1"
    next
end

```

6. Enable the SAML redirect port:

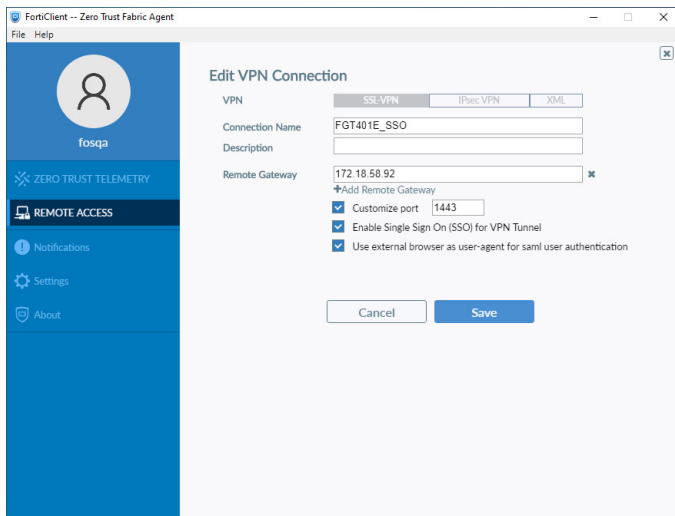

```

config vpn ssl settings
    set saml-redirect-port 8020
end

```

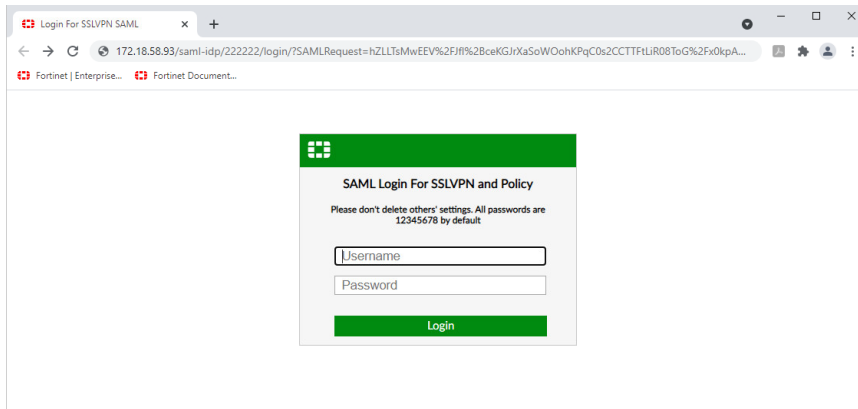

To connect to the VPN using FortiClient:

1. Configure the SSL VPN connection:
 - a. Open FortiClient and go to the *Remote Access* tab and click *Configure VPN*.
 - b. Enter a name for the connection.
 - c. Set the *Remote Gateway* to the FortiGate port 172.18.58.92.
 - d. Enable *Customize port* and set the port to 1443.
 - e. Enable *Enable Single Sign On (SSO) for VPN Tunnel* and *Use external browser as user-agent for saml user authentication*.

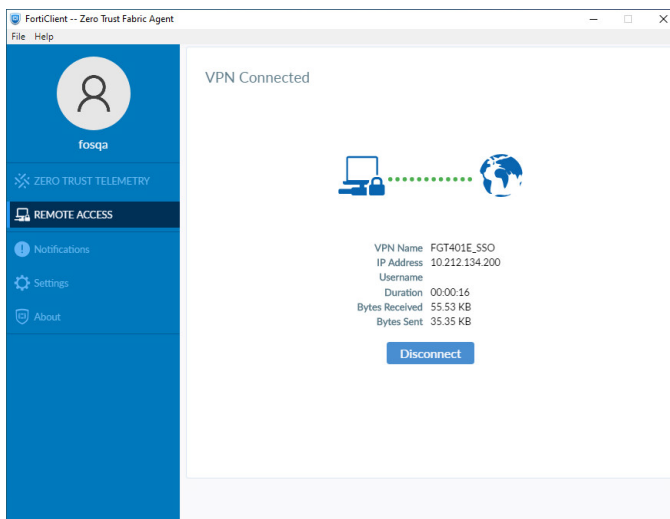

- f. Click *Save*.
2. On the *Remote Access* tab select the *FGT401E_SSO* VPN connection from the dropdown list.
3. Click *SAML Login*.

The default browser opens to the IdP authentication page.

4. Enter the username and password, then click *Login*.

The authenticated result is sent back to FortiClient and the connection is established.

To check the connection on the FortiGate:

```
# get vpn ssl monitor
```

SSL-VPN Login Users:

Index	User	Group	Auth Type	Timeout	Auth-Timeout	From	HTTP in/out
	HTTPS in/out	Two-factor	Auth				
1	fac3	saml_grp	256(1)	N/A	10.1.100.254	0/0	0/0 0

SSL-VPN sessions:

Index	User	Group	Source IP	Duration	I/O Bytes	Tunnel/Dest IP
0	fac3	saml_grp	10.1.100.254	5	9990/8449

```

SAML authentication in a proxy policy

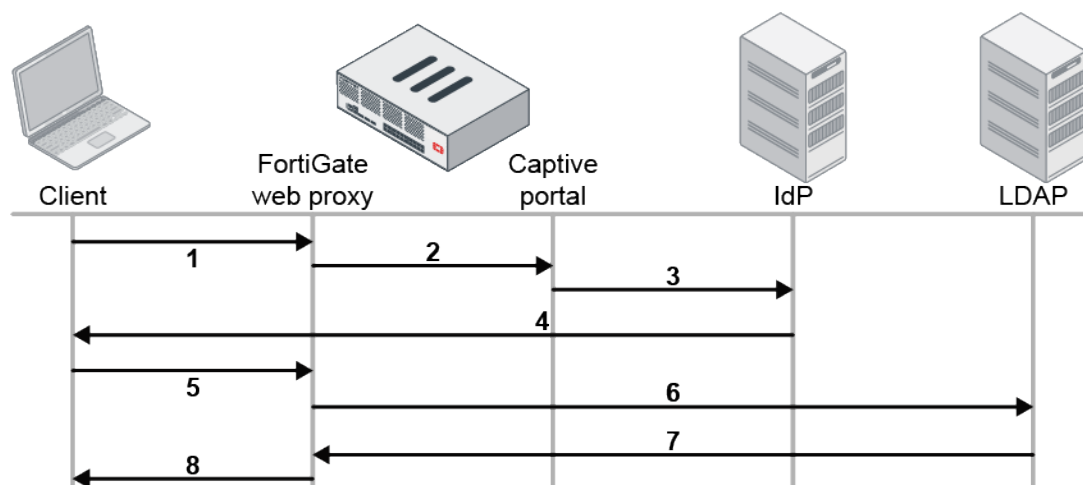

SAML user authentication can be used in explicit web proxies and transparent web proxies with the FortiGate acting as a SAML SP. SAML can be used as an authentication method for an authentication scheme that requires using a captive portal.

Topology

In this configuration, SAML authentication is used with an explicit web proxy. The IdP is a Windows 2016 server configured with ADFS. The LDAP and IdP servers are on the same server. The LDAP server is used as the user backend for the IdP to perform authentication; however, they are not required to be on the same server.

The authentication and authorization flow is as follows:

1. The client opens a browser and visits <https://www.google.com>.
2. The browser is redirected by the web proxy the captive portal.

3. The request is redirected to the IdP's sign-in page.
4. If the user signs in, the IdP authenticates the user and sends back a SAML assertion message to the user's browser with the user group information.
5. The browser forwards the SAML assertion response as a HTTP POST to the FortiGate SAML assertion consumer service URL (<https://fgt9.myqalab.local:7831/XX/YY/ZZ/saml/login/>).
6. If the FortiGate authentication scheme has a user database configured, the FortiGate will query the LDAP server for the user group information and ignore the user group information from the SAML message.
7. The user group information is returned. The FortiGate matches the user group information against the LDAP group in the proxy policy group settings. If there is a match, the request is authorized and the proxy policy is matched.
8. If all policy criteria match successfully, then the webpage is returned to the client.

To configure SAML authentication with an explicit web proxy:

1. Enable the web proxy:

```
config web-proxy explicit
    set status enable
    set http-incoming-port 8080
end
```

2. Enable the proxy captive portal:

```
config system interface
    edit "port10"
        set vdom "vdom1"
        set ip 10.1.100.1 255.255.255.0
        set allowaccess ping https ssh snmp http telnet
        set type physical
        set explicit-web-proxy enable
        set explicit-ftp-proxy enable
        set proxy-captive-portal enable
        set snmp-index 12
    next
end
```

3. Configure the LDAP server:

```
config user ldap
    edit "ldap-10.1.100.198"
        set server "10.1.100.198"
        set cnid "cn"
        set dn "dc=myqalab,dc=local"
        set type regular
        set username "cn=fosqal,cn=users,dc=myqalab,dc=local"
        set password *****
        set group-search-base "dc=myqalab,dc=local"
    next
end
```

4. Configure the user group:

```
config user group
    edit "ldap-group-saml"
        set member "ldap-10.1.100.198"
    next
end
```

5. Configure SAML:

```
config user saml
  edit "saml_user"
    set cert "Fortinet_CA_SSL"
    set entity-id "https://fgt9.myqalab.local:7831/XX/YY/ZZ/saml/metadata/"
    set single-sign-on-url "https://fgt9.myqalab.local:7831/XX/YY/ZZ/saml/login/"
    set single-logout-url "https://fgt9.myqalab.local:7831/XX/YY/ZZ/saml/logout/"
    set idp-entity-id "http://MYQALAB.LOCAL/adfs/services/trust"
    set idp-single-sign-on-url "https://myqalab.local/adfs/ls"
    set idp-single-logout-url "https://myqalab.local/adfs/ls"
    set idp-cert "REMOTE_Cert_4"
    set digest-method sha256
    set adfs-claim enable
    set user-claim-type name
    set group-claim-type group
  next
end
```

6. Configure the authentication scheme, rule, and setting:

```
config authentication scheme
  edit "saml"
    set method saml
    set saml-server "saml_user"
    set user-database "ldap-10.1.100.198"
  next
end

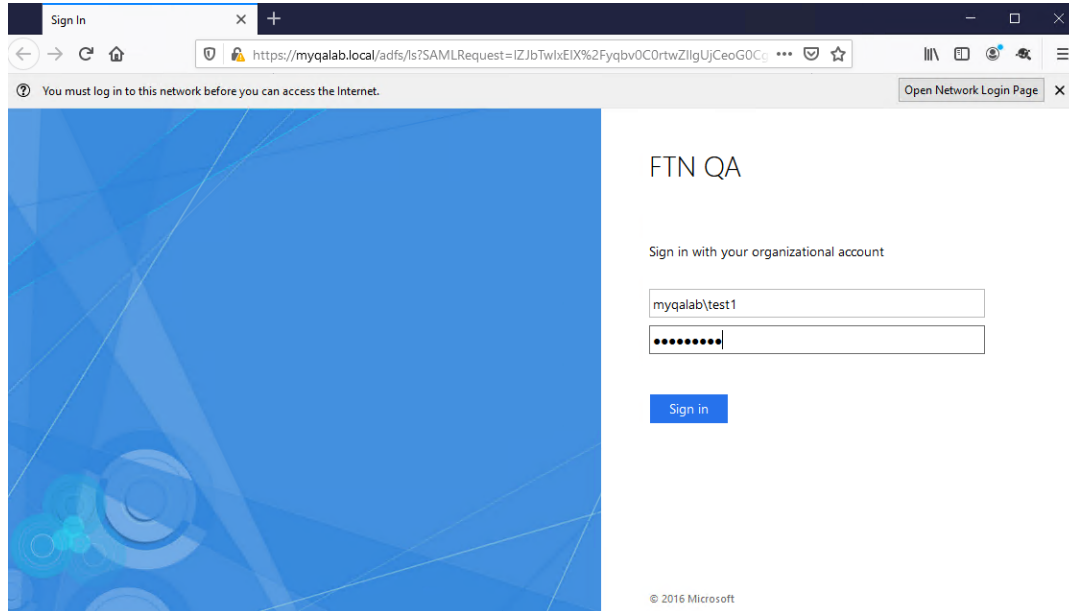

config authentication rule
  edit "saml"
    set srcaddr "all"
    set active-auth-method "saml"
  next
end

config authentication setting
  set captive-portal "fgt9.myqalab.local"
end
```

7. Configure the proxy policy:

```
config firewall proxy-policy
  edit 3
    set proxy explicit-web
    set dstintf "port9"
    set srcaddr "all"
    set dstaddr "all"
    set service "webproxy"
    set action accept
    set schedule "always"
    set logtraffic all
    set groups "ldap-group-saml"
    set utm-status enable
    set profile-protocol-options "protocol"
    set ssl-ssh-profile "deep-custom"
    set av-profile "av"
  next
end
```

When a user goes to www.google.com in a browser that is configured to use the FortiGate as a proxy, the IdP sign-in page appears.

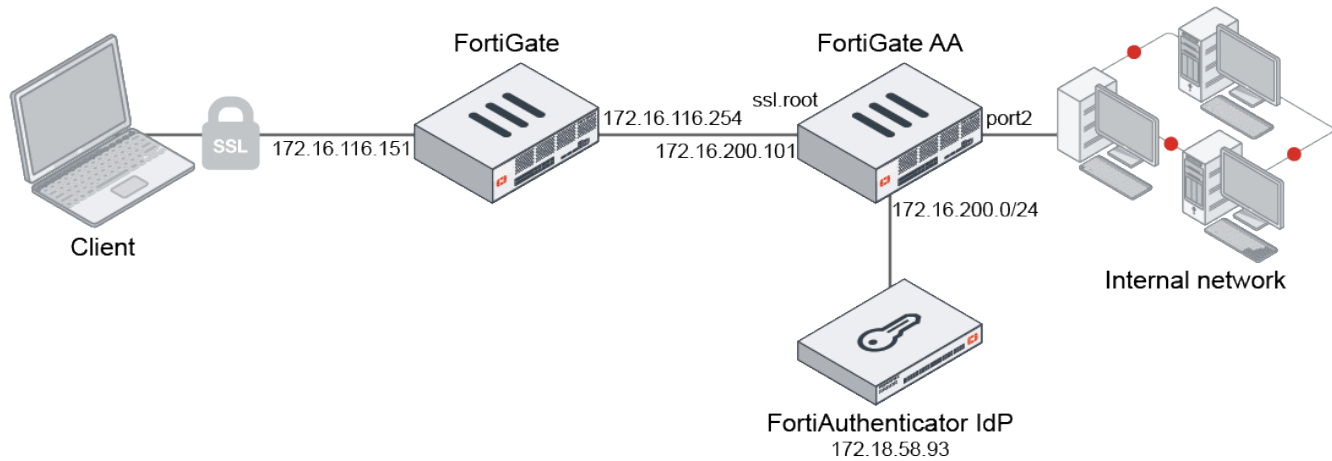

Sample log

```

```

Configuring SAML SSO in the GUI

SAML single sign-on can be configured in the GUI under *User & Authentication > User Groups*. The GUI wizard helps generate the service provider (SP) URLs based on the supplied SP address. The SAML object that is created can be selected when defining new user groups.

In this example, FortiGate AA is the inside firewall (172.16.200.101). The other FortiGate is the outside firewall that only does port forwarding from 172.16.116.151:55443 to 172.16.200.101:443. FortiGate AA is configured to allow full SSL VPN access to the network in port2. This SSL VPN portal allows users from the user group *saml_grp* and SAML server *saml_test* to log in. In this topology, a FortiAuthenticator acts as the SAML identity provider (IdP), while the FortiGate is the SAML SP. External users are directed to the FortiAuthenticator IdP login URL to authenticate. For more information about configuring a FortiAuthenticator as an IdP, see [Service providers](#).

The FortiAuthenticator in this example has the following configuration:

The screenshot displays the FortiAuthenticator VM configuration interface, specifically the 'Edit SAML Service Provider' page. The left sidebar shows the navigation menu with 'Authentication' expanded and 'SAML IdP' selected. The main configuration area is divided into several sections:

- General:** Contains fields for IdP address (172.18.58.93:443), SP name (FGT501E-kw), IdP prefix (43211234), IdP entity id (http://172.18.58.93:443/saml-idp/43211234/metadata/), IdP single sign-on URL (https://172.18.58.93:443/saml-idp/43211234/login/), IdP single logout URL (https://172.18.58.93:443/saml-idp/43211234/logout/), Server certificate (Default-Server-Certificate), and IdP signing algorithm (http://www.w3.org/2000/09/xmldsig#rsa-sha1). There are checkboxes for 'Support IdP-initiated assertion response' and 'Participate in single logout'.
- SP Metadata:** Includes an 'Import SP metadata' button, SP entity ID (http://172.16.116.151:55443/remote/saml/metadata/), SP ACS (login) URL (https://172.16.116.151:55443/remote/saml/login/), and SP SLS (logout) URL (https://172.16.116.151:55443/remote/saml/logout/). There is an 'Alternative ACS URLs' button and a checkbox for 'SAML request must be signed by SP'.
- Authentication:** Features a radio button for 'Authentication method' with options: 'Mandatory password and OTP', 'Every configured password and OTP factors' (selected), 'Password-only', 'OTP-only', 'FIDO-only', and 'Password and FIDO'. There is also an 'Adaptive Authentication' section with a 'Configure subnets' button, an 'Application name for FTM push notification' field, and a checkbox for 'Use FIDO-only authentication if requested by the SP'.
- Assertion Attribute Configuration:** Includes 'Subject NameID' (Username), 'Format' (urn:oasis:names:tc:SAML:2.0:nameid-format:unspecified), and a checkbox for 'Include realm name in subject NameID'.
- Assertion Attributes:** A table for mapping SAML attributes to user attributes. It shows two entries: one for 'users' with 'Username' as the user attribute, and another for 'Groupname' with 'Group' as the user attribute. There is an 'Add Assertion Attribute' button.
- Debugging Options:** A section at the bottom for debugging.

To configure FortiGate AA as an SP:

1. Create a new SAML server entry:
 - a. Go to *User & Authentication > Single Sign-On* and click *Create New*. The single-sign on wizard opens.
 - b. Enter a name (*saml_test*). The other fields will automatically populate based on the FortiGate's WAN IP and port.

New Single Sign-On

1 ————— 2

Name

SP address

SP address 

SP entity ID 

SP single sign-on URL 

SP single logout URL 

SP certificate ☐

Next

Click the icon beside the *SP entity ID*, *SP single sign-on URL*, and *SP single logout URL* fields to copy the text.

- c. Click **Next**.
- d. Enter the FortiAuthenticator IdP details:

IdP address	172.18.58.93:443
Prefix	43211234
IdP certificate	REMOTE_Cert_1

- e. Enter the additional SAML attributes that will be used to verify authentication attempts:

Attribute used to identify users	Username
Attribute used to identify groups	Group

The IdP must be configured to include these attributes in the SAML attribute statement. In FortiAuthenticator, this is configured in the *Assertion Attributes* section.

New Single Sign-On

✓ ————— 2

IdP Details

Log into your Identity Provider platform to find the following information.

IdP type: **Fortinet Product** Custom

IdP address: 172.18.58.93:443

Prefix: 43211234

IdP certificate: REMOTE_Cert_1

Additional SAML Attributes

The FortiGate will look for these attributes to verify authentication attempts. Configure your Identity Provider to include them in the SAML Attribute Statement.

Attribute used to identify users: Username

Attribute used to identify groups: Group

Back Submit Cancel

f. Click **Submit**.

The following is created in the backend:

```
config user saml
  edit "saml_test"
    set cert "fgt_gui_automation"
    set entity-id "http://172.16.116.151:55443/remote/saml/metadata/"
    set single-sign-on-url "https://172.16.116.151:55443/remote/saml/login/"
    set single-logout-url "https://172.16.116.151:55443/remote/saml/logout/"
    set idp-entity-id "http://172.18.58.93:443/saml-idp/43211234/metadata/"
    set idp-single-sign-on-url "https://172.18.58.93:443/saml-idp/43211234/login/"
    set idp-single-logout-url "https://172.18.58.93:443/saml-idp/43211234/logout/"
    set idp-cert "REMOTE_Cert_1"
    set user-name "Username"
    set group-name "Group"
    set digest-method sha1
  next
end
```

2. Create the SAML group:

- a. Go to **User & Authentication > User Groups** and click **Create New**.
- b. Enter a name, **saml_grp**.
- c. In the **Remote Groups** table, click **Add**.

- d. In the *Remote Server* dropdown, select *saml_test* and click *OK*.

New User Group

Name: saml_grp

Type: Firewall

Members: +

Remote Groups

Remote Server	Group Name
saml_test	

OK Cancel

- e. Click *OK*.

The following is created in the backend:

```
config user group
  edit "saml_grp"
    set member "saml_test"
  next
end
```

3. Add the SAML group in the SSL VPN settings:

- Go to *VPN > SSL-VPN Settings*.
- In the *Authentication/Portal Mapping* table, click *Create New*.
- For *Users/Groups*, click the + and select *saml_grp*.
- Select the *Portal* (*testportal1*).
- Click *OK*.

SSL-VPN Settings

New Authentication/Portal Mapping

Users/Groups: saml_grp

Portal: testportal1

OK Cancel

- f. Click *Apply*.
4. Configure the firewall policy:
 - a. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
 - b. Enter the following:

Incoming Interface	ssl.root
Outgoing Interface	port2
Source	all, saml_grp, saml_test

- c. Configure the other settings as needed.
- d. Click *OK*.
5. On the client, log in with SAML using the SSL VPN web portal.

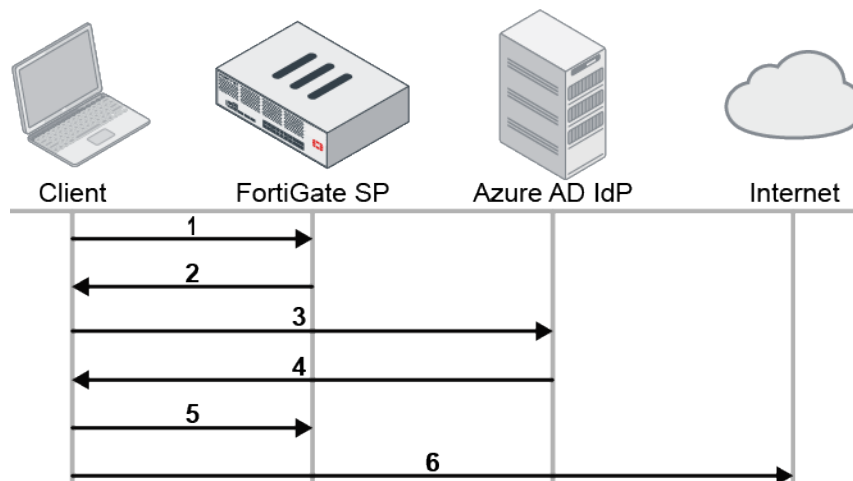

If you are using FortiClient for tunnel mode access, enable *Enable Single Sign On (SSO) for VPN Tunnel* in the *SSL-VPN* connection settings to use the SAML log in. See [Configuring an SSL VPN](#) connection for more information.

6. In FortiOS, go to *Dashboard > Network* and click the *SSL-VPN* widget to expand to full view and verify the connection information.

Outbound firewall authentication with Azure AD as a SAML IdP

In this example, users are managed through Microsoft Azure Active Directory (AD). The FortiGate is configured for SSO firewall authentication for outbound traffic, with authentication performed by the Azure AD as a SAML identity provider (IdP).

The SAML interaction occurs as follows:

1. The user initiates web traffic to the internet.
2. The FortiGate redirects to the local captive portal port (default is 1003), then redirects the user to the SAML IdP.
3. The user connects to the Microsoft log in page for the SAML authentication request.
4. The SAML IdP sends the SAML assertion containing the user and group.

5. The browser forwards the SAML assertion to the SAML SP.
6. If the user and group are allowed by the FortiGate, the user is allowed to access the internet.

In this example environment, a user is added in the Azure AD belonging to the security group called Firewall.

- Username: John Locus
- User login: jlocus@azure.kldocs.com
- Group: Firewall (ID 62b699ce-4f80-48c0-846e-c1dfde2dc667)

The goal is to allow users in the Firewall group to access the internet after passing firewall authentication.

Configuring the Azure AD

The following Azure AD configuration demonstrates how to add the FortiGate as an enterprise non-gallery application. This application provides SAML SSO connectivity to the Azure AD IdP. Some steps are performed concurrently on the FortiGate.

This example is configured with an Azure AD free-tier directory. There may be limitations to managing users in Azure in this tier that are not limited in other tiers. Consult the [Microsoft Azure AD](#) documentation for more information.

There are three steps to configure the Azure AD:

1. [Create a new enterprise application.](#)
2. [Configure the SAML SSO settings on the application and FortiGate.](#)
3. [Assign Azure AD users and groups to the application.](#)

To create a new enterprise application:

1. Log in to the Azure portal.
2. In the Azure portal menu, click *Azure Active Directory*.
3. In the left-side menu go *Manage > Enterprise applications*.
4. Click *New application*.

Categories : All

6. Enter a name for the application (*SAML-FW-Auth*) and select *Integrate any other application you don't find in the gallery (Non-gallery)*.

Create your own application

Got feedback?

What's the name of your app?

SAML-FW-Auth

What are you looking to do with your application?

☐ Configure Application Proxy for secure remote access to an on-premises application

☐ Register an application to integrate with Azure AD (App you're developing)

☒ Integrate any other application you don't find in the gallery (Non-gallery)

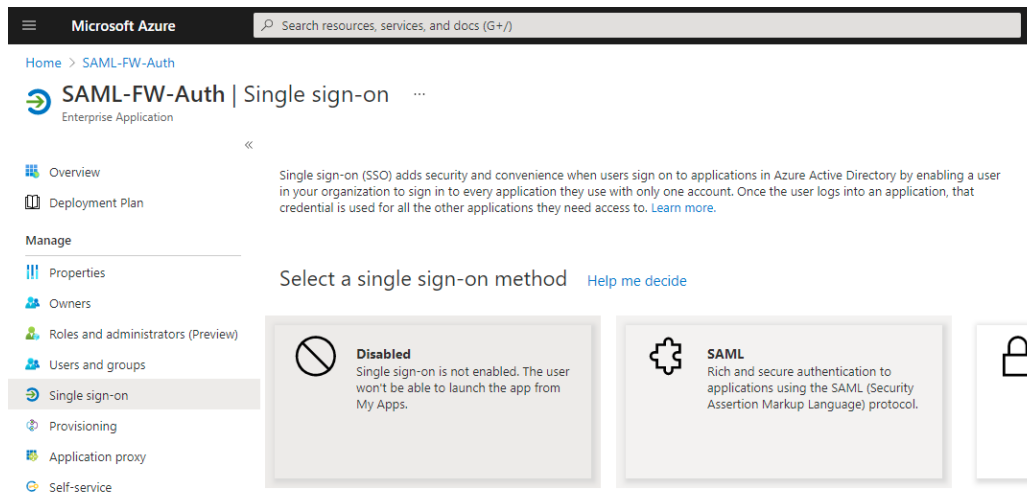

7. Click *Create*.

To configure the SAML SSO settings on the application and FortiGate:

This procedure requires going back and forth between Azure and the FortiGate GUI. Leave the FortiGate GUI open for the entire procedure.

1. On the *Enterprise Application Overview* page, go to *Manage > Single sign-on* and select *SAML* as the single sign-on method.

2. The *Basic SAML Configuration* section in Azure describes the SAML SP entity and links that Azure will reference. Configure these settings on the FortiGate by creating a new SAML server object and defining the SP address. The SP (IP or FQDN) address should be accessible by the user who is authenticating against the firewall. The port used should match the port used by the FortiGate firewall authentication captive portal. By default, this is port 1003 for HTTPS. A captive portal does not need to be configured separately.
 - a. Go to *User & Authentication > Single Sign-On* and click *Create New*.
 - b. Enter a *Name* for the SAML object, *Azure-AD-SAML*.
 - c. Enter the *SP address*, *10.1.0.1:1003*. The three SP URLs are automatically populated.

3. In Azure on the *Set up Single Sign-On with SAML* page, copy the following URLs from the FortiGate to the *Basic SAML Configuration* section:

From FortiGate	To Azure field
<i>SP entity ID</i> (http://10.1.0.1:1003/remote/saml/metadata/)	<i>Identifier (Entity ID)</i> , set to <i>Default</i>
<i>SP single sign-on URL</i> (https://10.1.0.1:1003/remote/saml/login/)	<i>Reply URL</i> and <i>Sign on URL</i>
<i>SP single logout URL</i> (https://10.1.0.1:1003/remote/saml/logout/)	<i>Logout URL</i>

4. Click **Save**.

Basic SAML Configuration	
Identifier (Entity ID)	https://10.1.0.1:1003/remote/saml/metadata/
Reply URL (Assertion Consumer Service URL)	https://10.1.0.1:1003/remote/saml/login/
Sign on URL	https://10.1.0.1:1003/remote/saml/login/
Relay State	Optional
Logout Url	https://10.1.0.1:1003/remote/saml/logout/

5. Under the **SAML Signing Certificate** section, download the Base64 certificate.

SAML Signing Certificate	
Status	Active
Thumbprint	977B10F89D1C087E3105564B1D31809D2478E8CD
Expiration	2/6/2026, 9:00:39 AM
Notification Email	tacbc_ftnt@outlook.com
App Federation Metadata Url	https://login.microsoftonline.com/d7cf19c6-620c-... [Download]
Certificate (Base64)	[Download]
Certificate (Raw)	[Download]
Federation Metadata XML	[Download]

6. Import the certificate from Azure on the FortiGate as the IdP certificate:

- Go to **System > Certificates** and click **Create/Import > Remote Certificate**.
- Upload the certificate from Azure and click **OK**. The new certificate appears under the **Remote Certificate** section with the name **REMOTE_Cert_(N)**.
- Optionally, rename the certificate in the CLI to give it a more recognizable name:

```
config vpn certificate remote
    rename REMOTE_Cert_3 to AZURE_AD_SAML_FW
end
```

7. In the **Set up <application name>** section, copy the URLs from Azure to the FortiGate in the **IdP Details** section:

Set up SAML-FW-Auth

You'll need to configure the application to link with Azure AD.

Login URL	https://login.microsoftonline.com/...
Azure AD Identifier	https://sts.windows.net/...
Logout URL	https://login.microsoftonline.com/...

[View step-by-step instructions](#)

- On the FortiGate, click **Next**.
- For **IdP type**, select **Custom** and copy the following from Azure to the corresponding field:

From Azure	To FortiGate field
Azure AD Identifier	IdP entity ID
Login URL	IdP single sign-on URL
Logout URL	IdP single logout URL

- For **IdP certificate**, select the remote certificate imported earlier.
8. In Azure, edit the **User Attributes & Claims** section. The attributes are returned in the SAML assertion, which the FortiGate uses to verify the user and group. Configuring group matching is optional.
- Click **Add new claim**, name it **username**, and set the **Source attribute** to **user.displayname**. The source attribute can be any of the related username fields. The value of the username returned to the FortiGate will be used in logs and monitors to identify the user.
 - Click **Save**.
 - Click **Add a group claim** and in the **Group Claims** pane, select **All groups**.

- d. In *Advanced Options*, select *Customize the name of the group claim*. Set the name to *group*.

Group Claims ×
Manage the group claims used by Azure AD to populate SAML tokens issued to your app

Which groups associated with the user should be returned in the claim?

☐ None
☒ All groups
☐ Security groups
☐ Directory roles
☐ Groups assigned to the application

Source attribute *
Group ID

Advanced options

☒ Customize the name of the group claim

Name (required)

Configuring the FortiGate

The user group, user authentication settings, and firewall policies must be configured on the FortiGate.

Configuring the user group

A user group named *Azure-FW-Auth* is created with the member *Azure-AD-SAML*.

Configuring group matching is optional, and the *Object ID* from Azure is needed for the `config match` settings. In the Azure default directory, go to *Manage > Groups* and locate the *Object ID* for the *Firewall* group.

The screenshot shows the Microsoft Azure portal interface. The top navigation bar includes the Microsoft Azure logo and a search bar. The main content area is titled 'Groups | All groups' and shows a list of groups. The 'Firewall' group is highlighted, and its details are shown in a table below.

Name	Object Id	Group Type	Membership Type
AAD DC Administrators	1d66da24-7066-4f0e-9971-d66a54c1472c	Security	Assigned
Firewall	62b699ce-4f80-48c0-846e-c1dfde2dc667	Security	Assigned

To configure the user group:

```
config user group
    edit "Azure-FW-Auth"
        set member "Azure-AD-SAML"
        config match
            edit 1
                set server-name "Azure-AD-SAML"
                set group-name "62b699ce-4f80-48c0-846e-c1dfde2dc667"
            next
        end
    next
end
```

Configuring the user authentication setting

When a user initiates traffic, the FortiGate will redirect the user to the firewall authentication captive portal before redirecting them to the SAML IdP portal. After the SAML IdP responds with the SAML assertion, the user is again redirected to the firewall authentication captive portal. If the firewall portal's certificate is not trusted by the user, they will receive a certificate warning. Use a custom certificate that the user trusts to avoid the certificate warning.

To configure a custom certificate:

1. Go to *User & Authentication > Authentication Settings*.
2. For *Certificate*, select the custom certificate. The custom certificate's SAN field should have the FQDN or IP from the SP URL.

Alternatively, assigning a CA certificate allows the FortiGate to automatically generate and sign a certificate for the portal page. This will override any assigned server certificate. In this example, the built-in Fortinet_CA_SSL is used.

To assign a CA certificate:

1. Edit the user setting:

```
config user setting
    set auth-ca-cert "Fortinet_CA_SSL"
end
```

2. Go to *System > Certificates* and download the certificate.
3. Install the certificate into the client's certificate store.

Configuring the firewall policies

Firewall policies must be configured to apply user authentication and still allow users behind the FortiGate to access the Microsoft log in portal without authentication.

To configure the firewall policies:

1. Configure a policy to allow traffic to the Microsoft Azure internet service:
 - a. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
 - b. Enter the following:

Name	<i>LAN-to-AuthPortal</i>
Incoming Interface	<i>port3</i>
Outgoing Interface	<i>Underlay</i>
Source	<i>all</i>
Destination	<i>Microsoft-Azure (under Internet Service)</i>
Schedule	<i>always</i>
Service	<i>ALL</i>
Action	<i>ACCEPT</i>
NAT	Enable and select <i>NAT</i> .
Log Allowed Traffic	Enable and select <i>All Sessions</i> .

- c. Configure the other settings as needed.
 - d. Click *OK*.
2. Configure a policy to apply user authentication:

- a. Click *Create New* and enter the following:

Name	<i>LAN-auth-policy</i>
Incoming Interface	<i>port3</i>
Outgoing Interface	<i>Underlay</i>
Source	<i>all, Azure-FW-Auth</i>
Destination	<i>all</i>
Schedule	<i>always</i>
Service	<i>ALL</i>
Action	<i>ACCEPT</i>
NAT	Enable and select <i>NAT</i> .
Log Allowed Traffic	Enable and select <i>All Sessions</i> .

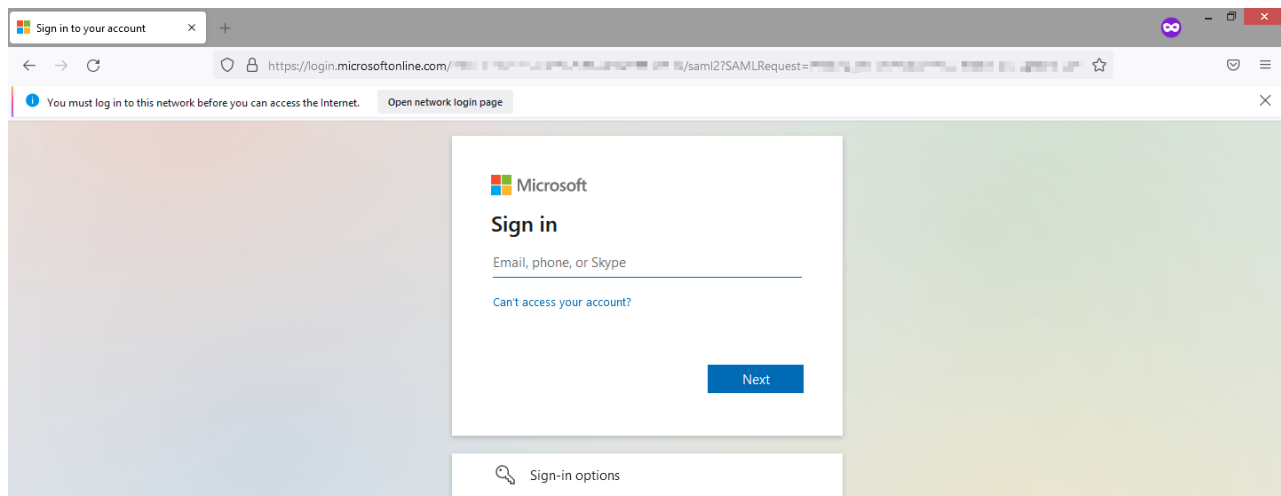

- b. Configure the other settings as needed.
c. Click OK.

Connecting from the client

When the client connects to the internet from a browser, they will be redirected to the Microsoft log in page to authenticate against the Azure AD. The FortiGate's authentication portal certificate should be installed on the client.

To connect from the client:

1. On the client, open a browser (such as Firefox) and go to a website. The user is redirected to the Microsoft log in page.
2. Enter the user credentials.

3. If the log in attempt is successful, the user is allowed to access the internet

Viewing logs and diagnostics

To verify user logins, go to the *Dashboard > Assets & Identities* and expand the *Firewall Users* widget, or enter the following in the CLI:

```
# diagnose firewall auth list
10.1.0.100, John Locus
    src_mac: 02:09:0f:00:03:03
    type: fw, id: 0, duration: 152, idled: 7
    expire: 292, allow-idle: 300
    server: Azure-AD-SAML
    packets: in 2097 out 932, bytes: in 2208241 out 143741
    group_id: 2
    group_name: Azure-FW-Auth
----- 1 listed, 0 filtered -----
```

To verify user login logs, go to *Log & Report > System Events* and select the *User Events* card, or enter the following in the CLI:

```
# execute log filter category event
# execute log filter field subtype user
# execute log display
17 logs found.
10 logs returned.
7: date=2021-09-30 time=09:49:25 eventtime=1633020565577584390 tz="-0700" logid="0102043039"
type="event" subtype="user" level="notice" vd="root" logdesc="Authentication logon"
srcip=10.1.0.100 user="John Locus" authserver="Azure-AD-SAML" action="auth-logon"
status="logon" msg="User John Locus added to auth logon"

8: date=2021-09-30 time=09:49:25 eventtime=1633020565577075629 tz="-0700" logid="0102043008"
type="event" subtype="user" level="notice" vd="root" logdesc="Authentication success"
srcip=10.1.0.100 dstip=10.1.0.1 policyid=11 interface="port3" user="John Locus"
group="Azure-FW-Auth" authproto="HTTPS(10.1.0.100)" action="authentication" status="success"
reason="N/A" msg="User John Locus succeeded in authentication"
```

If user authentication is successful in Azure AD, but their group does not match the one defined in the FortiGate user group, the user will receive a *Firewall Authentication Failed* message in the browser. A log is also recorded:

```
# execute log filter category event
# execute log filter field subtype user
# execute log display
1: date=2021-09-30 time=10:39:35 eventtime=1633023575381139214 tz="-0700" logid="0102043009"
type="event" subtype="user" level="notice" vd="root" logdesc="Authentication failed"
srcip=10.1.0.100 dstip=10.1.0.1 policyid=11 interface="port3" user="Adam Thompson"
group="N/A" authproto="HTTPS(10.1.0.100)" action="authentication" status="failure"
reason="No matched SAML user or group name in auth resp" msg="User Adam Thompson failed in authentication"
```

If a user receives the following error message, this means the user is not assigned to the enterprise application *SAML-FW-Auth* in Azure.

To troubleshoot SAML issues:

```
# diagnose debug application samld -1
# diagnose debug enable
```

Authentication settings

You can configure general authentication settings, including timeout, protocol support, and certificates.

You cannot customize FTP and Telnet authentication replacement messages.

To configure authentication settings using the GUI:

1. Go to *User & Authentication > Authentication Settings*.
2. Configure the following settings:

Setting	Description
Authentication Timeout	Enter the desired timeout in minutes. You can enter a number between 1 and 1440 (24 hours). The authentication timeout controls how long an authenticated connection can be idle before the user must reauthenticate. The default value is 5.
Protocol Support	<p>Select the protocols to challenge during firewall user authentication. When you enable user authentication within a security policy, the authentication challenge is normally issued for any of four protocols, depending on the connection protocol:</p> <ul style="list-style-type: none"> • HTTP (you can set this to redirect to HTTPS) • HTTPS • FTP • Telnet <p>The protocols selected here control which protocols support the authentication challenge. Users must connect with a supported protocol first so they can subsequently connect with other protocols. If HTTPS is selected as a protocol support method, it allows the user to authenticate with a customized local certificate.</p> <p>When you enable user authentication within a security policy, FortiOS challenges the security policy user to authenticate. For user ID and password authentication, the user must provide their username and password. For certificate authentication (HTTPS or HTTP redirected to HTTPS only), you can install customized certificates on the unit and the user can also install customized certificates on their browser. Otherwise, users see a warning message and must accept a default Fortinet certificate. The network user's web browser may deem the default certificate invalid.</p>
Certificate	If using HTTPS protocol support, select the local certificate to use for authentication. This is available only if <i>HTTPS</i> and/or <i>Redirect HTTP Challenge to a Secure Channel (HTTPS)</i> are selected.

To configure authentication settings using the CLI:

```
config user setting
  set auth-timeout 5
  set auth-type ftp http https telnet
  set auth-cert Fortinet_Factory
end
```

FortiTokens

FortiTokens are security tokens used as part of a multi-factor authentication (MFA) system on FortiGate and FortiAuthenticator. A security token is a 6-digit or 8-digit (configurable) one-time password (OTP) that is used to authenticate one's identity electronically as a prerequisite for accessing network resources. FortiToken is available as either a mobile or a physical (hard) token. Mobile tokens can be purchased as a license, or consumed with points as part of the FortiToken Cloud service.

FortiToken Mobile and physical FortiTokens store their encryption seeds on the cloud. FortiToken Mobile seeds are generated dynamically when the token is provisioned. They are always encrypted whether in motion or at rest.

You can only register FortiTokens to a single FortiGate or FortiAuthenticator for security purposes. This prevents malicious third parties from making fraudulent requests to hijack your FortiTokens by registering them on another FortiGate or FortiAuthenticator. If re-registering a FortiToken Mobile or Hard Token on another FortiGate is required, you must contact [Fortinet Customer Support](#).

Common usage for FortiTokens includes:

- Applying MFA to a VPN dialup user connecting to the corporate network
- Applying MFA to FortiGate administrators
- Applying MFA to firewall authentication and captive portal authentication

The MFA process commonly involves:

- **Something you know:** User password
- **Something you have:** The FortiToken OTP

A third factor of authentication is added to the authentication process:

- **Something you are:** Your fingerprint or face

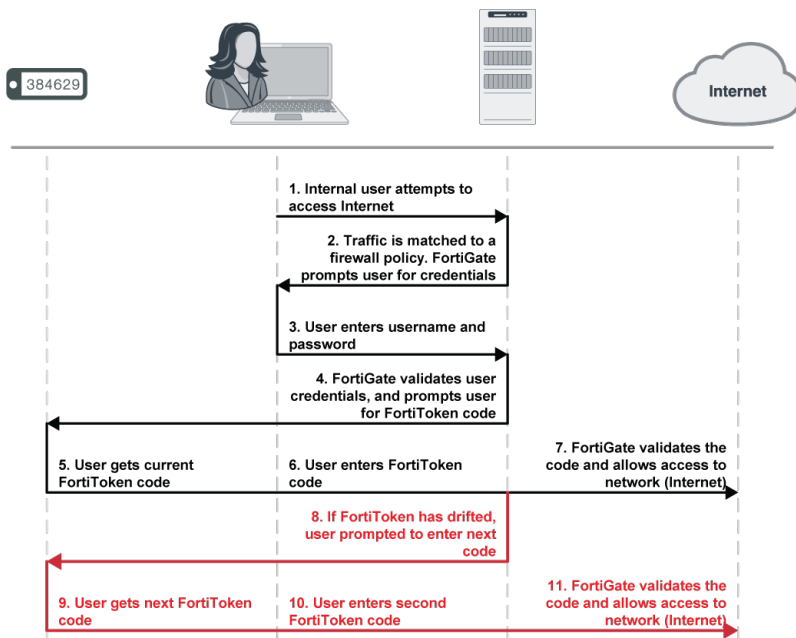

To enable the third factor, refer to the [Activating FortiToken Mobile on a mobile phone on page 2329](#) section.

The following illustrates the FortiToken MFA process:

1. The user attempts to access a network resource.
2. FortiOS matches the traffic to an authentication security policy and prompts the user for their username and password.
3. The user enters their username and password.
4. FortiOS verifies their credentials. If valid, it prompts the user for the FortiToken code.
5. The user views the current code on their FortiToken. They enter the code at the prompt.
6. FortiOS verifies the FortiToken code. If valid, it allows the user access to network resources.

If the FortiToken has drifted, the following must take place for the FortiToken to resynchronize with FortiOS:

1. FortiOS prompts the user to enter a second code to confirm.
2. The user gets the next code from the FortiToken. They enter the code at the prompt.
3. FortiOS uses both codes to update its clock to match the FortiToken.

This section includes the following topics to quickly get started with FortiTokens:

- [FortiToken Mobile quick start on page 2326](#)
- [FortiToken Cloud on page 2334](#)
- [Registering hard tokens on page 2334](#)
- [Managing FortiTokens on page 2336](#)
- [FortiToken Mobile Push on page 2338](#)
- [Synchronizing LDAP Active Directory users to FortiToken Cloud using the two-factor filter on page 2340](#)
- [Enable the FortiToken Cloud free trial directly from the FortiGate on page 2343](#)
- [Troubleshooting and diagnosis on page 2348](#)

FortiToken Mobile quick start

FortiToken Mobile is an OATH compliant, event- and time-based one-time password (OTP) generator for mobile devices. It provides an easy and flexible way to deploy and provision FortiTokens to your end users through mobile devices. FortiToken Mobile produces its OTP codes in an application that you can download onto your Android or iOS mobile device without the need for a physical token.

You can download the free FortiToken Mobile application for Android from the [Google Play Store](#), and for iOS from the [Apple App Store](#).

This section focuses on quickly getting started and setting up FortiToken Mobile for use on a FortiGate:

- [Registering FortiToken Mobile on page 2327](#)
- [Provisioning FortiToken Mobile on page 2328](#)
- [Activating FortiToken Mobile on a mobile phone on page 2329](#)
- [Applying multi-factor authentication on page 2333](#)

Registering FortiToken Mobile

To deploy FortiToken Mobile for your end users, you must first register the tokens on your FortiGate. After registering the tokens, you can assign them to your end users.

Each FortiGate comes with two free FortiToken Mobile tokens. These tokens should appear under *User & Authentication > FortiTokens*. If no tokens appear, you may import them. Ensure that your FortiGate is registered and has internet access to connect to the FortiToken servers to import the tokens.

To import FortiTokens from the FortiGate GUI:

1. Go to *User & Authentication > FortiTokens*.
2. Click the *Import Free Trial Tokens* icon at the top. The two free tokens are imported.

To import FortiTokens from the FortiGate CLI:

```
# execute fortitoken-mobile import 0000-0000-0000-0000-0000
# show user fortitoken
```

If only one free token appears, you can first delete that token and then follow the procedure to import the two free tokens from either the GUI or the CLI.

If you have the FortiToken Mobile redemption certificate, you can register FortiToken Mobile on a FortiGate.

To register FortiToken Mobile from the FortiGate GUI:

1. Go to *User & Authentication > FortiTokens* and click *Create New*. The *New FortiToken* dialog appears.
2. For the *Type* field, select *Mobile Token*.
3. Locate the 20-digit code on the redemption certificate and type it in the *Activation Code* field.
4. Click *OK*. The token is successfully registered.

If you attempt to add invalid FortiToken serial numbers, there is no error message. FortiOS does not add invalid serial numbers to the list.

To register FortiToken Mobile from the FortiGate CLI:

```
# execute fortitoken-mobile import <20-digit activation code>
# show user fortitoken
```

FortiToken Mobile stores its encryption seeds on the cloud. You can only register it to a single FortiGate or FortiAuthenticator.

Provisioning FortiToken Mobile

Once registered, FortiTokens need to be provisioned for users before they can be activated. In this example, you will provision a mobile token for a local user. Similar steps can be taken to assign FortiTokens to other types of users.

To create a local user and assign a FortiToken in the FortiGate GUI:

1. Go to *User & Authentication > User Definition*, and click *Create New*. The *Users/Groups Creation Wizard* appears.
2. In the *User Type* tab, select *Local User*, and click *Next*.

User Group ☐

6. Click *Submit*. An activation code should be sent to the created user by email or SMS, depending upon the delivery method configured above.

FortiGate has the *Email Service* setting configured using the server *notifications.fortinet.net* by default. To see configuration, go to *System > Settings > Email Service*.

The activation code expires if not activated within the 3-day time period by default. However, the expiry time period is configurable.

To configure the time period (in hours) for FortiToken Mobile, using the CLI:

```
config system global
  set two-factor-ftm-expiry <1-168>
end
```

To resend the email or SMS with the activation code, refer to the [Managing FortiTokens on page 2336](#) section.

Activating FortiToken Mobile on a mobile phone

After your system administrator provisions your token, you receive a notification with an activation code and expiry date via SMS or email. If you do not activate your token by the expiry date, you must contact your system administrator so that they can reassign your token for activation.

Platforms that support FortiToken Mobile:

Platform	Device and firmware support
iOS	iPhone, iPad, and iPod Touch with iOS 6.0 and later.
Android	Phones and tablets with Android Jellybean 4.1 and later.
Windows	Windows 10 (desktop and mobile), Windows Phone 8.1, and Windows Phone 8.
<div style="display: flex; align-items: center;"> <div> <p>FortiToken is a Windows Universal Platform (UWP) application. To download FortiToken for Windows 10 desktop and mobile platforms, see FortiToken for Windows on the Microsoft Store.</p> </div> </div>	

The following instructions describe procedures when using FortiToken Mobile for iOS on an iPhone. Procedures may vary depending on your device and firmware.

To activate FortiToken Mobile on iOS:

1. On your iOS device, tap on the FortiToken application icon to open the application. If this is your first time opening the application, it may prompt you to create a PIN for secure access to the application and tokens.

2. Tap on the + icon. The *Scan Barcode* screen appears.

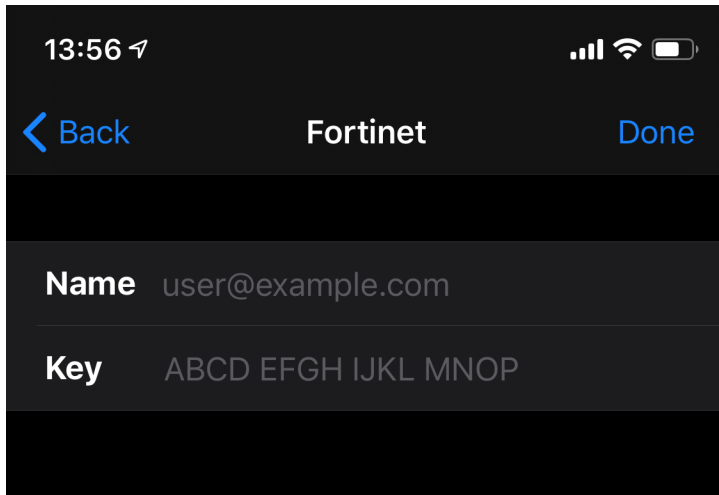

3. If you received the QR code via email, locate and scan the QR code in your email.

OR

If you received the activation key via SMS, tap on *Enter Manually* at the bottom of the screen, and tap on *Fortinet*.

Enter your email address in the *Name* field, the activation key in the *Key* field, and tap *Done*.

4. FortiToken Mobile activates your token, and starts generating OTP digits immediately. To view or hide the OTP digits, tap the eye icon.

After you open the application, FortiToken Mobile generates a new 6-digit OTP every 30 seconds. All configured tokens display on the application homescreen.

The FortiToken Mobile activation process described above caters to the MFA process that involves two factors (password and OTP) of the authentication process. A third factor (fingerprint or face) can be enabled as well.

To enable *Touch/Face ID* on iOS for FortiToken Mobile:

1. Open the FortiToken application and tap on *Info*.

2. Tap on *Touch/Face ID & PIN*.

3. Enable and set up a 4-digit *PIN* for the application. The *PIN* is required to be enabled before you can enable *Touch/Face ID*.

4. Enable *Touch/Face ID*.

You cannot enable *Touch/Face ID* for FortiToken if *Touch/Face ID* is not set up and enabled for device unlock (*iPhone Unlock* in this case) on iOS. You must first set up and enable *Touch/Face ID* from *Settings* on your iOS device.

5. When prompted by iOS, allow the FortiToken application to use *Touch/Face ID* by tapping on *OK* in the prompt.

Applying multi-factor authentication

Multi-factor authentication (MFA) may also be set up for SSL VPN users, administrators, firewall policy, wireless users, and so on. The following topics explain more about how you may use the newly created user in such scenarios:

- MFA for SSL VPN: [Set up FortiToken multi-factor authentication on page 2052](#)
- MFA for IPsec VPN: [Add FortiToken multi-factor authentication on page 1858](#)
- MFA for Administrators: [Administrator account options on page 2397](#)
- [MFA with Captive Portal](#)

- [MFA for wireless users via Captive Portal](#)
- [Configuring firewall authentication on page 2360](#)

FortiToken Cloud

FortiToken Cloud is an Identity and Access Management as a Service (IDaaS) cloud service offering by Fortinet. It enables FortiGate and FortiAuthenticator customers to add MFA for their respective users, through the use of Mobile tokens or Hard tokens. It protects local and remote administrators as well as firewall and VPN users.

For information, see [Getting started—FGT-FTC users](#) in the [FortiToken Cloud Administration Guide](#).

Registering hard tokens

Registering FortiTokens consists of the following steps:

1. [Adding FortiTokens to FortiOS](#).
2. [Activating FortiTokens](#).
3. [Associating FortiTokens with user accounts](#).

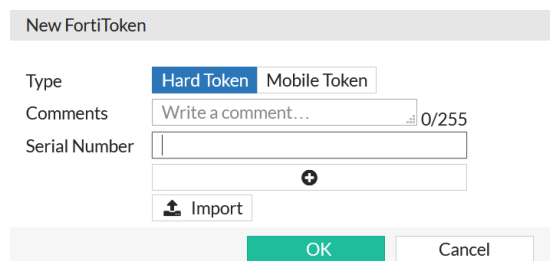

Adding FortiTokens to FortiOS

You can add FortiTokens to FortiOS in the following ways:

- [Add FortiToken serial numbers using the GUI](#)
- [Add FortiToken serial numbers using the CLI](#)
- [Import FortiTokens using a serial number or seed file using the GUI](#)

To manually add single hard token to FortiOS using the GUI:

1. Go to *User & Authentication > FortiTokens*.
2. Click *Create New*.
3. For *Type*, select *Hard Token*.
4. In the *Serial Number* field, enter one or more FortiToken serial numbers.
5. Click *OK*.

New FortiToken

Type: **Hard Token** Mobile Token

Comments: Write a comment... 0/255

Serial Number: [Empty field]

[Import button] [Add button]

[OK button] [Cancel button]

To add multiple FortiTokens to FortiOS using the CLI:

```
config user fortitoken
edit <serial_number>
next
edit <serial_number2>
next
```

end

To import multiple FortiTokens to FortiOS using the GUI:

1. Go to *User & Authentication > FortiTokens*.
2. Click *Create New*.
3. For *Type*, select *Hard Token*.
4. Click *Import*. The *Import Tokens* section slides in on the screen.

5. Select *Serial Number File*.

Seed files are only used with FortiToken-200CD. These are special hardware tokens that come with FortiToken seeds on a CD. See the [FortiToken Comprehensive Guide](#) for details.

6. Click *Upload*.
7. Browse to the file's location on your local machine, select the file, then click *OK*.
8. Click *OK*.

Activating FortiTokens

You must activate the FortiTokens before starting to use them. FortiOS requires connection to FortiGuard servers for FortiToken activation. During activation, FortiOS queries FortiGuard servers about each token's validity. Each token can only be used on a single FortiGate or FortiAuthenticator. If tokens are already registered, they are deemed invalid for re-activation on another device. FortiOS encrypts the serial number and information before sending for added security.

To activate a FortiToken using the GUI:

1. Go to *User & Authentication > FortiTokens*.
2. Select the desired FortiTokens that have an *Available* status.
3. Click *Activate* from the menu above.
4. Click *Refresh*. The selected FortiTokens are activated.

To activate a FortiToken using the CLI:

```
config user fortitoken
  edit <token_serial_num>
    set status activate
  next
end
```

Associating FortiTokens with user accounts

You can associate FortiTokens with local user or administrator accounts.

To associate a FortiToken to a local user account using the GUI:

1. Ensure that you have successfully added your FortiToken serial number to FortiOS and that its status is *Available*.
2. Go to *User & Authentication > User Definition*. Edit the desired user account.
3. Enable *Two-factor Authentication*.
4. From the *Token* dropdown list, select the desired FortiToken serial number.
5. In the *Email Address* field, enter the user's email address.
6. Click *OK*.

To associate a FortiToken to a local user account using the CLI:

```
config user local
  edit <username>
    set type password
    set passwd "myPassword"
    set two-factor fortitoken
    set fortitoken <serial_number>
    set email-to "username@example.com"
    set status enable
  next
end
```

Before you can use a new FortiToken, you may need to synchronize it due to clock drift.

To associate a FortiToken to an administrator account, refer to the [Administrator account options on page 2397](#) section.

Managing FortiTokens

This section focuses on the following:

- [Resending an activation email on page 2336](#)
- [Locking/unlocking FortiTokens on page 2337](#)
- [Managing FortiTokens drift on page 2337](#)
- [Deactivating FortiTokens on page 2337](#)
- [Moving FortiTokens to another device on page 2338](#)

Resending an activation email

To resend an activation email/SMS for a mobile token on a FortiGate:

1. Go to *User & Authentication > User Definition* and edit the user.
2. Click *Send Activation Code Email* from the *Two-factor Authentication* section.

Locking/unlocking FortiTokens

To change FortiToken status to active or to lock:

```
config user fortitoken
  edit <token_serial_num>
    set status <active | lock>
  next
end
```

A user attempting to log in using a locked FortiToken cannot successfully authenticate.

Managing FortiTokens drift

If the FortiToken has drifted, the following must take place for the FortiToken to resynchronize with FortiOS:

1. FortiOS prompts the user to enter a second code to confirm.
2. The user gets the next code from the FortiToken. They enter the code at the prompt.
3. FortiOS uses both codes to update its clock to match the FortiToken.

If you still experience clock drift, it may be the result of incorrect time settings on your mobile device. If so, make sure that the mobile device clock is accurate by confirming the network time and the correct timezone.

If the device clock is set correctly, the issue could be the result of the FortiGate and FortiTokens being initialized prior to setting an NTP server. This will result in a time difference that is too large to correct with the synchronize function. To avoid this, selected Tokens can be manually drift adjusted.

To show current drift and status for each FortiToken:

```
diagnose fortitoken info
FORTITOKEN DRIFT STATUS
FTK200XXXXXXXXX C 0 token already activated, and seed won't be returned
FTK200XXXXXXXXX E 0 token already activated, and seed won't be returned
FTKMOBXXXXXXXXX A 0 provisioned
FTKMOBXXXXXXXXX 4 0 new
Total activated token: 0
Total global activated token: 0
Token server status: reachable
```

This command lists the serial number and drift for each configured FortiToken. You can check if it is necessary to synchronize the FortiGate and any particular FortiTokens.

To adjust Mobile FortiToken for drift:

```
# execute fortitoken sync <FortiToken_ID> <token_code1> <next_token_code2>
```

Deactivating FortiTokens

To deactivate FortiToken on a FortiGate:

1. Go to *User & Authentication > User Definition*.
2. Select and edit the user for which you want to deactivate the token.
3. Disable the *Two-factor Authentication* toggle.

4. Click **OK**. The token will be removed from the user's *Two-factor Authentication* column. The user will also be removed from the token's *User* column under *User & Authentication > FortiTokens*.

Moving FortiTokens to another device

FortiTokens can only be activated on a single FortiGate or FortiAuthenticator. To move FortiTokens to another device, you would first have to reset the registered FortiTokens on a device and then reactivate them on another device.

To reset Hard tokens registered to a FortiGate appliance (non-VM model), you can reset all hardware FTK200 tokens from the [Support Portal](#), or during RMA transfer. See the [Migrating users and FortiTokens to another FortiGate](#) KB article, for more information.

The above process will reset all Hard tokens and you cannot select individual tokens to reset.

To reset FortiToken Mobile, a single Hard token, a Hard token registered to a VM, and so on, an administrator must contact Customer Support and/or open a ticket on the [Support Portal](#).

Once reset, the FortiTokens can be activated on another FortiGate or FortiAuthenticator.

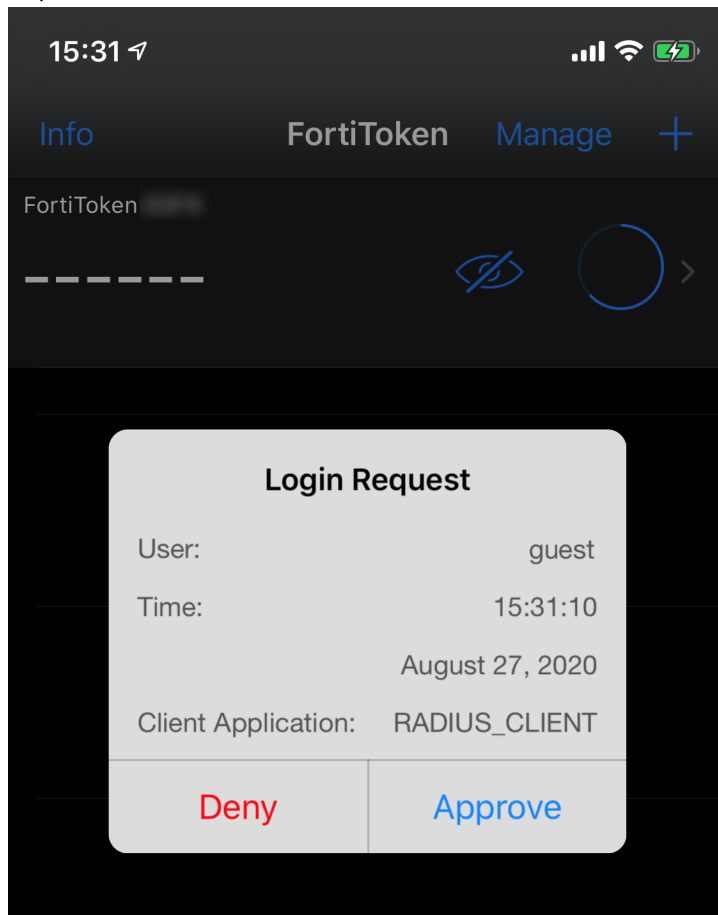

FortiToken Mobile Push

FortiToken Mobile Push allows authentication requests to be sent as push notifications to the end user's FortiToken Mobile application.

The FortiToken Mobile push service operates as follows:

1. FortiGate sends a DNS query to the FortiToken Mobile Push proxy server (*push.fortinet.com*).
2. FortiGate connects to the proxy server via an encrypted connection over TCP/443.
3. The proxy server handles the notification request by making a TLS connection with either Apple (for iOS) or Google (for Android) notification servers. Notification data may include the recipient, session, FortiGate callback IP and port, and so on.
4. The notification service from either Apple or Google notifies the user's mobile device of the push request.
5. The FortiToken Mobile application on the user's mobile displays a prompt for the user to either *Approve* or *Deny* the

request.

To configure FortiToken Mobile push services using the CLI:

```
config system ftm-push
  set status enable
  set server-ip <ip-address>
  set server-port [1-65535]
end
```

The default server port is 4433.

The server IP address is the public IP address of the FortiOS interface that FortiToken Mobile calls back to. FortiOS uses this IP address for incoming FortiToken Mobile calls.

If an SSL VPN user authenticates with their token, then logs out and attempts to reauthenticate within a minute, a *Please wait x seconds to login again* message displays. This replaces a previous error/permission denied message. The *x* value depends on the calculation of how much time is left in the current time step.

```
config system interface
  edit "guest"
    set allowaccess ftm
  next
end
```

FortiOS supports FortiAuthenticator-initiated FortiToken Mobile Push notifications for users attempting to authenticate through an SSL VPN and/or RADIUS server (with FortiAuthenticator as the RADIUS server).

Synchronizing LDAP Active Directory users to FortiToken Cloud using the two-factor filter

To synchronize Active Directory users and apply two-factor authentication using FortiToken Cloud, two-factor authentication can be enabled in the `user ldap` object definition in FortiOS. By default, FortiOS retrieves all Active Directory users in the LDAP server with a valid email or mobile number (`mail` and `mobile` attributes), and synchronizes the users to FortiToken Cloud. Users are then created on FortiToken Cloud and activation is sent out using email or SMS.

Two-factor filters can be used to reduce the number of the Active Directory users returned, and only synchronize the users who meet the filter criteria.

```
config user ldap
  edit <name>
    set dn <string>
    set two-factor {disable | fortitoken-cloud}
    set two-factor-filter <string>
  next
end
```

<code>dn <string></code>	Set the distinguished name used to look up entries on the LDAP server. The search for users and groups starts here based on what is defined.
<code>two-factor {disable fortitoken-cloud}</code>	Enable/disable two-factor authentication: <ul style="list-style-type: none"> <code>disable</code>: disable two-factor authentication <code>fortitoken-cloud</code>: use the FortiToken Cloud service
<code>two-factor-filter <string></code>	Set the filter used to synchronize users to FortiToken Cloud.

When configuring an LDAP connection to an Active Directory server, an administrator must provide Active Directory user credentials.

- To secure this connection, use LDAPS on both the Active Directory server and FortiGate. See [Configuring an LDAP server on page 2242](#) and [Configuring client certificate authentication on the LDAP server on page 2256](#).
- Apply the principle of least privilege. For the LDAP regular bind operation, do not use credentials that provide full administrative access to the Windows server when using credentials. See [Configuring least privileges for LDAP admin account authentication in Active Directory on page 2249](#).

Two-factor filter examples

In the following examples, a `user ldap` object is defined to connect to an Active Directory on a Windows server. The search will begin in the root of the `fortinet-fsso.com` directory.

To configure a default LDAP server configuration without a two-factor filter:

```
config user ldap
    edit "ad-ldap-auth"
        set server <ip_address>
        set cnid "cn"
        set dn "dc=fortinet-fsso,dc=com"
        set type regular
        set two-factor fortitoken-cloud
        set username "cn=Administrator,cn=users,dc=fortinet-fsso,dc=com"
        set password *****
    next
end
```

When a two-factor filter is not used, all users in the Active Directory with a valid email or mobile number will be retrieved.

Example 1: specific users and email address with wildcard

With this two-factor-filter, users under fortinet-fsso.com that have oliver* in their username and *fortinet* in their email will be matched.

```
config user ldap
    edit "ad-ldap-auth"
        set two-factor-filter "(&(SAMAccountName=oliver*)(mail=*fortinet*))"
    next
end
```

Example 2: all users with matching email

With this two-factor-filter, all users under fortinet-fsso.com with *fortinet* in their email will be matched.

```
config user ldap
    edit "ad-ldap-auth"
        set two-factor-filter "(&(SAMAccountName=*)(mail=*fortinet*))"
    next
end
```

Example 3: all users in a group

With this two-factor-filter, all users within the group fortinet-fsso.com > Testing > ftc-users will be matched.

```
config user ldap
    edit "ad-ldap-auth"
        set two-factor-filter "(&(objectCategory=Person)(sAMAccountName=*)(memberOf=cn=ftc-users,ou=Testing,dc=fortinet-fsso,DC=com))"
    next
end
```

Example configuration

In this example, Active Directory users are configured to be synchronized to FortiToken Cloud. The same two-factor filter is used from [example 1](#) and searches the Active Directory for users named oliver* with email *fortinet*.

Before configuring the FortiGate:

1. Gather the information to connect to the Active Directory server through LDAP. Include all necessary fields, such as the server IP, port, CN name identifier, DN for the start of the search, bind type, and username associated with a regular bind.
2. Consider the users or groups that require two-factor authentication and should be synchronized. If necessary, group the users under the same group in the Active Directory.
3. If using a two-factor filter, formulate the two-factor-filter string to limit the match. For this example, (&(SAMAccountName=oliver*)(mail=*fortinet*)).
4. Test the filter by using the FortiOS CLI to perform a quick LDAP search:

```
# diagnose test authserver ldap-search <server_ip> 389 "ou=Testing,dc=fortinet-
fsso,DC=com" cn Administrator@fortinet-fsso.com PASSWORD 0 '(&(SAMAccountName=oliver*)
(mail=*fortinet*))' 2
```

```
searching 'ou=Testing,dc=fortinet-fsso,DC=com, cn=cn' on 10.1.100.131:389 for
(Administrator@fortinet-fsso.com, PASSWORD), secure(0), filter((&
(SAMAccountName=oliver*)(mail=*fortinet*))), flag(0x2), page_no(0)...
CN=oliver2022,OU=Testing,DC=Fortinet-FSSO,DC=COM (oliver2022, 0 entries)
```

The user, oliver2022, was found.

5. Estimate how many users will be retrieved, and ensure that the FortiToken Cloud account has enough user licenses to support the number of users.

To configure Active Directory users to be synchronized to FortiToken Cloud:

1. Configure the user LDAP settings:

```
config user ldap
    edit "ad-ldap-auth"
        set server "10.1.100.131"
        set cnid "cn"
        set dn "dc=fortinet-fsso,dc=com"
        set type regular
        set two-factor fortitoken-cloud
        set username "cn=Administrator,cn=users,dc=fortinet-fsso,dc=com"
        set password *****
        set two-factor-filter "(&(SAMAccountName=oliver*)(mail=*fortinet*))"
    next
end
```

2. In the background, the FortiGate FAS daemon scans the LDAP server for users to be synchronized based on the two-factor filter pattern, but will not send them to the FortiToken Cloud server yet. Optionally, verify the users that are retrieved from the Active Directory based on the filter:

```
# diagnose fortitoken-cloud debug enable
# diagnose debug enable
# diagnose fortitoken-cloud sync
...
fas_sync_ftc[2788]: Sending packet to FTC server: "IP-of-FTC-server" Port: 8686
(length:444)
fas_sync_ftc[2792]: FTC User Sync Packet(length:444):
POST /api/v1/user_sync HTTP/1.1
Host: ftc.fortinet.com
Connection: keep-alive
User-Agent: FortiGate-401E v7.0.6,build****
Content-Type: application/json
```

Content-Length: 246

```
{ "users": [ { "username": "oliver2022", "vdom": "vdom1", "email": "o****@fortinet.com", "mobile_
number": "XXXXXXXXXXXX", "user_
data": 1, "action": "create" } ], "sn": "FG4H1E5819900000", "cluster_members": [
"FG4H1E5819900000" ], "group_name": "FGT400D", "group_id": "0" }
```

Reminder: User sync packet not actually sent out because of diagnose purpose!

As expected, only the user that matches the current filter is returned.

3. Manually trigger the synchronization process with FortiToken Cloud:

```
# execute fortitoken-cloud sync
```

The user is added to FortiToken Cloud, and an activation email or SMS message is sent to the user.

4. In FortiToken Cloud, go to *Users* to verify that the user was added.

Username	Status	MFA Method	Token SN	Notification Method	Email	Mobile Phone	Auth Client Count	Create Date
oliver2022	✓	FTM	FTC1A5J0J0	Email	o****@fortinet.com		1	5/24/2022, 9:27:05 AM
fso-user1	✓	FTM	FTCWGUSJ0U	Email	o****@fortinet.com		1	5/24/2022, 9:27:03 AM
admin	✓	FTM	FTCBXC00FU	Email	o****@fortinet.com		1	5/18/2022, 2:18:07 PM
test6	✓	FTM	FTCE40FH5X	Email	o****@hotmail.com		1	5/18/2022, 2:18:07 PM
test3	✓	FTM	FTC4S2JWA	Email	o****@fortinet.com		1	5/18/2022, 2:18:06 PM
test4	✓	FTM	FTCTON3KGE	Email	o****@fortinet.com		2	5/5/2022, 9:27:18 AM
ftm-mig-local1	✓	FTM	FTKM082276	Email	o****@fortinet.com		1	2/3/2022, 2:07:35 PM
ftm	✓	FTM	FTKM082174	Email	o****@fortinet.com		1	1/26/2022, 9:58:29 AM
ftm-mig1	✓	FTM	FTC4NQ19AH	Email	o****@fortinet.com		1	1/24/2022, 3:24:41 PM

If the activation email was sent, but user has not downloaded and activated the mobile token yet, a pending symbol appears in the *Status* column (such as for the *admin*, *test6*, and *test3* users).

5. In FortiOS, add the `ad-ldap-auth` object in a user group. The user group can be used for VPN, firewall authentication, and so on.

The `ldap user` object should not be used in remote LDAP user groups that require group matching because it is not supported.

Enable the FortiToken Cloud free trial directly from the FortiGate

Administrators can activate a free one-month trial of FortiToken Cloud directly from the FortiGate instead of logging into the FortiCare Support Portal. This can be performed while enabling two-factor authentication within a user or administrator configuration, or from the *System > FortiGuard* page.

The FortiToken Cloud free trial can only be activated once and can only be activated if there is a registered FortiCare account. It cannot be activated if there is another FortiToken Cloud license or trial associated with the FortiGate device or the registered FortiCare accounts.

If the free trial has not been activated, the *Activate free trial* button will be available.

After activation, license information will be displayed and a *Usage* field will display how many of the available licenses have been assigned. Detailed usage information can be found using the CLI.

To enable the FortiToken Cloud free trial for an Administrator:

1. Go to *System > Administrators*.
2. Click *Create new > Administrator*.
3. Enable *Two-factor Authentication*.
4. Set *Authentication Type* to *FortiToken Cloud*.

5. Select *Activate free trial*. A confirmation message is displayed.

6. Click *OK*. The license information is displayed.

6. Select *Activate free trial*. A confirmation message is displayed.

Confirm

FortiToken Cloud free trial can only be activated one time. Would you like to proceed?

OK

7. Click **OK**. The license information is displayed.

8. Click **OK**.

To enable the FortiToken Cloud free trial for FortiGuard:

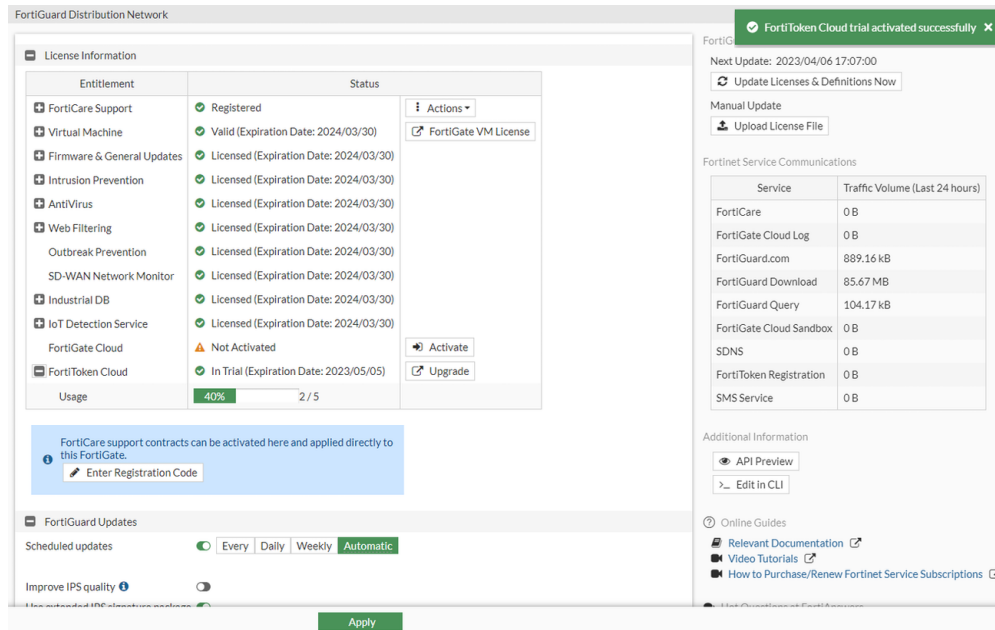

1. Go to *System > FortiGuard*.
2. Expand *License Information*.

Entitlement	Status	Actions
FortiCare Support	Registered	
Virtual Machine	Valid (Expiration Date: 2024/03/30)	
Firmware & General Updates	Licensed (Expiration Date: 2024/03/30)	
Intrusion Prevention	Licensed (Expiration Date: 2024/03/30)	
AntiVirus	Licensed (Expiration Date: 2024/03/30)	
Web Filtering	Licensed (Expiration Date: 2024/03/30)	
Outbreak Prevention	Licensed (Expiration Date: 2024/03/30)	
SD-WAN Network Monitor	Licensed (Expiration Date: 2024/03/30)	
Industrial DB	Licensed (Expiration Date: 2024/03/30)	
IoT Detection Service	Licensed (Expiration Date: 2024/03/30)	
FortiGate Cloud	Not Activated	Activate
FortiToken Cloud	Not Licensed	Activate free trial

Service	Traffic Volume (Last 24 hours)
FortiCare	0 B
FortiGate Cloud Log	0 B
FortiGuard.com	987.11 kB
FortiGuard Download	85.67 MB
FortiGuard Query	108.62 kB
FortiGate Cloud Sandbox	0 B
SDNS	0 B
FortiToken Registration	0 B
SMS Service	0 B

3. Select **Activate free trial** for *FortiToken Cloud*. A confirmation message is displayed.

4. Click **OK**. The license information is displayed.

5. Click *Apply*.

To enable the FortiToken Cloud free trial in the CLI:

1. Activate the FortiToken Cloud trial:

```
# execute fortitoken-cloud trial
FortiToken Cloud free trial activated!
```

2. Review the status of the free trial:

```
# diagnose fortitoken-cloud show service
FortiToken Cloud service status: free trial.
Service balance: 0.00 users. Expiration date: 2022-07-06. Customer ID: 139XXXX.
```

```
# execute fortitoken-cloud show
FortiToken Cloud service status: free trial.
Service balance: 0.00 users. Expiration date: 2022-07-06. Customer ID: 139XXXX.
```

3. View users associated with FortiToken Cloud:

```
# diagnose fortitoken-cloud show users
Number of users in fortitoken cloud: 2
1: username:vm3_ftc vdom:#FOS_Administrator email:fos@fortinet.com phone:
realm:FGTABCDXXXXXXXXXX-#FOS_Administrator userdata:0
2: username:ftc_user vdom:root email:fos@fortinet.com phone: realm:FGTABCDXXXXXXXXXX-
root userdata:0
```

Troubleshooting and diagnosis

This section contains some common scenarios for FortiTokens troubleshooting and diagnosis:

- [FortiToken Statuses on page 2349](#)
- [Recovering trial FortiTokens on page 2350](#)

- [Recovering lost Administrator FortiTokens on page 2350](#)
- [SSL VPN with multi-factor authentication expiry timers on page 2351](#)

FortiToken Statuses

When troubleshooting FortiToken issues, it is important to understand different FortiToken statuses. FortiToken status may be retrieved either from the CLI or the GUI, with a slightly different naming convention.

Before you begin, verify that the FortiGate has Internet connectivity and is also connected to both the FortiGuard and registration servers:

```
# execute ping fdsl.fortinet.com
# execute ping directregistration.fortinet.com
# execute ping globalftm.fortinet.net
```

The `globalftm.fortinet.net` server is the Fortinet Anycast server added in FortiOS 6.4.2.

If there are connectivity issues, retrieving FortiToken statuses or performing FortiToken activation could fail. Therefore, troubleshoot connectivity issues before continuing.

To retrieve FortiToken statuses:

- In the CLI:
`diagnose fortitoken info`
- In the GUI:
Go to *User & Authentication > FortiTokens*.

Various FortiToken statuses in either the CLI or the GUI may be described as follows:

CLI	GUI	Description
<code>new</code>	<i>Available</i>	Newly added, not pending, not activated, not yet assigned.
<code>active</code>	<i>Assigned</i>	Assigned to a user, hardware token.
<code>provisioning</code>	<i>Pending</i>	Assigned to a user and waiting for activation on the FortiToken Mobile app.
<code>provisioned</code>	<i>Assigned</i>	Assigned to user and activated on the FortiToken Mobile app.
<code>provision timeout</code>		Token provided to user but not activated on the FortiToken Mobile app. To fix, the token needs to be re-provisioned and activated in time.
<code>token already activated, and seed won't be returned</code>	<i>Error</i>	Token is locked by FortiGuard FDS. The hardware token was already activated on another device and locked by FDS.
<code>locked</code>		Either manually locked by an Administrator (<code>set status lock</code>), or locked automatically, for example, when the token is unassigned and the FortiCare FTM provisioning server was unreachable to process that change.

Recovering trial FortiTokens

You can recover trial FortiTokens if deleted from a FortiGate, or if stuck in a state where it is not possible to provision to a user.

When a token is stuck in an unusual state or with errors, delete the FortiTokens from the unit and proceed to recover trial FortiTokens.

To recover trial tokens via the GUI:

1. Go to *User & Authentication > FortiTokens*.
2. Click the *Import Free Trial Tokens* button at the top. The two free trial tokens are recovered.

To recover trial tokens via the CLI:

```
# execute fortitoken-mobile import 0000-0000-0000-0000-0000
```

- Before attempting to recover the trial tokens, both the tokens should be deleted from the unit first.
 - If VDOMs are enabled, trial tokens are in the management VDOM (`root` by default).
-

Following error codes might come up in the CLI:

- If the device is not registered:

```
# execute fortitoken-mobile import 0000-0000-0000-0000-0000
import fortitoken license error: -7571
```
- If the serial number format is incorrect:

```
# execute fortitoken-mobile import 0000-0000-0000-0000-00
import fortitoken license error: -7566
```

Recovering lost Administrator FortiTokens

If an Administrator loses their FortiToken or the FortiToken is not working, they will not be able to log into the admin console through the GUI or the CLI. If there is another Administrator that can log into the device, they may be able to reset the two-factor settings configured for the first Administrator, or create a new Admin user for them. Note that a *super_admin* user will be able to edit other admin user settings, but a *prof_admin* user will not be able to edit *super_admin* settings.

In the case where there are no other administrators configured, the only option is to flash format the device and reload a backup config file. You must have console access to the device in order to format and flash the device. It is recommended to be physically on site to perform this operation.

Before formatting the device, verify that you have a backup config file. You may or may not have the latest config file backed up, though you should consider using a backed up config file, and reconfigure the rest of the recent changes manually. Otherwise, you may need to configure your device starting from the default factory settings.

To recover lost Administrator FortiTokens:

1. If you have a backed up config file:
 - a. Open the config file and search for the specific admin user. For representational purposes we will use `Test` in our example.

```
# edit "Test"
```

```

    set accprofile "super_admin"
    set vdom "root"
    set two-factor fortitoken
    set fortitoken "FTKXXXXXXXXXX"
    set email-to "admin@email.com"
    set password "*****"
    next
end

```

- b. Once you find the settings for the `Test` user, delete the `fortitoken`-related settings:

```

# edit "Test"
    set accprofile "super_admin"
    set vdom "root"
    set password "*****"
    next
end

```

2. Format the boot device during a maintenance window and reload the firmware image using instructions in the [Formatting and loading FortiGate firmware image using TFTP](#) KB article.
3. Once the reload is complete, log into the admin console from the GUI using the default admin user credentials, and go to *Configuration > Restore* from the top right corner to reload your config file created in Step 1 above.
4. Once the FortiGate reboots and your configuration is restored, you can log in with your admin user credentials.

SSL VPN with multi-factor authentication expiry timers

When SSL VPN is configured with multi-factor authentication (MFA), sometimes you may require a longer token expiry time than the default 60 seconds.

To configure token expiry timers using the CLI:

```

config system global
    set two-factor-ftk-expiry <number of seconds>
    set two-factor-ftm-expiry <number of seconds>
    set two-factor-sms-expiry <number of seconds>
    set two-factor-fac-expiry <number of seconds>
    set two-factor-email-expiry <number of seconds>
end

```

These timers apply to the tokens themselves and remain valid for as long as configured above. However, SSL VPN does not necessarily accept tokens for the entire duration they are valid. To ensure SSLVPN accepts the token for longer durations, you need to configure the remote authentication timeout setting accordingly.

To configure the remote authentication timeout:

```

config system global
    set remoteauthtimeout <1-300 seconds>
end

```

SSL VPN waits for a maximum of five minutes for a valid token code to be provided before closing down the connection, even if the token code is valid for longer.

The `remoteauthtimeout` setting shows how long SSL VPN waits not only for a valid token to be provided before closing down the connection, but also for other remote authentication like LDAP, RADIUS, and so on.

Configuring the maximum log in attempts and lockout period

Failed log in attempts can indicate malicious attempts to gain access to your network. To prevent this security risk, you can limit the number of failed log in attempts. After the configured maximum number of failed log in attempts is reached, access to the account is blocked for the configured lockout period.

To configure number of maximum log in attempts:

This example sets the maximum number of log in attempts to five.

```
config user setting
    set auth-lockout-threshold 5
end
```

To configure the lockout period in seconds:

This example sets the lockout period to five minutes (300 seconds).

```
config user setting
    set auth-lockout-duration 300
end
```

PKI

The following topics include information about public key infrastructure (PKI):

- [Configuring a PKI user on page 2352](#)
- [Using the SAN field for LDAP-integrated certificate authentication on page 2356](#)
- [SSL VPN with certificate authentication on page 2093](#)
- [SSL VPN with LDAP-integrated certificate authentication on page 2099](#)

Configuring a PKI user

PKI users are users who are identified by a digital certificate they hold. Defining a PKI user in FortiOS specifies:

- Which CA certificate to use to validate the user's certificate
- The field and value of the user's certificate that FortiOS will check to verify a user

These peer users can then be used in a FortiGate user group, or as a peer certificate group used for IPsec VPN configurations that accept RSA certificate authentication.

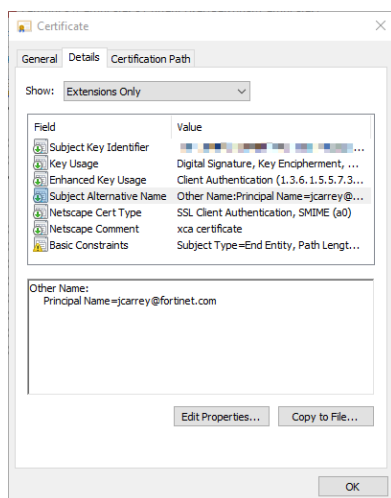

Example X.509 certificate

The following certificate demonstrates which FortiGate settings can be used to match on different fields.

Subject:

Subject Alternative Name:

Certification path:

To configure a PKI user:

```

config user peer
    edit <name>
        set ca <string>
        set mandatory-ca-verify {enable | disable}
        set subject <string>
        set cn <string>
        set cn-type {string | email | FQDN | ipv4 | ipv6}
        set ldap-server <string>
        set ldap-username <string>
        set ldap-password <string>
        set ldap-mode {password | principal-name}
    next
end

```

ca <string>	Specify which certificate on the FortiGate is used to validate the client's certificate. This can be any CA in the client's certificate chain. You may need to upload a CA certificate to the FortiGate specifically to identify PKI peer users (see CA certificate on page 2714).
mandatory-ca-verify {enable disable}	Control the action if the CA certificate used to sign the client's certificate is not installed on the FortiGate (default = enable). Disabling this setting makes the FortiGate consider any certificate presented by the peer as valid. In the example certificate, the certification path shows that VF_CA signed jcarrey's certificate.
subject <string>	Enter the peer certificate name constraints.
cn <string>	Enter the peer certificate common name.
cn-type {string email FQDN ipv4 ipv6}	Set the peer certificate common name type: string, email, FQDN, IPv4 address, or IPv6 address. See CN on page 2355 for more details.
ldap-server <string>	Enter the name of an LDAP server defined under <code>config user ldap</code> for performing client access rights checks. See LDAP servers on page 2242 for more details.
ldap-mode {password principal-name}	Set the mode for LDAP peer authentication, either by password or principal name (default = password). See LDAP on page 2356 for more details.
ldap-username <string>	Enter the username for the LDAP server bind when the LDAP mode is password.
ldap-password <string>	Enter the password for the LDAP server bind when the LDAP mode is password.

Identifying users based on their client certificate

When the client's certificate is valid, or `mandatory-ca-verify` is disabled, the FortiGate can then inspect the certificate to check specific fields for matching values. There are three ways of specifying which certificate field to verify: by subject, CN, or LDAP. All string comparisons are case sensitive.

Subject

This basic method verifies that the subject string defined in the PKI user setting matches a value or substring in the subject field of the user certificate. Further matching is controlled in the following VPN certificate settings.

```
config vpn certificate setting
    set subject-match {substring | value}
    set subject-set {superset | subset}
    set cn-match {substring | value}
    set cn-allow-multi {enable | disable}
end
```

```
subject-match {substring
| value}
```

Control how to do relative distinguished name (RDN) value matching with the certificate subject name:

- **substring:** find a match if any string in the certificate subject name matches the name being searched for (such as `set subject jcarrey`).
- **value:** find a match if any attribute value string in a certificate subject name is an exact match with the name being searched for (such as `set subject "OU=TAC"` or `set subject "C=CA, CN=jcarrey, OU=TAC"`).

```
set subject-set {superset
| subset}
```

Control how to do RDN value matching with the certificate subject name:

- **superset:** a certificate only passes verification if it contains all the RDNs defined in the subject settings (such as `set subject "E = jcarrey@fortinet.com, CN = jcarrey, OU = TAC, O = Fortinet, L = Burnaby, S = British Columbia, C = CA"`).
- **subset:** a certificate passes verification if the RDN is a subset of the certificate subject (such as `set subject "CN = jcarrey, OU = TAC"`).

```
cn-match {substring |
value}
```

Control how to do CN value matching with the certificate subject name:

- **substring:** find a match if any string in the certificate subject name matches the name being searched for.
- **value:** find a match if any attribute value string in a certificate subject name is an exact match with the name being searched for.

```
cn-allow-multi {enable |
disable}
```

Enable/disable allowing multiple CN entries with the certificate subject name (default = enable).

CN

Common name (CN) certificate verification compares the CN in the subject field with the configured string (such as `set cn "jcarrey"`). The following logic is used when configuring different CN types:

Type	Action
string	Based on the <code>cn-match</code> setting, perform a substring or exact match in the certificate subject.
email	Look for a match in the certificate subject.
FQDN	Look for a match in the certificate subject, then compare the mapped IP and client IP. The FQDN is only retrieved from the CN.

Type	Action
ipv4	Look for a match in the certificate subject, then compare the IP.
ipv6	Look for a match in the certificate subject, then compare the IP.

The CN type also controls the format checking of the CN string. In this example, if the CN type is set to email, the CN must be in email format (`set cn "jcarrey@fortinet.com"`).

LDAP

LDAP-integrated user authentication allows the FortiGate to check the connecting user against an LDAP server in two ways: through a username and password, or the certificate's principal name. The `password` method requires the username and password of each authenticating user to be entered, so it is not recommended when configuring PKI users. The `principal-name` method is recommended.

The UPN in the user certificate's Subject Alternative Name (SAN) field is used to look up the user in the LDAP directory. The SAN in the certificate for UPN matching can be the UPN on the AD LDAP server (default), RFC 822 Name (corporate email address), or DNS name. If a match is found, then authentication succeeds. This type of configuration scales well since only one PKI user needs to be created on the FortiGate. Connecting clients use their unique user certificate to match within the configured LDAP server. See [Using the SAN field for LDAP-integrated certificate authentication on page 2356](#) for an example.

Using the SAN field for LDAP-integrated certificate authentication

Certificate-based authentication against Active Directory LDAP (AD LDAP) supports the UserPrincipalName (UPN), RFC 822 Name (corporate email address) defined in the SAN extension of the certificate, and the DNS defined in the user certificate as the unique identifier in the Subject Alternative Name (SAN) field for peer user certificates.

```
config user ldap
    edit <name>
        set account-key-upn-san {othername | rfc822name | dnsname}
    next
end
```

```
account-key-upn-san
{othername |
 rfc822name |
 dnsname}
```

Define the SAN in the certificate for UserPrincipalName matching:

- othername: match to UserPrincipalName (UPN) on AD LDAP server (default)
- rfc822name: match to RFC 822 email address
- dnsname: match to DNS name

The LDAP server configurations are applied to the user peer configuration when the PKI user is configured.

```
config user peer
    edit <name>
        set ca <string>
        set cn <string>
        set ldap-server <string>
        set ldap-mode principal-name
    next
end
```

When a user authenticates to the FortiGate for an administrative log in, SSL VPN, IPsec dialup, or firewall authentication using a user certificate, it presents a signed certificate issued by a trusted CA to the FortiGate. The following sequence of events occurs as the FortiGate processes the certificate for authentication:

1. The FortiGate verifies if the certificate is issued by a trusted CA. If the CA is not a public CA, ensure that the CA certificate is uploaded and trusted by the FortiGate, and is applied to the user peer configurations (`set ca <string>`).
2. The FortiGate verifies that the CN field of the certificate matches the CN specified in the user peer configurations (`set cn <string>`).
3. If the user peer configuration has `ldap-server` configured and the `ldap-mode` is set to `principal-name`, the FortiGate uses the unique identifier in the certificate to authenticate against the LDAP server.
 - a. If `set account-key-upn-san othername` is configured (the default setting), the FortiGate uses the UPN in the certificate's SAN field to authenticate against LDAP.
 - b. If `set account-key-upn-san rfc822name` is configured, the FortiGate uses the RFC 822 Name in the certificate's SAN field to authenticate against LDAP.
 - c. If `set account-key-upn-san dnsname` is configured, the FortiGate uses the DNS name in the certificate to authenticate against LDAP.
4. By default, the FortiGate tries to match the UserPrincipalName (UPN) attribute on the AD LDAP. If this needs to be changed to another field, configure the `account-key-filter` setting on the LDAP configuration:

```
config user ldap
  edit <name>
    set account-key-filter <string>
  next
end
```

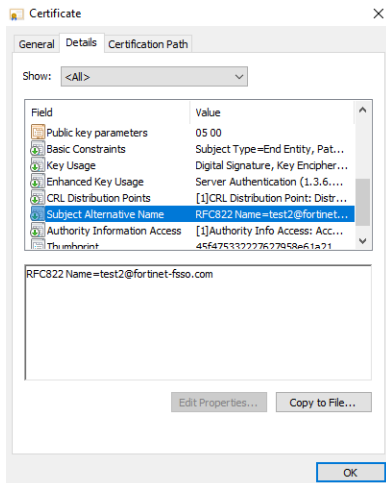

When configuring an LDAP connection to an Active Directory server, an administrator must provide Active Directory user credentials.

- To secure this connection, use LDAPS on both the Active Directory server and FortiGate. See [Configuring an LDAP server on page 2242](#) and [Configuring client certificate authentication on the LDAP server on page 2256](#).
- Apply the principle of least privilege. For the LDAP regular bind operation, do not use credentials that provide full administrative access to the Windows server when using credentials. See [Configuring least privileges for LDAP admin account authentication in Active Directory on page 2249](#).

Example

In this example, a user certificate is issued by a customer's CA to a user. The user uses this certificate to authenticate to the SSL VPN web portal. The administrator decides to use the RFC 822 Name in the SAN field to authenticate against their corporate AD LDAP. The Active Directory attribute to check against the RFC 822 Name field is the mail attribute.

User certificate information:

The configuration used in this example assumes the following:

- The CA certificate has already been uploaded to the FortiGate.
- The SSL VPN configurations have already been configured, pending the assignment of the PKI user group.

To configure the authentication settings:

1. Configure the LDAP server:

```
config user ldap
    edit "ad-ldap-peer-user"
        set server "10.1.100.131"
        set cnid "cn"
        set dn "dc=fortinet-fsso,dc=com"
        set type regular
        set username "cn=Administrator,cn=users,dc=fortinet-fsso,dc=com"
        set password ENC XXXXXXXXXXXXXXXXXXXX
        set password-renewal enable
        set account-key-upn-san rfc822name
        set account-key-filter "(&(mail=%s)(!(UserAccountControl:1.2.840.113556.1.4.803:=2)))"
    next
end
```

By default, the `account-key-filter` filters on the UPN attribute uses the following string: `(&(userPrincipalName=%s)(!(UserAccountControl:1.2.840.113556.1.4.803:=2)))`.

- `(userPrincipalName=%s)` matches the UPN attribute on the AD LDAP.
- `(!(UserAccountControl:1.2.840.113556.1.4.803:=2))` filters out inactive and locked AD accounts.

2. Configure the local peer user:

```
config user peer
    edit "peer-RFC822-name"
        set ca "CA_Cert_2"
        set cn "test2"
        set ldap-server "ad-ldap-peer-user"
        set ldap-mode principal-name
    next
end
```

3. Configure the firewall user group for SSL VPN authentication:

```
config user group
    edit "vpn-group"
        set member "peer-RFC822-name"
    next
end
```

4. Apply the user group to the SSL VPN configuration and firewall policy.**Verification**

When the SSL VPN user authenticates in a browser, the FortiOS fnbamd daemon first validates the certificate supplied by the user. If the certificate check is successful, the information in the SAN field of the user certificate is used to find a matching user record on the AD LDAP.

To verify the configuration:

```
# diagnose debug app fnbamd -l
# diagnose debug enable
```

The output includes the following information.

- Validate the certificate:

```
...
__check_crl-***CERTIFICATE IS GOOD***
[567] fnbamd_cert_verify-Issuer found: CA_Cert_2 (SSL_DPI opt 1)
[500] fnbamd_cert_verify-Following cert chain depth 1
[675] fnbamd_cert_check_group_list-checking group with name 'vpn-group'
[490] __check_add_peer-check 'peer-RFC822-name'
[366] peer_subject_cn_check-Cert subject 'C = CA, ST = BC, L = Burnaby, CN = test2'
[294] __RDN_match-Checking 'CN' val 'test2' -- match.
[404] peer_subject_cn_check-CN is good.
```

- Bind to LDAP and try to match the content of the SAN in the user certificate with the user record in the AD LDAP:

```
...
__cert_ldap_query-LDAP query, idx 0
[448] __cert_ldap_query-UPN = 'test2@fortinet-fsso.com'
[1717] fnbamd_ldap_init-search filter is: (&(mail=test2@fortinet-fsso.com)(!(UserAccountControl:1.2.840.113556.1.4.803:=2)))
```

- Confirm the successful match:

```
...
__cert_ldap_query_cb-LDAP ret=0, server='ad-ldap-peer-user', req_id=269178889
[388] __cert_ldap_query_cb-Matched peer 'peer-RFC822-name'
...
[1066] fnbamd_cert_auth_copy_cert_status-req_id=269178889
[1074] fnbamd_cert_auth_copy_cert_status-Matched peer user 'peer-RFC822-name'
[833] fnbamd_cert_check_matched_groups-checking group with name 'vpn-group'
[895] fnbamd_cert_check_matched_groups-matched
[1193] fnbamd_cert_auth_copy_cert_status-Cert st 290, req_id=269178889
[209] fnbamd_comm_send_result-Sending result 0 (nid 672) for req 269178889, len=2155
```

Configuring firewall authentication

In this example, a Windows network is connected to the FortiGate on port 2, and another LAN, Network_1, is connected on port 3.

All Windows network users authenticate when they log on to their network. Engineering and Sales groups members can access the Internet without reentering their authentication credentials. The example assumes that you have already installed and configured FSSO on the domain controller.

LAN users who belong to the Internet_users group can access the Internet after entering their username and password. The example shows two users: User1, authenticated by a password stored in FortiOS; and User 2, authenticated on an external authentication server. Both users are local users since you create the user accounts in FortiOS.

1. [Create a locally authenticated user account.](#)
2. [Create a RADIUS-authenticated user account.](#)
3. [Create an FSSO user group.](#)
4. [Create a firewall user group.](#)
5. [Define policy addresses.](#)
6. [Create security policies.](#)

Creating a locally authenticated user account

User1 is authenticated by a password stored in FortiOS.

To create a locally authenticated user account in the GUI:

1. Go to *User & Authentication > User Definition* and click *Create New*.
2. Configure the following settings:

User Type	Local User
User Name	User1
Password	hardtoguess1@@1
User Account Status	Enabled

3. Click *Submit*.

To create a locally authenticated user account in the CLI:

```
config user local
  edit user1
    set type password
    set passwd hardtougness1@@1
  next
end
```

Creating a RADIUS-authenticated user account

You must first configure FortiOS to access the external authentication server, then create the user account.

To create a RADIUS-authenticated user account in the GUI:

1. Go to *User & Authentication > RADIUS Servers* and click *Create New*.
2. Configure the following settings:

Name	OurRADIUSsrv
Authentication method	Default
Primary Server	
IP/Name	10.11.101.15
Secret	OurSecret

3. Click *OK*.
4. Go to *User & Authentication > User Definition* and click *Create New*.
5. Configure the following settings:

User Type	Remote RADIUS User
User Name	User2
RADIUS Server	OurRADIUSsrv
User Account Status	Enabled

6. Click *Submit*.

To create a RADIUS-authenticated user account in the CLI:

```
config user radius
  edit OurRADIUSsrv
    set server 10.11.102.15
    set secret OurSecret
    set auth-type auto
  next
end
config user local
  edit User2
    set name User2
    set type radius
    set radius-server OurRADIUSsrv
```

next
end

Creating an FSSO user group

This example assumes that you have already set up FSSO on the Windows network and that it used advanced mode, meaning that it uses LDAP to access user group information. You must do the following:

- Configure LDAP access to the Windows AD global catalog
- Specify the collector agent that sends user log in information to FortiOS
- Select Windows user groups to monitor
- Select and add the Engineering and Sales groups to an FSSO user group

To create an FSSO user group in the GUI:

1. Configure LDAP for FSSO:
 - a. Go to *User & Authentication > LDAP Servers* and click *Create New*.
 - b. Configure the following settings:

Name	ADserver
Server Name / IP	10.11.101.160
Distinguished Name	dc=office,dc=example,dc=com
Bind Type	Regular
Username	cn=FSSO_Admin,cn=users,dc=office,dc=example,dc=com
Password	Enter a secure password.

- c. Leave other fields as-is. Click *OK*.
2. Specify the collector agent for FSSO;
 - a. Go to *Security Fabric > External Connectors* and click *Create New*.
 - b. Under *Endpoint/Identity*, select *FSSO Agent on Windows AD*.

c. Configure the following settings:

Name	Enter the Windows AD server name. This name appears in the Windows AD server list when you create user groups. In this example, the name is WinGroups.
Server IP/Name	Enter the IP address or name of the server where the agent is installed. The maximum name length is 63 characters. In this example, the IP address is 10.11.101.160.
Password	Enter the password of the server where the agent is installed. You only need to enter a password for the collector agent if you configured the agent to require authenticated access. If the TCP port used for FSSO is not the default, 8000, you can run the <code>config user fsso</code> command to change the setting in the CLI.
Collector Agent AD access mode	Advanced
LDAP Server	Select the previously configured LDAP server. In this example, it is ADserver.
User/Groups/Organization Units	Select the users, groups, and OUs to monitor.

d. Click OK.

3. Create the FSSO_Internet_users user group:

- a. Go to *User & Authentication > User Groups* and click *Create New*.
- b. Configure the following settings:

Name	FSSO_Internet_users
Type	Fortinet Single Sign-On (FSSO)
Members	Engineering, Sales

c. Click OK.

To create an FSSO user group in the CLI:

```

config user ldap
  edit "ADserver"
    set server "10.11.101.160"
    set dn "cn=users,dc=office,dc=example,dc=com"
    set type regular
    set username "cn=administrator,cn=users,dc=office,dc=example,dc=com"
    set password set_a_secure_password
  next
end
config user fsso
  edit "WinGroups"
    set ldap-server "ADserver"
    set password *****
    set server "10.11.101.160"
  next
end

```

```
config user group
edit FSSO_Internet_users
set group-type fsso-service
set member CN=Engineering,cn=users,dc=office,dc=example,dc=com
        CN=Sales,cn=users,dc=office,dc=example,dc=com
next
end
```

Creating a firewall user group

This example shows a firewall user group with only two users. You can add additional members.

To create a firewall user group in the GUI:

1. Go to *User & Authentication > User Groups* and click *Create New*.
2. Configure the following settings:

Name	Internet_users
Type	Firewall
Members	User1, User2

3. Click *OK*.

To create a firewall user group in the CLI:

```
config user group
edit Internet_users
set group-type firewall
set member User1 User2
next
end
```

Defining policy addresses

To define policy addresses:

1. Go to *Policy & Objects > Addresses*.
2. Click *Create New > Address*.
3. Configure the following settings:

Name	Internal_net
Type	Subnet
IP/Netmask	10.11.102.0/24
Interface	Port 3

4. Click *OK*.
5. Create another new address by repeating steps 2-4 using the following settings:

Name	Windows_net
Type	Subnet
IP/Netmask	10.11.101.0/24
Interface	Port 2

Creating security policies

You must create two security policies: one for the firewall group connecting through port 3, and one for the FSSO group connecting through port 2.

To create security policies using the GUI:

1. Go to *Policy & Objects > Firewall Policy*.
2. Click *Create New*.
3. Configure the following settings:

Incoming Interface	Port2
Source Address	Windows_net
Source User(s)	FSSO_Internet_users
Outgoing Interface	Port1
Destination Address	all
Schedule	always
Service	ALL
NAT	Enabled.
Security Profiles	You can enable security profiles as desired.

4. Click *OK*.

5. Create another new policy by repeating steps 2-4 using the following settings:

Incoming Interface	Port3
Source Address	Internal_net
Source User(s)	Internet_users
Outgoing Interface	Port1
Destination Address	all
Schedule	always
Service	ALL
NAT	Enabled.
Security Profiles	You can enable security profiles as desired.

6. Click OK.

To create security policies using the CLI:

```
config firewall policy
  edit 0
    set srcintf port2
    set dstintf port1
    set srcaddr Windows_net
    set dstaddr all
    set action accept
    set groups FSSO_Internet_users
    set schedule always
    set service ANY
    set nat enable
  next
end
config firewall policy
  edit 0
    set srcintf port3
    set dstintf port1
    set srcaddr internal_net
    set dstaddr all
    set action accept
    set schedule always
    set groups Internet_users
    set service ANY
    set nat enable
  next
end
```

FSSO

FortiOS can provide single sign-on capabilities to Windows AD, Citrix, VMware Horizon, Novell eDirectory, and Microsoft Exchange users with the help of agent software installed on these networks. The agent software sends information

about user logons to the FortiGate unit. With user information such as IP address and user group memberships from the network, FortiGate security policies can allow authenticated network access to users who belong to the appropriate user groups without requesting their credentials again.

Fortinet Single Sign-On (FSSO), through agents installed on the network, monitors user logons and passes that information to the FortiGate unit. When a user logs on at a workstation in a monitored domain, FSSO:

- Detects the logon event and records the workstation name, domain, and user,
- Resolves the workstation name to an IP address,
- Determines which user groups the user belongs to,
- Sends the user logon information, including IP address and groups list, to the FortiGate unit, and
- Creates one or more log entries on the FortiGate unit for this logon event as appropriate.

When the user tries to access network resources, the FortiGate unit selects the appropriate security policy for the destination. If the user belongs to one of the permitted user groups associated with that policy then the connection is allowed, otherwise the connection is denied.

Agent-based FSSO

Several different FSSO agents can be used in an FSSO implementation:

- Domain Controller (DC) agent
- eDirectory agent
- Citrix/Terminal Server (TS) agent
- Collector Agent

Consult the latest [FortiOS Release Notes](#) for operating system compatibility information.

Domain Controller agent

The Domain Controller (DC) agent must be installed on every domain controller when you use DC Agent mode. The DC agents monitor user logon events and pass the information to the Collector agent, which stores the information and sends it to the FortiGate unit.

eDirectory agent

The eDirectory agent is installed on a Novell network to monitor user logons and send the required information to the FortiGate unit. It functions much like the Collector agent on a Windows AD domain controller. The agent can obtain information from the Novell eDirectory using either the Novell API or LDAP.

Terminal Server agent

The Terminal Server (TS) agent can be installed on a Citrix, VMware Horizon 7.4, or Windows Terminal Server to monitor user logons in real time. It functions much like the DC Agent on a Windows AD domain controller.

Collector agent

The Collector Agent (CA) is installed as a service on a server in the Windows AD network to monitor user logons and send the required information to the FortiGate unit. The Collector agent can collect information from a DC agent (Windows AD) and TS agent (Citrix or VMware Horizon Terminal Server).

In a Windows AD network, the Collector agent can optionally obtain logon information by polling the AD domain controllers. In this case, DC agents are not needed.

The CA is responsible for DNS lookups, group verification, workstation checks, and updating FortiGates on logon records. The FSSO CA sends Domain Local Security Group and Global Security Group information to FortiGate units. The CA communicates with the FortiGate over TCP port 8000 and it listens on UDP port 8002 for updates from the DC agents.

The FortiGate device can have up to five CAs configured for redundancy. If the first CA on the list is unreachable, the next is attempted, and so on down the list until one is contacted.

All DC agents must point to the correct CA port number and IP address on domains with multiple DCs.

A FortiAuthenticator device can act much like a CA, collecting Windows AD user logon information and sending it to the FortiGate device. It is particularly useful in large installations with several FortiGate units. For more information, see the [FortiAuthenticator Administration Guide](#).

Agentless FSSO

For Windows AD networks, FortiGate devices can also provide SSO capability by directly polling Windows Security Event log entries on Windows DC for user log in information. This configuration does not require a CA or DC agent.

FortiGate configuration

To configure FSSO on a FortiGate, go to *Security Fabric > External Connectors*.

When creating a new connector, several options for connectors are available under Endpoint/Identity:

- [Fortinet single sign-on agent on page 3084](#)
For most FSSO Agent-based deployments, this connector option will be used. Specify either Collector Agent or Local as User Group Source to collect user groups from the Collector Agent, or to match users to user groups from a LDAP server.
- [Poll Active Directory server on page 3085](#)
This connection option directly polls Windows Security Event log entries on Windows DC for user log in information.
- [RADIUS single sign-on agent on page 3092](#)
FortiGate can authenticate users who have authenticated on a remote RADIUS server by monitoring the RADIUS accounting records forwarded by the RADIUS server to the FortiGate.
- [Exchange Server connector on page 3095](#)
FortiGate collects information about authenticated users from corporate Microsoft Exchange Servers.
- [Symantec endpoint connector on page 3086](#)
This connector uses client IP information from Symantec Endpoint Protection Manager (SEPM) to assign dynamic IP addresses on FortiOS.
Since FSSO is commonly associated with Agent-based FSSO and Agentless FSSO, this chapter will primarily focus on the first two Security Fabric External Connector options.

FSSO polling connector agent installation

This topic gives an example of configuring a local FSSO agent on the FortiGate. The agent actively pools Windows Security Event log entries on Windows Domain Controller (DC) for user log in information. The FSSO user groups can then be used in a firewall policy.

This method does not require any additional software components, and all the configuration can be done on the FortiGate.

To configure a local FSSO agent on the FortiGate:

1. [Configure an LDAP server on the FortiGate on page 2369](#)
2. [Configure a local FSSO polling connector on page 2369](#)
3. [Add the FSSO groups to a policy on page 2370](#)

Configure an LDAP server on the FortiGate

Refer to [Configuring an LDAP server on page 2242](#). The connection must be successful before configuring the FSSO polling connector.

Configure a local FSSO polling connector

To configure a local FSSO polling connector:

1. Go to *Security Fabric > External Connectors* and click *Create New*.
2. In the *Endpoint/Identity* section, select *Poll Active Directory Server*.
3. Fill in the required information.
4. For *LDAP Server*, select the server you just created.
5. Configure the group settings:
 - a. For *Users/Groups*, click *Edit*. The structure of the LDAP tree is shown in the *Users/Groups* window.
 - b. Click the *Groups* tab.
 - c. Select the required groups, right-click on them, and select *Add Selected*. Multiple groups can be selected at one time by holding the CTRL or SHIFT keys. The groups list can be filtered or searched to limit the number of groups that are displayed.
 - d. Click the *Selected* tab and verify that the required groups are listed. To remove a group, right-click and select *Remove Selected*.
 - e. Click *OK* to save the group settings.
6. Click *OK* to save the connector settings.
7. Go back to *Security Fabric > External Connectors*.
8. There should be two new connectors:

- The *Local FSSO Agent* is the backend process that is automatically created when the first FSSO polling connector is created.

- The *Active Directory Connector* is the front end connector that can be configured by FortiGate administrators.

To verify the configuration, hover the cursor over the top right corner of the connector; a popup window will show the currently selected groups. A successful connection is also shown by a green up arrow in the lower right corner of the connector.

If you need to get log in information from multiple DCs, then you must configure other Active Directory connectors for each additional DC to be monitored.

Add the FSSO groups to a policy

FSSO groups can be used in a policy by either adding them to the policy directly, or by adding them to a local user group and then adding the group to a policy.

To add the FSSO groups to a local user group:

1. Go to *User & Authentication > User Groups* and click *Create New*.
2. Enter a name for the group in the *Name* field.
3. Set the *Type* to *Fortinet Single Sign-On (FSSO)*.
4. In the *Members* field, click the **+** and add the FSSO groups.

5. Click **OK**.
6. Add the local FSSO group to a policy.

To add the FSSO groups directly to a firewall policy:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. In the *Source* field, click the **+**. In the *Select Entries* pane, select the *User* tab.
3. Select the FSSO groups.
4. Configure the remaining settings as required.
5. Click **OK**.

Troubleshooting

If an authenticated AD user cannot access the internet or pass the firewall policy, verify the local FSSO user list:

```
# diagnose debug authd fsso list
----FSSO logons----
IP: 10.1.100.188 User: test2 Groups: CN=group2,OU=Testing,DC=Fortinet-FSSO,DC=COM
Workstation: MemberOf: CN=group2,OU=Testing,DC=Fortinet-FSSO,DC=COM
Total number of logons listed: 1, filtered: 0
----end of FSSO logons----
```

1. Check that the group in *MemberOf* is allowed by the policy.
2. If the expected AD user is not in list, but other users are, it means that either:
 - The FortiGate missed the log in event, which can happen if many users log in at the same time, or
 - The user's workstation is unable to connect to the DC, and is currently logged in with cached credentials, so there is no entry in the DC security event log.
3. If there are no users in the local FSSO user list:

- a. Ensure that the local FSSO agent is working correctly:

```
# diagnose debug enable
# diagnose debug authd fsso server-status
```

Server Name	Connection Status	Version	Address
-----	-----	-----	-----
FGT_A (vdom1) # Local FSSO Agent	connected	FSAE server 1.1	127.0.0.1

The connection status must be connected.

- b. Verify the Active Directory connection status:

```
# diagnose debug fsso-polling detail 1
AD Server Status (connected):
ID=1, name(10.1.100.131),ip=10.1.100.131,source(security),users(0)
port=auto username=Administrator
read log eof=1, latest logon timestamp: Fri Jul 26 10:36:20 2019
```

```
polling frequency: every 10 second(s) success(274), fail(0)
LDAP query: success(0), fail(0)
LDAP max group query period(seconds): 0
LDAP status: connected
```

```
Group Filter: CN=group2,OU=Testing,DC=Fortinet-
FSSO,DC=com+CN=group21,OU=Testing,DC=Fortinet-FSSO,DC=COM
```

If the polling frequency shows successes and failures, that indicates sporadic network problems or a very busy DC. If it indicates no successes or failures, then incorrect credentials could be the issue.

If the LDAP status is connected, then the FortiGate can access the configured LDAP server. This is required for AD group membership lookup of authenticated users because the Windows Security Event log does not include group membership information. The FortiGate sends an LDAP search for group membership of authenticated users to the configured LDAP server.

FortiGate adds authenticated users to the local FSSO user list only if the group membership is one of the groups in Group Filter.

4. If necessary, capture the output of the local FortiGate daemon that polls Windows Security Event logs:

```
# diagnose debug application fssod -1
```

This output contains a lot of detailed information which can be captured to a text file.

Limitations

- NTLM based authentication is not supported.
- If there are a large number of user log ins at the same time, the FSSO daemon may miss some. Consider using FSSO agent mode if this will be an issue. See [Public and private SDN connectors on page 3015](#) for information.
- The FSSO daemon does not support all of the security log events that are supported by other FSSO scenarios. For example, only Kerberos log in events 4768 and 4769 are supported.

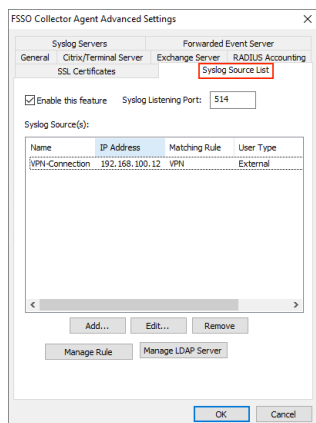

FSSO using Syslog as source

This example describes how to configure Fortinet Single Sign-On (FSSO) agent on Windows using syslog as the source and a custom syslog matching rule.

The FSSO collector agent must be build 0291 or later, and in advanced mode (see [How to switch FSSO operation mode from Standard Mode to Advanced Mode](#)).

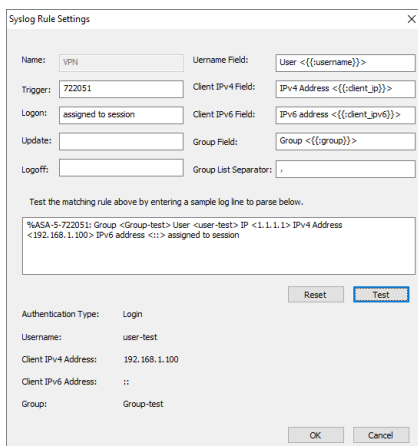

To configure the FSSO agent on Windows:

1. Open the FSSO agent on Windows.
2. Click *Advanced Settings*.
3. Go to the *Syslog Source List* tab.
4. Select *Enable this feature*.
5. Set *Syslog Listening Port*, or use the default port.

6. Click *Manage Rule*.
7. Create a new syslog rule:
 - a. Click *Add*.
 - b. Configure the rule:

Trigger	722051
Logon	assigned to session
Username Field	User <{{:username}}>
Client IPv4 Field	IPv4 Address <{{:client_ip}}>
Client IPv6 Field	IPv6 Address <{{:client_ipv6}}>
Group Field	Group <{{:group}}>
Groups List Separator	,

The Syslog Rule Settings dialog box contains the following fields and options:

- Name:** VPN
- Username Field:** User <{{username}}>
- Trigger:** 722051
- Client IPv4 Field:** IPv4 Address <{{client_ip}}>
- Logon:** assigned to session
- Client IPv6 Field:** IPv6 address <{{client_ipv6}}>
- Update:** (empty)
- Group Field:** Group <{{group}}>
- Logoff:** (empty)
- Group List Separator:** ,

Below the fields is a text area for testing the rule with a sample log line:

```
%ASA-5-722051: Group <Group-test> User <user-test> IP <1.1.1.1> IPv4 Address <192.168.1.100> IPv6 address <::> assigned to session
```

Buttons: Reset, Test, OK, Cancel.

Summary section:

- Authentication Type:** Login
- Username:** user-test
- Client IPv4 Address:** 192.168.1.100
- Client IPv6 Address:** ::
- Group:** Group-test

c. To test the rule, enter a sample log line, then click *Test*.

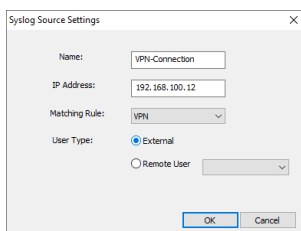

d. Click *OK*.

8. Create a new syslog source:

a. On the *Advanced Settings* window, click *Add*.

b. Configure the source:

Name	<i>VPN-Connection</i>
IP Address	<i>192.168.100.12</i>
Matching Rule	<i>VPN</i>
User Type	<p><i>External:</i> Users are not defined on the CA and user groups come from the source.</p> <p><i>Remote User:</i> Users are defined on a remote LDAP server and user groups are retrieved from the specified LDAP server. Any group from the syslog messages are ignored. See Connect to a remote LDAP server on page 2373.</p>

The Syslog Source Settings dialog box contains the following fields and options:

- Name:** VPN-Connection
- IP Address:** 192.168.100.12
- Matching Rule:** VPN (dropdown)
- User Type:**
 - ☒ External
 - ☐ Remote User (disabled dropdown)

Buttons: OK, Cancel.

c. Click *OK*.

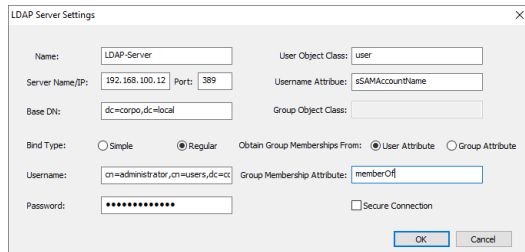

9. Click *OK*.

Connect to a remote LDAP server

This section describes how to connect to a remote LDAP server to match the user identity from the syslog server with an LDAP server.

To connect to a remote LDAP server:

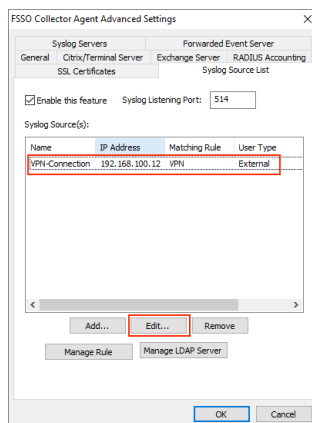

1. Open the FSSO agent on Windows.
2. Click *Advanced Settings*.
3. Go to the *Syslog Source List* tab.
4. Click *Manage LDAP Server*.
5. Click *Add* and configure the LDAP server settings:

The LDAP Server Settings dialog box contains the following fields and options:

- Name: LDAP-Server
- Server Name/IP: 192.168.100.12
- Port: 389
- Base DN: dc=corpo,dc=local
- User Object Class: user
- Username Attribute: sAMAccountName
- Group Object Class:
- Bind Type: ☒ Regular (Simple is unselected)
- Obtain Group Memberships From: ☒ User Attribute (Group Attribute is unselected)
- Username: cn=admin,dc=corpo,dc=local
- Group Membership Attribute: memberOf
- Password: [masked]
- Secure Connection: ☐
- Buttons: OK, Cancel

6. Click *OK*.
7. Select the syslog source and click *Edit*.

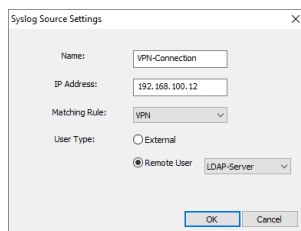

The FSSO Collector Agent Advanced Settings dialog box shows the Syslog Source List tab with the following configuration:

- Enable this feature: ☒
- Syslog Listening Port: 514
- Syslog Source(s) table:

Name	IP Address	Matching Rule	User Type
VPN-Connection	192.168.100.12	VPN	External
- Buttons: Add..., Edit... (highlighted), Remove, Manage Rule, Manage LDAP Server, OK, Cancel

8. Set *User Type* to *Remote User*, and select the LDAP server from the drop-down list.

The Syslog Source Settings dialog box for the VPN-Connection source shows the following configuration:

- Name: VPN-Connection
- IP Address: 192.168.100.12
- Matching Rule: VPN
- User Type: ☒ Remote User (External is unselected)
- LDAP Server: LDAP-Server (selected from dropdown)
- Buttons: OK, Cancel

9. Click *OK*.

Configuring the FSSO timeout when the collector agent connection fails

The `login-timeout` option is used to manage how long authenticated FSSO users on the FortiGate will remain on the list of authenticated FSSO users when a network connection to the collector agent is lost.

```
config user fsso
  edit <name>
    set server <string>
```

```

    set password <string>
    set logon-timeout <integer>
next
end

```

logon-timeout <integer> Enter the interval to keep logons after the FSSO server is down, in minutes (1 - 2880, default = 5).

Example

In this example, the logon timeout is set for four minutes.

To configure the FSSO logon timeout:

1. Set the timeout value:

```

config user fsso
  edit "ad"
    set server "10.1.100.141"
    set password *****
    set logon-timeout 4
  next
end

```

2. Log on to a PC with a valid FSSO user account.
3. Enable real-time debugging and check for authd polling collector agent information. During this time, the connection to the collector agent is lost:

```

# diagnose debug enable
# diagnose debug application authd -1
# diagnose debug application fssod -1
2021-06-10 16:20:41 authd_timer_run: 2 expired
2021-06-10 16:20:41 authd_epoll_work: timeout 39970
2021-06-10 16:20:46 fsae_io_ctx_process_msg[ad]: received heartbeat 100031
2021-06-10 16:20:46 authd_epoll_work: timeout 1690
2021-06-10 16:20:47 authd_timer_run: 1 expired
2021-06-10 16:20:47 authd_epoll_work: timeout 39990
2021-06-10 16:20:56 fsae_io_ctx_process_msg[ad]: received heartbeat 100032

```

```

2021-06-10 16:20:56 authd_epoll_work: timeout 31550
2021-06-10 16:21:00 _event_error[ad]: error occurred in epoll_in: Success
2021-06-10 16:21:00 disconnect_server_only[ad]: disconnecting
2021-06-10 16:21:00 authd_timer_run: 1 expired
2021-06-10 16:21:00 authd_epoll_work: timeout 9620

```

4. After about three minutes, check that the FSSO user is still in the list of authenticated users and can connect to the internet:

```

# diagnose firewall auth 1
10.1.100.188, TEST1
    type: fssso, id: 0, duration: 229, idled: 229
    server: ad
    packets: in 0 out 0, bytes: in 0 out 0
    user_id: 16777219
    group_id: 3 33554433
    group_name: ad CN=GROUP1,OU=TESTING,DC=FORTINET-FSSO,DC=COM

----- 1 listed, 0 filtered -----

```

5. After four minutes, check the debugs again. Note that the FSSO users are cleared:

```

...
2021-06-10 16:24:57 authd_timer_run: 3 expired
2021-06-10 16:24:57 authd_epoll_work: timeout 60000
2021-06-10 16:24:59 [fsae_db_logoff:248]: vfid 0, ip 10.1.100.188, id(0), port_range_sz(0)
2021-06-10 16:24:59 [authd_fp_notify_logoff:444]: vfid 0, ip 10.1.100.188, id 0
2021-06-10 16:24:59 [authd_fp_on_user_logoff:412]: vfid 0, ip 10.1.100.188
2021-06-10 16:24:59 [authd_fp_on_user_logoff:412]: vfid 0, ip 10.1.100.188
2021-06-10 16:24:59 [authd_fp_on_user_logoff:412]: vfid 0, ip 10.1.100.188
2021-06-10 16:24:59 [authd_fpc_on_msg:545]: code 0, type 132, len 28 seq 0
2021-06-10 16:24:59 [authd_fp_on_user_logoff:412]: vfid 0, ip 10.1.100.188
2021-06-10 16:24:59 authd_epoll_work: timeout 21990

# diagnose firewall auth 1

----- 0 listed, 0 filtered -----

```

After the connection to the collector agent is restored, all users remain in the list of authenticated users and are synchronized to the FortiGate. The users do not need to log in again for authentication.

Authentication policy extensions

By default, unauthenticated traffic is permitted to fall to the next policy. This means that unauthenticated users are only forced to authenticate against a policy when there are no other matching policies. To avoid this, you can force authentication to always take place.

To set that authentication requirement:

```

config user setting
    set auth-on-demand {always | implicitly}
end

```

Where:

<code>always</code>	Always trigger firewall authentication on demand.
<code>implicitly</code> (default)	Implicitly trigger firewall authentication on demand. This is the default setting (and the behavior in FortiOS 6.0 and earlier).

In the following example, authentication is required; traffic that would otherwise be allowed by the second policy is instead blocked by the first policy.

To use forced authentication:

```
config user setting
    set auth-on-demand always
end

config firewall policy
    edit 1
        set name "QA to Database"
        set srcintf "port10"
        set dstintf "port9"
        set srcaddr "QA_subnet"
        set dstaddr "Database"
        set action accept
        set schedule "always"
        set service "ALL"
        set fsso disable
        set groups "qa_group"
        set nat enable
    next
    edit 2
        set name "QA to Internet"
        set srcintf "port10"
        set dstintf "port9"
        set srcaddr "QA_subnet"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set fsso disable
        set nat enable
    next
end
```

Configuring the FortiGate to act as an 802.1X supplicant

The FortiGate can be configured to act as a 802.1X supplicant. The settings can be enabled on the network interface in the CLI. The EAP authentication method can be either PEAP or TLS using a user certificate.

```
config system interface
    edit <interface>
        set eap-supplicant {enable | disable}
        set eap-method {peap | tls}
        set eap-identity <identity>
        set eap-password <password>
    end
```

```

        set eap-ca-cert <CA_cert>
        set eap-user-cert <user_cert>
    next
end

```

Example

In this example, the FortiGate connects to an L3 switch that is not physically secured. All devices that connect to the internet must be authenticated with 802.1X by either a username and password (PEAP), or a user certificate (TLS). Configuration examples for both EAP authentication methods on port33 are shown.

To configure EAP authentication with PEAP:

1. Configure the interface:

```

config system interface
    edit "port33"
        set vdom "vdom1"
        set ip 7.7.7.2 255.255.255.0
        set allowaccess ping https ssh snmp http telnet fgfm radius-acct probe-response
    fabric
        set stpforward enable
        set type physical
        set snmp-index 42
        set eap-supPLICant enable
        set eap-method peap
        set eap-identity "test1"
        set eap-password *****
    next
end

```

2. Verify the interface's PEAP authentication details:

```

# diagnose test app eap_supp 2
Interface: port33
status:Authorized
method: PEAP
identity: test1
ca_cert:

```

```
client_cert:
private_key:
last_eapol_src =70:4c:a5:3b:0b:c6
```

Traffic is able to pass because the status is authorized.

To configure EAP authentication with TLS:

1. Configure the interface:

```
config system interface
    edit "port33"
        set vdom "vdom1"
        set ip 7.7.7.2 255.255.255.0
        set allowaccess ping https ssh snmp http telnet fgfm radius-acct probe-response
    fabric
        set stpforward enable
        set type physical
        set snmp-index 42
        set eap-supPLICant enable
        set eap-method tls
        set eap-identity "test2@fortiqa.net"
        set eap-ca-cert "root_G_CA_Cert_1.cer"
        set eap-user-cert "root_eap_client_global.cer"
    next
end
```

2. Verify the interface's TLS authentication details:

```
# diagnose test application eap_supp 2
Interface: port33
status:Authorized
method: TLS
identity: test2@fortiqa.net
ca_cert: /etc/cert/ca/root_G_CA_Cert_1.cer
client_cert: /etc/cert/local/root_eap_client_global.cer
private_key: /etc/cert/local/root_eap_client_global.key
last_eapol_src =70:4c:a5:3b:0b:c6
```

Traffic is able to pass because the status is authorized.

Include usernames in logs

Usernames can be included in logs, instead of just IP addresses. The benefits of doing this include:

- FortiOS monitors and FortiAnalyzer reports display usernames instead of IP addresses, allowing you to quickly determine who the information pertains to. Without the usernames, it is difficult to correlate the IP addresses with specific users.
- User activity can be correlated across multiple IP addresses.
For example, if DHCP is used a user might receive different IP addresses every day, making it difficult to track a specific user by specifying an IP address as the match criterion.

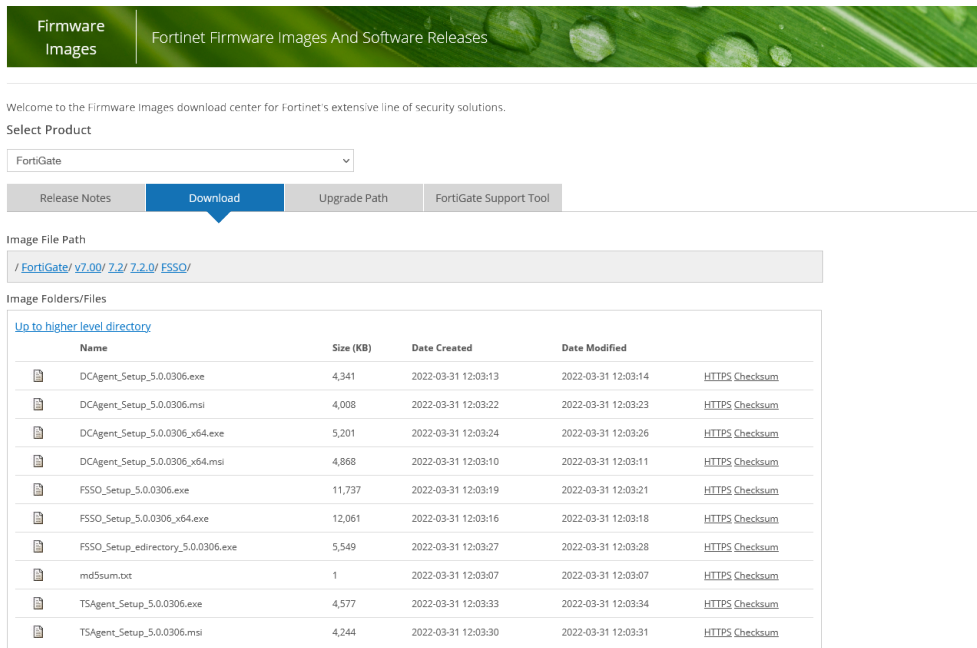

In this example, a collector agent (CA) is installed on a Windows machine to poll a domain controller (DC) agent (see [FSSO on page 2366](#) for more information). On the FortiGate, an external connector to the CA is configured to

receives user groups from the DC agent. The received group or groups are used in a policy, and some examples of the usernames in logs, monitors, and reports are shown.

Install and configure FSSO Agent

To download the FSSO agent:

1. Sign in to your [FortiCloud account](#).
2. Go to *Support > Firmware Download* and select the *Download* tab.
3. Browse to the appropriate directory for the version of the FSSO agent that you need to download.

Welcome to the Firmware Images download center for Fortinet's extensive line of security solutions.

4. Click *HTTPS* to download the appropriate *FSSO_Setup* file.

To install the FSSO agent:

1. Run the *FSSO_Setup* file with administrator privileges.
2. Click *Next*, accept the terms of the license agreement, and click *Next* again.
3. Select the installation directory, or use the default location, then click *Next*.
4. Enter the User Name and Password, then click *Next*.

Fortinet Single Sign On Agent

The user account on which you want to launch the service. Please input the user account's name and password. This must be an administrator user.

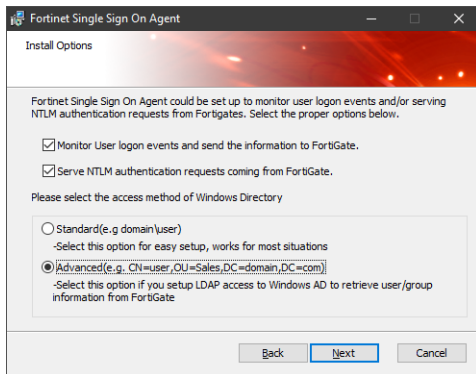

User name must be in form DomainName\UserName. If you want to use local user account, please enter .\UserName.

User Name: .\administrator

Password: [masked]

Back Next Cancel

- On the *Install Options*, select *Advanced*, then click *Next*.

Fortinet Single Sign On Agent

Install Options

Fortinet Single Sign On Agent could be set up to monitor user logon events and/or serving NTLM authentication requests from FortiGate. Select the proper options below.

☒ Monitor User logon events and send the information to FortiGate.

☒ Serve NTLM authentication requests coming from FortiGate.

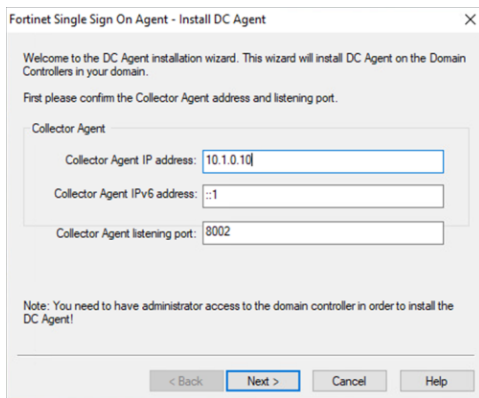

Please select the access method of Windows Directory

☐ Standard(e.g domain\user)
-Select this option for easy setup, works for most situations

☒ Advanced(e.g. CN=user,OU=Sales,DC=domain,DC=com)
-Select this option if you setup LDAP access to Windows AD to retrieve user/group information from FortiGate

Back Next Cancel

- Click *Install*.
- After the FSSO Agent installs, run *Install DC Agent*.
- Update the Collector Agent IP address and listening port as needed, then click *Next*.

Fortinet Single Sign On Agent - Install DC Agent

Welcome to the DC Agent installation wizard. This wizard will install DC Agent on the Domain Controllers in your domain.

First please confirm the Collector Agent address and listening port.

Collector Agent

Collector Agent IP address: 10.1.0.10

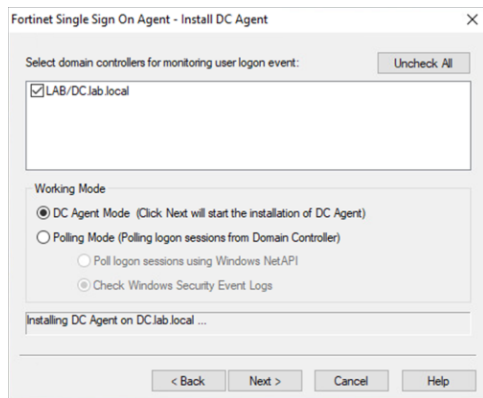

Collector Agent IPv6 address: ::1

Collector Agent listening port: 8002

Note: You need to have administrator access to the domain controller in order to install the DC Agent!

< Back Next > Cancel Help

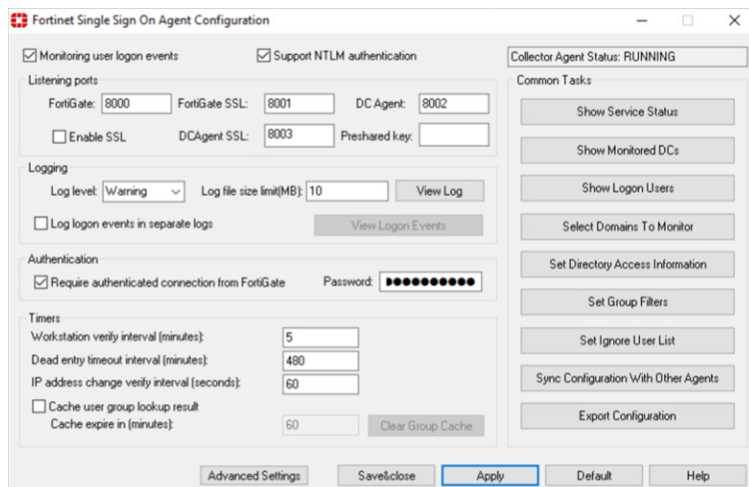

- Select the domain, in this example *LAB:lab.local*, then click *Next*.
- Set the *Working Mode* to *DC Agent Mode*, then click *Next* to install the agent.

11. After the DC agent mode installation finishes, Reboot the DC to complete the setup.

To configure the FSSO agent:

1. Open the FSSO agent.
2. Enable *Require authentication from FortiGate* and enter a password for FortiGate authentication.

3. Click *Set Group Filters*, and create a default group filter to limit the groups that are sent to the FortiGate.
4. Click *Save&close*.

Configure the FortiGate

Create an external connector to the FSSO agent to receive the AD user groups. Add the user group or groups as the source in a firewall policy to include usernames in traffic logs. Enable security profiles, such as web filter or antivirus, in the policy to include the usernames in UTM logs.

Event logs include usernames when the log is created for a user action or interaction, such as logging in or an SSL VPN connection.

To create an external connector:

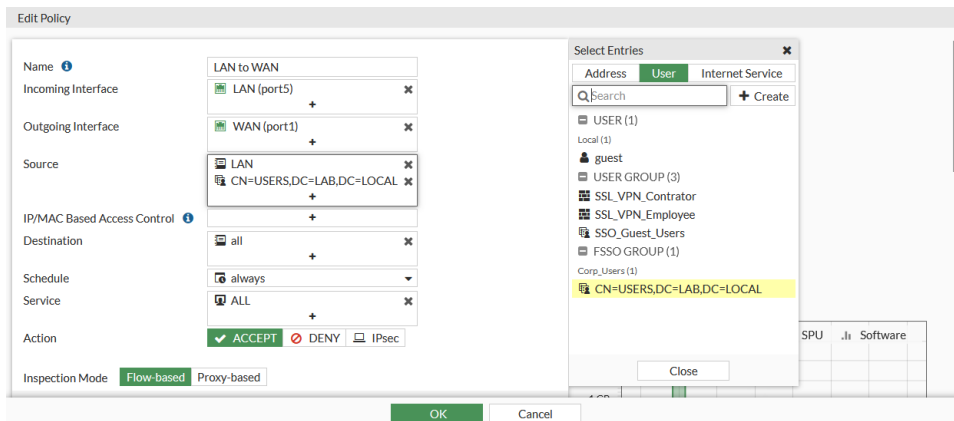

1. On the FortiGate, go to *Security Fabric > External Connectors*.
2. Click *Create New* and select *FSSO Agent on Windows AD*.
3. Set the *Primary FSSO agent* to the previously configured *Collector Agent IP address* and authentication password.

4. Click *OK*

The connector shows a green arrow when the connection is established, and a number in the top right indicating the number of AD groups received from the DC agent. Edit the connector to view the user groups.

**To configure a policy with an imported user group and web filter in the GUI:**

1. Go to *Policy & Objects > Firewall Policy*.
2. Edit an existing policy, or create a new one. See [Firewall policy on page 1177](#) for information.
3. Add the FSSO groups or groups as sources:
 - a. Click in the *Source* field.
 - b. Select the *User* tab.
 - c. Select the group or groups.

d. Click *Close*.

4. Under *Security Profiles*, enable *Web Filter* and select a profile that monitors or blocks traffic, such as the *monitor-all* profile. See [Web filter on page 1476](#) for information.
5. Click *OK*.

To configure a policy with an imported user group and web filter in the CLI:

```
config firewall policy
  edit 0
    set name "LAN to WAN"
    set srcintf "port5"
    set dstintf "port1"
    set action accept
    set srcaddr "LAN"
    set dstaddr "all"
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set ssl-ssh-profile "certificate-inspection"
    set webfilter-profile "monitor-all"
    set logtraffic all
    set nat enable
    set fsso-groups "CN=USERS,DC=LAB,DC=LOCAL"
  next
end
```

Log, monitor, and report examples

For more information about logs, see the [FortiOS Log Message Reference](#).

FortiOS monitors:

The *FortiView Web Sites by Bytes* monitor shows a list of visited websites. Double click a specific domain (or manually create a filter), such as *microsoft.com*, to see a breakdown of the usernames and IP addresses that visited that domain. See [Monitors on page 133](#) for more information.

FortiAnalyzer reports:

The *User Detailed Browsing Log* report requires a username or IP address to run. If a username is used, the report includes logs related to that user regardless of their IP address. For example, the following report shows two source IP addresses:

FORTINET

User: USER2

Source IP: 10.1.0.11, 10.1.0.222

Hostname (MAC): 00:0c:29:5e:f5:25, LAB, PC1

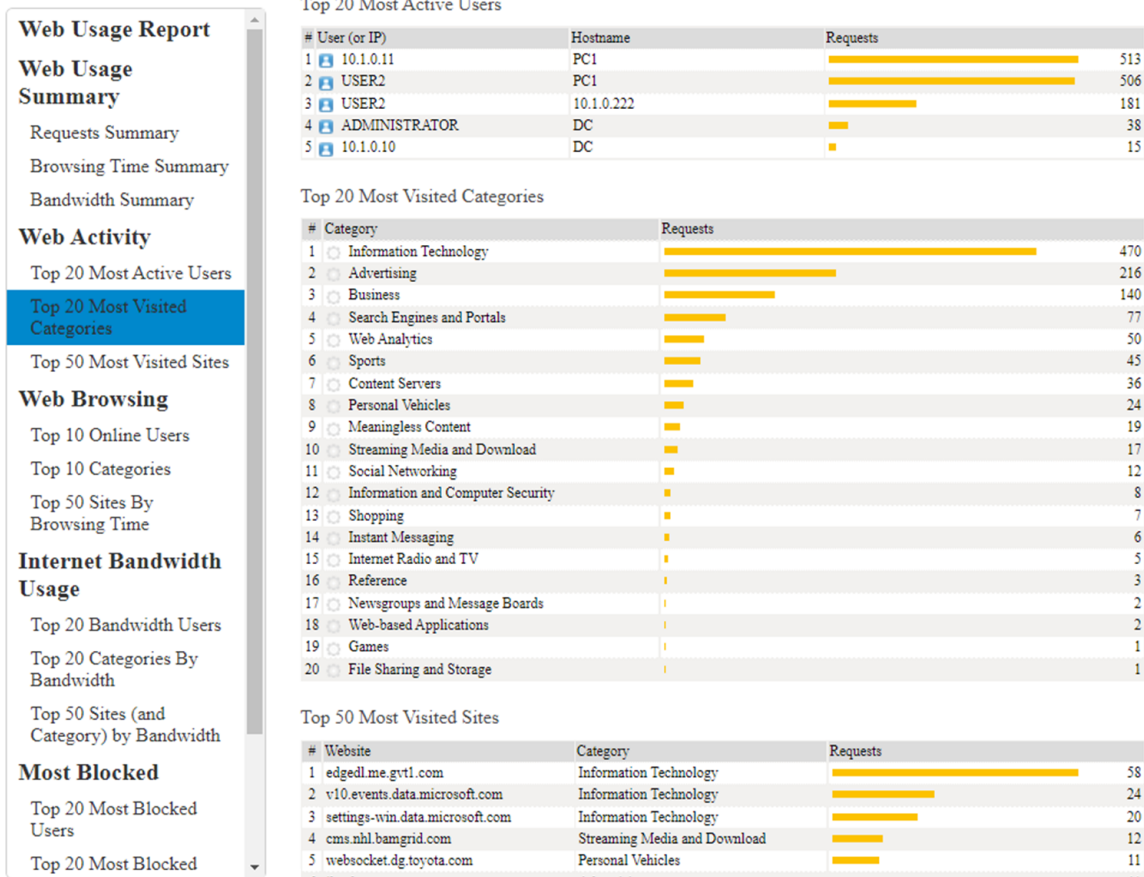

Source Interface: port5

Devices: FGVM01TM22000459

The *Web Usage* report includes all usernames and IP addresses that match the specified conditions, like most visited categories.

See [Reports](#) in the [FortiAnalyzer Administration guide](#) for more information.

Wireless configuration

See the [FortiWiFi and FortiAP Configuration Guide](#).

Switch Controller

Use the Switch Controller function, also known as FortiLink, to remotely manage FortiSwitch units. In the commonly-used layer 2 scenario, the FortiGate that is acting as a switch controller is connected to distribution FortiSwitch units. The distribution FortiSwitch units are in the top tier of stacks of FortiSwitch units and connected downwards with Convergent or Access layer FortiSwitch units. To leverage CAPWAP and the Fortinet proprietary FortiLink protocol, set up data and control planes between the FortiGate and FortiSwitch units.

FortiLink allows administrators to create and manage different VLANs, and apply the full-fledged security functions of FortiOS to them, such as 802.1X authentication and firewall policies. Most of the security control capabilities on the FortiGate are extended to the edge of the entire network, combining FortiGate, FortiSwitch, and FortiAP devices, and providing secure, seamless, and unified access control to users.

See [FortiSwitch devices managed by FortiOS](#).

System

This topic contains information about FortiGate administration and system configuration that you can do after installing the FortiGate in your network.

Basic system settings

Administrators

By default, FortiGate has an administrator account with the username *admin* and no password. See [Administrators on page 2393](#) for more information.

Administrator profiles

An administrator profile defines what the administrator can see and do on the FortiGate. See [Administrator profiles on page 2416](#) for more information.

Password policy

Set up a password policy to enforce password criteria and change frequency. See [Password policy on page 2407](#) for more information.

Interfaces

Physical and virtual interface allow traffic to flow between internal networks, and between the internet and internal networks. See [Interfaces on page 161](#) for more information.

Advanced system settings

SNMP

The simple network management protocol (SNMP) allows you to monitor hardware on your network. See [SNMP on page 2661](#) for more information.

DHCP server

You can configure one or more DHCP servers on any FortiGate interface. See [DHCP servers and relays on page 384](#) for more information.

VDOM

You can use virtual domains (VDOMs) to divide a FortiGate into multiple virtual devices that function independently. See [Virtual Domains on page 2475](#) for more information.

High availability

You can configure multiple FortiGate devices, including private and public cloud VMs, in HA mode. See [High Availability on page 2514](#) for more information.

Certificates

You can manage certificates on the FortiGate. See [Certificates on page 2702](#) for more information.

Operating modes

A FortiGate or VDOM (in multi-vdom mode) can operate in either NAT/route mode or transparent mode.

NAT/route mode

The FortiGate or VDOM is installed as a gateway or router between multiple networks, such as a private network and the internet. One function of NAT/route mode is to allow the FortiGate to hide the IP addresses on the private network using NAT. NAT/route mode can also be used to connect to multiple ISPs in an SD-WAN setup, and to route traffic between different networks. .

By default, new VDOMs are set to NAT/route operation mode.

Transparent mode

The FortiGate or VDOM operates in layer 2 to forward traffic between network devices such as routers, firewalls, and switches. For example, it can be installed inline between a router and a switch to perform security scanning without changing the network topology or modifying the IP addresses. When you add a FortiGate that is in transparent mode to a network, it only needs to be provided with a management IP address in order to access the device. It is recommended that a dedicated interface is used to connect to the management network in transparent mode.

The following topology is an example of a transparent mode FortiGate inserted inline between a router and a switch:

Using transparent mode VDOMs is recommended when multiple VLANs pass through the FortiGate. Otherwise, they must be separated into different forwarding domains within the same VDOM.

Changing modes

The following is a sample configuration for changing from NAT/route operation mode to transparent operation mode in the CLI:

```

config system settings
    set opmode transparent
    set manageip <IP_address>
    set gateway <gateway_address>
end
  
```

The gateway setting is optional. However, once the operation mode is changed from NAT/route to transparent, the gateway configuration is found under the static router settings:

```

config router static
    edit <seq-num>
        set gateway <IP_address>
    next
end
  
```

The following is a sample configuration for changing from transparent operation to NAT/route operation mode in the CLI:

```

config system settings
    set opmode nat
    set ip <IP_address>
    set device <interface>
    set gateway <gateway_address>
end
  
```

The IP and device settings are mandatory. Once the operation mode is changed from transparent to NAT/route, the IP address configuration is found under the corresponding interface settings:

```
config system interface
    edit <interface>
        set ip <IP_address>
    next
end
```

The gateway setting is optional. However, once the operation mode is changed, the gateway configuration is found under the static router settings:

```
config router static
    edit <seq-num>
        set gateway <IP_address>
        device <interface>
    next
end
```

Administrators

By default, FortiGate has an administrator account with the username *admin* and no password. To prevent unauthorized access to the FortiGate, this account must be protected with a password. Additional administrators can be added for various functions, each with a unique username, password, and set of access privileges.

The following topics provide information about administrators:

- [Local authentication on page 2393](#)
- [Remote authentication for administrators on page 2394](#)
- [Administrator account options on page 2397](#)
- [REST API administrator on page 2399](#)
- [SSO administrators on page 2401](#)
- [FortiCloud SSO on page 2401](#)
- [Allowing the FortiGate to override FortiCloud SSO administrator user permissions on page 2402](#)
- [Password policy on page 2407](#)
- [Public key SSH access on page 2409](#)
- [Restricting SSH and Telnet jump host capabilities on page 2410](#)
- [Remote administrators with TACACS VSA attributes on page 2411](#)

Local authentication

By default, FortiGate has one super admin named *admin*. You can create more administrator accounts with different privileges.

To create an administrator account in the GUI:

1. Go to *System > Administrators*.
2. Select *Create New > Administrator*.
3. Specify the *Username*.

- Usernames can include lower and upper case letters (a-z, A-Z), numbers (0-9), underscores (_), and dashes (-)
- Usernames cannot start with a dash (-)
- Usernames can end with dollar symbol (\$)
- Usernames must not use the following characters: < > () # " ' . Using these characters in an administrator username might have a cross site scripting (XSS) vulnerability.

4. Set *Type* to *Local User*.
5. Set the password and other fields.
6. Click *OK*.

To create an administrator account in the CLI:

```
config system admin
    edit <admin_name>
        set accprofile <profile_name>
        set vdom <vdom_name>
        set password <password for this admin>
    next
end
```

Remote authentication for administrators

Administrators can use remote authentication, such as LDAP, RADIUS, and TACACS+ to connect to the FortiGate.

Configuring remote authentication with an LDAP server is shown. For more information about configuring LDAP, see [Configuring an LDAP server on page 2242](#).

For information about configuring RADIUS or TACACS+ servers, see [Configuring a RADIUS server on page 2259](#) and [TACACS+ servers on page 2295](#). To use a RADIUS or TACACS+ server for remote authentication, configure the server, and then add it to the user group instead of the LDAP server.

Local logins can also be restricted when remote authentication servers are available, see [Restricting logins from local administrator accounts when remote servers are available on page 2397](#).

Configuring remote authentication for administrators using LDAP includes the following steps:

1. [Configuring the LDAP server on page 2395](#)
2. [Adding the LDAP server to a user group on page 2395](#)
3. [Configuring the administrator account on page 2395](#)

Configuring the LDAP server

To configure the LDAP server in the GUI:

1. Go to *User & Authentication > LDAP Servers* and click *Create New*.
2. Enter the server *Name* and *Server IP/Name*.
3. Enter the *Common Name Identifier* and *Distinguished Name*.
4. Set the *Bind Type* to *Regular* and enter the *Username* and *Password*.
5. Click *OK*.

To configure the LDAP server in the CLI:

```
config user ldap
  edit <name>
    set server <server_ip>
    set cnid "cn"
    set dn "dc=XYZ,dc=fortinet,dc=COM"
    set type regular
    set username "cn=Administrator,dc=XYA, dc=COM"
    set password <password>
  next
end
```

Adding the LDAP server to a user group

After configuring the LDAP server, create a user group that includes that LDAP server.

To create a user group in the GUI:

1. Go to *User & Authentication > User Groups* and click *Create New*.
2. Enter a *Name* for the group.
3. In the *Remote groups* section, select *Create New*.
4. Select the *Remote Server* from the dropdown list.
5. Click *OK*.

To create a user group in the CLI:

```
config user group
  edit <name>
    set member <ldap_server_name>
  next
end
```

Configuring the administrator account

After configuring the LDAP server and adding it to a user group, create a new administrator. For this administrator, instead of entering a password, use the new user group for authentication.

A remote authentication server can allow authentication of either a single user or any user from a specified group.

Public key infrastructure (PKI) administrator authentication requires a PKI user instead of a remote server. For information about creating a PKI user, see [Configuring a PKI user on page 2352](#).

To create an administrator to match a single user in the GUI:

1. Go to *System > Administrators* and click *Create New > Administrator*.
2. Specify the *Username*.
This username is used when the administrator logs in, and is what FortiOS sends to the remote authentication server for authorization.
3. Set *Type* to *Match a user on a remote server group*.
4. In *Remote User Group*, select the user group that you created.
5. Select an *Administrator Profile*.
6. Enter a *Backup Password*, to be used if the remote authentication server is unreachable.
7. Click *OK*.

To create an administrator match a single user in the CLI:

```
config system admin
  edit <name>
    set remote-auth enable
    set accprofile super_admin
    set remote-group <ldap_group_name>
    set password *****
  next
end
```

To create an administrator to match all users in a remote server group in the GUI:

1. Go to *System > Administrators* and click *Create New > Administrator*.
2. Specify the *Username*.
This username is only used to identify this administrator group. Administrators can log in with any username in the remote user group.
3. Set *Type* to *Match all users in a remote server group*.
4. In *Remote User Group*, select the user group that you created.
5. Select an *Administrator Profile*.
6. Click *OK*.

To create an administrator to match all users in a remote server group in the CLI:

```
config system admin
  edit <name>
    set remote-auth enable
    set accprofile super_admin
    set wildcard enable
    set remote-group <ldap_group_name>
  next
end
```

To create an administrator that uses a PKI group in the GUI:

1. Go to *System > Administrators* and click *Create New > Administrator*.
2. Specify the *Username*.
3. Set *Type* to *Use public key infrastructure (PKI) group*.
4. In *Remote User Group*, select the user group that you created.
5. Select an *Administrator Profile*.
6. Click *OK*.

To create an administrator that uses a PKI group in the CLI:

```
config system admin
  edit <name>
    set remote-auth enable
    set accprofile super_admin
    set peer-group <pki_group_name>
  next
end
```

Restricting logins from local administrator accounts when remote servers are available

Logins from local administrator accounts can be restricted when remote servers are available. When enabled, FortiOS will check if all of the remote servers used by administrators are down before allowing a local administrator to log in. This option is applied globally, and is disabled by default.

To restrict local administrator authentication when a remote authentication server available:

```
config system global
  set admin-restrict-local enable
end
```

Administrator account options

Options to further define the access and abilities of an administrator account include:

- [Multi-factor authentication on page 2397](#)
- [Restricting logins to trusted hosts on page 2399](#)
- [Restricting administrators to guest account provisioning on page 2399](#)
- [Global and VDOM administrators on page 2399](#)

Multi-factor authentication

Multi-factor authentication (MFA) requires authenticating administrators to supply more than one factor to identify themselves in addition to their password, such as a FortiToken.

Before enabling MFA, it is recommended that you create second administrator account that is configured to guarantee administrator access to the FortiGate if you are unable to authenticate on the main account for any reason.

Multi-factor authentication options include:

- [FortiToken](#)
- [FortiToken Cloud](#)
- [Email](#)
- [SMS](#)

FortiToken

To associate a FortiToken to an administrator account using the GUI:

1. Ensure that you have successfully added your FortiToken serial number to FortiOS and that its status is *Available*.
2. Go to *System > Administrators*. Edit the admin account. This example assumes that the account is fully configured except for MFA.
3. Enable *Two-factor Authentication* and for *Authentication Type*, select *FortiToken*.
4. From the *Token* dropdown list, select the FortiToken serial number.
5. In the *Email Address* field, enter the administrator's email address.
6. Click *OK*.

For a mobile token, click *Send Activation Code* to send the activation code to the configured email address. The admin uses this code to activate their mobile token. You must have configured an email service in *System > Settings* to send the activation code.

To associate a FortiToken to an administrator account using the CLI:

```
config system admin
  edit <username>
    set password "myPassword"
    set two-factor fortitoken
    set fortitoken <serial_number>
    set email-to "username@example.com"
  next
end
```

The `fortitoken` keyword is not visible until you select `fortitoken` for the `two-factor` option.

Before you can use a new FortiToken, you may need to synchronize it due to clock drift.

FortiToken Cloud

FortiToken Cloud is an Identity and Access Management as a Service (IDaaS) cloud service provided by Fortinet. It enables FortiGate and FortiAuthenticator customers to add MFA for their users using Mobile or Hard tokens.

For more information, see [Getting started—FGT-FTC users](#) in the [FortiToken Cloud Administration Guide](#).

Email

Enter an email address to send an MFA code to that address.

SMS

Enable *SMS* then select the *Country Dial Code* and enter the *Phone Number* (`sms-phone` in the CLI) to send an MFA code to.

SMS messages can also be sent to the FortiGuard SMS server or a custom server.

```
config system admin
    edit "admin"
        ...
        set sms-server {fortiguard | custom}
        set sms-server-custom <string>
        ...
    next
end
```

Restricting logins to trusted hosts

Administrator accounts can be configured to only be accessible to a user using a trusted host. You can set a specific IP address for the trusted host, or use a subnet. Up to ten trusted hosts can be specified for an administrator.

When trusted hosts are defined for all of the administrators on the FortiGate, the administrative access on each interface will be restricted to the trusted hosts that are defined for the administrator, except for ping. If ping is enabled on an interface, it works regardless of the trusted hosts.

Restricting administrators to guest account provisioning

To simplify guest account creation, an administrator account can be created exclusively for guest user management. This allows new accounts to be created without requiring full administrative access to FortiOS.

When enabling this option, a guest group must be specified for the administrator to provision new accounts to. See [Configuring guest user groups on page 2236](#) for information about creating such a group.

Global and VDOM administrators

When a FortiGate is in multi VDOM mode, it can be managed by either global or per-VDOM administrators. Each type of administrator will have a different view of the GUI that corresponds to their role. For more information, see [Administrator roles and views on page 2477](#).

For information about configuring per-VDOM administrators, see [Create per-VDOM administrators on page 2483](#).

REST API administrator

REST API administrator accounts are used for automated configuration, backup creation, and monitoring of the FortiGate.

For more information about the REST API, see the [Fortinet Development Network \(FNDN\)](#). Note that an account is required to access the FNDN.

Only an administrator with the *super_admin* profile can create a REST API administrator by using the GUI or CLI.

To create a REST API administrator in the GUI:

1. Go to *System > Administrators*.
2. Select *Create New > REST API Admin*.
3. Configure the administrator:

<i>Username</i>	The username of the administrator. Do not use the characters < > () # " ' in the administrator username. Using these characters in an administrator username might have a cross site scripting (XSS) vulnerability.
<i>Administrator Profile</i>	Where permissions for the REST API administrator are defined. A REST API administrator should have the minimum permissions required to complete the request.
<i>PKI Group</i>	Certificate matching is supported as an extra layer of security. Both the client certificate and token must match to be granted access to the API.
<i>CORS Allow Origin</i>	Cross Origin Resource Sharing (CORS) allows third-party web apps to make API requests to the FortiGate using the token.
<i>Trusted Hosts</i>	The following can be used to restrict access to FortiGate API: <ul style="list-style-type: none"> • Multiple trusted hosts/subnets can be configured • IPv6 hosts are supported • Allow all (0.0.0.0/0) is not allowed You need your <i>Source Address</i> to create the trusted host.

4. Click **OK**.
An API token is generated. Make note of the token, as it is only shown once.

To create a REST API administrator in the CLI:

1. Create the REST API administrator:

```
config system api-user
  edit "api-admin"
    set comments <string>
    set api-key *****
    set accprofile "API profile"
    set vdom "root"
    config trusthost
      edit 1
        set ipv4-trusthost <class_ip&net_netmask>
      next
    ...
  end
```

```

    next
end

```

2. Generate the API token:

```
# execute api-user generate-key <API username>
```

Make note of the token, as it is only shown once.

By default, The SSO administrator account can only be assigned the *admin_no_access* or *super_admin_readonly* profile. You can define a new administrator profile with the required permissions for the account. For example, you could use a specific API user to query the FortiGate for just their own status. In that case, the profile would be configured as read-only.

SSO administrators

SSO administrators are automatically created when the FortiGate acts as a SAML service provider (SP) with *SAML Single Sign-On* enabled in the Security Fabric settings.

On the system login page, an administrator can log in with their username and password against the root FortiGate acting as the identity provider (IdP) in the Security Fabric. After the first successful log in, this user is added to the administrators table (*System > Administrators* under *Single Sign-On Administrator*). The default profile selected is based on the SP settings (*Default admin profile*). See [Configuring a downstream FortiGate as an SP on page 2891](#) for more information.

SSO administrators can be manually configured in FortiOS.

To manually configure an SSO administrator in the GUI:

1. Go to *System > Administrators* and click *Create New > SSO Admin*.
2. Enter the username.
3. Select an administrator profile.
4. Click *OK*.

To manually configure an SSO administrator in the CLI:

```

config system sso-admin
    edit <name>
        set accprofile <profile>
        set vdom <vdom>
    next
end

```

FortiCloud SSO

By default, the FortiGate is configured to allow administrators to log in using FortiCloud single sign-on. Both IAM and non-IAM users on the FortiCloud support portal are supported. Non-IAM users must be the FortiCloud account that the FortiGate is registered to.

To configure an IAM user in FortiCloud:

1. Log in to your FortiCloud account at support.fortinet.com.
2. Select *Services > IAM*.
3. See the [FortiCloud Identity & Access Management \(IAM\)](#) guide for more information.

To manually enable FortiCloud single sign-on in the GUI:

1. Log in to the FortiGate and go to *System > Settings*.
2. In the *Administration Settings* section, enable *Allow administrative login using FortiCloud SSO*.
3. Click *Apply*.

To manually enable FortiCloud single sign-on in the CLI:

```
config system global
    set admin-forticloud-ss0-login {enable | disable}
end
```

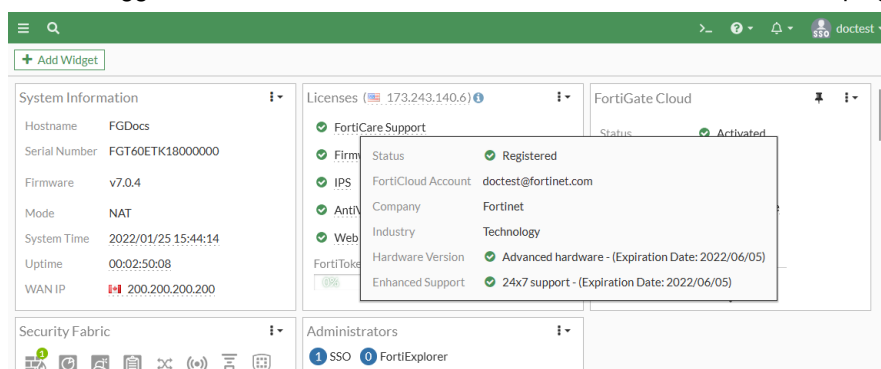

To log in to the FortiGate with the FortiCloud user:

1. Go to the FortiGate log in screen.

2. Click *Sign in with FortiCloud*. The FortiCloud log in page opens.
3. Enter the FortiCloud account credentials and click *Login*.

You are logged in to the FortiOS GUI. The SSO username is shown in the top right corner of the GUI.

Allowing the FortiGate to override FortiCloud SSO administrator user permissions

The FortiGate can allow single sign-on (SSO) from FortiCloud and FortiCloud IAM users with administrator profiles inherited from FortiCloud or overridden locally by the FortiGate. Similarly, users accessing the FortiGate remotely from FortiGate Cloud can have their permissions inherited or overridden by the FortiGate.

To enable FortiCloud SSO in the GUI:

1. Go to *System > Settings*.
2. In the *Single Sign-On* section, enable *FortiCloud SSO*.
3. Set the default *Administrator profile* to assign: *Inherit from FortiCloud*, or *Specify* and select a profile from the dropdown.

4. Click *Apply*.

To enable FortiCloud SSO in the CLI:

```
config system global
    set admin-forticloud-sso-login enable
    set admin-forticloud-sso-default-profile <profile>
end
```

The following administrator profiles are assigned based on the inherited or overwritten permissions:

User type	Inherited from FortiCloud/FortiGate Cloud	Specify
FortiCloud	Uses the super_admin profile.	Local user profile
FortiCloud IAM	Is based on the IAM permission profile's FortiOS SSO portal settings: <ul style="list-style-type: none"> • If <i>Access</i> is disabled = no access • If <i>Access</i> is enabled and the <i>Access Type</i> is set to <i>SuperAdmin</i> = super_admin profile • If <i>Access</i> is enabled and the <i>Access Type</i> is set to <i>Read Only</i>= super_admin_readonly profile 	Local user profile
FortiGate Cloud subscription tier	Uses the super_admin profile.	Local user profile
FortiGate Cloud free tier	Has read-only access.	Cannot override

This topic includes four use case examples:

- [Example 1: specifying permissions for a FortiCloud SSO user](#)
- [Example 2: inheriting FortiCloud permissions for a FortiCloud SSO user](#)
- [Example 3: specifying a local user profile for a FortiCloud IAM user](#)
- [Example 4: accessing a FortiGate remotely from FortiGate Cloud](#)

Example 1: specifying permissions for a FortiCloud SSO user

In this example, a FortiCloud SSO user is configured to override permissions and use the `prof_admin` profile, which is a local read-only profile.

To configure the FortiCloud SSO user:

1. Go to *System > Settings*.
2. In the *Single Sign-On* section, enable *FortiCloud SSO*.
3. Set *Administrator profile* to *Specify*, and select *prof_admin*. The FortiCloud SSO user will be created upon the first login.
4. Get the user to log in to the FortiGate:
 - a. On the FortiOS login screen, click *Sign in with FortiCloud*. The FortiCloud log in page opens.
 - b. Click *Email Login*.
 - c. Enter the FortiCloud account credentials and click *Log In*.

The new SSO user is created.

Since the profile has read-only access, the SSO user can only view items (such as interfaces) and cannot edit them.

Name	Type	Members	IP/Netmask	Transceiver(s)	Administrative Access	DHCP Clients	DHCP Ranges
802.3ad Aggregate							
fortilink	802.3ad Aggregate		Dedicated to FortiSwitch		PING Security Fabric Connection		10.255.1.2-10.255.1.254
Physical Interface							
ha	Physical Interface		0.0.0.0/0.0.0.0				
mgmt	Physical Interface		10.6.30.2/255.255.255.0		PING HTTPS SSH FMG-Access		192.168.1.110-192.168.1.2

port3	Physical Interface		0.0.0.0/0.0.0.0				
port4	Physical Interface		0.0.0.0/0.0.0.0				

Example 2: inheriting FortiCloud permissions for a FortiCloud SSO user

In this example, a local administrator changes the permissions of an existing FortiCloud SSO user (created in the previous example) to *Inherit from FortiCloud*, which means the `super_admin` profile will be used.

To configure the existing SSO user:

1. Go to *System > Administrators* and edit the user in the *FortiCloud SSO Administrator* section (*****@gmail.com).
2. Set *Administrator profile* to *Inherit from FortiCloud*.

Username: j.x.ftnt@gmail.com-1038287

Administrator profile: **Inherit from FortiCloud** Specify

How to configure WSSO for WPA2-Enterprise Login with NPS?

1 Answers 0 Votes 184 Views

Why are my SWG SSO users seeing certificates signed by a Fortinet CA when Deep Inspection is disabled?

1 Answers 0 Votes 131 Views

See More

OK Cancel

3. Click **OK**.
4. Get the user to log in to the FortiGate. Since the profile changed to *super_admin*, they can modify items (such as interfaces).

Name	Type	Members	IP/Netmask	Transeiver(s)	Administrative Access	DHCP Clients	DHCP Ranges
802.3ad Aggregate							
fortilink	802.3ad Aggregate		Dedicated to FortiSwitch		PING Security Fabric Connection		10.255.1.2-10.255.1.254
Physical Interface							
ha	Physical Interface		0.0.0.0/0.0.0.0				
mgmt	Physical Interface		10.6.30.2/255.255.255.0		PING HTTPS SSH FMG-Access		192.168.1.110-192.168.1.2
port1	Physical Interface		0.0.0.0/0.0.0.0				
port2	Physical Interface		0.0.0.0/0.0.0.0				
port3	Physical Interface		0.0.0.0/0.0.0.0				
port4	Physical Interface		0.0.0.0/0.0.0.0				

Example 3: specifying a local user profile for a FortiCloud IAM user

In this example, a FortiCloud IAM user is configured to have read-only SSO access based on the settings in the FortiOS SSO portal. Once the FortiCloud IAM user logs in, an administrator with *super_admin* access changes the permission of the IAM user to have *super_admin* access.

This example assumes the *FortiOS* SSO portal has already been added to the IAM permission profile. See [Creating a permission profile](#) and [Managing permission profiles](#) in the Identity & Access Management (IAM) Guide for more information about configuring permission profiles in FortiCloud.

To configure the FortiCloud IAM user:

1. In FortiCloud, configure the permission profile:
 - a. Go to *Services > IAM*, then click *Permission Profiles*.
 - b. Select a profile and click *Edit*.
 - c. In the *FortiOS SSO* portal, enable *Access*. Set the *Access Type* to *Read Only*.

- d. Click *Update*.
2. Get the user to log in to the FortiGate:
 - a. On the FortiOS login screen, click *Sign in with FortiCloud*. The FortiCloud log in page opens.
 - b. Click *IAM Login*.
 - c. Enter the IAM account credentials and click *Log In*.

The new SSO user is created with a `super_admin_readonly` profile.

3. Update the IAM user permission to have `super_admin` access:
 - a. Log in to the FortiGate with a `super_admin` administrator account.
 - b. Go to *System > Administrators* and edit the IAM user (2022).
 - c. Set *Administrator profile* to *Specify* and select *super_admin*.
 - d. Click *OK*.
4. Get the user to log in to the FortiGate again. Since the profile changed to `super_admin`, they can modify items.

Example 4: accessing a FortiGate remotely from FortiGate Cloud

In this example, a FortiGate Cloud user with a paid subscription accesses the FortiGate remotely from FortiGate Cloud. When the user logs in with SSO, the profile has `super_admin` access. After the FortiGate Cloud user logs in, an administrator with `super_admin` access changes the permission of the FortiGate Cloud user to have `prof_admin` (read-only) access.

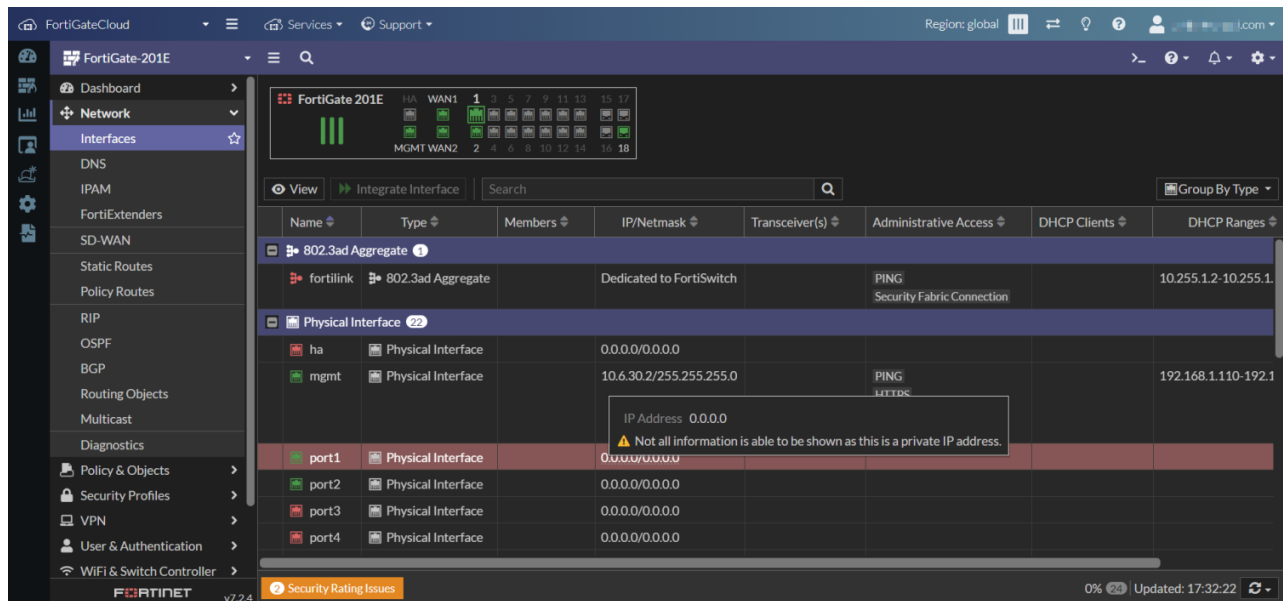

FortiGate Cloud must be accessed from a FortiGate Cloud 2.0 portal (also called FortiGate Cloud Premium) in order to have remote access using the FortiGate Cloud proxy. See [Getting started with FortiGate Cloud 2.0](#) for more details.

To access a FortiGate remotely from FortiGate Cloud:

1. Log in to the FortiGate Cloud 2.0 portal.
2. Go to *Inventory > Asset List*. Select the desired FortiGate, then click *Remote Access*.

FortiGate Cloud accesses the FortiGate using the FortiGate Cloud proxy and creates a super_admin user. The FortiOS interface is displayed in the current browser window.

3. Log out of FortiGate Cloud.
4. Update the FortiGate Cloud user permission to have prof_admin access:
 - a. Log in to the FortiGate with a super_admin administrator account.
 - b. Go to *System > Administrators* and edit the user in the *FortiGate Cloud SSO Administrator* section (*****@gmail.com).
 - c. Set *Administrator profile* to *Specify* and select *prof_admin*.
 - d. Click OK.
5. Log in to the FortiGate Cloud 2.0 portal and access the FortiGate remotely again. Since the profile changed to prof_admin, they can only view items (such as interfaces).

Password policy

Brute force password software can launch more than just dictionary attacks. It can discover common passwords where a letter is replaced by a number. For example, if `passw0rd` is used as a password, it can be cracked.

Using secure passwords is vital for preventing unauthorized access to your FortiGate. When changing the password, consider the following to ensure better security:

- Do not use passwords that are obvious, such as the company name, administrator names, or other obvious words or phrases.
- Use numbers in place of letters, for example: `passw0rd`.
- Administrator passwords can be up to 64 characters.
- Include a mixture of numbers, symbols, and upper and lower case letters.
- Use multiple words together, or possibly even a sentence, for example: `correcthorsebatterystaple`.
- Use a password generator.
- Change the password regularly and always make the new password unique and not a variation of the existing password. for example, do not change from `password` to `password1`.

- Make note of the password and store it in a safe place away from the management computer, in case you forget it; or ensure at least two people know the password in the event one person becomes unavailable. Alternatively, have two different admin logins.

FortiGate allows you to create a password policy for administrators and IPsec pre-shared keys. With this policy, you can enforce regular changes and specific criteria for a password policy, including:

- The minimum length, between 8 and 64 characters.
- If the password must contain uppercase (A, B, C) and/or lowercase (a, b, c) characters.
- If the password must contain numbers (1, 2, 3).
- If the password must contain special or non-alphanumeric characters: !, @, #, \$, %, ^, &, *, (, and)
- Where the password applies (admin or IPsec or both).
- The duration of the password before a new one must be specified.
- The minimum number of unique characters that a new password must include.

If you add a password policy or change the requirements on an existing policy, the next time that administrator logs into the FortiGate, the administrator is prompted to update the password to meet the new requirements before proceeding to log in.

For information about setting passwords, see [Default administrator password on page 2450](#).

To create a system password policy the GUI:

1. Go to *System > Settings*.
2. In the *Password Policy* section, change the *Password scope* to *Admin*, *IPsec*, or *Both*.
3. Configure the password policy options.

The screenshot displays the FortiGate GUI's System Settings page. The 'Password Policy' section is expanded, showing configuration options. The 'Password scope' is set to 'Admin'. Other options include 'Minimum length' (8), 'Minimum number of new characters' (6), 'Character requirements' (checked), 'Allow password reuse' (checked), and 'Password expiration' (checked). The 'View Settings' section shows 'Language' (English), 'Theme' (Jade), and 'Date/Time display' (FortiGate timezone). The right sidebar contains 'Additional Information' with links to 'API Preview', 'Edit in CLI', 'Virtual Domain', 'Setup guides', 'Documentation', 'Online Help', 'Video Tutorials', and 'Security Rating Issues'.

4. Click *Apply*.

To create a system password policy the CLI:

```
config system password-policy
  set status {enable | disable}
  set apply-to {admin-password | ipsec-preshared-key}
  set minimum-length <8-128>
  set min-lower-case-letter <0-128>
  set min-upper-case-letter <0-128>
  set min-non-alphanumeric <0-128>
  set min-number <0-128>
  set min-change-characters <0-128>
  set expire-status {enable | disable}
  set expire-day <1-999>
```

```
set reuse-password {enable | disable}
end
```

Public key SSH access

Public-private key pairs can be used to authenticate administrators connecting to the CLI using an SSH client. These keys can be RSA, ECDSA, or EdDSA.

Weigh the pros and cons of using key-pair authentication, versus passwords, when considering their use:

	Key-pair	Password
Pros	More secure (higher complexity)	Easy to remember
	Restricts logon to hosts that have the private key	Easy to update
	Never sent to the FortiGate	Can log in from any system
	Can add a password in addition to the key	
Cons	More complex to implement	Might be guessable or brute forced
	The private key is only as secure as the system storing it	Could be reused and compromised on another system
	More complicated to train users and administrators to use keys	Might be stored in plain text on an authenticating device (This does not apply to FortiGates)
		Can be phished or observed if written down

Key-pair authentication is often implemented when connecting to the FortiGate without any human interaction, such as when using a script. The script can leverage existing mechanisms to secure private keys, instead of trying to develop a way to securely store a username and password.

Generating the key pair

Key pairs can be generated and added in multiple different ways. This example shows generating a key pair using *PuTTY Key Generator* and adding the private key to the endpoint using *PuTTY Pageant*.

To create the key pair using PuTTY:

1. [Download](#) and install PuTTY.
2. Run *PuTTYgen.exe*.
3. Set *Type of key to generate* to *RSA*, *ECDSA*, or *EdDSA*.
4. Click *Generate*, then move the mouse cursor around in the blank space to generate randomness while the keys are generated.
5. Save both the public and private keys. Optionally, a key passphrase can be entered to protect the private key.

To add the public key to the FortiGate:

1. Delete the *Key comment*, then copy the public key from the *PuTTY Key Generator*.

Conversely, you can also open the saved public key in Notepad, remove the line breaks from the key, then remove extraneous lines:

```
---- BEGIN SSH2 PUBLIC KEY ----
Comment: "rsa-key-2022XXXX"

---- END SSH2 PUBLIC KEY ----
```

2. Add the key to the FortiGate:

```
config system admin
    edit <admin>
        set ssh-public-key1 "<key_type> <key_value>"
    next
end
```

Where *<key_value>* is the copied key, and *<key_type>* depends on the type of key that was generated:

RSA	ssh-rsa
ECDSA	ecdsa-sha2-nistp256 ecdsa-sha2-nistp384 ecdsa-sha2-nistp521
EdDSA	ssh-ed25519

To add the private key to the endpoint:

1. Open *PuTTY Pageant*.
2. Click *Add Key* or *Add Key (encrypted)* and select the previously saved private key.
3. Click *Close*.

You can now log in to the FortiGate on an SSH connection without using a password.

If using PuTTY, the username can be entered under *Connection > Data* in the *Auto-login username* field.

The generated keys can also be used in a certificate to authenticate with the FortiGate. See [Administrative access using certificates on page 2728](#) for information about generating and using certificates for administrative authentication.

Restricting SSH and Telnet jump host capabilities

Jump hosts are used to access devices in separate security zones, such as the internet and an internal network. Administrator access profiles can be configured to prevent administrators from using the FortiGate as a jump host for SSH and Telnet connections.

To configure permission to execute SSH or Telnet commands in an access profile:

```
config system accprofile
  edit <name>
    set system-execute-ssh {enable | disable}
    set system-execute-telnet {enable | disable}
  next
end
```

To block SSH and Telnet connections for an administrator:**1. Disable permission to execute SSH or Telnet commands in an administrator access profile:**

```
config system accprofile
  edit "test_accprofile"
    set system-execute-ssh disable
    set system-execute-telnet disable
  next
end
```

2. Configure an administrator in the profile:

```
config system admin
  edit "admin1"
    set accprofile "test_accprofile"
    set vdom "root"
    set password *****
  next
end
```

3. Log in as the new administrator, and attempt to connect to another host using SSH or Telnet:

```
# execute ssh root@172.16.200.55
You are not entitled to run the command.
Command fail. Return code -37

# execute ssh6 root@2000:172:16:200::55
You are not entitled to run the command.
Command fail. Return code -37

# execute telnet 172.16.200.55
You are not entitled to run the command.
Command fail. Return code -37
```

Remote administrators with TACACS VSA attributes

Vendor-Specific Attributes (VSAs) can be used with TACACS authentication and authorization in wildcard system administrator access to FortiGates from browsers and SSH. The `memberof` VSA can be used in remote TACACS user group for group matching. The `vdom` VSA returned from TACACS can be used to overwrite the VDOM in the `system admin` settings. The `admin_prof` VSA returned from TACACS can be used to overwrite the `accprofile` in the `system admin` settings.

Example

In this example, a FortiGate is configured with multiple VDOMs, and the root acts as the management VDOM. Administrators attempt to log in with SSH or HTTPS through each VDOM.

Using the VSA values for the `vdom` and `admin_prof` attributes returned from the TACACS server, the FortiGate can allow access only to the VDOMs returned with the permissions from the corresponding administrator profile. If no VSA values are returned from TACACS, then the FortiGate uses the default values under the `config system admin` settings.

The TACACS server settings are configured as follows:

```
user = admin-all-vdom {
    default service = permit
    member = sys_admin_all_vdom
    ...
}
user = admin-vdom1 {
    default service = permit
    member = sys_admin_vdom1
    ...
}
group = sys_admin_all_vdom {
    default service = permit
    service = fortigate {
        memberof = group3
        admin_prof = admin_all_vdom
    }
}
group = sys_admin_vdom1 {
    default service = permit
    service = fortigate {
        memberof = group3
        admin_prof = admin_vdom1
        vdom = vdom1
    }
}
```

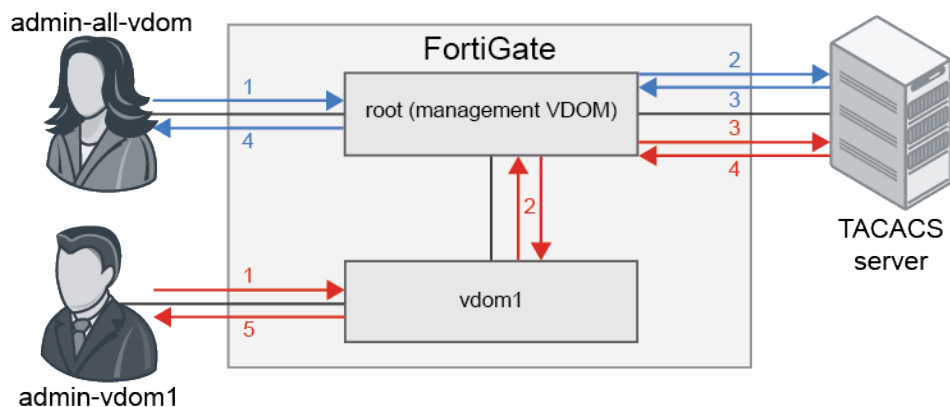

For multiple VDOMs, each VDOM must be specified in a separate field. For example, for access to vdom1 and vdom2:

```
vdom = vdom1
vdom = vdom2
```

Some TACACS servers, such as Linux TACACS servers, may only return the last VDOM specified.

The authentication process is as follows:

Authentication for admin-all-vdom:

1. The administrator attempts to log in to the FortiGate over the remote TACACS user group, `remote-tacacs`.
2. The FortiGate sends an authorization request to the TACACS server.
3. TACACS authenticates the `admin-all-vdom` user. The user matches the `sys_admin_all_vdom` TACACS group. TACACS returns following VSA values:
 - `memberof = group3`
 - `admin_prof = admin_all_vdom`
4. The FortiGate authenticates and authorizes the user based on the returned `memberof` group. The `admin_prof` value overwrites the `accprofile` setting configured under `system admin`. Since no other VDOM VSA is returned, the FortiGate matches the user to the default VDOM configured under `system admin`, which is `admin_no_access`.

Authentication for admin-vdom1:

1. The administrator attempts to log in to the FortiGate over the remote TACACS user group, `remote-tacacs`.
2. `vdom1` forwards the request to the management VDOM, which is the root.
3. The FortiGate sends an authorization request to the TACACS server through the management VDOM.
4. TACACS authenticates the `admin-vdom1` user. The user matches the `sys_admin_vdom1` TACACS group. TACACS returns following VSA values:
 - `memberof = group3`
 - `admin_prof = admin_vdom1`
 - `vdom = vdom1`
5. The FortiGate authenticates and authorizes the user based on the returned `memberof` group. The other VSA values overwrite the `accprofile` and VDOM settings configured under `system admin`. The user is only allowed to access `vdom1` with the administrative permissions allowed for `admin_vdom1`.

To configure the FortiGate:

1. Create two system administrator profiles.
 - a. Configure `admin_vdom1` who has read-write access to `vdom1` (except for firewall policies) and is restricted from using `diagnose` commands in the CLI:

```
config system accprofile
  edit "admin_vdom1"
    set secfabgrp read-write
    set ftviewgrp read-write
```

```
        set authgrp read-write
        set fwgrp custom
        set system-diagnostics disable
        config fwgrp-permission
            set policy read
            set address read
            set service read
            set schedule read
            set others read
        end
    next
end
```

- b. Configure admin_all_vdom who has read-write access to all VDOMs, but not with super_admin permissions:

```
config system accprofile
    edit "admin_all_vdom"
        set secfabgrp read-write
        set ftviewgrp read-write
        set authgrp read-write
        set sysgrp read
        set netgrp read-write
        set loggrp read-write
        set fwgrp read-write
        set vpngrp read
        set utmgrp read
        set wanoptgrp read
        set wifi read
    next
end
```

2. Configure the TACACS server:

```
config user tacacs+
    edit "tac1"
        set server "10.1.100.34"
        set key XXXXXXXXXXXXX
        set authorization enable
    next
end
```

3. Configure the remote TACACS group with group matching:

```
config user group
    edit "remote-tacacs"
        set member "tac1"
        config match
            edit 1
                set server-name "tac1"
                set group-name "group3"
            next
        end
    next
end
```

4. Configure the wildcard administrative user assigned to the remote TACACS group:

```
config system admin
    edit "remote-admin"
```

```

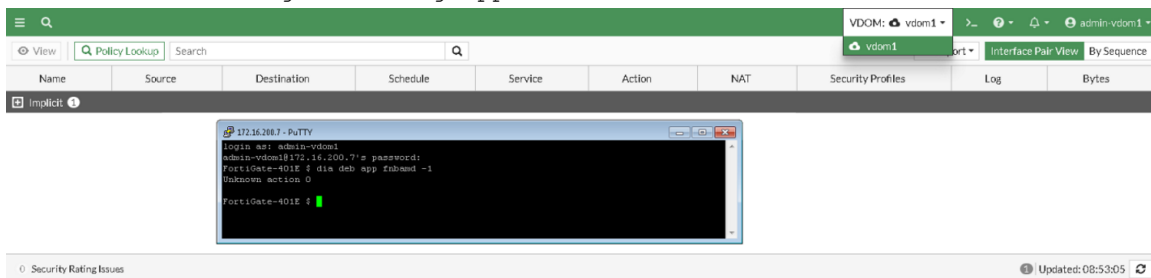

set remote-auth enable
set accprofile "admin_no_access"
set vdom "root" "vdom1"
set wildcard enable
set remote-group "remote-tacacs"
set accprofile-override enable
set vdom-override enable
next
end

```

To verify the configuration:

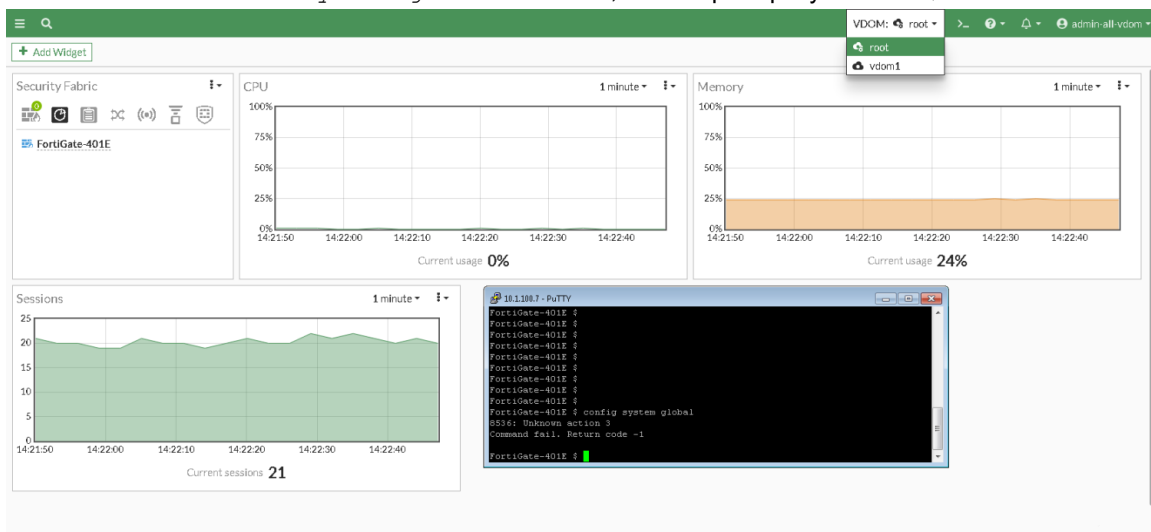

1. Log in as admin-vdom1 using a browser and SSH. The following behavior is expected:

- The user can only access vdom1 (returned by TACACS in the vdom VSA).
- The user can view firewall policies, but they cannot not create new policies.
- The user cannot run `diagnose debug application` commands in the PuTTY SSH session.

2. Log in as admin_all_vdom using a browser and SSH. The following behavior is expected:

- The user has no VSA VDOM configured on the TACACS server, so the default setting in the `system admin` configuration should apply. The user can access the root and vdom1 VDOMs.
- The user has no access to `system global` in the CLI, and the prompt symbol is a `$` instead of a `#`.

Administrator profiles

Administrator profiles define what the administrator can do when logged into the FortiGate. When you set up an administrator account, you also assign an administrator profile which dictates what the administrator sees. Depending on the nature of the administrator's work, access level or seniority, you can allow them to view and configure as much or as little as is required. Access to CLI diagnose commands can also be disabled for global and VDOM level administrators.

By default, the FortiGate has an *admin* administrator account that uses the *super_admin* profile.

super_admin profile

This profile has access to all components of FortiOS, including the ability to add and remove other system administrators. For certain administrative functions, such as backing up and restoring the configuration, *super_admin* access is required. To ensure that there is always a method to administer the FortiGate, the *super_admin* profile cannot be deleted or modified.

Lower level administrator profiles cannot backup or restore the FortiOS configuration.

The *super_admin* profile is used by the default *admin* account. It is recommended that you add a password and rename this account once you have set up your FortiGate. In order to rename the default account, a second *admin* account is required.

Creating customized profiles

To create a profile in the GUI:

1. Go to *System > Admin Profiles* and click *Create New*.
2. Configure the following settings:
 - Name
 - Access permissions
 - Usage of CLI diagnose commands
 - Override idle timeout
3. Click *OK*.

To create a profile in the CLI:

```
config system accprofile
  edit <name>
    set secfabgrp {none | read | read-write}
    set ftviewgrp {none | read | read-write}
    set authgrp {none | read | read-write}
    set sysgrp {none | read | read-write | custom}
    set netgrp {none | read | read-write | custom}
    set loggrp {none | read | read-write | custom}
```

```

        set fwgrp {none | read | read-write | custom}
        set vpngrp {none | read | read-write}
        set utmgrp {none | read | read-write | custom}
        set wanoptgrp {none | read | read-write}
        set wifi {none | read | read-write}
        set admintimeout-override {enable | disable}
        set system-diagnostics {enable | disable}
    next
end

```

Displaying execute commands for custom system permissions

A custom access profile can have customized system permissions. In this example, a profile is created for maintenance read access, and the profile is applied to a new system administrator account. Once the administrator logs in, they can view the available execute commands by entering `execute ?` in the CLI.

To create the profile:

1. Configure the access profile:

```

config system accprofile
    edit "mnt test"
        set sysgrp custom
        config sysgrp-permission
            set mnt read
        end
    next
end

```

2. Configure the system administrator account:

```

config system admin
    edit "mnt"
        set accprofile "mnt test"
        set vdom "root"
        set password *****
    next
end

```

To display the list of the execute commands:

```

$ execute ?
backup                backup
fctems                fctems
ping                  PING command.
ping-options          ping-options
ping6                 PINGv6 command. [Take 0-100 arg(s)]
ping6-options         ping6-options
ssh-options           SSH options.
ssh6-options          IPv6 SSH options.
telnet-options        telnet-options
traceroute            Traceroute {IP|hostname}.
traceroute-options    traceroute-options
tracert6              Traceroute for IPv6. [Take 0-32 arg(s)]
usb-device            usb-device

```

usb-disk	usb-disk
vm-license-options	VM license options.

The output will vary based on the FortiGate model. A FortiGate VM is used in this example. For more information about using the CLI, see [CLI basics on page 42](#).

Editing profiles

To edit a profile in the GUI:

1. Go to *System > Admin Profiles*.
2. Select the profile to be edited and click *Edit*.
3. Make the required changes.
4. Click *OK* to save any changes.

To edit a profile in the CLI:

```
config system accprofile
  edit "sample"
    set secfabgrp read
  next
end
```

Deleting profiles

To delete a profile in the GUI:

1. Go to *System > Admin Profiles*.
2. Select the profile to be deleted and click *Delete*.
3. Click *OK*.

To delete a profile in the CLI:

```
config system accprofile
  delete "sample"
end
```

Firmware & Registration

The *Firmware & Registration* page allows administrators to manage the firmware running on each FortiGate, FortiAP, and FortiSwitch in the Security Fabric, and to authorize and register these Fabric devices.

The *Firmware & Registration* page displays a summary of devices in the Security Fabric that includes:

- Total number of devices in the Fortinet Security Fabric and the types of devices
- Upgrade status

- Device name
- Device status
- Registration status
- Firmware version and maturity level
- Upgrade status

From the *Firmware & Registration* page, administrators can perform the following actions:

Upgrade	<p>Use to upgrade firmware for the selected device.</p> <p>The <i>Upgrade</i> option uses released firmware images from FortiGuard. Alternately you can download a firmware file from the Fortinet Customer Service & Support website, and upload it for the upgrade process.</p> <p>See Upgrading individual device firmware on page 2423 and Upgrading individual device firmware by following the upgrade path (federated update) on page 2424.</p>
Fabric Upgrade	<p>Use to upgrade firmware for the root FortiGate as well as all Fabric devices. You can also use this option to upgrade firmware for a non-Security Fabric FortiGate with managed FortiSwitch and FortiAP devices.</p> <p>The <i>Fabric Upgrade</i> option uses released firmware images from FortiGuard.</p> <p>See Upgrading all device firmware on page 2426 and Upgrading all device firmware by following the upgrade path (federated update) on page 2428.</p>
Register	<p>Use the <i>Register</i> option to register a selected device to FortiCare.</p> <p>The FortiGate, and then its service contract, must be registered to have full access to Fortinet Customer Service and Support, and FortiGuard services. The FortiGate can be registered in either the FortiGate GUI or the FortiCloud support portal. The service contract can be registered from the FortiCloud support portal.</p> <p>See also Registration on page 65.</p>
Authorization	<p>Use the <i>Authorization</i> option to authorize, deauthorize, or reject the selected device.</p> <p>See Authorizing devices on page 2434.</p>

Before you upgrade FortiGate firmware, it is recommended to learn about firmware updates and firmware maturity levels. See [About firmware installations on page 2420](#) and [Firmware maturity levels on page 2420](#).

This section also includes the following topics:

- [Enabling automatic firmware updates on page 2431](#)
- [Firmware upgrade notifications on page 2435](#)
- [Downloading a firmware image on page 2436](#)
- [Testing a firmware version on page 2437](#)
- [Installing firmware from system reboot on page 2438](#)
- [Restoring from a USB drive on page 2440](#)
- [Using controlled upgrades on page 2441](#)
- [Downgrading individual device firmware on page 2441](#)
- [Downloading the EOS support package for supported Fabric devices on page 2443](#)
- [Preventing FortiGates with an expired support contract from upgrading to a major or minor firmware release on page 2447](#)

About firmware installations

Fortinet periodically updates the FortiGate firmware to include new features and resolve important issues. After you have registered your FortiGate unit, firmware updates are available from FortiGuard and from the [Fortinet Customer Service & Support](#) website.

Installing a new firmware image replaces the current antivirus and attack definitions, along with the definitions included with the firmware release that is being installing. After you install new firmware, make sure that the antivirus and attack definitions are up to date.

It is recommended to back up your configuration before making any firmware changes. You will be prompted to back up your configuration as part of the upgrade process. See also [Configuration backups on page 72](#).

Before you install any new firmware, follow the below steps:

1. Understand the maturity level of the current and target firmware releases to help you determine whether to upgrade. See [Firmware maturity levels on page 2420](#).
2. Review the [Release Notes](#) for a new firmware release.
3. Review the [Supported Upgrade Paths](#).
4. Download a copy of the currently installed firmware, in case you need to revert to it. See [Downloading a firmware image on page 2436](#) and [Downgrading individual device firmware on page 2441](#) for details.
5. Have a plan in place in case there is a critical failure, such as the FortiGate not coming back online after the update. This could include having console access to the device ([Connecting to the CLI on page 39](#)), ensuring that your TFTP server is working ([Installing firmware from system reboot on page 2438](#)), and preparing a USB drive ([Restoring from a USB drive on page 2440](#)).
6. Back up the current configuration, including local certificates. The upgrade process prompts you to back up the current configuration. See also [Configuration backups on page 72](#) for details.
7. Test the new firmware until you are satisfied that it applies to your configuration. See [Testing a firmware version on page 2437](#) and [Using controlled upgrades on page 2441](#) for details.

Installing new firmware without reviewing release notes or testing the firmware may result in changes to settings and unexpected issues.

Only FortiGate admin users and administrators whose access profiles contain system read and write privileges can change the FortiGate firmware.

Firmware maturity levels

Starting with FortiOS 7.2.0, released FortiOS firmware images use tags to indicate the following maturity levels:

- The *Feature* tag indicates that the firmware release includes new features.
- The *Mature* tag indicates that the firmware release includes no new, major features. Mature firmware will contain bug fixes and vulnerability patches where applicable.

Administrators can use the tags to identify the maturity level of the current firmware in the GUI or CLI.

Administrators can view the maturity level of each firmware image that is available for upgrade on the *Firmware & Registration* page. When upgrading from mature firmware to feature firmware, a warning message is displayed.

To view maturity levels for firmware in the GUI:

1. Go to *Dashboard > Status*. The *Firmware* field in the *System Information* widget displays the version with build number and either (*Mature*) or (*Feature*).

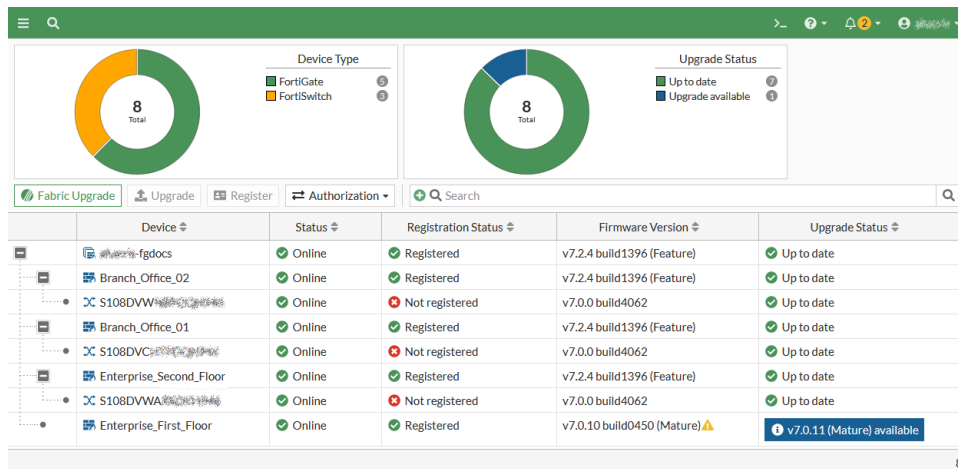

The following is an example of firmware with the *(Mature)* tag:

The following is an example of firmware with the *(Feature)* tag:

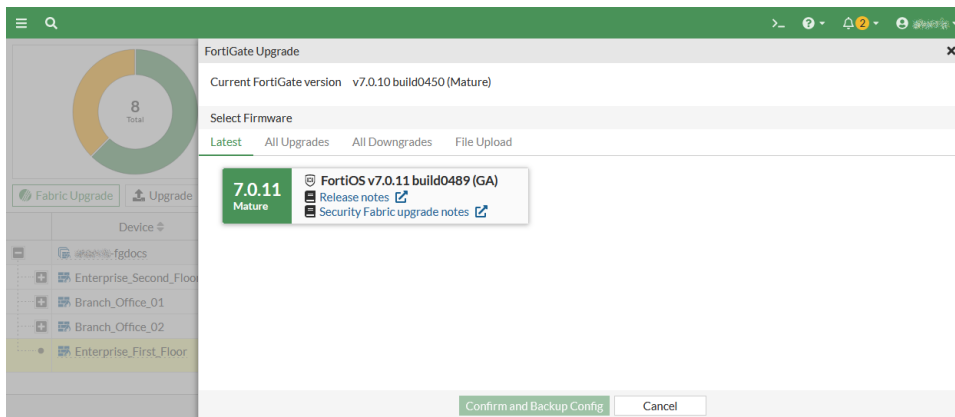

2. Go to *System > Firmware & Registration*. The *Firmware Version* column displays the version with build number and either *(Mature)* or *(Feature)*.

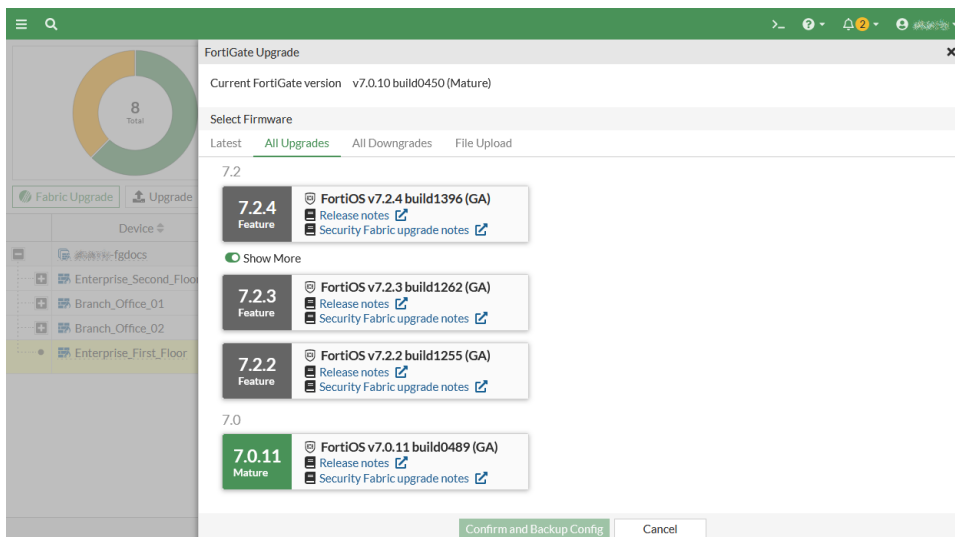

3. Select a device and click *Upgrade*. The *FortiGate Upgrade* pane is displayed.

- Click the *Latest* tab to view the latest available firmware version with its maturity level.

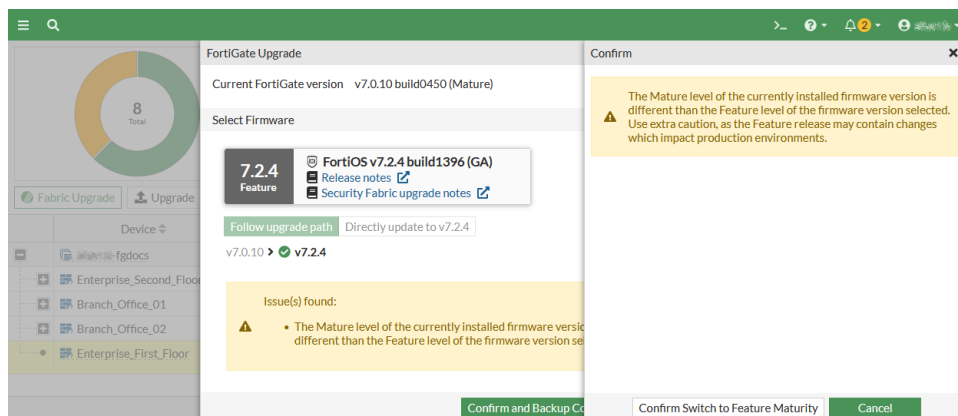

- Click the *All Upgrades* tab to view all available firmware versions and their maturity levels.

A gray box around the version number and the label *Feature* identifies feature firmware version. A green box around the version with the label *Mature* identifies a mature firmware version.

- Select a version and click *Confirm and Backup Config*.

When the firmware version is a feature release, a warning is displayed; click *Confirm Switch to Feature Maturity*.

To view maturity levels for firmware in the CLI:

In this example, the `Version` field includes `.F` to indicate that the maturity level is feature:

```
# get system status
Version: FortiWiFi-81F-2R-POE v7.2.4,build1396,230131 (GA.F)
...
```

In this example, the `Version` field includes `.M` to indicate that the maturity level is mature:

```
# get system status
Version: FortiWiFi-81F-2R-POE v7.0.10,build0450,230221 (GA.M)
...
```

Upgrading individual device firmware

To upgrade individual device firmware in the GUI:

1. Log into the FortiGate GUI as the admin administrative user.
2. Go to *System > Firmware & Registration*.
3. Select the FortiGate, and click *Upgrade*. The *FortiGate Upgrade* pane opens.
4. Click the following tabs to view the available firmware:

<i>Latest</i>	Displays the latest, available firmware from FortiGuard.
<i>All Upgrades</i>	Displays all available firmware from FortiGuard.
<i>File Upload</i>	Click the <i>File Upload</i> tab to upload a firmware file that you previously downloaded from the Fortinet Customer Service & Support website. See Downloading a firmware image on page 2436 .

5. Select a firmware version and click *Confirm and Backup Config*.
If you are upgrading from a mature to a feature firmware version, the *Confirm* pane opens with a warning message.
6. Review the warning, and click *Confirm* to continue. A warning message is displayed.
7. Click *Continue* to initiate the upgrade.
The FortiGate unit backs up the current configuration to the management computer, uploads the firmware image file, upgrades to the new firmware version, and restarts. This process takes a few minutes.

To upgrade individual device firmware in the CLI:

1. Make sure that the TFTP server is running.
2. Copy the new firmware image file to the root directory of the TFTP server.
3. Log in to the CLI.
4. Ping the TFTP server to ensure that the FortiGate can connect to it:
`execute ping <tftp_ip>`
5. Enter the following command to copy the firmware image from the TFTP server to the FortiGate unit:
`execute restore image tftp <filename> <tftp_ip>`
The FortiGate unit responds with the message:
`This operation will replace the current firmware version!`
`Do you want to continue? (y/n)`
6. Type `y`. The FortiGate unit uploads the firmware image file, verifies the signature of the firmware image, and determines the firmware maturity level.

When you are upgrading to a feature firmware image, you are asked to confirm whether to continue with the upgrade.

When you proceed with the upgrade, the upgrade image is installed and FortiGate restarts. This process takes a few minutes.

```
Please wait...
Connect to tftp server 172.16.200.55 ...
#####
Get image from tftp server OK.
Verifying the signature of the firmware image.

Warning: Upgrading to an image with Feature maturity notation.
Image file uploaded is marked as a Feature image, are you sure you want to upgrade?
Do you want to continue? (y/n)y
Please confirm again. Are you sure you want to upgrade using uploaded file?
Do you want to continue? (y/n)y
Checking new firmware integrity ... pass
Please wait for system to restart.
Firmware upgrade in progress ...
Done.
The system is going down NOW !!
```

7. Reconnect to the CLI.

8. Update the antivirus and attack definitions:

```
execute update-now
```

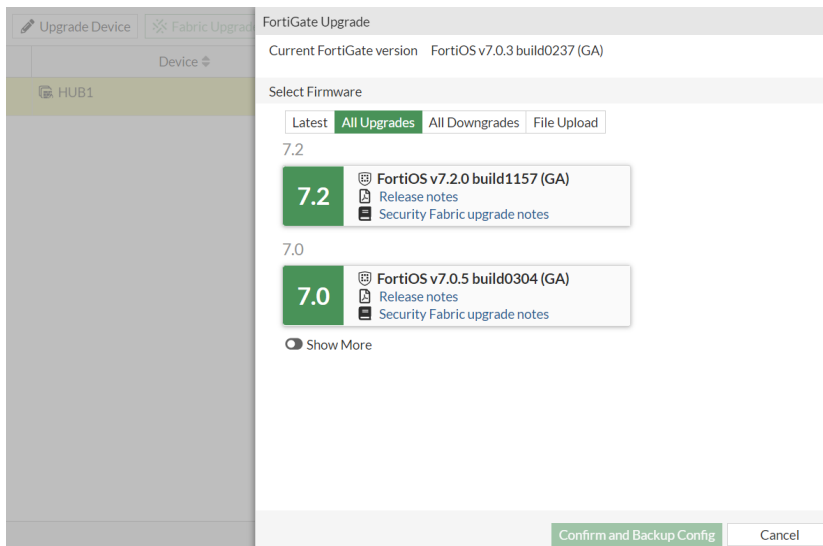

Upgrading individual device firmware by following the upgrade path (federated update)

When upgrading a FortiGate to firmware that requires multiple builds in the upgrade path, FortiGate can follow the upgrade path to complete the upgrade automatically. This process is sometimes called a *federated update*. A federated update can be performed immediately or during a scheduled time.

To upgrade individual device firmware by following the upgrade path in the GUI:

1. Log into the FortiGate GUI as the admin administrative user.
2. Go to *System > Firmware & Registration*. The *Firmware Version* column displays the version and either (*Feature*) or (*Mature*).
3. Select the FortiGate, and click *Upgrade*. The *FortiGate Upgrade* pane opens.
4. Click *All Upgrades*. The available firmware versions are displayed.

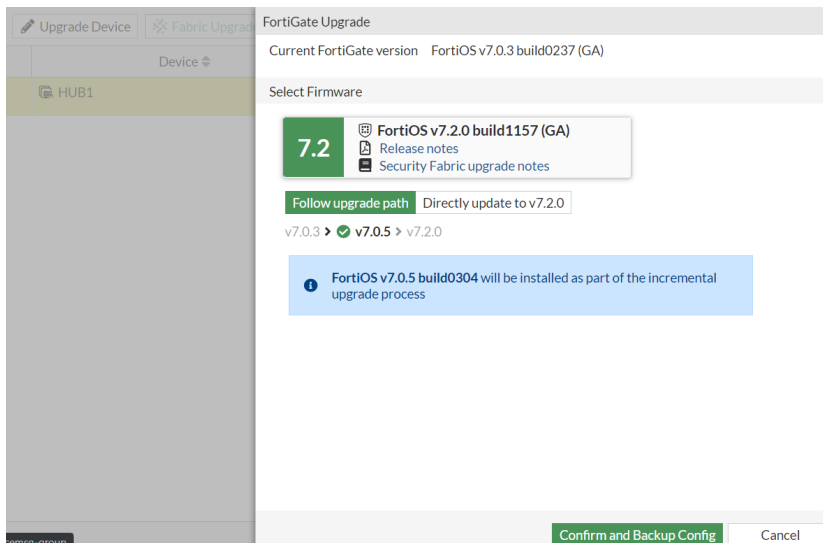

In this example, the firmware is available for 7.2 and 7.0.

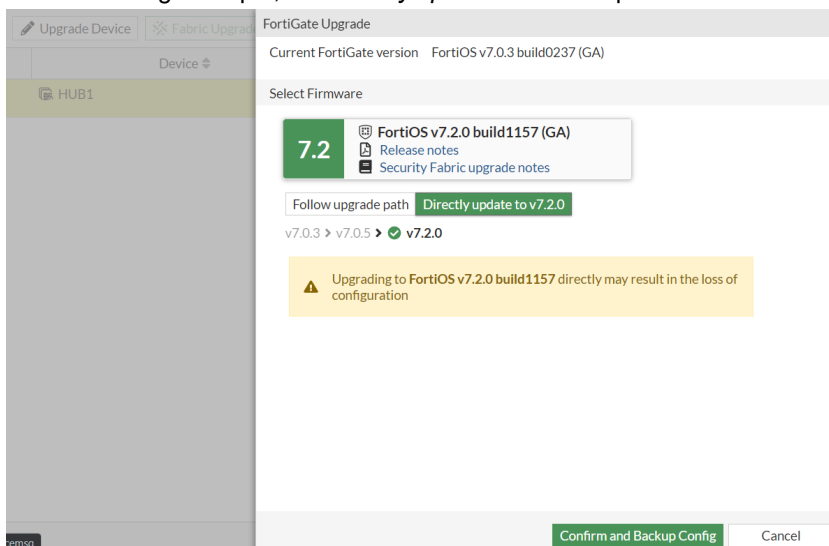

5. Select the target firmware, and view the upgrade options.

You can instruct FortiOS to follow the upgrade path (referred to as a federated upgrade) or upgrade directly to the selected firmware version.

In this example, the target firmware is *7.2.0 build 1157(GA)*, and *Follow upgrade path* is selected. According to the upgrade path, the device can be automatically upgraded to *v7.0.5*, but not all the way to *7.2.0*.

- In the following example, the *Directly update to v7.2.0* option is selected.

- Select *Follow upgrade path*, and click *Confirm and Backup Config*. A warning message is displayed.
- Click *Continue* to initiate the upgrade.
The FortiGate unit backs up the current configuration to the management computer, uploads the firmware image file, upgrades to the new firmware version, and restarts. This process takes a few minutes.

Upgrading all device firmware

Use the *Fabric Upgrade* process to select a firmware version from FortiGuard for the FortiGate. When part of a Security Fabric, the select target firmware is for the root FortiGate.

The target firmware version is used to automatically upgrade firmware for all FortiGate, FortiAP, and FortiSwitch devices. Fabric members or managed devices download the chosen firmware directly from FortiGuard.

A *Fabric Upgrade* can be performed immediately or during a scheduled time.

To upgrade all device firmware:

- Log into the FortiGate GUI as the admin administrative user.
- Go to *System > Firmware & Registration* and click *Fabric Upgrade*. The *Fabric Upgrade* pane opens, and the following tabs are available:

<i>Latest</i>	Displays the latest, available firmware from FortiGuard.
<i>All Upgrades</i>	Displays all available firmware from FortiGuard.

- Select *Latest* or *All Upgrades*, select a target firmware version, and then click *Next*.
In this example, *All Upgrades* is selected.

4. Select an upgrade schedule, either *Immediate* or *Custom*. If using *Custom*, enter an upgrade date and time (*Custom* is used in this example).

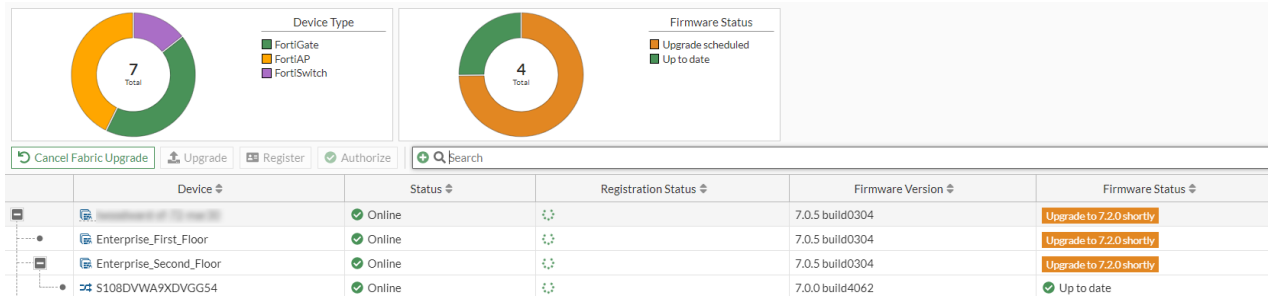

In a custom upgrade, the configuration backups are saved when the administrator schedules the upgrade. If the scheduled upgrade occurs after further configuration changes are made, the latest changes will not be saved in a new backup configuration file.

5. Click *Next* and review the update schedule. For FortiSwitch, a message appears because no firmware upgrade is currently available.

Device	Firmware
Enterprise_First_Floor	Upgrade to v7.2.0
Enterprise_Second_Floor	Upgrade to v7.2.0
S108DVWA9XDVG54	No firmware upgrade available for this device

6. Click *Confirm and Backup Config*. The pane goes into a loading state to wait for all FortiGate configurations to save. Once completed, the pane closes and the device list refreshes to reflect the latest changes.

Upgrading all device firmware by following the upgrade path (federated update)

When performing a Fabric upgrade or non-Fabric upgrade under *System > Firmware & Registration* and choosing a firmware that requires multiple builds in the upgrade path, the FortiGate can follow the upgrade path to complete the upgrade automatically. This process is sometimes called a *federated update*. A federated update can be performed immediately or during a scheduled time.

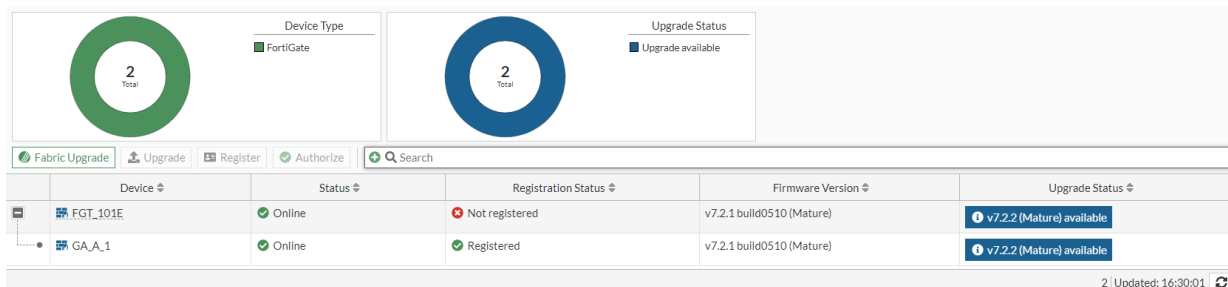

To demonstrate the functionality of this feature, this example uses FortiGates that are running and upgrading to fictitious build numbers.

FortiAPs and FortiSwitches currently cannot follow the upgrade path. They upgrade directly to the target version.

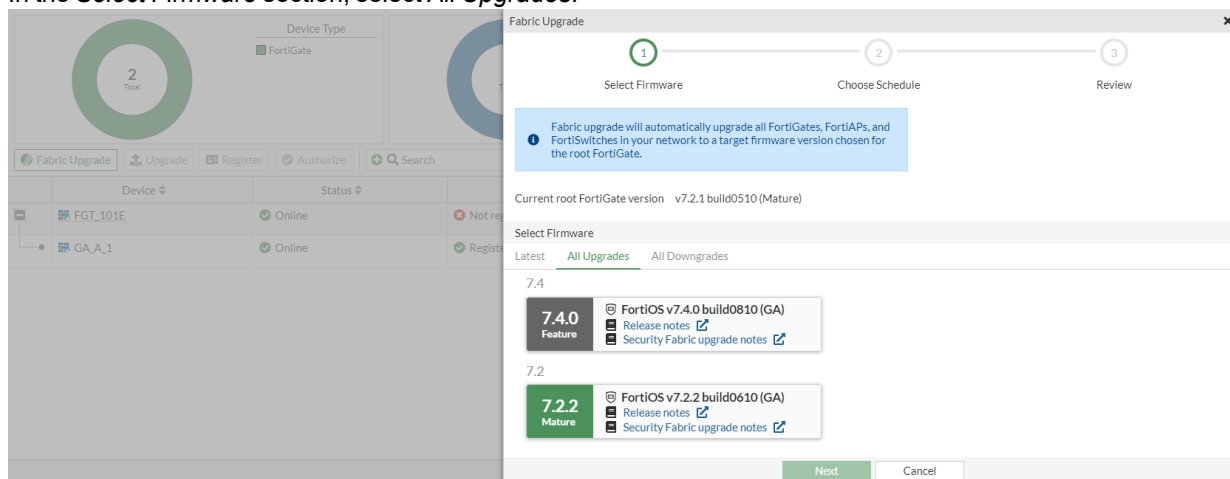

Example

In this example, the Security Fabric consists of a root FortiGate (FGT_101E) and a downstream FortiGate (GA_A_1). The FortiGates are currently running FortiOS 7.2.1 (build 0510). The administrator wants to upgrade the firmware to version 7.4.0 (build 0810). When upgrading the firmware on the *Firmware & Registration* page, the FortiGate is able to display the upgrade path, 7.2.1 > 7.2.2 > 7.4.0, and perform all of the upgrades in sequence (with multiple reboots).

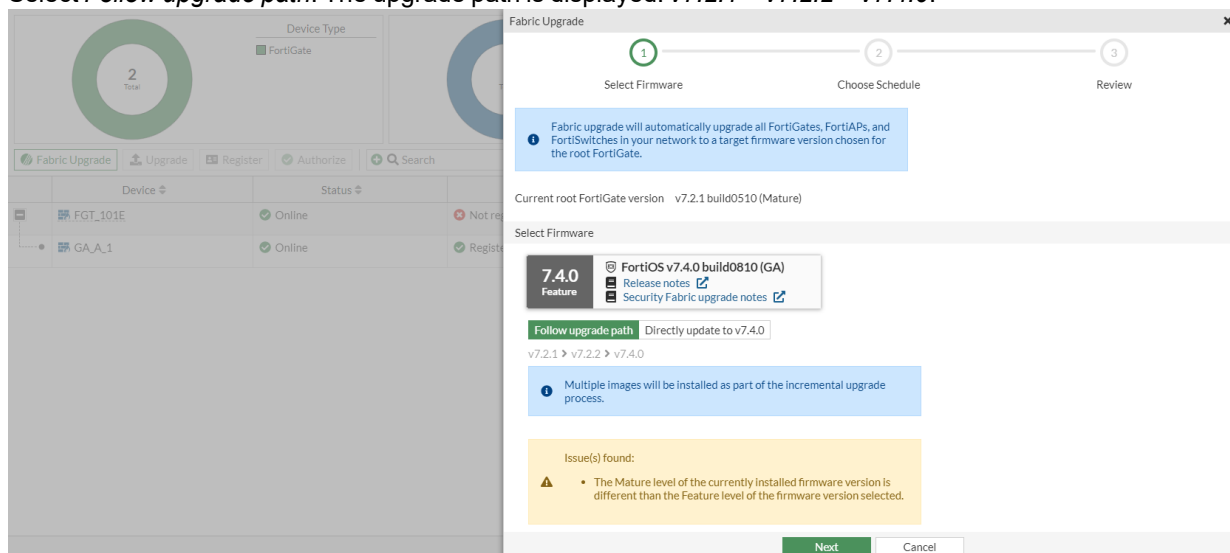

To upgrade the FortiGate firmware:

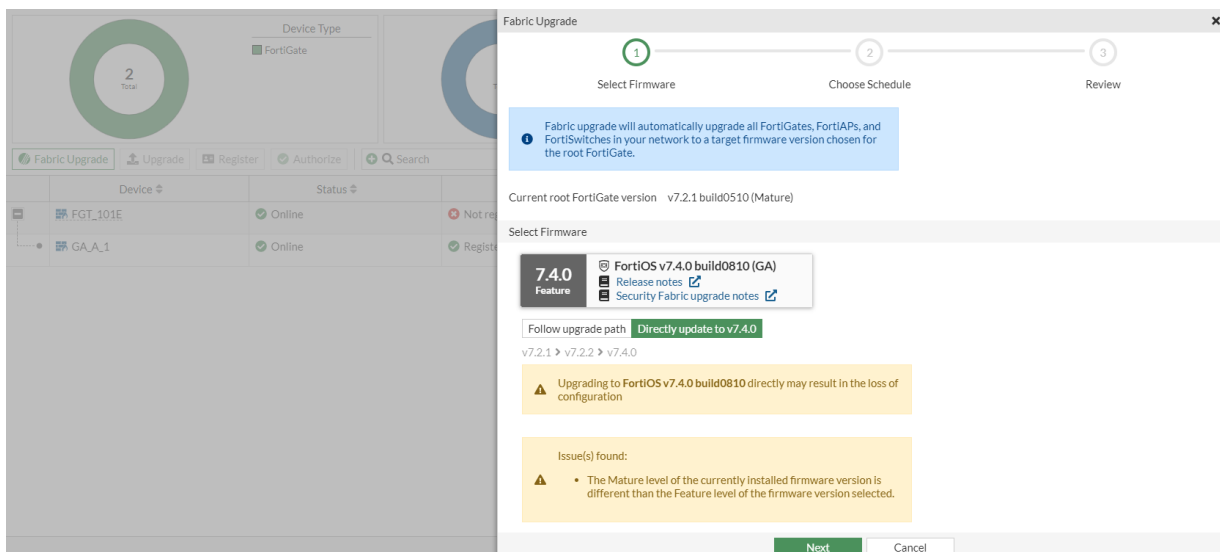

1. Go to **System > Firmware & Registration** and click **Fabric Upgrade**. The **Fabric Upgrade** pane opens.
2. In the **Select Firmware** section, select **All Upgrades**.

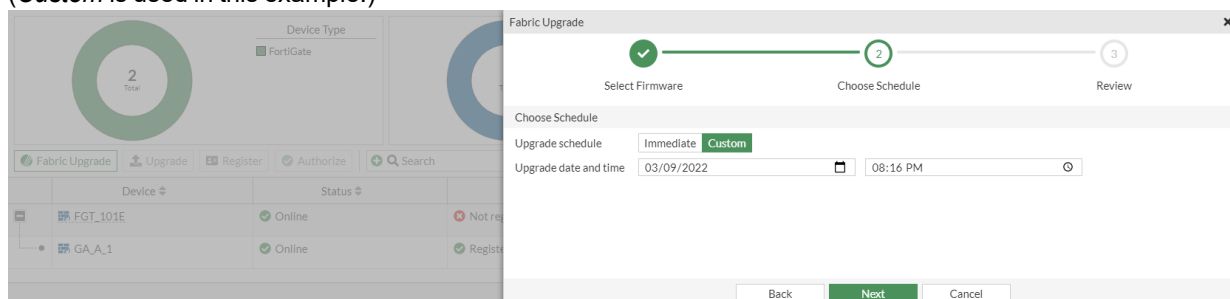

3. Select the 7.4.0 version. Upgrade options appear.
4. Select **Follow upgrade path**. The upgrade path is displayed: **v7.2.1 > v7.2.2 > v7.4.0**.

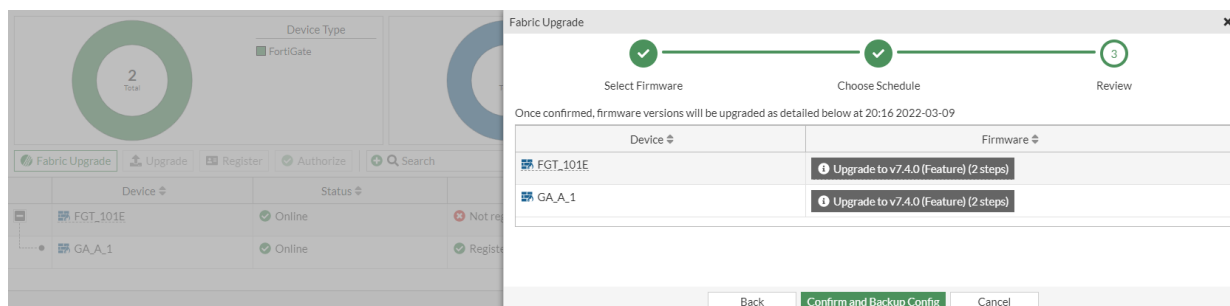

- If **Directly upgrade to v7.4.0** is selected, a warning message appears that this may result in the loss of configuration.

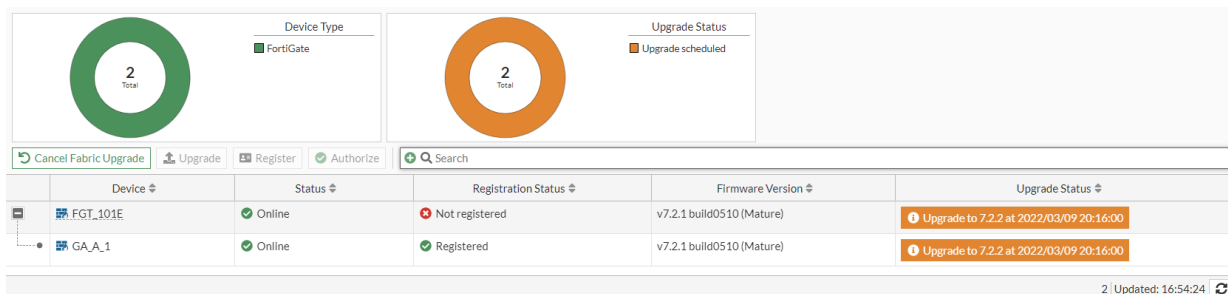

5. Click **Next**.
6. Select an upgrade schedule, either *Immediate* or *Custom*. If using *Custom*, enter an upgrade date and time. (*Custom* is used in this example.)

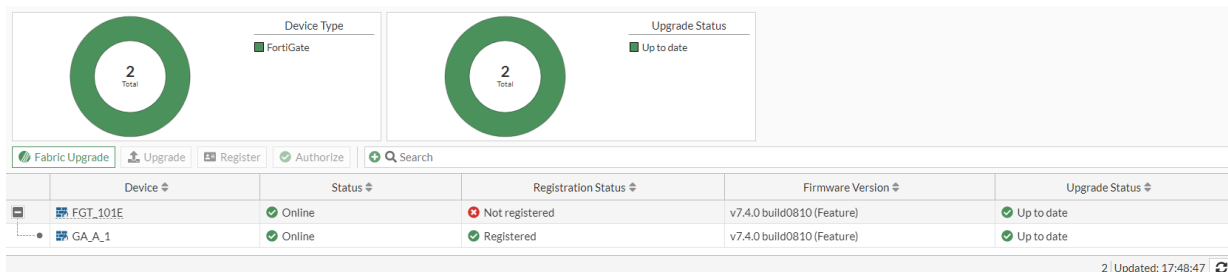

7. Click **Next** and review the update schedule.
8. Click **Confirm and Backup Config**.

The **Upgrade Status** for both FortiGates indicated when the scheduled upgrade will take place. In this example, the first upgrade in the path is to version 7.2.2. The FortiGates will reboot and then upgrade to 7.4.0 as per the upgrade path.

Once the upgrades are complete and both FortiGates are running the desired firmware (7.4.0), the *Upgrade Status* changes to *Up to date*.

CLI commands

The following options are available in `execute federated-upgrade <option>`:

Option	Description
<code>cancel</code>	Cancel the currently configured upgrade.
<code>initialize</code>	Set up a federated upgrade.
<code>status</code>	Show the current status of a federated upgrade.
<code>restart</code>	Restart the currently configured federated upgrade.

The `config system federated-upgrade` command is read-only. Attempting to configure federated upgrade using the `config` command will show the following error message:

Federated upgrade cannot be configured directly.
Please use 'execute federated-upgrade ...' to configure.

Enabling automatic firmware updates

The `auto-firmware-upgrade` option can be enabled to automatically update firmware based on the FortiGuard upgrade path. When enabled, the FortiGate will look for an upgrade path and perform an upgrade at a time within the time period specified by the administrator. The upgrade will only be performed on a patch within the same major release version.

When automatic firmware update is enabled, the FortiGate will check for firmware upgrades daily between a configured time interval. When a new patch release is available, a firmware upgrade will be scheduled. By actively searching for patch updates and performing patch upgrades, the system quality is improved as new security fixes are implemented and released.

After the patch release is successfully installed, an email is sent to the FortiCloud account that the FortiGate is registered to.

```
config system fortiguard
    set auto-firmware-upgrade {enable | disable}
    set auto-firmware-upgrade-day {sunday monday tuesday wednesday thursday friday saturday}
    set auto-firmware-upgrade-delay <integer>
    set auto-firmware-upgrade-start-hour <integer>
    set auto-firmware-upgrade-end-hour <integer>
end
```

auto-firmware-upgrade {enable disable}	Enable/disable automatic patch-level firmware upgrade from FortiGuard.
auto-firmware-upgrade-day {sunday monday tuesday wednesday thursday friday saturday}	Enter the allowed day or days of the week to start the automatic patch-level firmware upgrade from FortiGuard.
auto-firmware-upgrade-delay <integer>	Enter the number of days to wait before automatically installing the automatic patch-level firmware upgrade from FortiGuard (default = 3).
auto-firmware-upgrade-start-hour <integer>	Set the start time of the designated time window for the automatic patch-level firmware upgrade from FortiGuard (in hours, 0 - 23, default = 2). The actual upgrade time is randomly selected in the time window.
auto-firmware-upgrade-end-hour <integer>	Set the end time of the designated time window for the automatic patch-level firmware upgrade from FortiGuard (in hours, 0 - 23, default = 4). When this value it is smaller than the start time, it will be treated as the same time in the next day. The actual upgrade time is randomly selected in the time window.

The `auto-firmware-upgrade-delay` command overrides the `auto-firmware-upgrade-day` command. Disable `auto-firmware-upgrade-delay` by setting it to zero if you would rather use the `auto-firmware-upgrade-day` command to select a day of the week for automatic installation, regardless of when the patch release is detected.

Example

The following example demonstrates setting automatic firmware upgrades after a delay of three days.

To demonstrate the functionality of this feature, this example uses FortiGates that are running and upgrading to fictitious build numbers.

To configure automatic firmware upgrades:

```
config system fortiguard
    set auto-firmware-upgrade enable
    set auto-firmware-upgrade-delay 3
    set auto-firmware-upgrade-start-hour 2
    set auto-firmware-upgrade-end-hour 4
end
```

The FortiGate will perform a check between the start and end hours set for the firmware upgrade to review if there is an upgrade available.

To review the available firmware upgrade check schedule:

```
# diagnose test application forticldd 13
Scheduled push image upgrade: no
Scheduled Config Restore: no
Scheduled Script Restore: no
Automatic image upgrade: Enabled.
    Next upgrade check scheduled at (local time) Thu Mar 29 03:10:56 2023
```

When an available patch upgrade is detected, the automatic firmware update will be scheduled based on the set upgrade delay.

Sample event log after a new patch upgrade is detected:

```
date=2023-03-29 time=03:10:56 eventtime=1679336380720695924 tz="-0700"
logid="0100032263" type="event" subtype="system" level="notice" vd="vdom1"
logdesc="Automatic firmware upgrade schedule changed" user="system"
msg="System patch-level auto-upgrade new image installation scheduled
    between local time Sat Apr 01 03:10:56 2023 and local time Sat Apr 01 04:00:00 2023."
```

To review the installation window of new patch releases:

```
# diagnose test application forticldd 13
Scheduled push image upgrade: no
Scheduled Config Restore: no
Scheduled Script Restore: no
Automatic image upgrade: Enabled.
    Next upgrade check scheduled at (local time) Mon Mar 30 03:10:56 2023
    New image 7.4.1b2305(07004000FIMG0021204001) installation is scheduled to
        start at Sat Apr 01 03:10:56:21 2023
        end by Sat Apr 01 04:00:00 2023
```

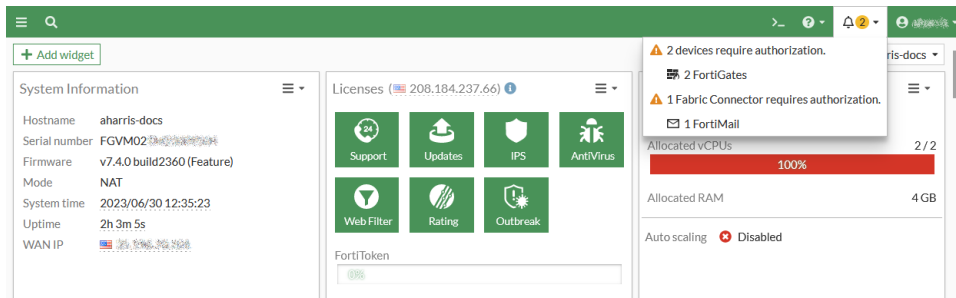

Once the firmware patch is successfully installed, an event log is created to track the change and an email is sent to the FortiCloud account under which the FortiGate is registered.

Sample event log after successfully updating firmware:

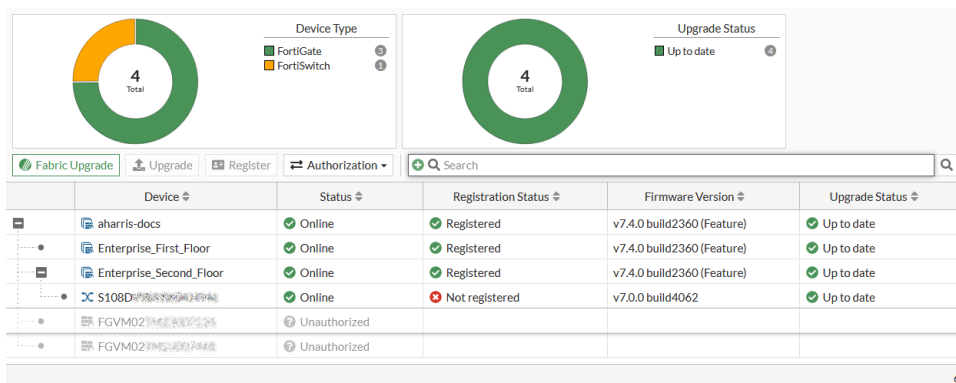

```
date=2023-04-01 time=03:13:04 devid="FG3H1E5819904039" devname="D"
eventtime=1679590383750408029 tz="-0700"
logid="0100022094" type="event" subtype="system" level="information" vd="vdom1"
logdesc="A federated upgrade was completed by the root FortiGate"
msg="Federated upgrade complete" version="7.4.1"
```

Authorizing devices

If there are any notifications in the top banner dropdown for unauthorized devices or devices that require authorization, clicking the notification redirects the user to the *System > Firmware & Registration* page. In this example, two devices require authorization.

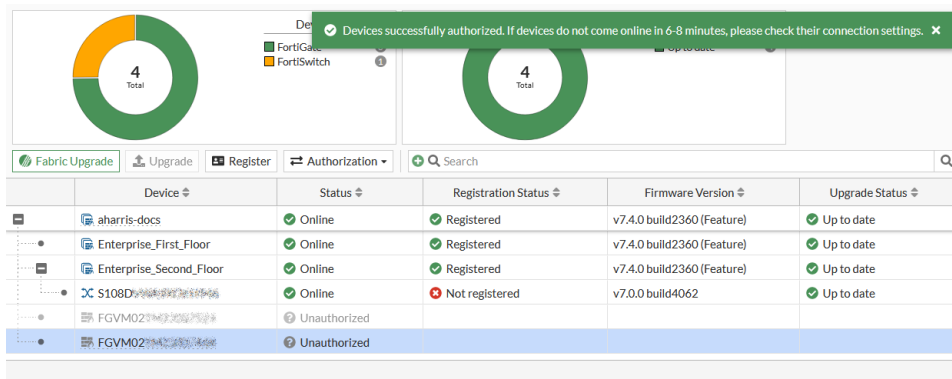

On the *Firmware & Registration* page, the unauthorized devices are grayed out, and their status is *Unauthorized*.

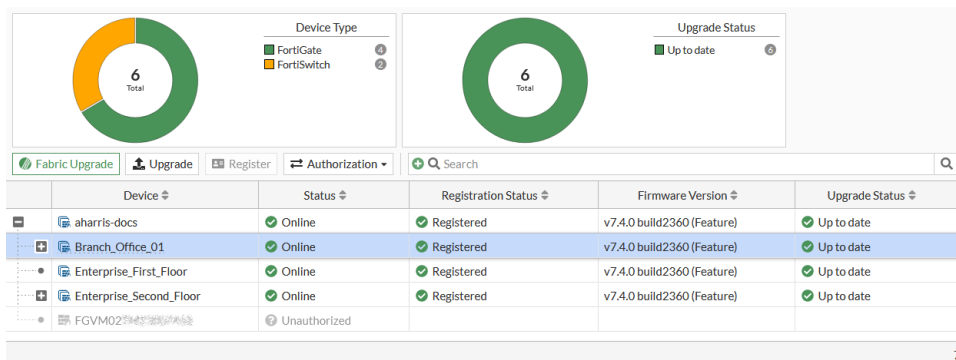

To authorize a Security Fabric device from the *Firmware & Registration* page:

1. Go to *System > Firmware & Registration*, and select an unauthorized device.
2. Click *Authorization > Authorize* (below the donut charts), or right-click and select *Authorization > Authorize*.

A notification appears when the device is authorized.

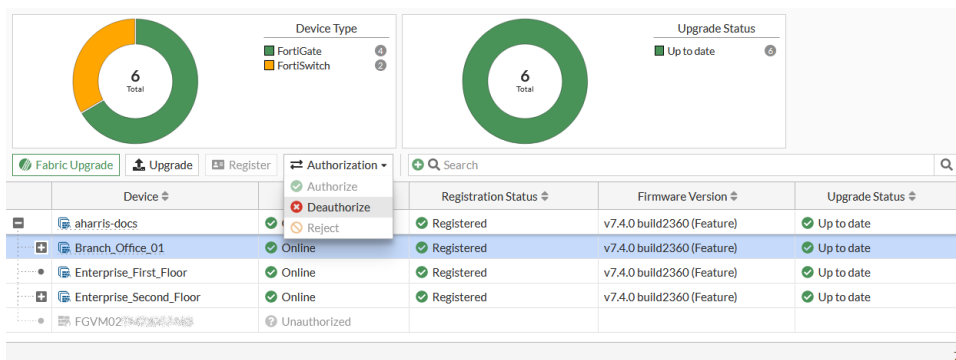

- Refresh the page. The device's status should now be *Online*.

To deauthorize a Security Fabric device from the Firmware & Registration page:

- Go to the *System > Firmware & Registration* page, and select a device.
- Click *Authorization > Deauthorize*.

- Refresh the page to see that the device has been deauthorized.

Firmware upgrade notifications

FortiGates with a firmware upgrade license that are connected to FortiGuard display upgrade notifications in the setup window, banner, and FortiGuard menu. The firmware notifications are enabled by default.

To configure firmware notifications in the CLI:

```
config system global
    set gui-firmware-upgrade-warning {enable | disable}
end
```

To use the firmware upgrade notifications in the GUI:

1. When you log in to FortiGate, the *FortiGate Setup* window includes an *Upgrade firmware* step. Click *Begin*.

2. Follow the steps in the *Setup Progress*, then click *Review Firmware Upgrade*.

The *System > Firmware & Registration* page opens.

3. Notifications appear below the *Notification* icon in the banner, and beside *Firmware & Registration* in the tree menu.

Downloading a firmware image

Firmware images for all FortiGate units are available on the [Fortinet Customer Service & Support](#) website.

To download firmware:

1. Log into the support site with your user name and password.
2. Go to *Support > Firmware Download*.
A list of Release Notes is shown. If you have not already done so, download and review the Release Notes for the firmware version that you are upgrading your FortiGate unit to.
3. Select the *Download* tab.
4. Navigate to the folder for the firmware version that you are upgrading to.
5. Find your device model on the list. FortiWiFi devices have file names that start with *FWF*.
6. Click *HTTPS* in the far right column to download the firmware image to your computer.

Firmware can also be downloaded using FTP, but as FTP is not an encrypted file transferring protocol, HTTPS downloading is recommended.

Security levels are pre-configured on the BIOS. See [BIOS-level signature and file integrity checking on page 2736](#) and [Real-time file system integrity checking on page 2740](#) for more information.

Testing a firmware version

The integrity of firmware images downloaded from Fortinet's support portal can be verified using a file checksum. A file checksum that does not match the expected value indicates a corrupt file. The corruption could be caused by errors in transfer or by file modification. A list of expected checksum values for each build of released code is available on Fortinet's support portal.

Image integrity is also verified when the FortiGate is booting up. This integrity check is done through a cyclic redundancy check (CRC). If the CRC fails, the FortiGate unit will encounter an error during the boot process.

Firmware images are signed and the signature is attached to the code as it is built. When upgrading an image, the running OS will generate a signature and compare it with the signature attached to the image. If the signatures do not match, the new OS will not load.

Testing before installation

FortiOS lets you test a new firmware image by installing the firmware image from a system reboot and saving it to system memory. After completing this procedure, the FortiGate unit operates using the new firmware image with the current configuration. The new firmware image is not permanently installed. The next time the FortiGate unit restarts, it operates with the originally installed firmware image using the current configuration. If the new firmware image operates successfully, you can install it permanently using the procedure explained in [Upgrading individual device firmware](#).

For this procedure, you must install a TFTP server that you can connect to from the FortiGate internal interface. The TFTP server should be on the same subnet as the internal interface.

To test the new firmware version:

1. Connect to the CLI using an RJ-45 to USB (or DB-9) or null modem cable.
2. Ensure that the TFTP server is running.
3. Copy the new firmware image file to the root directory on the TFTP server.
4. Ensure that the FortiGate unit can connect to the TFTP server using the `execute ping` command.
5. Restart the FortiGate unit: `execute reboot`. The following message is shown:

```
This operation will reboot the system!
Do you want to continue? (y/n)
```
6. Type `y`. As the FortiGate unit starts, a series of system startup messages appears.
7. When the following messages appears:

```
Press any key to display configuration menu.....
```

Immediately press any key to interrupt the system startup.

You have only three seconds to press any key. If you do not press a key during this time, the FortiGate will reboot, and you will have to log in and repeat the `execute reboot` command.

If you successfully interrupt the startup process, the following messages appears:

```
[G]: Get firmware image from TFTP server.
[F]: Format boot device.
[B]: Boot with backup firmware and set as default
[C]: Configuration and information
[Q]: Quit menu and continue to boot with default firmware.
[H]: Display this list of options.
Enter G, F, Q, or H:
```

8. Type `G` to get the new firmware image from the TFTP server. The following message appears: `Enter TFTP server address [192.168.1.168]:`

9. Type the address of the TFTP server, then press *Enter*. The following message appears: `Enter Local Address [192.168.1.188]:`
10. Type the IP address of the FortiGate unit to connect to the TFTP server.

The IP address must be on the same network as the TFTP server.
Make sure that you do not enter the IP address of another device on this network.

The following message appears:

`Enter File Name [image.out]:`

11. Enter the firmware image file name then press *Enter*. The TFTP server uploads the firmware image file to the FortiGate unit and the following message appears:
`Save as Default firmware/Backup firmware/Run image without saving: [D/B/R]`
12. Type *R*. The FortiGate image is installed to system memory and the FortiGate unit starts running the new firmware image, but with its current configuration.

Test the new firmware image as required. When done testing, reboot the FortiGate unit, and the it will resume using the firmware that was running before you installed the test firmware.

Installing firmware from system reboot

In the event that the firmware upgrade does not load properly and the FortiGate unit will not boot, or continuously reboots, it is best to perform a fresh install of the firmware from a reboot using the CLI. If configured, the firmware can also be automatically installed from a USB drive; see [Restoring from a USB drive on page 2440](#) for details.

This procedure installs a firmware image and resets the FortiGate unit to factory default settings. You can use this procedure to upgrade to a new firmware version, revert to an older firmware version, or re-install the current firmware.

To use this procedure, you must connect to the CLI using the FortiGate console port and a RJ-45 to USB (or DB-9), or null modem cable. You must also install a TFTP server that you can connect to from the FortiGate internal interface. The TFTP server should be on the same subnet as the internal interface.

Before beginning this procedure, ensure that you backup the FortiGate unit configuration. See [Configuration backups on page 72](#) for details. If you are reverting to a previous FortiOS version, you might not be able to restore the previous configuration from the backup configuration file.

Installing firmware replaces your current antivirus and attack definitions, along with the definitions included with the firmware release you are installing. After you install new firmware, make sure that antivirus and attack definitions are up to date.

To install firmware from a system reboot:

1. Connect to the CLI using the RJ-45 to USB (or DB-9) or null modem cable.
2. Ensure that the TFTP server is running.
3. Copy the new firmware image file to the root directory of the TFTP server.
4. Ensure that the FortiGate unit can connect to the TFTP server using the `execute ping` command.
5. Restart the FortiGate unit: `execute reboot`. The following message is shown:
`This operation will reboot the system!`
`Do you want to continue? (y/n)`
6. Type *y*. As the FortiGate unit starts, a series of system startup messages appears.

7. When the following messages appears:

Press any key to display configuration menu.....

Immediately press any key to interrupt the system startup.

You have only three seconds to press any key. If you do not press a key during this time, the FortiGate will reboot, and you will have to log in and repeat the `execute reboot` command.

If you successfully interrupt the startup process, the following messages appears:

```
[C]: Configure TFTP parameters.
[R]: Review TFTP parameters.
[T]: Initiate TFTP firmware transfer.
[F]: Format boot device.
[I]: System information.
[B]: Boot with backup firmware and set as default.
[Q]: Quit menu and continue to boot.
[H]: Display this list of options.
```

Enter C,R,T,F,I,B,Q,or H:

8. If necessary, type C to configure the TFTP parameters, then type Q to return to the previous menu:

```
[P]: Set firmware download port.
[D]: Set DHCP mode.
[I]: Set local IP address.
[S]: Set local subnet mask.
[G]: Set local gateway.
[V]: Set local VLAN ID.
[T]: Set remote TFTP server IP address.
[F]: Set firmware file name.
[E]: Reset TFTP parameters to factory defaults.
[R]: Review TFTP parameters.
[N]: Diagnose networking(ping).
[Q]: Quit this menu.
[H]: Display this list of options.
```

Enter P,D,I,S,G,V,T,F,E,R,N,Q,or H:

The IP address must be on the same network as the TFTP server.
Make sure that you do not enter the IP address of another device on this network.

9. Type T get the new firmware image from the TFTP server.

The FortiGate unit loads the firmware.

10. Save the firmware as the default (D) or backup (B) firmware image, or run the image without saving it (R).

The FortiGate unit installs the new firmware image and restarts. The installation might take a few minutes to complete.

Factory resetting the FortiGate when the password is lost

For security reasons, users who lose their password must have physical access to the FortiGate and perform a TFTP restore of the firmware in order to regain access to the FortiGate. They will not have access to the current running configurations through the FortiGate. Configurations will be reset to the factory default once the firmware is reloaded. This process requires a connection to the TFTP server where the firmware image is stored.

To restore the FortiGate:

This procedure may vary depending on whether the FortiGate is a physical appliance or a VM.

1. Connect to the console port.
2. Ensure you can see the FortiGate prompt from the console terminal.
3. Physically power off the device, then power on the device.
4. Boot into the boot menu by pressing a key when prompted.
5. Follow the steps in the [previous procedure](#) to reload the firmware. Configurations will be reset to the factory default once the firmware is installed.
6. Once the firmware reload is complete, log in to the FortiGate to reconfigure the settings.

It is recommended to preform regular configuration backups and to store the backup on a secure server (see [Configuration changes](#) in the FortiOS Best Practices for more details). In the event that a password is lost, the configuration backup can be used to restore a configuration after the user completes the firmware installation process. This assumes the user knows the password from the previous backed up configuration. If the user does not know the password, they can still reload the configuration if it is not encrypted.

The following procedure describes how to edit an unencrypted backup configuration file so that the administrator password can be replaced before restoring the file.

To edit the configuration file when a password is lost:

1. Locate the line in the configuration file where `config system admin` is defined.
2. Edit an administrator account with an `accprofile` set to `super_admin`. This will ensure you can log in and perform any operations afterward.
3. Locate the line with `set password ENC xxxxxx`, and edit it to set a temporary new password in clear text (such as `set password cleartextpassword`).
4. Reload the configuration file.
5. Log in to the console using the temporary password, and then change the password.

The configuration backup allows the administrator to confirm the firmware that the FortiGate is running, so the same firmware can be restored. This information is listed in the first line of the configuration: `config-version=FGT61F-7.2.4-FW-build1396-230131:opmode=0:vdom=0:user=admin`.

Restoring from a USB drive

The FortiGate firmware can be manually restored from a USB drive, or installed automatically from a USB drive after a reboot.

To restore the firmware from a USB drive:

1. Copy the firmware file to the root directory on the USB drive.
2. Connect the USB drive to the USB port of the FortiGate device.

3. Connect to the FortiGate CLI using the RJ-45 to USB (or DB-9) or null modem cable.

4. Enter the following command:

```
execute restore image usb <filename>
```

The FortiGate unit responds with the following message:

```
This operation will replace the current firmware version! Do you want to continue?  
(y/n)
```

5. Type `y`. The FortiGate unit restores the firmware and restarts. This process takes a few minutes.

6. Update the antivirus and attack definitions:

```
execute update-now
```

To install firmware automatically from a USB drive:

1. Go to *System > Settings*.
2. In the *Start Up Settings* section, enable *Detect firmware* and enter the name of the firmware file.
3. Copy the firmware file to the root directory on the USB drive.
4. Connect the USB drive to the USB port of the FortiGate device.
5. Reboot the FortiGate device.

Using controlled upgrades

Using a controlled upgrade, you can upload a new version of the FortiOS firmware to a separate partition in the FortiGate memory for later upgrade. The FortiGate unit can be configured so that when it is rebooted, it will automatically load the new firmware. Using this option, you can stage multiple FortiGate units to upgrade simultaneously using FortiManager or a script.

To load the firmware for later installation:

```
execute restore secondary-image {ftp | tftp | usb} <filename_str>
```

To set the FortiGate unit so that when it reboots, the new firmware is loaded:

```
execute set-next-reboot {primary | secondary}
```

where {primary | secondary} is the partition with the preloaded firmware.

Downgrading individual device firmware

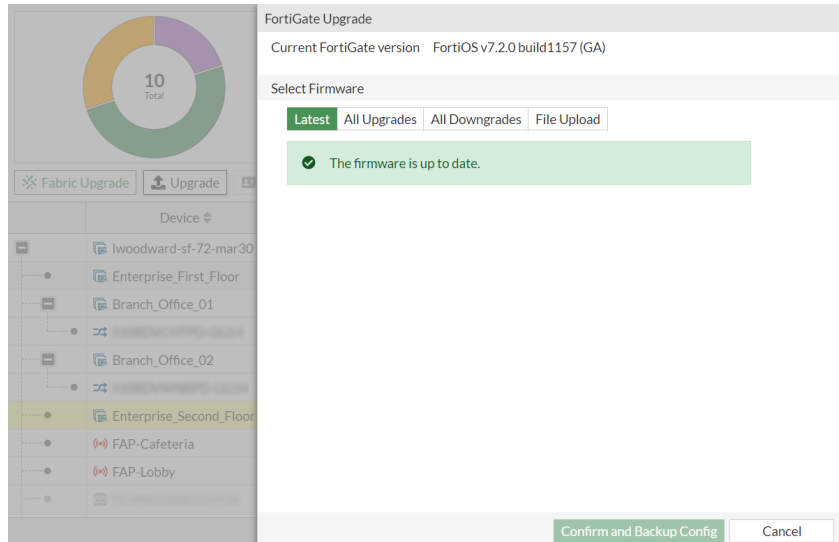

Downgrading the firmware is not recommended.

This procedure downgrades the FortiGate to a previous firmware version. After downgrading, you may be unable to restore the backup configuration.

To downgrade to a previous firmware version in the GUI:

1. Log into the FortiGate GUI as the admin administrative user.
2. Go to *System > Firmware & Registration*. The *Firmware Version* column displays the version and either (*Feature*) or (*Mature*).
3. Select the FortiGate, and click *Upgrade*. The *FortiGate Upgrade* pane opens.

4. Click one of the following tabs to select a downgrade method:

All Downgrades

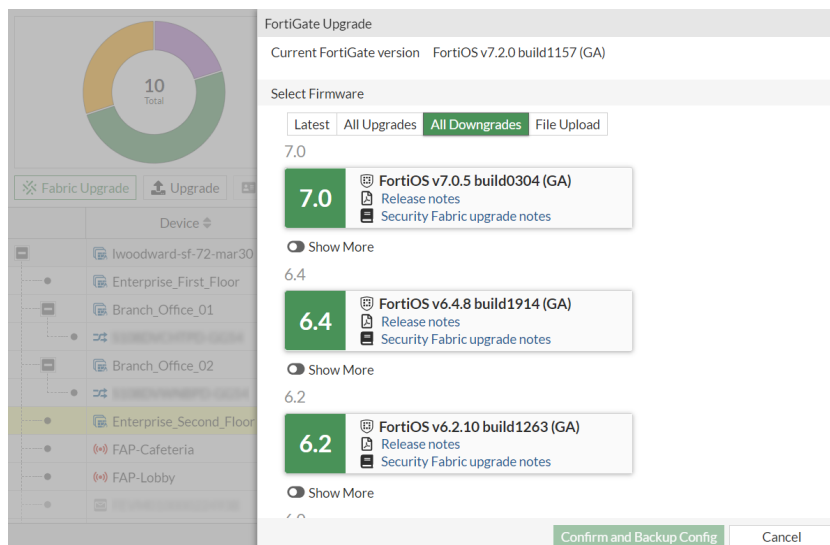

Click the *All Downgrades* tab to view and select all firmware versions that are available from FortiGuard for downgrade.

File Upload

Click the *File Upload* tab to upload a firmware file that you previously downloaded from the [Fortinet Customer Service & Support](#) website.

1. See [Downloading a firmware image on page 2436](#).

In this example, the *All Downgrades* tab is selected.

5. Select a firmware version and click *Confirm and Backup Config*. A warning message is displayed.

6. Click *Continue* to continue with the downgrade.

The FortiGate unit backs up the current configuration to the management computer, uploads the firmware image file, downgrades to the firmware version, and restarts. This process takes a few minutes.

To downgrade to a previous firmware version in the CLI:

1. Make sure that the TFTP server is running.
2. Copy the new firmware image file to the root directory of the TFTP server.
3. Log into the CLI.
4. Ping the TFTP server to ensure that the FortiGate can connect to it:

```
execute ping <tftp_ipv4>
```
5. Enter the following command to copy the firmware image from the TFTP server to the FortiGate unit:

```
execute restore image tftp <filename> <tftp_ipv4>
```

The FortiGate unit responds with the message:

```
This operation will replace the current firmware version!
Do you want to continue? (y/n)
```
6. Type *y*. The FortiGate unit uploads the firmware image file, then a message similar to the following is shown:

```
Get image from tftp server OK.
Check image OK.
This operation will downgrade the current firmware version!
Do you want to continue? (y/n)
```
7. Type *y*. The FortiGate unit downgrades to the old firmware version and restarts. This process takes a few minutes.
8. Reconnect to the CLI.
9. Update the antivirus and attack definitions:

```
execute update-now
```

Downloading the EOS support package for supported Fabric devices

FortiGates, FortiSwitches, FortiAPs, and FortiExtenders can download an EOS (end of support) package automatically from FortiGuard during the bootup process or by using manual commands. Based on the downloaded EOS package files, when a device passes the EOS date, a warning message is displayed in the device's tooltip. The device is also highlighted in the following GUI locations:

- *System > Firmware & Registration* page
- *Security Fabric > Physical Topology* and *Logical Topology* pages
- *Dashboard > Status > System Information* widget

FortiGuard updates

The EOS packages can be downloaded automatically from FortiGuard, but they can also be downloaded manually.

To manually download the EOS package from the FortiGuard server:

```
# diagnose fortiguard-resources update <product>-end-of-support
```

Product	Description
fortigate-end-of-support	FortiGate product life cycle information.

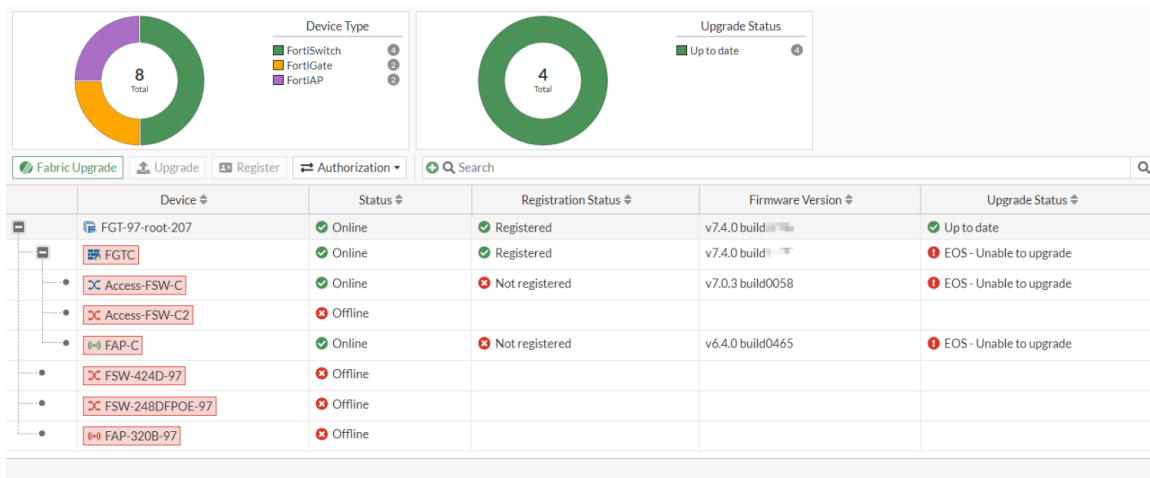

Product	Description
fortiswitch-end-of-support	FortiSwitch product life cycle information.
fortiap-end-of-support	FortiAP product life cycle information.
fortiextender-end-of-support	FortiExtender product life cycle information.

In the event the EOS package files are not downloaded due to a connection issue, use `diag fortiguard-resources update <product>-end-of-support` to download the package files.

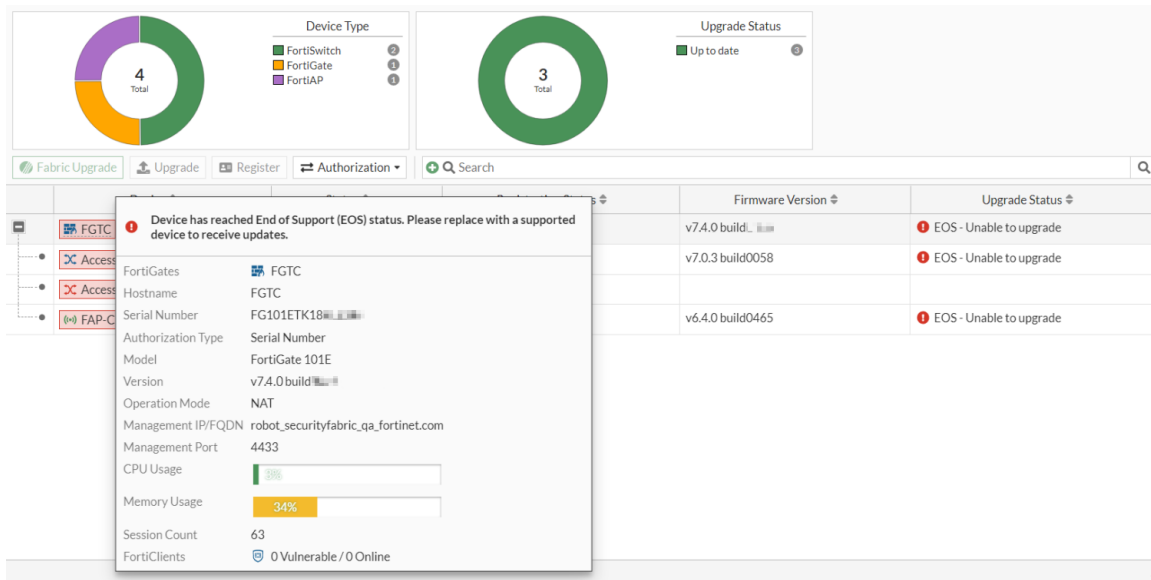

GUI warnings

On the *System > Firmware & Registration* page, devices that have reached EOS are highlighted in red, and their *Status* is *EOS - Unable to upgrade*.

Hover over a device name to view the tooltip, which includes an EOS warning.

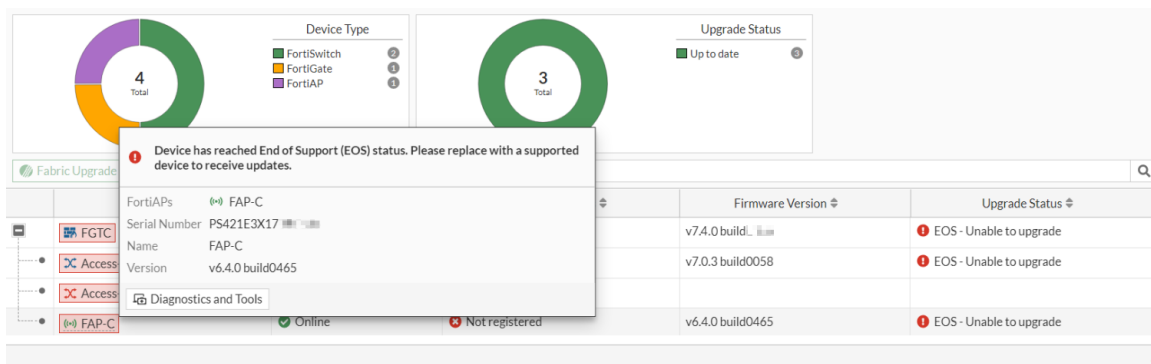

- Sample FortiGate tooltip:

- Sample FortiSwitch tooltip:

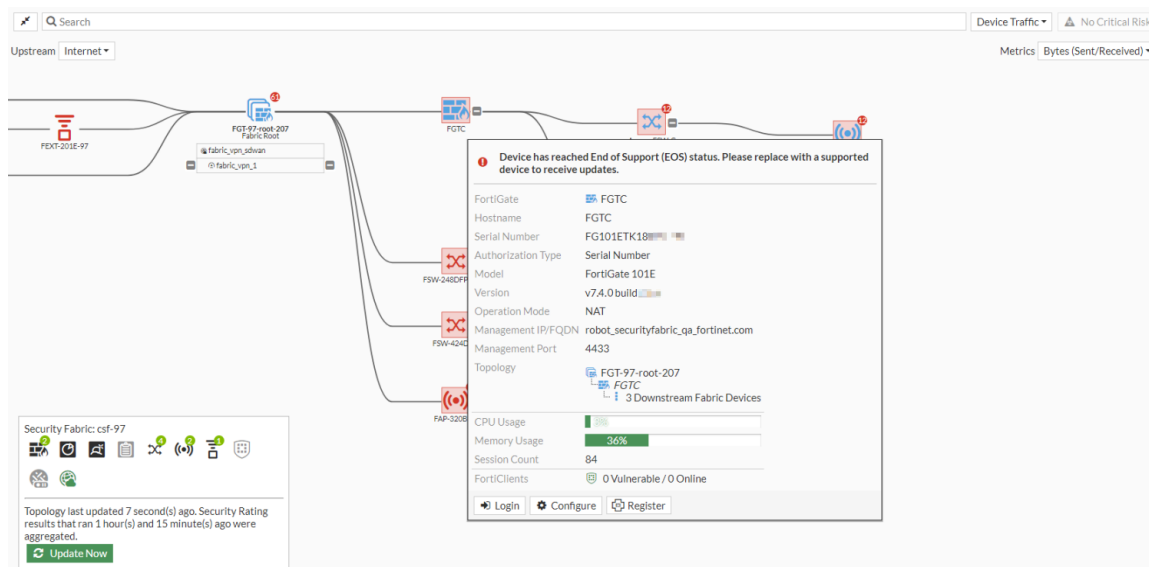

- Sample FortiAP tooltip:

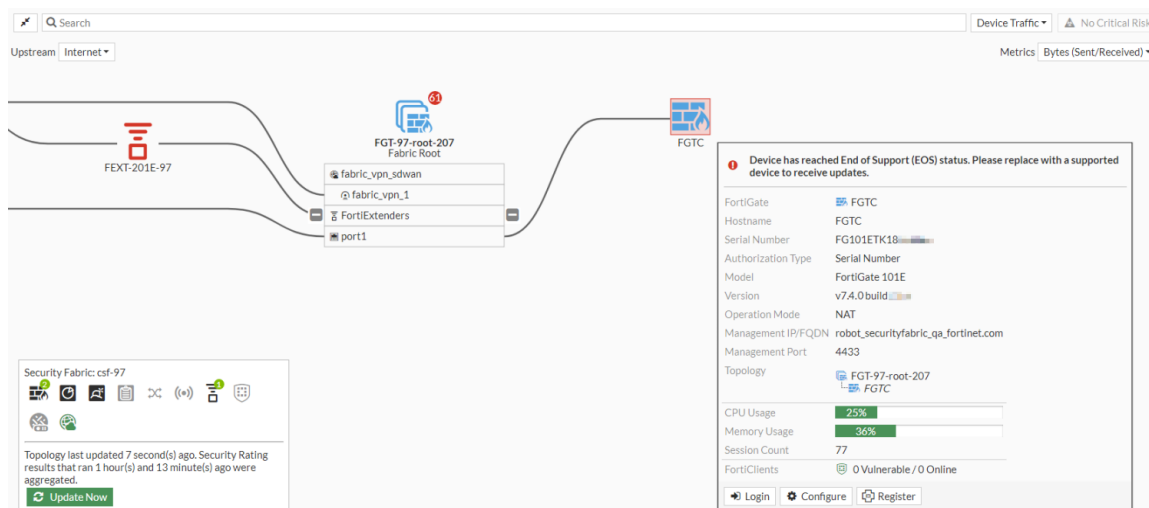

On the *Security Fabric > Physical Topology* and *Logical Topology* pages, devices that have reached EOS are highlighted in red. The device tooltips also include an EOS warning.

- Sample *Security Fabric > Physical Topology* page with tooltip:

- Sample *Security Fabric > Logical Topology* page with tooltip:

The *Dashboard > Status > System Information* widget includes a warning at the bottom of the widget that the *Device has reached EOS status*.

Preventing FortiGates with an expired support contract from upgrading to a major or minor firmware release

If the FortiGate support contract has expired, you will be unable to upgrade the firmware to a higher major version, such as from FortiOS 6.0 to 7.0, or to a higher minor version, such as from FortiOS 7.0 to 7.2. However, you can upgrade the firmware of a FortiGate with an expired support contract to a higher patch build, such as from FortiOS 7.4.0 to 7.4.1, to allow for security updates.

You can confirm the *Firmware & General Updates* (FMWR) contract expiry date in the *System > FortiGuard* page or by using the `diagnose test update info contract` command or from the *Licenses* widget in *Dashboard > Status*.

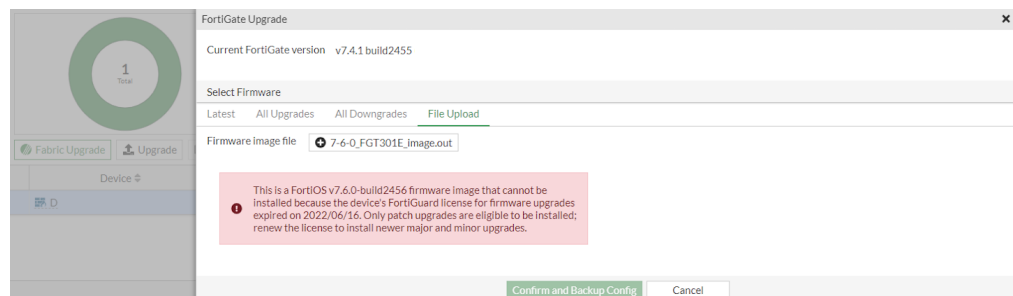

Firmware upgrades are performed in the *System > Firmware & Registration* page or in the CLI. To demonstrate the functionality of this feature, the following examples use FortiGates that are running and upgrading to fictitious build numbers. For more information on performing an upgrade, see [Upgrading individual device firmware on page 2423](#).

Upgrading firmware in the GUI

If the contract is expired, the following upgrade attempts will be blocked in the GUI *System > Firmware & Registration* page:

- If a higher, major or minor version firmware is uploaded to the FortiGate, the upgrade cannot be processed and a warning will display.

In the following example, a firmware image file is uploaded in an attempt to upgrade the FortiGate from 7.4.1 to 7.6.0. However, since the license is expired, the upgrade is denied and a warning is displayed.

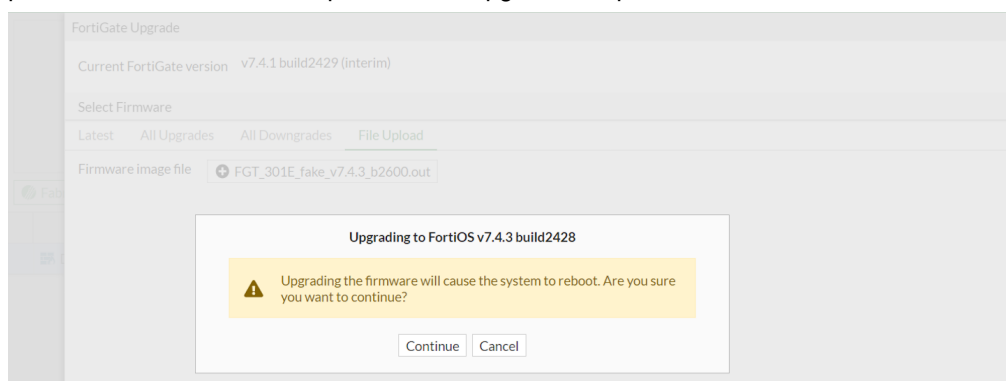

- FortiGuard upgrades will be unavailable until the support contract is renewed.

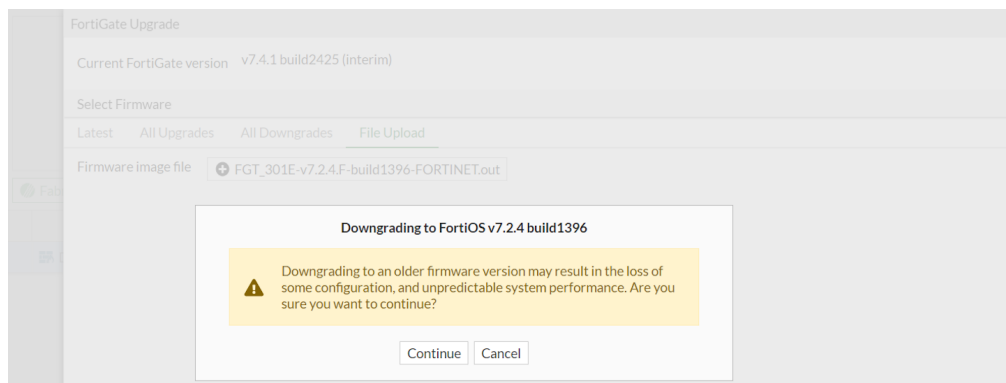

When the support contract is expired, the following actions are still available in the GUI *System > Firmware & Registration* page:

- The FortiGate firmware can be upgraded to a higher patch build to allow for necessary security updates.
In the following example, a firmware image file is uploaded in an attempt to upgrade from 7.4.1 to 7.4.3. Since it is a patch release, the file is accepted and the upgrade can proceed.

- The FortiGate firmware can be downgraded to lower major and minor versions.
In the following example, a firmware image file is uploaded in an attempt to downgrade from 7.4.1 to 7.2.4. Since the firmware is for a lower version, the firmware is accepted and the downgrade can proceed.

Upgrading firmware in the CLI

The following example demonstrates what occurs when upgrading the firmware to a patch build and to a higher version with an expired license in the CLI. The patch upgrade successfully upgrades the firmware from FortiOS 7.4.0 to 7.4.3. The major upgrade attempts and fails to upgrade the firmware from FortiOS 7.4.0 to 7.6.3.

To upgrade the firmware to a higher patch build:**1. Confirm the current firmware version:**

```
# get system status
Version: FortiGate-301E v7.4.0,build2303,230307 (interim)
```

2. Upgrade the firmware:

```
# execute restore image tftp v743-B2400-GA-M_B230309_FGT_301E.out 172.16.200.55
This operation will replace the current firmware version!
Do you want to continue? (y/n)y
Please wait...
Connect to tftp server 172.16.200.55 ...
.....
Firmware upgrade in progress ...
Done.
```

3. Confirm the new firmware version:

```
# get system status
Version: FortiGate-301E v7.4.3,build2400,230309 (GA.M)
```

To upgrade the firmware to a higher major version:**1. Confirm the current firmware version:**

```
# get system status
Version: FortiGate-301E v7.4.0,build2303,230307 (interim)
```

2. Upgrade the firmware:

```
# execute restore image tftp v763-B1505-GA-F_B234847_FGT_301E.out 172.16.200.55
.....
Firmware update licence is expired! Please update to a valid licence.
Command fail. Return code -180
```

Settings

The default administrator password should be configured immediately after the FortiGate is installed, see [Default administrator password on page 2450](#).

After that, there are several system settings that should also be configured in *System > Settings*:

- [Changing the host name on page 2451](#)
- [Setting the system time on page 2451](#)

Default administrator password

By default, your FortiGate has an administrator account set up with the username `admin` and no password. In order to prevent unauthorized access to the FortiGate, it is highly recommended that you add a password to this account.

Adding a password to the *admin* administrator is mandatory. You will be prompted to configure it the first time you log in to the FortiGate using that account, after a factory reset, and after a new image installation.

To change the default password in the GUI:

1. Go to *System > Administrators*.
2. Edit the *admin* account.
3. Click *Change Password*.
4. If applicable, enter the current password in the *Old Password* field.
5. Enter a password in the *New Password* field, then enter it again in the *Confirm Password* field.

If the password does not conform to the password policy, an error is shown:

The screenshot shows the 'Edit Password' dialog box. At the top, a yellow warning banner states: 'Changing the password of the current administrator account will require you to login again.' Below this, the 'Username' field is set to 'admin'. The 'Old Password' field contains a single dot. The 'New Password' field is highlighted with a red border and contains ten dots. A red error message below it reads: 'The password must conform to the system password policy.' The 'Confirm Password' field is empty. Below the fields, a section titled 'Password must conform to the following rules:' lists two rules: 'Minimum length' and 'Minimum number of new characters'. At the bottom are 'OK' and 'Cancel' buttons.

If the password conforms to the password policy, no error message is shown:

This screenshot is identical to the previous one, but the 'New Password' field now contains ten dots and there is no red error message. The 'Confirm Password' field also contains ten dots. The 'OK' and 'Cancel' buttons remain at the bottom.

6. Click *OK*.

To change the default password in the CLI:

```
config system admin
    edit admin
        set password <old password> <old password>
New password must conform to the password policy enforced on this device:
minimum-length=8; the new password must have at least 1 unique character(s) which don't
exist in the old password.; must not be same as last two passwords

node_check_object fail! for password *

value parse error before '*'
Command fail. Return code -49

        set password <new password> <old password>
    next
end
```

It is also recommended that you change the user name of this account; however, since you cannot change the user name of an account that is currently in use, a second administrator account must be created in order to do this.

Changing the host name

The FortiGate host name is shown in the *Hostname* field in the *System Information* widget on a dashboard, as the command prompt in the CLI, as the SNMP system name, as the device name on FortiGate Cloud, and other places. If the FortiGate is in an HA cluster, use a unique host name to distinguish it from the other devices in the cluster.

An administrator requires *System > Configuration* read/write access to edit the host name. See [Administrator profiles on page 2416](#) for details.

To change the host name in the GUI:

1. Go to *System > Settings*.
2. In the *Host name* field, enter a new name.
3. Click *Apply*.

To change the host name in the CLI:

```
config system global
    set hostname <hostname>
end
```

Setting the system time

You can either manually set the FortiOS system time, or configure the device to automatically keep its system time correct by synchronizing with a Network Time Protocol (NTP) or Precision Time Protocol (PTP) server.

Daylight savings time is enabled by default, and can only be configured in the CLI.

For many features to work, including scheduling, logging, and SSL-dependent features, the FortiOS system time must be accurate.

To configure the date and time in the GUI:

1. Go to *System > Settings*.
2. In the *System Time* section, configure the following settings to either manually set the time or use an NTP server:

Time Zone	Select a time zone from the list. This should be the time zone that the FortiGate is in.
Set Time	Select either <i>NTP</i> , <i>PTP</i> , or <i>Manual settings</i> .
NTP	To use an NTP server other than FortiGuard, the CLI must be used. In the <i>Sync interval</i> field, enter how often, in minutes, that the device synchronizes its time with the NTP server.
PTP	<ul style="list-style-type: none"> • Set the <i>Mode</i> to <i>Multicast</i> or <i>Hybrid</i>. • Select the <i>Delay mechanism</i>: <i>E2E</i> or <i>P2P</i>. • Set the <i>Request interval</i>, in seconds. • Select the <i>Interface</i>.
Manual settings	Manually enter the <i>Date</i> , and <i>Time</i> .
Setup device as local NTP server	<p>Enable to configure the FortiGate as a local NTP server. This option is not available if <i>Set Time</i> is <i>PTP</i>.</p> <p>In the <i>Listen on Interfaces</i> field, set the interface or interfaces that the FortiGate will listen for NTP requests on.</p>

3. Click *Apply*.

To configure the date and time in the CLI:

1. Configure the timezone and daylight savings time:

```
config system global
    set timezone <integer>
    set dst {enable | disable}
end
```

2. Either manually configure the date and time, or configure an NTP or PTP server:

- Manual:

```
execute date <yyyy-mm-dd>
execute time <hh:mm:ss>
```

- NTP server:

```
config system ntp
    set ntpsync enable
    set type {fortiguard | custom}
    set syncinterval <integer>
    set source-ip <ip_address>
```

```
set source-ip6 <ip6_address>
set server-mode {enable | disable}
set interface <interface>
set authentication {enable | disable}
set key-type {MD5 | SHA1}
set key <password>
set key-id <integer>
config ntpserver
  edit <server_id>
    set server <ip_address or hostname>
    set ntpv3 {enable | disable}
    set authentication {enable | disable}
    set interface-select-method {auto | sdwan | specify}
    set key <password>
    set key-id <integer>
  next
end
end
```

- **PTP server:**

```
config system ptp
  set status enable
  set mode {multicast | hybrid}
  set delay-mechanism {E2E | P2P}
  set request-interval <integer>
  set interface <string>
end
```

SHA-1 authentication support (for NTPv4)

SHA-1 authentication support allows the NTP client to verify that servers are known and trusted and not intruders masquerading (accidentally or intentionally) as legitimate servers. In cryptography, SHA-1 is a cryptographic hash algorithmic function.

SHA-1 authentication support is only available for NTP clients, not NTP servers.

To configure authentication on a FortiGate NTP client:

```
config system ntp
  set ntpsync enable
  set type custom
  set syncinterval 1
  config ntpserver
    edit "883502"
      set server "10.1.100.11"
      set authentication enable
      set key *****
      set key-id 1
    next
  end
end
```

Command	Description
authentication {enable disable}	Enable/disable MD5/SHA1 authentication (default = disable).
key <passwd>	Key for MD5/SHA1 authentication. Enter a password value.
key-id <integer>	Key ID for authentication. Enter an integer value from 0 to 4294967295.

To confirm that NTP authentication is set up correctly:

```
# diagnose sys ntp status
synchronized: yes, ntpsync: enabled, server-mode: disabled
ipv4 server(10.1.100.11) 10.1.100.11 -- reachable(0xff) S:4 T:6 selected
server-version=4, stratum=3
```

If NTP authentication is set up correctly, the server version is equal to 4.

PTPv2

Precision time protocol (PTP) is used to synchronize network clocks. It is best suited to situations where time accuracy is of the utmost importance, as it supports accuracy in the sub-microsecond range. Conversely, NTP accuracy is in the range of milliseconds or tens of milliseconds.

The following CLI commands are available:

```
config system ptp
    set status {enable | disable}
    set mode {multicast | hybrid}
    set delay-mechanism {E2E | P2P}
    set request-interval <integer>
    set interface <interface>
end
```

Command	Description
status {enable disable}	Enable or disable the FortiGate system time by synchronizing with a PTP server (default = disable).
mode {multicast hybrid}	Use multicast or hybrid transmission (default = multicast).
delay-mechanism {E2E P2P}	Use end-to-end (E2E) or peer-to-peer (P2P) delay detection (default = E2E).
request-interval <integer>	The logarithmic mean interval between the delay request messages sent by the client to the server in seconds (default = 1).
interface <interface>	The interface that the PTP client will reply through.

Sample configuration

This example uses the following topology:

To configure a FortiGate to act as a PTP client that synchronizes itself with a Linux PTP server:

1. Enable debug messages:

```
# diagnose debug application ptpd -1
```

This command will provide details to debug the PTP communication with the server.

2. Check the system date:

```
# execute date
current date is: 2021-04-01
```

3. Configure PTP in global mode:

```
config system ptp
    set status enable
    set interface wan2
end
```

4. Check the system date again after synchronization with the PTP server:

```
# execute date
current date is: 2021-04-27
```

Configuring ports

To improve security, the default ports for administrative connections to the FortiGate can be changed. Port numbers must be unique. If a conflict exists with a particular port, a warning message is shown.

When connecting to the FortiGate after a port has been changed, the port number be included, for example:

`https://192.168.1.99:100.`

To configure the ports in the GUI:

1. Go to *System > Settings*.
2. In the *Administration Settings* section, set the HTTP, HTTPS, SSH, and Telnet ports.
3. Enable *Redirect to HTTPS* to prevent HTTP from being used by administrators.
4. Click *Apply*.

To configure the ports in the CLI:

```
config system global
    set admin-port <port>
    set admin-sport <port>
    set admin-https-redirect {enable | disable}
    set admin-ssh-port <port>
```

```
set admin-telnet-port <port>
end
```

Custom default service port range

The default service port range can be customized using the following CLI command:

```
config system global
    set default-service-source-port <port range>
end
```

Where <port range> is the new default service port range, that can have a minimum value of 0 and a maximum value up to 65535. The default value is 1 to 65535.

This change effects the TCP/UDP protocol.

Setting the idle timeout time

The idle timeout period is the amount of time that an administrator will stay logged in to the GUI without any activity. This is to prevent someone from accessing the FortiGate if the management PC is left unattended. By default, it is set to five minutes.

A setting of higher than 15 minutes will have a negative effect on a security rating score. See [Security rating on page 2905](#) for more information.

To change the idle timeout in the GUI:

1. Go to *System > Settings*.
2. In the *Administration Settings* section, set the *Idle timeout* to up to 480 minutes.
3. Click *Apply*.

To change the idle timeout in the CLI:

```
config system global
    set admintimeout <1-480>
end
```

Setting the password policy

A password policy can be created for administrators and IPsec pre-shared keys. See [Password policy on page 2407](#) for information.

Changing the view settings

The view settings change the look and language of the FortiOS GUI.

To change the view settings in the GUI:

1. Go to *System > Settings*.
2. In the *View Settings* section, configure the following settings:

Language	Set the GUI language: <i>English, French, Spanish, Portuguese, Japanese, Traditional Chinese, Simplified Chinese, Korean.</i>
Theme	Set the theme color: <i>Jade, Neutrino, Mariner, Graphite, Melongene, Retro, Dark Matter, Onyx, or Eclipse.</i>
Date/Time Display	Set the date and time to display using the FortiGate's or the browser's timezone.
NGFW Mode	Set the NGFW mode to either <i>Profile-based</i> (default) or <i>Policy-based</i> .
Central SNAT	Optionally, enable central SNAT. This option is only available in <i>Profile-based</i> mode.

3. Click *Apply*.

To change the view settings in the CLI:

```
config system global
    set language {english | french | spanish | portuguese | japanese | trach | simch |
korean}
    set gui-theme {jade | neutrino | mariner | graphite | melongene | retro | dark-matter |
onyx | eclipse}
    set gui-date-time-source {system | browser}
end

config system settings
    set ngfw-mode {profile-based | policy-based}
    set central-nat {enable | disable}
end
```

Setting the administrator password retries and lockout time

By default, the number password retry attempts is set to three, allowing the administrator a maximum of three attempts at logging in to their account before they are locked out for a set amount of time (by default, 60 seconds).

The number of attempts and the default wait time before the administrator can try to enter a password again can be configured using the CLI.

A maximum of ten retry attempts can be configured, and the lockout period can be 1 to 2147483647 seconds (over 68 years). The higher the retry attempts, the higher the risk that someone might be able to guess the password.

To configure the lockout options:

```
config system global
    set admin-lockout-threshold <failed_attempts>
    set admin-lockout-duration <seconds>
end
```

For example, to set the number of retry attempts to 1, and the lockout time to 5 minutes:

```
config system global
    set admin-lockout-threshold 1
    set admin-lockout-duration 300
end
```

If the time span between the first failed log in attempt and the lockout threshold failed attempt is less than lockout time, the lockout will be triggered.

TLS configuration

The minimum TLS version that is used for local out connections from the FortiGate can be configured in the CLI:

```
config system global
    set ssl-min-proto-version {SSLv3 | TLSv1 | TLSv1-1 | TLSv1-2 | TLSv1-3}
end
```

By default, the minimum version is TLSv1.2. The FortiGate will try to negotiate a connection using the configured version or higher. If the server that FortiGate is connecting to does not support the version, then the connection will not be made. Some FortiCloud and FortiGuard services do not support TLSv1.3.

Minimum SSL/TLS versions can also be configured individually for the following settings, not all of which support TLSv1.3:

Setting	CLI
Email server	config system email-server
Certificate	config vpn certificate setting
FortiSandbox	config system fortisandbox
FortiGuard	config log fortiguard setting
FortiAnalyzer	config log fortianalyzer setting
Syslog	config log syslogd setting
User Authentication	config user setting
LDAP server	config user ldap
POP3 server	config user pop3
Exchange server	config user exchange

A minimum (`ssl-min-proto-ver`) and a maximum (`ssl-max-proto-ver`) version can be configured for SSL VPN. See [TLS 1.3 support on page 2176](#)

Controlling return path with auxiliary session

When multiple incoming or outgoing interfaces are used in ECMP or for load balancing, changes to routing, incoming, or return traffic interfaces impacts how an existing sessions handles the traffic. Auxiliary sessions can be used to handle these changes to traffic patterns.

- In FortiOS 6.0 and earlier, the auxiliary session feature is not supported.
- In FortiOS 6.2.0 to 6.2.2, the auxiliary session feature is permanently enabled.
- In FortiOS 6.2.3 and later, the auxiliary session feature is disabled by default, and can be enabled if required.

To enable or disable the auxiliary session feature:

```
config system settings
    set auxiliary-session {enable | disable*}
end
```

When enabling auxiliary sessions, consider the impact of routing in both traffic directions. In topologies such as SD-WAN hub and spoke or ADVPN deployments, the symmetry of the return traffic is important for maintaining the stability of the session. It is expected that the spoke selects the outbound interface and path, and the other nodes obey and reply symmetrically. It is recommended to disable auxiliary in these scenarios, and others where incoming and return traffic symmetry is expected.

Scenarios

Incoming traffic is from the client to the server. Return traffic is from the server to the client.

Scenario 1 - Return traffic returns on the original outgoing interface

In this scenario, a session is established between port1 and port3. When the return traffic hits port3:

Auxiliary sessions disabled:

The reply to the client egresses on the original incoming interface, port1. If policy routes or SD-WAN rules are configured, the next hop gateway is applied if the output device is the same as the original incoming interface.

Auxiliary sessions enabled:

The reply to the client egresses on the best route in the routing table:

- If the best route is port1, then it will egress on port1.
- If the best route is port2, then it will egress on port2.

If policy routes or SD-WAN rules are configured, they must be matched to determine the egress interface. If both are configured, policy routes have higher priority.

Scenario 2 - Return traffic returns on an interfaces other than the original outgoing interfaces

In this scenario, a session is established between port1 and port3. When the return traffic hits port4:

Auxiliary sessions disabled:

- The session is dirtied and then gets refreshed, and interfaces on the session are updated.
- If there is a high traffic volume or flapping between the interfaces, the CPU usage increases.

Auxiliary sessions enabled:

An auxiliary session is created for the existing session, and traffic returns to the client as normal on the auxiliary session.

Scenario 3 - Incoming traffic enters on an interfaces other than the original incoming interfaces

In this scenario, a session is established between port1 and port3. When the incoming traffic hits port2:

Auxiliary sessions disabled:

The session is dirtied and then gets refreshed, and interfaces on the session are updated.

Auxiliary sessions enabled:

An auxiliary session is created for the existing session, and traffic is forwarded to the server as normal on the auxiliary session.

Scenario 4 - the routing table is changed

In this scenario, a session has been established between port1 and port3, when a new route on port4 is updated as the route to the server.

Auxiliary sessions disabled:

As long as there is a route to the destination, the session will not be dirtied or refreshed. Even though there is a better route, traffic continues on the original path between port1 and port3.

Auxiliary sessions enabled:

The session is dirtied and then gets refreshed, and interfaces on the session are updated.

Effect on NPU offloading sessions

When the auxiliary session feature is disabled, there is always one session. If the incoming or return interface changes, the FortiGate marks the session as dirty and updates the session's interfaces. This cannot be done by the NPU, so the session is not offloaded to the NPU, and is processed by the CPU instead. If Equal-Cost Multi-Path (ECMP) causes the interface to keep changing, then it will use significant CPU resources.

When the auxiliary session feature is enabled and the incoming or return interface changes, it creates an auxiliary session, and all traffic can continue to be processed by the NPU.

Verification

When an auxiliary, or reflect, session is created, it will appear as a reflect session below the existing session:

```
# diagnose sys session list
session info: proto=17 proto_state=00 duration=111 expire=175 timeout=0 flags=00000000
socktype=0 sockport=0 av_idx=0 use=4

Email alerts

Alert emails are used to notify administrators about events on the FortiGate device, allowing a quick response to any issues.

There are two methods that can be used to configure email alerts:

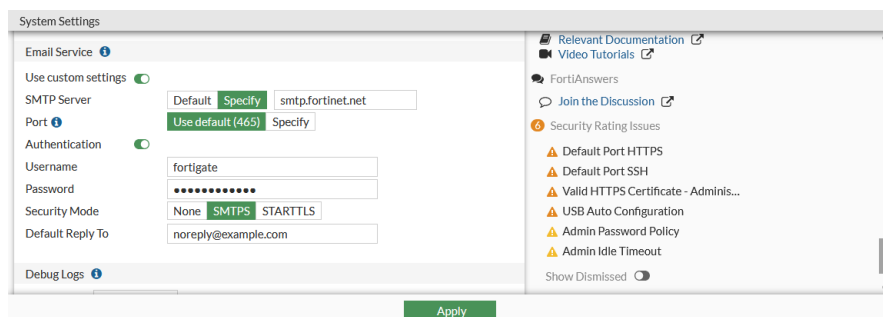

- [Automation stitches on page 2464](#)
- [Alert emails on page 2466](#)

The FortiGate has a default SMTP server, `notification.fortinet.net`, that provides secure mail service with SMTPS. It is used for all emails that are sent by the FortiGate, including alert emails, automation stitch emails, and FortiToken Mobile activations. You can also configure a custom email service.

To configure a custom email service in the GUI:

1. Go to *System > Settings*.
2. In the *Email Service* section, enable *Use custom settings*.
3. Configure the following settings:

SMTP Server	If required, select <i>Specify</i> and enter the address or name of the SMTP server, such as <i>smtp.example.com</i> .
Port	If required, select <i>Specify</i> and enter a specific port number. The default is port 465.
Authentication	If required by the email server, enable authentication. If enabled, enter the <i>Username</i> and <i>Password</i> .
Security Mode	Set the security mode: <i>None</i> , <i>SMTPS</i> , or <i>STARTTLS</i> .
Default Reply To	<p>Optionally, enter the reply to email address, such as <i>noreply@example.com</i>. This address will override the from address that is configured for an alert email.</p> <p>If <i>SMTP Server</i> is set to <i>Default</i>, the <i>Default Reply To</i> field is hidden and cannot be configured, and the default address is set to <i>DoNotReply@notification.fortinet.net</i>. This ensures that default SMTP server can work correctly.</p>

4. Click *Apply*.

To configure a custom email service in the CLI:

```
config system email-server
  set server "smtp.fortinet.net"
  set reply-to "noreply@example.com"
  set port 465
  set authenticate enable
  set username "fortigate"
  set password *****
  set security smtps
end
```

If server is set to `notification.fortinet.net`, the `reply-to` command is hidden and cannot be configured, and the default reply to address is set to `DoNotReply@notification.fortinet.net`. This ensures that default SMTP server can work correctly.

Automation stitches

Automation stitches can be configured to send emails based on a variety of triggers, giving you control over the events that cause an alert, and who gets alerted. For more information, see [Automation stitches on page 2915](#).

In this example, the default mail service sends an email to two recipients when an Admin login failed event occurs or there is a configuration change.

To configure the automation stitch in the GUI:

1. On the root FortiGate, go to *Security Fabric > Automation* and click *Create New*.
2. Enter a name for the stitch, such as *Admin Fail*.
3. Configure the trigger:
 - a. Click *Add Trigger*.
 - b. Click *Create* and select *FortiOS Event Log*.
 - c. Enter a name for the trigger, such as *Admin Fail*.
 - d. Click in the *Event* field, and in the slide out pane, search for and select *Admin login failed*.

- e. Click **OK**.
 - f. Select the trigger in the list and click **Apply**.
4. Configure the action:
- a. Click **Add Action**.
 - b. Click **Create** and select **Email**.
 - c. Configure the following settings:

Name	Enter a name for the action, such as <i>Admin Fail_email</i> .
To	Enter the two email recipients' addresses, such as <i>admin@example.com</i> and <i>manager@example.com</i> .
Subject	Enter an subject, such as <i>Admin log in failed</i> .
Body	Edit as required. By default, the email body will include all the fields from the log event that triggered the stitch.

Create New Automation Action

Email Send a custom email to the specified recipient(s). [CHANGE TYPE](#)

Name: Admin Fail_email

Minimum interval: 0 second(s)

Description: 0/255

Email

From:

Send to FortiCare email: ☐

To: admin@example.com, manager@example.com

Subject: Admin log in failed

Body: %%log%%

Replacement message: ☐

[See More](#)

OK **Cancel**

- d. Click **OK**.
 - e. Select the action in the list and click **Apply**.
5. Click **OK**.
6. Create a second stitch with *Configuration Change* as the trigger, and an email action with a different subject line (such as *Configuration Change Detected*).

To configure the automation stitch in the CLI:

1. Create the automation triggers:

```
config system automation-trigger
  edit "Admin Fail"
    set event-type event-log
    set logid 32002
  next
  edit "Config Change"
    set event-type config-change
```

```
    next
end
```

2. Create automation actions to send the email messages:

```
config system automation-action
    edit "Admin Fail_email"
        set action-type email
        set email-to "admin@example.com" "manager@example.com"
        set email-subject "Admin log in failed"
    next
    edit "Config Change_email"
        set action-type email
        set email-to "admin@example.com" "manager@example.com"
        set email-subject "Configuration Change Detected"
    next
end
```

3. Create the automation stitches:

```
config system automation-stitch
    edit "Admin Fail"
        set trigger "Admin Fail"
        config actions
            edit 1
                set action "Admin Fail_email"
                set required enable
            next
        end
    next
    edit "Config Change"
        set trigger "Config Change"
        config actions
            edit 1
                set action "Config Change_email"
                set required enable
            next
        end
    next
end
```

Alert emails

When configuring an alert email, you can define the threshold when an issue becomes critical and requires attention. When the threshold is reached, an email is sent to up to three recipients on the configured schedule to notify them of the issue.

Alert email messages can be configured in the CLI. For more information on the available CLI commands, see [Configure alert email settings](#).

Alert email messages (under `config alertemail setting`) cannot monitor and notify users of the current logging status or the status of the miglogd daemon. In the event that the miglogd daemon is unresponsive, alert email messages cannot be triggered.

IPS, SSH, violation traffic, antivirus, and web filter logs are supported as triggers in automation stitches. For more information, see [Event log category triggers on page 2945](#).

In this example, the FortiGate is configured to send email messages to two addresses, `admin@example.com` and `manager@example.com`, every two minutes when multiple intrusions, administrator log in or out events, or configuration changes occur.

To configure an alert email:

```
config alertemail setting
    set username fortigate@example.com
    set mailto1 admin@example.com
    set mailto2 manager@example.com
    set filter-mode category
    set email-interval 2
    set IPS-logs enable
    set configuration-changes-logs enable
    set admin-login-logs enable
end
```

Using configuration save mode

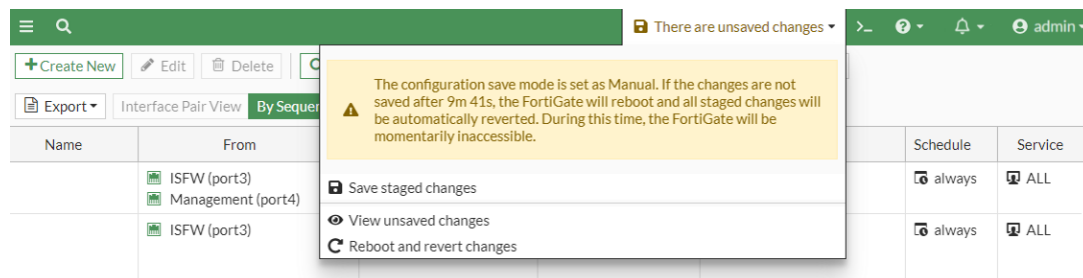

Administrators can use configuration save mode set to *Manual* to implement strict change control by requiring changes to be manually committed to the flash. To configure the setting in the GUI, go to *System > Settings*.

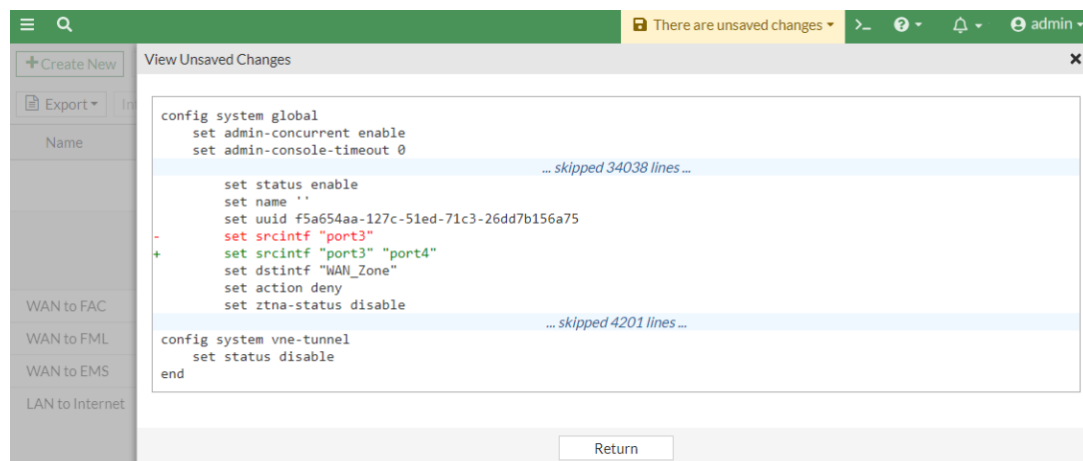

When *Configuration save mode* is set to *Automatic* (default), configuration changes are automatically saved to both memory and flash.

When *Configuration save mode* is set to *Manual*, configuration changes are saved to memory, but not to flash. The changes take effect immediately, but must be manually saved to flash. Unsaved changes are reverted when the device is rebooted. If *Revert upon timeout* is enabled, the system might be unresponsive for a short time after the configured timeout while it reverts the changes back to the previous save point. Prior to the timeout expiring, a pop-up warning gives you the option to postpone reverting the configuration by one minute, revert the configuration immediately, or save the configuration changes.

In *Manual* mode, a warning is shown in the banner when there are unsaved changes. Click the warning to save, view, or revert the changes. When *Reboot and revert changes* is clicked, the system might be unresponsive for a short time while it reverts the changes back to the previous save point.

Clicking *View Unsaved Changes* opens a pane highlighting the changes that have not been committed.

This feature is also available in the CLI:

```
config system global
    set cfg-save {automatic | manual | revert}
    set cfg-revert-timeout <integer>
end

# execute cfg {reload | save}
```

Trusted platform module support

On supported FortiGate hardware devices, the Trusted Platform Module (TPM) can be used to protect your password and key against malicious software and phishing attacks. The dedicated module hardens the FortiGate by generating, storing, and authenticating cryptographic keys. To help prevent tampering, the chip is soldered on the motherboard to reduce the risk of data transaction interceptions from attackers.

By default, the TPM is disabled. To enable it, you must set the 32 hexadecimal digit master-encryption-password which encrypts sensitive data on the FortiGate using AES128-CBC. With the password, TPM generates a 2048-bit primary key to secure the master-encryption-password through RSA-2048 encryption. The master-encryption-password protects the data. The primary key protects the master-encryption-password.

The TPM module does not encrypt the disk drive of eligible FortiGate.

The primary key binds the encrypted configuration file to a specific FortiGate unit and never leaves the TPM. When backing up the configuration, the TPM uses the primary key to encrypt the master-encryption-password in the configuration file. When restoring a configuration that includes a TPM protected master-encryption-password:

- If TPM is disabled, then the configuration cannot be restored.
- If TPM is enabled but has a different master-encryption-password than the configuration file, then the configuration cannot be restored.
- If TPM is enabled and the master-encryption-password is the same in the configuration file, then the configuration can be restored.

For information on backing up and restoring the configuration, see [Configuration backups on page 72](#).

Passwords and keys that can be encrypted by the master-encryption-key include:

- Alert email user's password
- BGP and other routing related configurations
- External resource
- FortiGuard proxy password
- FortiToken/FortiToken Mobile's seed
- HA password
- IPsec pre-shared key
- Link Monitor, server side password
- Local certificate's private key
- Local, LDAP, RADIUS, FSSO, and other user category related passwords
- Modem/PPPoE
- NST password
- NTP Password
- SDN connector, server side password
- SNMP
- Wireless Security related password

In HA configurations, each cluster member must use the same master-encryption-key so that the HA cluster can form and its members can synchronize their configurations.

To check if your FortiGate device has a TPM:

Verify all the following commands exist. Otherwise, the platform does not support it.

```
# diagnose hardware test info
List of test cases:
  bios: sysid
  bios: checksum
  bios: license
```

```

    bios: detect

# diagnose hardware deviceinfo tpm
TPM capability information of fixed properties:
=====
TPM_PT_FAMILY_INDICATOR: 2.0
TPM_PT_LEVEL: 0
TPM_PT_REVISION: 138
TPM_PT_DAY_OF_YEAR: 8
TPM_PT_YEAR: 2018
TPM_PT_MANUFACTURER: NTC
# diagnose hardware test tpm
===== Fortinet Hardware Test Report =====
TPM
TPM Device Detection..... PASS
===== Fortinet Hardware Test PASSED =====
# diagnose tpm
get-property Get TPM properties. [Take 0-1 arg(s)]
get-var-property Get TPM var properties.
read-clock Read TPM internal clock.
shutdown-prepare Prepare for TPM power cycle.
selftest Perform self tests.
generate-random-number Generate a 4-byte random number
SHA-1 HASH a sequence of num with SHA-1 algo
SHA-256 HASH a sequence of num with SHA-256 algo

```

To enable TPM and input the master-encryption-password:

```

config system global
    set private-data-encryption enable
end
Please type your private data encryption key (32 hexadecimal numbers):
*****
Please re-enter your private data encryption key (32 hexadecimal numbers) again:
*****
Your private data encryption key is accepted.

```

Configuring the persistency for a banned IP list

The `banned-ip-persistency` option configures whether the banned IP list persists through a power cycle.

```

config firewall global
    set banned-ip-persistency {disabled | permanent-only | all}
end

```

```

banned-ip-persistency
{disabled |
permanent-only |
all}

```

Set the persistency of banned IPs across power cycling:

- `disabled`: no entries are kept across power cycling (default).
- `permanent-only`: only permanent IP bans are kept across power cycling.
- `all`: all IP bans are kept across power cycling.

The banned IP list is created from quarantining. For example, when quarantining is enabled for IPS, application control, and DDoS. Permanent quarantining can be added manually using `diagnose user banned-ip add src4`.

The `diagnose user quarantine <parameter>` command has changed to `diagnose user banned-ip <parameter>`.

Example 1: keep all banned IPs across power cycling

When `banned-ip-persistency` is set to `all`, all the banned IPs are saved after a reboot. In this example, an application control security profile with quarantining is already configured. After traffic is generated that triggers the quarantine rule, a quarantine list is generated.

To view the list of banned IPs:

```
# diagnose user banned-ip list
src-ip-addr      created                expires                cause
10.1.100.12      Tue Jul  5 18:01:05 2022 Tue Jul  5 18:21:05 2022 APP
```

After a reboot, the banned IP list is the same:

```
# diagnose user banned-ip list
src-ip-addr      created                expires                cause
10.1.100.12      Tue Jul  5 18:01:05 2022 Tue Jul  5 18:21:05 2022 APP
```

Example 2: keep only permanent banned IPs across power cycling

When `banned-ip-persistency` is set to `permanent-only`, only banned IPs with an indefinite expiry time are saved after a reboot. The permanent IP ban was already configured for 10.1.100.11 using `diagnose user banned-ip add src4 10.1.100.11 0 ips`.

To view the list of banned IPs:

```
# diagnose user banned-ip list
src-ip-addr      created                expires                cause
10.1.100.12      Tue Jul  5 18:01:05 2022 Tue Jul  5 18:21:05 2022 APP
10.1.100.11      Tue Jul  5 18:06:35 2022 indefinite      IPS
```

After a reboot, only 10.1.100.11 remains in the banned IP list:

```
# diagnose user banned-ip list
src-ip-addr      created                expires                cause
10.1.100.11      Tue Jul  5 18:06:35 2022 indefinite      IPS
```

Using the default certificate for HTTPS administrative access

By default, the FortiGate uses the certificate named `Fortinet_GUI_Server` for HTTPS administrative access. This certificate is generated and signed by the built-in `Fortinet_CA_SSL` certificate, which dynamically updates the SAN field of the `Fortinet_GUI_Server` certificate with the IP addresses of all interfaces enabled for HTTPS. After installing the `Fortinet_CA_SSL` CA certificate on a PC, administrators can access the FortiGate GUI through a browser without any warnings.

How the certificate works

The Fortinet_GUI_Server certificate is generated by the built-in certificate authority (CA) with the Fortinet_CA_SSL certificate, which is unique to each FortiGate. This CA certificate is also used in SSL deep inspection. When the Fortinet_GUI_Server certificate is generated, the SAN (Subject Alternative Name) extension field is populated with the IP addresses of all physical and logical (VLAN, loopback, and so on) interfaces enabled for HTTPS. It is also populated with the management IP address whenever this field is an IP address and not an FQDN. If there are any changes to the IP addresses on the interface or management IP, the Fortinet_GUI_Server certificate is updated and regenerated with the new IP. If the Fortinet_CA_SSL certificate itself is updated, the Fortinet_GUI_Server certificate is regenerated.

Because the root CA is not a public CA, the Fortinet_CA_SSL CA certificate must be installed in the trusted certificate store on the client PC in order for the trusted certificate chain to be recognized by a browser. This certificate can be downloaded from the FortiGate in several ways.

The Fortinet_GUI_Server certificate can only be used for HTTPS administrative access. It cannot be used anywhere else.

Example

The HTTPS server certificate can be configured in the GUI or CLI.

To configure the HTTPS server certificate in the GUI:

1. On an administrative PC, log in to the FortiGate GUI and go to *System > Settings*.
2. In the *Administration Settings* section, set the *HTTPS server certificate* to *Fortinet_GUI_Server*.
3. Download the Fortinet_CA_SSL certificate using one of the following methods:
 - On the *System > Settings* page, click *Download HTTPS CA certificate* (below the *HTTPS server certificate* option).
 - Go to *System > Certificates*. In the *Local CA Certificate* section, select *Fortinet_CA_SSL*, and click *Download*.
 - Go to *Dashboard > Status*. In the *Administrator* widget, click *Download HTTPS CA certificate*.
4. Install the certificate in the PC's trusted certificate store. Refer to your OS documentation if needed.
5. Reload the FortiGate GUI. The browser now trusts the certificate and does not display a certificate warning.
6. If you are connecting to the FortiGate over DNAT or port forwarding, the certificate needs to add the NATed management IP into the SAN field so that the browser does not display a warning about an invalid CN. Configure the management IP in the global settings:

```
config system global
    set management-ip <IP_address>
end
```

To configure the HTTPS server certificate in the CLI:

1. Configure the HTTPS server certificate:

```
config system global
    set admin-server-cert Fortinet_GUI_Server
end
```

2. Download the Fortinet_CA_SSL certificate on the administrative PC through TFTP:

```
# execute vpn certificate local export tftp Fortinet_CA_SSL cer <file_name> <server_IP>
```

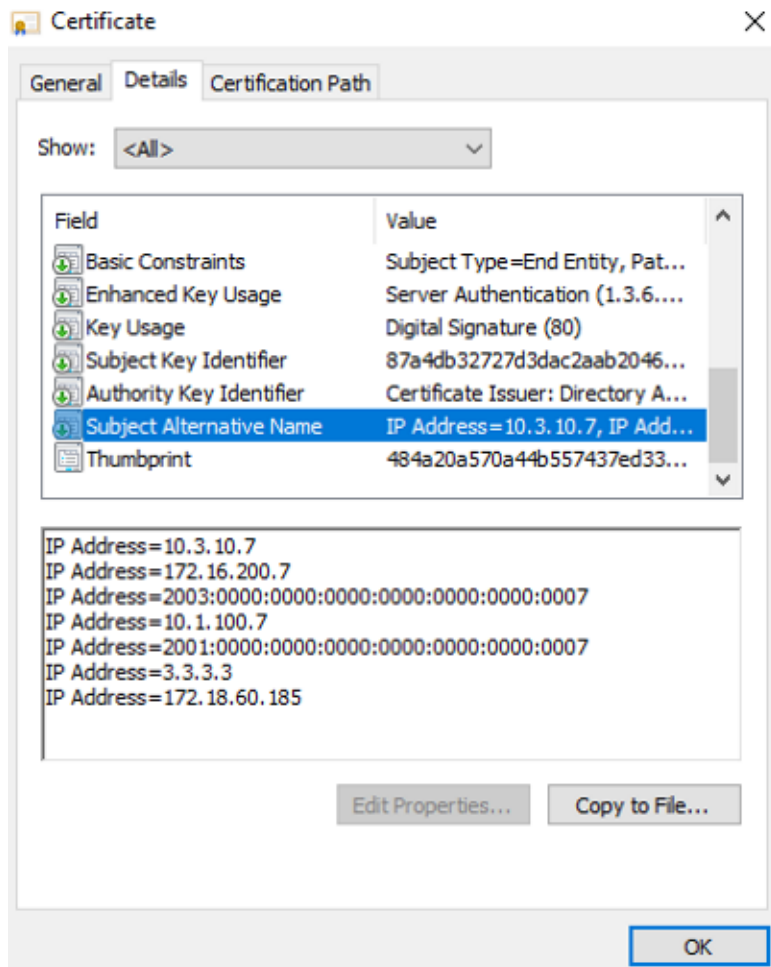

Done.

To verify the connection:

1. Access the FortiGate from a browser and verify the certificate information. For example, in Chrome:
 - a. In the left side of the address bar, click the icon to view the site information.
 - b. Click *Certificate*.
 - c. Click the *Details* tab.
 - d. Locate the *Subject Alternative Name* (SAN) field, and note the IP addresses that are listed (*1.1.1.1*).

- e. Click OK.
2. In FortiOS, change one of the interface addresses. In this example, the port11 address is changed from 1.1.1.1 to 3.3.3.3.
3. Reload the browser and review the certificate information again. The IP 1.1.1.1 in the SAN field is updated to 3.3.3.3.

4. In FortiOS, go to *System > Certificates* and double-click *Fortinet_GUI_Server* to view the *Certificate Details*.
5. At the bottom of the pane, the *X509v3 Subject Alternative Name* field displays the IP addresses from the certificate.
6. Verify the logs when the certificate is regenerated:

```

# execute log filter category 1
# execute log display
12 logs found.
10 logs returned.

Virtual Domains

Virtual Domains (VDOMs) are used to divide a FortiGate into two or more virtual units that function independently. VDOMs can provide separate security policies and, in NAT mode, completely separate configurations for routing and VPN services for each connected network.

Multiple VDOMs can be created and managed as independent units in multi VDOM mode.

By default, most FortiGate units support 10 VDOMs, and many FortiGate models support purchasing a license key to increase the maximum number. Some exceptions may apply.

The following topics provide an overview of VDOM concepts, topologies, best practices, and the general configurations involved when working with multi VDOM mode:

- [VDOM overview on page 2475](#)
- [General configurations on page 2480](#)
- [Backing up and restoring configurations in multi VDOM mode on page 2488](#)

The following topics provide examples of configuring VDOMs:

- [Inter-VDOM routing configuration example: Internet access on page 2491](#)
- [Inter-VDOM routing configuration example: Partial-mesh VDOMs on page 2500](#)

VDOM overview

The following sections provide conceptual information on VDOMs:

- [Multi VDOM mode on page 2475](#)
- [Global settings on page 2476](#)
- [Global and per-VDOM resources on page 2476](#)
- [Management VDOM on page 2476](#)
- [VDOM types on page 2476](#)
- [Administrator roles and views on page 2477](#)
- [Inter-VDOM routing on page 2477](#)

The following sections provide information on methods of VDOM configuration:

- [Topologies on page 2477](#)
- [Best practices on page 2479](#)

Multi VDOM mode

In multi VDOM mode, the FortiGate can have multiple VDOMs that function as independent units. When multi VDOM mode is first enabled, all VDOM configurations will move to the root VDOM by default. The root VDOM cannot be deleted, and remains in the configuration even if it is not processing any traffic. New VDOMs can be created, up to the VDOM limit allowable on your device.

Global settings

Global settings are configured outside of a VDOM. They effect the entire FortiGate, and include settings such as interfaces, firmware, DNS, some logging and sandboxing options, and so on. Global settings should only be changed by top level administrators.

Global and per-VDOM resources

Global and per-VDOM resources can be configured when the FortiGate is in multi VDOM mode. Global resources apply to resources that are shared by the whole FortiGate, while per-VDOM resources are specific to each VDOM.

By default, all per-VDOM resource settings are set to have no limits. This means that any single VDOM can use all of the FortiGate device's resources. This could deprive other VDOMs of the resources that they require, to the point that could be unable to function. We recommend setting maximum values on the resources that are vital to you.

Management VDOM

The management VDOM refers to the specific role that must be designated to one of the VDOMs. By default, the root VDOM is the management VDOM, and management-related services such as FortiGuard updates and other local out (self-originating) traffic such as logs to remote servers originate from the management VDOM. The management VDOM cannot be deleted. See [Management VDOM on page 2481](#) for configuration details.

VDOM types

When a FortiGate is in multi VDOM mode, a VDOM can be configured as an *Admin*, *Traffic*, or LAN extension type VDOM.

When the VDOM type is set to *Admin*, the VDOM is used to administer and manage the FortiGate. Usually, the *Admin* VDOM resides in a management network which is only accessible by administrators. Global and VDOM administrators can log in to the FortiGate using SSH, HTTPS, and so on but traffic cannot pass through this *Admin* VDOM. A FortiGate does not need to have an *Admin* VDOM and, at most, there can only be one *Admin* VDOM per FortiGate.

When VDOM type is set to *Traffic*, the VDOM can pass traffic like a regular firewall. Most VDOMs will be *Traffic* type VDOMs. Network interfaces on a *Traffic* VDOM can also enable SSH, HTTPS, and so on for administrative and management purposes.

In general, an *Admin* VDOM has a subset of a *Traffic* VDOM's capabilities. See [Configure an administrative VDOM type on page 2484](#) for configuration details.

A LAN extension mode VDOM allows a remote FortiGate to provide remote connectivity to a local FortiGate over a backhaul connection. It can only be configured in the CLI. See [FortiGate LAN extension on page 684](#) for details.

FortiGate-VM supports having at least two VDOMs; one that supports an administrative VDOM and another that supports a traffic VDOM.

Administrator roles and views

When a FortiGate has been configured in multi VDOM mode, the device can be managed by global administrators and per-VDOM administrators. Each type of administrator will have a different view of the GUI in multi VDOM mode which corresponds to their role.

Global administrators

Global administrators have complete visibility and access because the scope of their role is to manage the entire physical FortiGate device. An example of a global administrator is an administrator working for a managed security services provider (MSSP) providing the FortiGate as a multi-tenant environment to its clients.

When global administrators log into the GUI, from the *VDOM: Global* view they will see all pages for global settings shared between VDOMs, and VDOM-specific settings.

To create a global administrator that has access to all VDOMs and access to global settings, it must be created at the global level and must use the *super_admin* administrator profile.

See [Administrator profiles on page 2416](#) and [Local authentication on page 2393](#) for configuration details.

VDOM administrators

VDOM administrators will be unable to view global settings or VDOMs not assigned to them because the scope of their role is restricted to managing specific VDOMs only. An example of a VDOM administrator is the administrator working for a company which is a client, or tenant, of an MSSP's multi-tenant FortiGate.

When VDOM administrators log into the GUI, from the *VDOM:<VDOM>* view they will see pages for settings specific to the VDOM they have been configured to administer such as interfaces, routes, firewall policies, and security profiles.

See [Create per-VDOM administrators on page 2483](#) for configuration details.

Inter-VDOM routing

VDOM links are virtual interfaces that allow VDOMs to communicate internally without using additional physical interfaces. A VDOM link contains a pair of interfaces, each one connected to a VDOM to form each end of the inter-VDOM connection. Inter-VDOM routing can be configured in order to communicate between one VDOM to another.

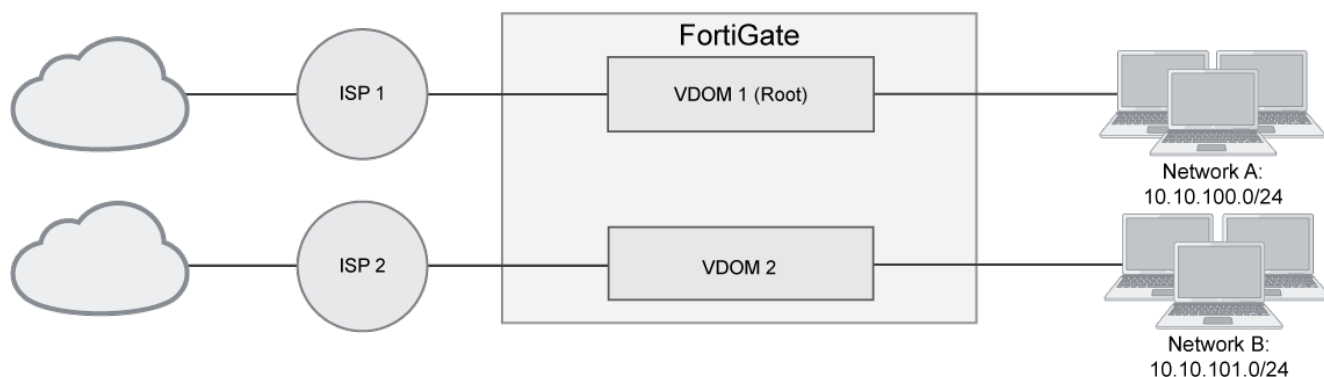

When VDOMs are configured on your FortiGate unit, configuring inter-VDOM routing and VDOM links is similar to creating a VLAN interface. VDOM links can be managed in either the CLI or in the network interface list in the GUI.

See [Inter-VDOM routing configuration example: Internet access on page 2491](#) for more information.

Topologies

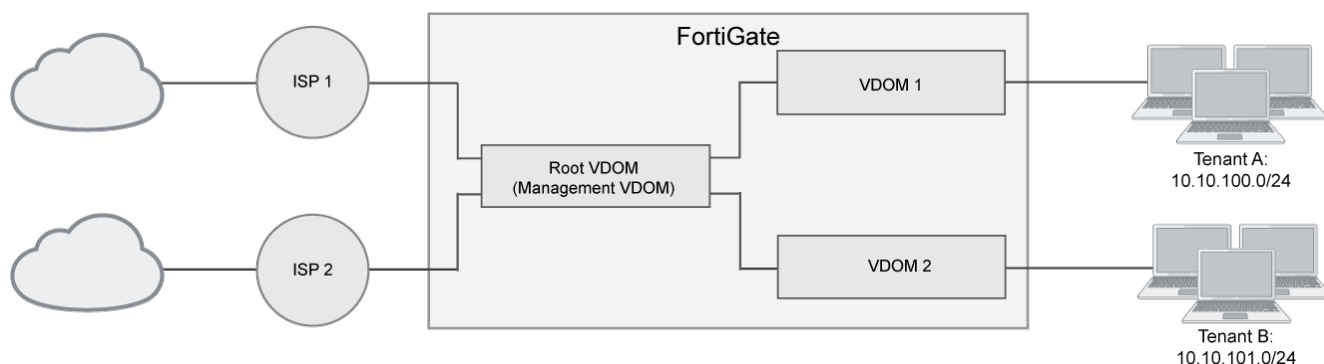

These are the main configuration types in multi VDOM mode:

Independent VDOMs

Multiple, completely separate VDOMs are created. Any VDOM can be the management VDOM, as long as it has Internet access to connect to FortiGuard services and other management resources. There are no inter-VDOM links, and each VDOM is independently managed.

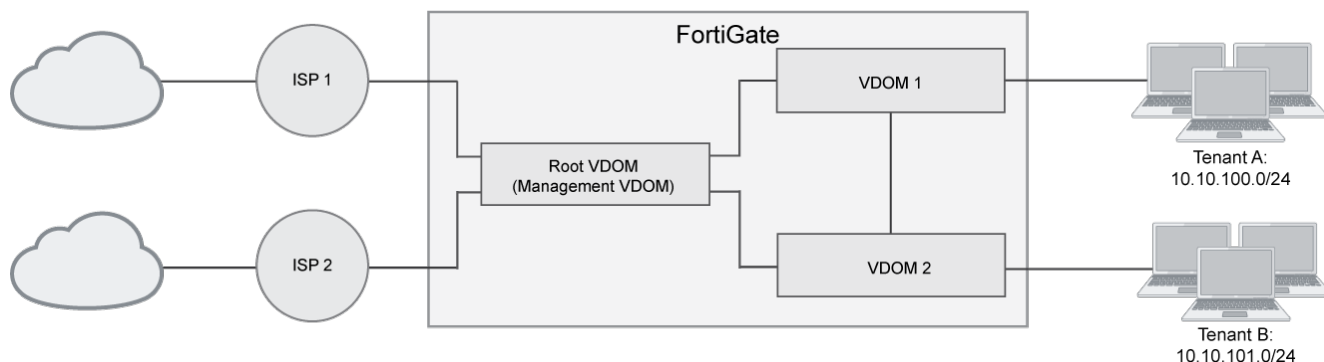

Internet access VDOM

In the Internet access VDOM configuration, Internet access is provided primarily by a single VDOM; for example, the management VDOM (depicted as root VDOM in the preceding diagram). Each tenant connects to the management VDOM via an inter-VDOM link. The management VDOM has complete control over Internet access, including the types of traffic that are allowed in both directions. This can improve security, as there is only one point of ingress and egress.

There is no communication between the other VDOMs.

Meshed VDOMs

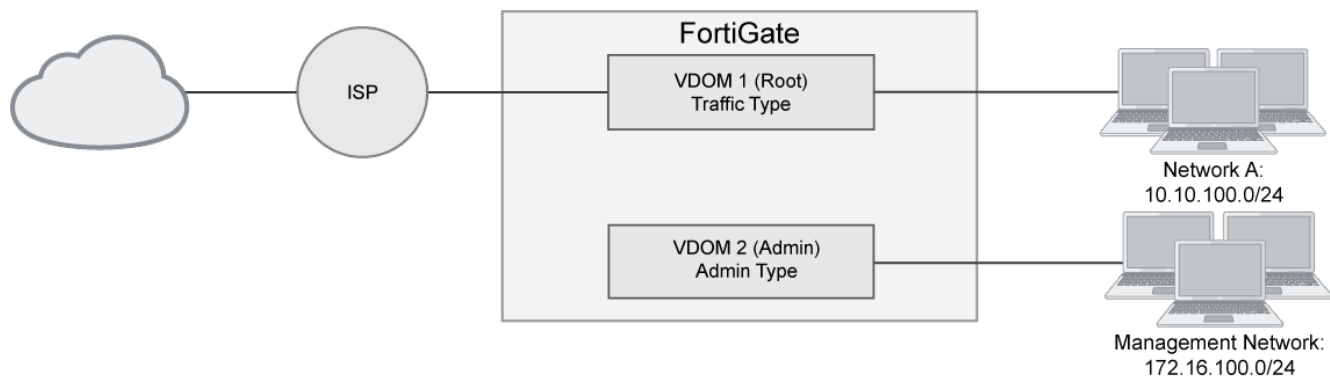

VDOMs can communicate with inter-VDOM links. In full-mesh configurations, all the VDOMs are interconnected. In partial-mesh configurations, only some of the VDOMs are interconnected.

In this configuration, inter-vdom links between tenants are created by the global administrator, but each tenant controls the firewall policies to allow access to other tenants.

See [Inter-VDOM routing on page 2485](#) and [Inter-VDOM routing configuration example: Internet access on page 2491](#) for configuration details.

Administrative VDOM on a management network

The administrative VDOM type can be used to limit administrative access to the FortiGate using SSH, HTTPS and so on to administrators working from a management network. Administrators may be limited to management settings or may have global privileges to access other VDOMs. The user or tenant network (depicted as Network A in the diagram) uses a traffic type VDOM, which allows traffic to pass through it like a regular firewall and allows configuration of firewall-related settings. This configuration can improve security if the management network is a closed network and administrative access is not enabled on any interfaces on the traffic VDOM.

Best practices

VDOMs can provide separate firewall policies and, in NAT mode, completely separate configurations for routing and VPN services for each connected network or organization. This section provides a list of best practices for configuring VDOMs.

Per-VDOM resource setting

All per-VDOM resource settings are set to no limit by default. To ensure proper functionality of all VDOMs, it is recommended that you set some maximum values for the most vital resources. See [Global and per-VDOM resources on page 2482](#) for configuration details.

Virtual domains in NAT mode

Once the virtual domains have been enabled and one or more VDOMs have been created, they must be configured. The following steps provide a general overview of the configuration process.

To configure VDOMs:

1. Change the management virtual domain.
2. Configure FortiGate interfaces for your VDOMs in NAT mode.

3. Configure VDOM routing.
4. Configure security policies for VDOMs in NAT mode.
5. Configure UTM profiles for VDOMs in NAT mode.
6. Test the configuration.

While you may not require all of the steps for your network topology, it is recommended that you perform them in the order given.

See [General configurations on page 2480](#) for configuration details.

Virtual clustering

Virtual clustering is an extension of FGCP HA that provides failover protection between two instances of one or more VDOMs operating on two FortiGates that are in a virtual cluster. A standard virtual cluster consists of FortiGates that are operating in active-passive HA mode with multiple VDOMs enabled. See [HA virtual cluster setup on page 2534](#) for more details.

Typically, virtual clustering is configured with override enabled and uses device priorities to distribute traffic between the primary and secondary FortiGates.

If you decide to disable override for clustering, as a result of persistent renegotiating, you should disable it for both cluster units.

General configurations

VDOMs can be configured in the GUI and the CLI. To ensure that no VDOMs are accidentally configured in the CLI, prompts can be enabled. These prompts will display to ask for confirmation that the VDOM is meant to be configured in the CLI.

To configure confirmation prompts:

```
config system global
    set edit-vdom-prompt enable
end
```

The following topics provide information on general VDOM configurations:

- [Enable multi VDOM mode on page 2481](#)
- [Management VDOM on page 2481](#)
- [Global and per-VDOM resources on page 2482](#)
- [Create per-VDOM administrators on page 2483](#)
- [Configure an administrative VDOM type on page 2484](#)
- [Assign interfaces to a VDOM on page 2485](#)
- [Inter-VDOM routing on page 2485](#)
- [Allow FortiGuard services and updates to initiate from a traffic VDOM on page 2486](#)

Enable multi VDOM mode

Enable multi VDOM mode and create the VDOMs in the GUI and CLI.

On FortiGate 90 series models and lower, VDOMs can only be enabled using the CLI.

To enable VDOMs in the GUI:

1. Go to *System > Settings*.
2. In the *System Operation Settings* sections, enable *Virtual Domains*.
3. Click *OK*.

To enable VDOMs in the CLI:

```
config system global
    set vdom-mode multi-vdom
end
```

You will be logged out of the device when the VDOM mode is enabled.

Management VDOM

By default, the management VDOM is *root*. The management VDOM can be manually assigned from the GUI or the CLI.

To assign the management VDOM in the GUI:

1. In the *Global VDOM*, go to *System > VDOM*.
2. Select the VDOM you want to assign as the management VDOM.
3. Click *Switch Management*.
4. Click *OK*.

To assign the management VDOM in the CLI:

```
config global
    config system global
        set management-vdom <vdom>
    end
end
```

Only one management VDOM can exist at a time. It is strongly recommended that the management VDOM have Internet access otherwise management-related services, such as FortiGuard updates and queries, will not work.

Global and per-VDOM resources

Global resources apply to resources that are shared by the whole FortiGate, while per-VDOM resources are specific to each VDOM.

To configure global resources:

1. In the *Global* VDOM, go to *System > Global Resources*.
2. Enable the resource's override in the *Override Maximum* column, then enter the override value.

Global Resources

[Reset All](#)

Resource	Current Usage	Default Maximum	Override Maximum
Active Sessions	0% (12)	No Limit Set	<input type="checkbox"/>
Policy & Objects			
Firewall Policies	0% (0)	21024	<input checked="" type="checkbox"/> 20512
Firewall Addresses	0% (41)	11024	<input type="checkbox"/>

Firewall Recurring Schedules	0% (4)	No Limit Set	<input type="checkbox"/>
User & Device			
User	0% (0)	No Limit Set	<input checked="" type="checkbox"/> 715827883
User Groups	0% (1)	No Limit Set	<input type="checkbox"/>
Concurrent Explicit Proxy Users	0% (0)	1000	<input type="checkbox"/>
VPN			
SSL-VPN	0% (0)	No Limit Set	<input type="checkbox"/>
VPN IPsec Phase1 Tunnels	0% (0)	200	<input checked="" type="checkbox"/> 190
VPN IPsec Phase2 Tunnels	0% (0)	200	<input checked="" type="checkbox"/> 190

[Apply](#)

3. Click *Apply*.
To reset all of the override values, click *Reset All*.

To configure per-VDOM resources:

1. In the *Global* VDOM, go to *System > VDOM*.
2. Select the VDOM whose resources need to be configured and click *Edit*.
3. Enable the resource's override in the *Override Maximum* column, then enter the override value.
4. Optionally, enter a value in the *Guaranteed* column.

Virtual Domain: root

NGFW Mode: **Profile-based** Policy-based

Central SNAT: ☐

How to Purchase and Renew VDOM Licenses

5. Click **OK**.

To reset all of the override values, click *Reset All*.

Create per-VDOM administrators

Per-VDOM administrators can be created that can access only the administrative or traffic VDOM. These administrators must use either the *prof_admin* administrator profile, or a custom profile.

A per-VDOM administrator can only access the FortiGate through a network interface that is assigned to the VDOM that they are assigned to. The interface must also be configured to allow management access. They can also connect to the FortiGate using the console port.

To assign an administrator to multiple VDOMs, they must be created at the global level. When creating an administrator at the VDOM level, the *super_admin* administrator profile cannot be used.

To create a per-VDOM administrator in the GUI:

1. On the FortiGate, connect to the *Global* VDOM.
2. Go to *System > Administrators* and click *Create New > Administrator*.
3. Fill in the required information, setting the *Type* as *Local User*.
4. In the *Virtual Domains* field, add the VDOM that the administrator will be assigned to, and if necessary, remove the other VDOM from the list.

New Administrator

Username: PJFry

Type: **Local User**

Match a user on a remote server group

Match all users in a remote server group

Use public key infrastructure (PKI) group

Password:

Confirm Password:

Comments: Write a comment... 0/255

Administrator profile: prof_admin

Virtual Domains: FG-traffic

Select Entries

Search

FG-traffic

root

Close

OK Cancel

5. Click **OK**.

To create a per-VDOM administrator using the CLI:

```
config global
  config system admin
    edit <name>
      set vdom <VDOM_name>
      set password <password>
      set accprofile <admin_profile>
      ...
    next
  end
end
```

Configure an administrative VDOM type

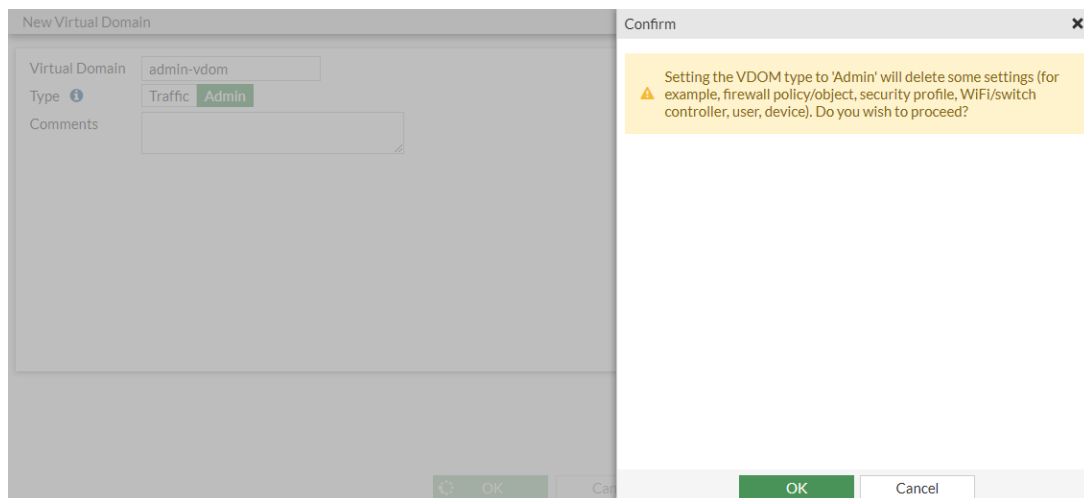

Individual VDOMs can be configured as an administrative type in multi VDOM mode.

Only one administrative VDOM can exist at a time and cannot be set on a FortiWifi. A VDOM cannot be an administrative type and in transparent mode at the same time.

To configure an administrative VDOM in the GUI:

1. Go to *System > VDOM*.
2. Click *Create New*.
3. Enter a *Virtual Domain* name and set the *Type* to *Admin*.
4. Click *OK*.

5. Click *OK* in the confirmation pane. The administrative VDOM is created.

To configure the VDOM type in the CLI:

```
config system settings
  set vdom-type {traffic | admin}
end
```

Assign interfaces to a VDOM

An interface can only be assigned to one of the VDOMs. An interface cannot be moved if it is referenced in an existing configuration.

In the GUI, the interface list *Ref.* column shows if the interface is referenced in an existing configuration, and allows you to quickly access and edit those references.

To assign an interface to a VDOM in the GUI:

1. In the *Global* VDOM, go to *Network > Interfaces*.
2. Select the interface that will be assigned to a VDOM and click *Edit*.
3. Select the VDOM that the interface will be assigned to from the *Virtual Domain* list.

4. Click *OK*.

To assign an interface to a VDOM using the CLI:

```
config global
  config system interface
    edit <interface>
      set vdom <VDOM_name>
    next
  end
end
```

Inter-VDOM routing

VDOM links allow VDOMs to communicate internally without using additional physical interfaces.

A VDOM link cannot share the same name as a VDOM.

VDOM link does not support traffic offload. If you want to use traffic offload, use NPU-VDOM-LINK. See [Configuring inter-VDOM link acceleration with NP6 processors](#) in the Hardware Acceleration guide for details.

To configure a VDOM link in the GUI:

1. In the *Global VDOM*, go to *Network > Interfaces*.
2. Click *Create New > VDOM Link*.
3. Configure the fields, including the *Name*, *Virtual Domain*, IP information, *Administrative Access*, and so on, then click *OK*.

By default, VDOM links are created as point-to-point (ppp) links. If required, the link type can be changed in the CLI.

For example, when running OSPF in IPv6, a link-local address is required in order to communicate with OSPF neighbors. For a VDOM link to obtain a link-local address, its type must be set to `ethernet`.

To configure a VDOM link in the CLI:

```
config global
  config system vdom-link
    edit "<vdom-link-name>"
      set type {ppp | ethernet}
    next
  end
  config system interface
    edit "<vdom-link-name0>"
      set vdom "<VDOM Name>"
      set type vdom-link
    next
    edit "<vdom-link-name1>"
      set vdom "<VDOM Name>"
      set type vdom-link
    next
  end
end
```

To delete a VDOM link in the GUI:

1. In the *Global VDOM*, go to *Network > Interfaces*.
2. Select a *VDOM Link* and click *Delete*.

To delete a VDOM link in the CLI:

```
config global
  config system vdom-link
    delete <VDOM-LINK-Name>
  end
end
```

Allow FortiGuard services and updates to initiate from a traffic VDOM

In multi VDOM mode, users can choose from which VDOM FortiGuard services and updates are initiated from, instead of being locked to the management VDOM. This allows deployment scenarios where the management VDOM resides in a closed management network.

When the management VDOM resides in a closed network, it does not have internet access. FortiGuard services (FortiGuard updates, web filters, DNS proxy, DDNS, and so on) must be configured in a VDOM with Internet access in order to work. Therefore, in the example above, change the FortiGuard settings to initiate from the root VDOM.

To configure FortiGuard services on a traffic VDOM:

1. Set up a traffic VDOM for FortiGuard services:

```
config global
  config system fortiguard
    set vdom "root"
  end
end
```

2. Ensure the traffic VDOM has the correct gateway to reach the internet:

```
config vdom
  edit root
    config router static
      edit 1
        set gateway 172.16.200.254
        set device "wan1"
      next
    end
  next
end
```

3. Configure the DNS servers to ensure the FortiGuard services can resolve the server name through the traffic VDOM:

```
config vdom
  edit root
    config system vdom-dns
      set vdom-dns enable
      set primary 208.91.112.53
      set secondary 208.91.112.52
    end
  next
end
```

Backing up and restoring configurations in multi VDOM mode

When a FortiGate is in multi VDOM mode, the configuration can be backed up or restored using the GUI or the CLI. Back up and restoration permissions depend on the VDOM administrator when in multi VDOM mode:

- A global *super_admin* can back up and restore the global configuration or the configuration of a specific VDOM.
- A VDOM administrator of one VDOM can only back up and restore the configuration of the current VDOM.
- A VDOM administrator of multiple VDOMs can back up and restore the configuration of multiple VDOMs.

To back up the configuration using the GUI:

1. Click on the user name in the upper right-hand corner of the screen and select *Configuration > Backup*.
2. Select *VDOM* for the *Scope*. The *VDOM* dropdown menu is displayed.
3. Select the VDOM you want to back up.
4. Direct the backup to your *Local PC* or to a *USB Disk*.
5. Enable *Encryption*.

This is recommended to secure your backup configurations and prevent unauthorized parties from reloading your configuration.

6. Enter a password, and enter it again to confirm it. This password will be required to restore the configuration.
7. Click *OK*.
8. When prompted, select a location on the PC or USB disk to save the configuration file. The configuration file will have a *.conf* extension.

To restore the FortiGate configuration using the GUI:

1. Click on the user name in the upper right-hand corner of the screen and select *Configuration > Restore*.
2. Select *VDOM* for the *Scope*. The *VDOM* dropdown menu is displayed.
3. Select the VDOM that you want to restore the configuration for.
4. Identify the source of the configuration file to be restored: your *Local PC* or a *USB Disk*.
The *USB Disk* option will not be available if no USB drive is inserted in the USB port. You can restore from the FortiManager using the CLI.
5. Click *Upload*, locate the configuration file, and click *Open*.

Confirm that the configuration file you are uploading is for the same VDOM selected from the dropdown menu.

6. Enter the password if required.
7. Click *OK*.

Backing up configurations in the CLI

Configuration backups can be performed in the CLI using the `execute backup` commands. If you are backing up a VDOM configuration instead of the global configuration, first enter the commands:

```
config vdom
  edit <vdom_name>
```

Configurations can be backed up in FortiOS and YAML format.

Configuration files can be backed up to various locations depending on the command:

- **flash:** Backup the configuration file to the flash drive.
- **ftp:** Backup the configuration file to an FTP server.
- **sftp:** Backup the configuration file to a SFTP server.
- **tftp:** Backup the configuration file to a TFTP server.
- **usb:** Backup the configuration file to an external USB drive.

Command	Description
# execute backup config	Back up the configuration in FortiOS format. Backup your configuration file to: <ul style="list-style-type: none"> • flash • ftp • sftp • tftp • usb
# execute backup full-config	Backup the configuration, including backups of default configuration settings. Backup your configuration file to: <ul style="list-style-type: none"> • ftp • sftp • tftp • usb
# execute backup yaml-config	Backup the configuration in YAML format. Backup your configuration file to: <ul style="list-style-type: none"> • ftp • tftp

To back up the configuration in FortiOS format using the CLI:

For FTP, note that port number and username are optional depending on the FTP site:

```
config vdom
  edit <vdom_name>
    execute backup config ftp <backup_filename> <ftp_server>[:<ftp_port>] [<user_name>]
    [<password>] [<backup_password>]
```

or for TFTP:

```
config vdom
  edit <vdom_name>
    execute backup config tftp <backup_filename> <tftp_servers> [<backup_password>]
```

or for SFTP:

```
config vdom
  edit <vdom_name>
    execute backup config sftp <backup_filename> <sftp_server>[:<sftp_port>] <user>
    <password> [<backup_password>]
```

or for an external USB:

```
config vdom
  edit <vdom_name>
    execute backup config usb <backup_filename> [<backup_password>]
```

To back up the configuration in YAML format using the CLI:

For FTP:

```
config vdom
  edit <vdom_name>
    execute backup yaml-config ftp <file_path> <ftp_server>[:<port>] [<user_name>] [<FTP
password>]
```

or for TFTP:

```
config vdom
  edit <vdom_name>
    execute backup yaml-config tftp <file_path> <tftp_server>
```

Restoring configurations in the CLI

Restoring configurations can be performed in the CLI using the `execute restore` command. If you are restoring a VDOM configuration instead of the global configuration, first enter the commands:

```
config vdom
  edit <vdom_name>
```

When restoring a VDOM configuration, ensure that the configuration file is for the correct VDOM specified.

Command	Description
# <code>execute restore config</code>	<p>Restore a configuration that is in FortiOS or YAML format.</p> <p>Configurations can be loaded from:</p> <ul style="list-style-type: none"> <code>dhcp</code>: Load the configuration through DHCP. <code>flash</code>: Load the configuration file from flash to firewall. <code>ftp</code>: Load the configuration file from an FTP server. <code>tftp</code>: Load the configuration from a TFTP server. <code>usb</code>: Load the configuration file from an external USB disk to firewall.

To restore the FortiGate configuration in FortiOS or YAML format using the CLI:

For FTP, note that port number and username are optional depending on the FTP site:

```
config vdom
  edit <vdom_name>
    execute restore config ftp <file_path> <ftp_server>[:<port>] [<user_name>] [<FTP
password>] [<password>]
```

or for TFTP:

```
config vdom
  edit <vdom_name>
    execute restore config tftp <file_name> <tftp_server> [<password>]
```

or for DHCP:

```
config vdom
  edit <vdom_name>
    execute restore config dhcp <port> [<VLAN_ID>]
```

or for flash:

```
config vdom
  edit <vdom_name>
    execute restore config flash <revision_ID>
```

or for an external USB:

```
config vdom
  edit <vdom_name>
    execute restore config usb <file_name> [<password>]
```

Inter-VDOM routing configuration example: Internet access

This example shows how to configure a FortiGate unit to use inter-VDOM routing to route outgoing traffic from individual VDOMs to a root VDOM with Internet access. See [Inter-VDOM routing on page 2485](#) for more information.

Two departments of a company, Accounting and Sales, are connected to one FortiGate. The company uses a single ISP to connect to the Internet. This is an example of the Internet access configuration. See [Topologies on page 2477](#) for details.

This example assumes that the interfaces of the FortiGate have already been configured with the IP addresses depicted in the preceding diagram.

General steps for this example

This example includes the following general steps. We recommend following the steps in the order below:

1. [Enable multi VDOM mode and create the VDOMs on page 2492](#)
2. [Assign interfaces to VDOMs on page 2492](#)
3. [Configure the VDOM links on page 2493](#)
4. [Configure inter-VDOM routing on page 2494](#)
5. [Configure the firewall policies on page 2495](#)
6. [Test the configuration on page 2497](#)

This example demonstrates how to configure these steps first using the GUI and then, at the end of the section, using the CLI. See [Configuration with the CLI on page 2497](#) for details.

Enable multi VDOM mode and create the VDOMs

Create the Accounting and Sales VDOMs.

To enable VDOMs in the GUI:

1. Go to *System > Settings*.
2. In the *System Operation Settings* section, enable *Virtual Domains*.
3. Click *OK*.

On FortiGate 90 series models and lower, VDOMs can only be enabled using the CLI.

To create the Sales and Accounting VDOMs in the GUI:

1. In the *Global VDOM*, go to *System > VDOM*.
2. Click *Create New*.
3. In the *Virtual Domain* field, enter *Sales*.

4. If required, set the *NGFW Mode*. If the *NGFW Mode* is *Profile-based*, *Central SNAT* can be enabled.
5. Click *OK* to create the VDOM.
6. Repeat the above steps for *Accounting*.

Assign interfaces to VDOMs

This example uses three interfaces on the FortiGate unit: port2 (AccountingLocal), port3 (SalesLocal), and port1 (WAN). Port2 and port3 interfaces each have a department's network connected. Port1 is for all traffic to and from the Internet and uses DHCP to configure its IP address, which is common with many ISPs.

To assign interfaces to VDOMs in the GUI:

1. In the *Global VDOM*, go to *Network > Interfaces*.
2. Select *port2* and click *Edit*.
3. From the *Virtual domain* list, select *Accounting*.

4. Click **OK**.
5. Repeat the preceding steps to assign *port3* to the *Sales* VDOM.
6. Repeat the preceding steps to assign *port1* to the *root* VDOM.

Configure the VDOM links

To complete the connection between each VDOM and the management VDOM, add the two VDOM links. One pair is the Accounting – management link and the other is the Sales – management link. Each side of these links will be assigned IP addresses since they will be handy in configuring inter-VDOM routing in the next step.

To configure the Accounting and management VDOM link in the GUI:

1. In the *Global* VDOM, go to *Network > Interfaces*.
2. Select *Create New > VDOM Link*.
3. Enter the following information:

Name	AccountVlnk
Interface 0	
Virtual Domain	Accounting
IP/Netmask	11.11.11.2/255.255.255.252
Administrative Access	HTTPS, PING, SSH
Comment	Accounting side of the VDOM link
Interface 1	
Virtual Domain	root
IP/Netmask	11.11.11.1/255.255.255.252
Administrative Access	HTTPS, PING, SSH
Comment	Management side of the VDOM link

4. Click **OK**.

To configure the Sales and management VDOM link in the GUI:

1. In the *Global* VDOM, go to *Network > Interfaces*.
2. Select *Create New > VDOM link*.
3. Enter the following information:

Name	SalesVlnk
Interface 0	
Virtual Domain	Sales
IP/Netmask	12.12.12.2/255.255.255.252
Administrative Access	HTTPS, PING, SSH
Comment	Accounting side of the VDOM link
Interface 1	
Virtual Domain	root
IP/Netmask	12.12.12.1/255.255.255.252
Administrative Access	HTTPS, PING, SSH
Comment	Management side of the VDOM link

4. Click *OK*.

Configure inter-VDOM routing

A default static route can be configured on each VDOM to provide Internet access. In other words, this static route would provide inter-VDOM routing between each department VDOM and the root VDOM.

For this static route, these settings are used:

- Default Gateway: IP address of the management side of the VDOM link
 - Accounting VDOM: 11.11.11.1
 - Sales VDOM: 12.12.12.1
- Interface: Interface on the department VDOM side of the VDOM link
 - Accounting VDOM: AccountVlnk0
 - Sales VDOM: SalesVlnk0
- IP address: 0.0.0.0/0.0.0.0 (default)

To configure the default static route to the Internet in the Accounting VDOM:

1. In the *Accounting* VDOM, go to *Network > Static Routes*.
2. Click on *Create New* and select the version you need.

3. Enter the following information:

Destination	Subnet
IP address	0.0.0.0/0.0.0.0
Gateway	11.11.11.1
Interface	AccountVlink0
Administrative Distance	10

4. Click **OK**.

To configure the default static route to the Internet in the Sales VDOM:

1. In the *Sales* VDOM, go to *Network > Static Routes*.
2. Click on *Create New* and select the version you need.
3. Enter the following information:

Destination	Subnet
IP address	0.0.0.0/0.0.0.0
Gateway	12.12.12.1
Interface	SalesVlink0
Administrative Distance	10

4. Click **OK**.

Configure the firewall policies

With the VDOMs, physical interfaces, VDOM links, and static routes configured, the firewall must now be configured to allow the proper traffic. Firewalls are configured per-VDOM, and firewall objects and routes must be created for each VDOM separately.

To configure the firewall policies from AccountingLocal to Internet in the GUI:

1. In the *Accounting* VDOM, go to *Policy & Objects > Firewall Policy*.
2. Click *Create New*.
3. Enter the following information:

Name	Account-Local-to-Management
Incoming Interface	port2
Outgoing Interface	AccountVlink0
Source	All
Destination	All
Schedule	always

Service	ALL
Action	ACCEPT
NAT	enabled

4. Click *OK*.
5. In the *root* VDOM, go to *Policy & Objects > Firewall Policy*.
6. Click *Create New*.
7. Enter the following information:

Name	Account-VDOM-to-Internet
Incoming Interface	AccountVInk1
Outgoing Interface	port1
Source	All
Destination	All
Schedule	always
Service	ALL
Action	ACCEPT
NAT	enabled

8. Click *OK*.

To configure the firewall policies from SalesLocal to Internet in the GUI:

1. In the *Sales* VDOM, go to *Policy & Objects > Firewall Policy*.
2. Click *Create New*.
3. Enter the following information:

Name	Sales-Local-to-Management
Incoming Interface	port3
Outgoing Interface	SalesVInk0
Source	All
Destination	All
Schedule	always
Service	ALL
Action	ACCEPT
NAT	enabled

4. Click *OK*.
5. In the *root* VDOM, go to *Policy & Objects > Firewall Policy*.
6. Click *Create New*.

7. Enter the following information:

Name	Sales-VDOM-to-Internet
Incoming Interface	SalesVlnk1
Outgoing Interface	port1
Source	All
Destination	All
Schedule	always
Service	ALL
Action	ACCEPT
NAT	enabled

8. Click OK.

Test the configuration

When the inter-VDOM routing has been configured, test the configuration to confirm proper operation. Testing connectivity ensures that physical networking connections, FortiGate unit interface configurations, and firewall policies are properly configured.

The easiest way to test connectivity is to use the `ping` and `traceroute` commands on hosts in the Accounting and Sales networks, respectively, to confirm the connectivity of different routes on the network. Test connectivity with hosts connected to port2 (AccountingLocal) in the Accounting VDOM to the internet and hosts connected to port3 (SalesLocal) in the Sales VDOM to the internet.

Configuration with the CLI

The example can also be configured in the CLI.

To configure inter-VDOM routing in the CLI:

1. Enable multi VDOM mode:

```
config system global
    set vdom-mode multi-vdom
end
```

You will be logged out of the device when VDOM mode is enabled.

2. Create the Sales and Accounting VDOMs:

```
config vdom
    edit Accounting
    next
    edit Sales
    next
end
```

3. Assign interfaces to the VDOMs:

```
config global
  config system interface
    edit port2
      set vdom Accounting
    next
    edit port3
      set vdom Sales
    next
    edit port1
      set vdom root
    next
  end
end
```

4. Configure the Accounting and management VDOM link:

```
config global
  config system vdom-link
    edit AccountVlnk
      next
    end
  config system interface
    edit AccountVlnk0
      set vdom Accounting
      set ip 11.11.11.2 255.255.255.252
      set allowaccess https ping ssh
      set description "Accounting side of the VDOM link"
    next
    edit AccountVlnk1
      set vdom root
      set ip 11.11.11.1 255.255.255.252
      set allowaccess https ping ssh
      set description "Management side of the VDOM link"
    next
  end
end
```

5. Configure the Sales and management VDOM link:

```
config global
  config system vdom-link
    edit SalesVlnk
      next
    end
  config system interface
    edit SalesVlnk0
      set vdom Sales
      set ip 12.12.12.2 255.255.255.252
      set allowaccess https ping ssh
      set description "Sales side of the VDOM link"
    next
    edit SalesVlnk1
      set vdom root
      set ip 12.12.12.1 255.255.255.252
      set allowaccess https ping ssh
      set description "Management side of the VDOM link"
    next
  end
end
```

```
    end
end
```

6. Configure the default static route to the Internet in the Accounting VDOM:

```
config vdom
  edit Accounting
    config router static
      edit 1
        set gateway 11.11.11.1
        set device "AccountVlnk0"
      next
    end
  end
end
```

7. Configure the default static route to the Internet in the Sales VDOM:

```
config vdom
  edit Sales
    config router static
      edit 1
        set gateway 12.12.12.1
        set device "SalesVlnk0"
      next
    end
  end
end
```

8. Configure the firewall policies from AccountingLocal to the Internet:

```
config vdom
  edit Accounting
    config firewall policy
      edit 1
        set name "Accounting-Local-to-Management"
        set srcintf port2
        set dstintf AccountVlnk0
        set srcaddr all
        set dstaddr all
        set action accept
        set schedule always
        set service ALL
        set nat enable
      next
    end
  next
edit root
  config firewall policy
    edit 2
      set name "Accounting-VDOM-to-Internet"
      set srcintf AccountVlnk1
      set dstintf port1
      set srcaddr all
      set dstaddr all
      set action accept
      set schedule always
      set service ALL
      set nat enable
    next
  end
end
```

```
        end
    next
end
```

9. Configure the firewall policies from SalesLocal to the Internet:

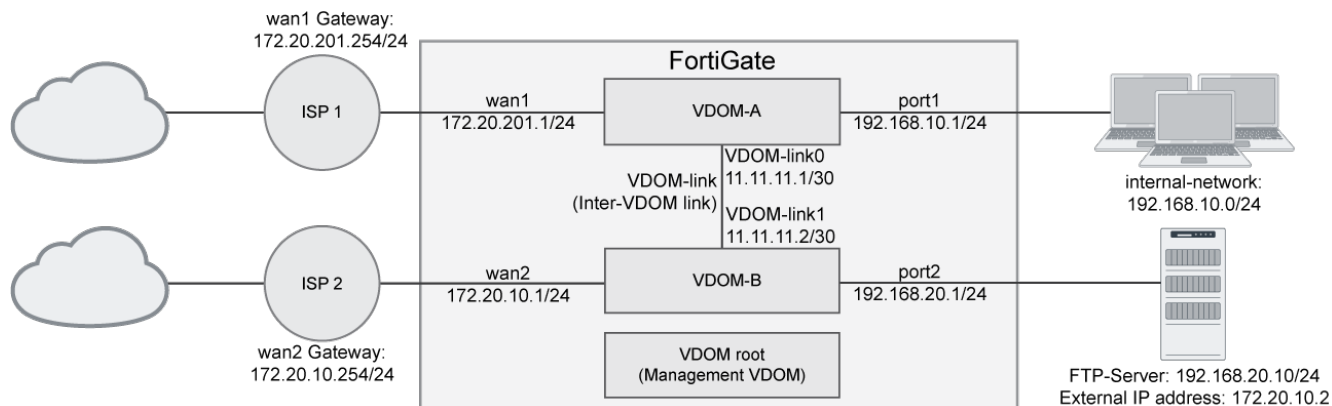

```
config vdom
    edit Sales
        config firewall policy
            edit 3
                set name "Sales-local-to-Management"
                set srcintf port3
                set dstintf SalesVlnk0
                set srcaddr all
                set dstaddr all
                set action accept
                set schedule always
                set service ALL
                set nat enable
            next
        end
    next
edit root
    config firewall policy
        edit 4
            set name "Sales-VDOM-to-Internet"
            set srcintf SalesVlnk1
            set dstintf port1
            set srcaddr all
            set dstaddr all
            set action accept
            set schedule always
            set service ALL
            set nat enable
        next
    end
next
end
```

Inter-VDOM routing configuration example: Partial-mesh VDOMs

This example shows how to configure a FortiGate unit to use inter-VDOM routing to route traffic between an internal network and FTP server that are each behind separate VDOMs. See [Inter-VDOM routing on page 2485](#) for more information.

The following example shows how to configure per-VDOM settings, such as operation mode, routing, and firewall policies, in a network that includes the following VDOMs:

- VDOM-A: allows the internal network to access the Internet.
- VDOM-B: allows external connections to an FTP server.
- root: the management VDOM.

You can use VDOMs in either NAT or transparent mode on the same FortiGate. By default, VDOMs operate in NAT mode. In this example, both VDOM-A and VDOM-B use NAT mode. An inter-VDOM link is created and inter-VDOM routes configured to allow users on the internal network to access the FTP server.

This is an example of the partial-mesh VDOMs configuration since only VDOM-A is connected to VDOM-B but neither of those VDOMs are connected to the root VDOM. See [Topologies on page 2477](#) for details.

This example assumes that the interfaces of the FortiGate have already been configured with the IP addresses depicted in the preceding diagram.

General steps for this example

This configuration requires the following general steps:

1. [Enable Multi VDOM mode and create the VDOMs on page 2501](#)
2. [Assign interfaces to VDOMs on page 2502](#)
3. [Configure VDOM-A on page 2503](#)
4. [Configure VDOM-B on page 2504](#)
5. [Configure the VDOM link on page 2506](#)
6. [Configure inter-VDOM routing on page 2506](#)
7. [Configure firewall policies using the VDOM link on page 2508](#)

This example demonstrates how to configure these steps first using the GUI and then, at the end of the section, using the CLI. See [Configuration with the CLI on page 2509](#) for details.

Enable Multi VDOM mode and create the VDOMs

Multi VDOM mode can be enabled in the GUI or CLI. Enabling it does not require a reboot, but does log you out of the device. The current configuration is assigned to the root VDOM.

On FortiGate 90 series models and lower, VDOMs can only be enabled using the CLI.

To enable multi VDOM mode in the GUI:

1. On the FortiGate, go to *System > Settings*.
2. In the *System Operation Settings* section, enable *Virtual Domains*.
3. Click *OK*.

To create the VDOMs in the GUI:

1. In the *Global VDOM*, go to *System > VDOM*.
Click *Create New*.
2. In the *Virtual Domain* field, enter *VDOM-A*.

3. If required, set the *NGFW Mode*. If the *NGFW Mode* is *Profile-based*, *Central SNAT* can be enabled.
4. Click *OK* to create the VDOM.
5. Repeat the above steps for *VDOM-B*.

Assign interfaces to VDOMs

This example uses three interfaces on the FortiGate unit: port1 (internal network), port2 (FTP server), wan1 (WAN link for VDOM-A), and wan2 (WAN link for VDOM-B). The port1 and port2 interfaces are connected to the internal network and FTP server, respectively. The wan1 and wan2 interfaces are static assigned with IP addresses and default gateways provided by the ISPs for those WAN links.

To assign interfaces to VDOMs in the GUI:

1. In the *Global VDOM*, go to *Network > Interfaces*.
2. Select *port1* and click *Edit*.
3. From the *Virtual domain* list, select *VDOM-A*.

4. Click *OK*.
5. Repeat the preceding steps to assign *port2* to *VDOM-B*.
6. Repeat the preceding steps to assign *wan1* to *VDOM-A*.
7. Repeat the preceding steps to assign *wan2* to *VDOM-B*.

Configure VDOM-A

VDOM-A allows connections from devices on the internal network to the Internet. WAN1 and port1 are assigned to this VDOM.

The per-VDOM configuration for VDOM-A includes the following:

- A firewall address for the internal network
- A static route to the ISP gateway
- A firewall policy allowing the internal network to access the Internet

All procedures in this section require you to connect to VDOM-A, either using a global or per-VDOM administrator account.

To add the firewall addresses in the GUI:

1. Go to *Policy & Objects > Addresses*.
2. Click *Create New > Address*.
3. Enter the following information:

Name	internal-network
Type	Subnet
IP/Netmask	192.168.10.0/255.255.255.0
Interface	port1

4. Click *OK*.

To add a default route in the GUI:

1. Go to *Network > Static Routes* and create a new route.
2. Enter the following information:

Destination	Subnet
IP address	0.0.0.0/0.0.0.0
Gateway	172.20.201.254
Interface	wan1
Administrative Distance	10

3. Click *OK*.

To add the firewall policy in the GUI:

1. Go to *Policy & Objects > Firewall Policy*.
2. Click *Create New*.
3. Enter the following information:

Name	VDOM-A-Internet
Incoming Interface	port1
Outgoing Interface	wan1
Source	internal-network
Destination	all
Schedule	always
Service	ALL
Action	ACCEPT
NAT	enabled

4. Click *OK*.

Configure VDOM-B

VDOM-B allows external connections to reach an internal FTP server. WAN2 and port2 are assigned to this VDOM.

The per-VDOM configuration for VDOM-B includes the following:

- A firewall address for the FTP server
- A virtual IP address for the FTP server
- A static route to the ISP gateway
- A firewall policy allowing external traffic to reach the FTP server

The procedures described above require you to connect to VDOM-B, either using a global or per-VDOM administrator account.

To add the firewall addresses in the GUI:

1. Go to *Policy & Objects > Addresses*.
2. Click *Create New > Address*.
3. Enter the following information:

Name	FTP-server
Type	Subnet
IP/Netmask	192.168.10.0/255.255.255.255
Interface	port2

4. Click *OK*.

To add the virtual IP address in the GUI:

1. Go to *Policy & Objects > Virtual IPs*.
2. Click *Create New > Virtual IP*.
3. Enter the following information:

Name	FTP-server-VIP
Interface	wan2
External IP address/range	172.20.10.2
Map To	192.168.20.10

4. Click *OK*.

To add a default route in the GUI:

1. Go to *Network > Static Routes* and create a new route.
2. Enter the following information:

Destination	Subnet
IP address	0.0.0.0/0.0.0.0
Gateway	172.20.201.254
Interface	wan2
Administrative Distance	10

3. Click *OK*.

To add the firewall policy in the GUI:

1. Go to *Policy & Objects > Firewall Policy*.
2. Click *Create New*.
3. Enter the following information:

Name	Access-server
Incoming Interface	wan2
Outgoing Interface	port2
Source	all
Destination	FTP-server-VIP
Schedule	always
Service	FTP
Action	ACCEPT
NAT	enabled

4. Click *OK*.

Configure the VDOM link

The VDOM link allows connections from VDOM-A to VDOM-B. The VDOM link interface configured in this step will be used for inter-VDOM routing.

This step requires you to connect to the global VDOM using a global administrator account.

To add the VDOM link in the GUI:

1. In the *Global* VDOM, go to *Network > Interfaces*.
2. Create *New > VDOM link*.
3. Enter the following information:

Name	VDOM-link
Interface 0	
Virtual Domain	VDOM-A
IP/Netmask	11.11.11.1/255.255.255.252
Interface 1	
Virtual Domain	VDOM-B
IP/Netmask	11.11.11.2/255.255.255.252

4. Click *OK*.

Configure inter-VDOM routing

Inter-VDOM routing allows users on the internal network to route traffic to the FTP server through the FortiGate.

The configuration of inter-VDOM routing includes the following:

- Firewall addresses for the FTP server on VDOM-A and for the internal network on VDOM-B
- Inter-VDOM routing using static routes for the FTP server on VDOM-A and for the internal network on VDOM-B
- Policies allowing traffic using the VDOM link

The procedures described above require you to connect to both VDOM-A and VDOM-B, either using a global or per-VDOM administrator account.

To add the firewall address on VDOM-A in the GUI:

1. In the *VDOM-A* VDOM, go to *Policy & Objects > Addresses*.
2. Click *Create New > Address*.

3. Enter the following information:

Name	FTP-server
Type	Subnet
IP/Netmask	192.168.20.10/32
Interface	VDOM-link2
Static route configuration	enabled

4. Click *OK*.

To add the static route on VDOM-A in the GUI:

1. Connect to *VDOM-A*.
2. Go to *Network > Static Routes* and create a new route.
3. Enter the following information:

Destination	Named Address
Named Address	FTP-server
Gateway	11.11.11.2
Interface	VDOM-link0

4. Click *OK*.

To add the firewall address on VDOM-B in the GUI:

1. In the *VDOM-B* VDOM, go to *Policy & Objects > Addresses*.
2. Click *Create New > Address*.
3. Enter the following information:

Name	internal-network
Type	Subnet
IP/Netmask	192.168.10.0/24
Interface	VDOM-link1
Static route configuration	enabled

4. Click *OK*.

To add the static route on VDOM-B in the GUI:

1. In the *VDOM-B* VDOM, go to *Network > Static Routes* and create a new route.
2. Enter the following information:

Destination	Named Address
--------------------	---------------

Named Address	internal-network
Gateway	11.11.11.1
Interface	VDOM-link1

3. Click *OK*.

Configure firewall policies using the VDOM link

Firewall policies using the VDOM link allows users on the internal network to access the FTP server through the FortiGate.

Configuring policies allowing traffic using the VDOM link require you to connect to both VDOM-A and VDOM-B, respectively, either using a global or per-VDOM administrator account.

To add the firewall policy on VDOM-A in the GUI:

1. In the *VDOM-A* VDOM, go to *Policy & Objects > Firewall Policy*.
2. Click *Create New*.
3. Enter the following information:

Name	Access-FTP-server
Incoming Interface	port1
Outgoing Interface	VDOM-link0
Source	internal-network
Destination	FTP-server
Schedule	always
Service	FTP
Action	ACCEPT
NAT	disabled

4. Click *OK*.

To add the firewall policy on VDOM-B in the GUI:

1. In the *VDOM-B* VDOM, go to *Policy & Objects > Firewall Policy*.
2. Click *Create New*.

3. Enter the following information:

Name	Internal-server-access
Incoming Interface	VDOM-link1
Outgoing Interface	port2
Source	internal-network
Destination	FTP-server
Schedule	always
Service	FTP
Action	ACCEPT
NAT	disabled

4. Click OK.

Configuration with the CLI

The example can also be configured in the CLI.

To configure the two VDOMs:

1. Enable multi VDOM mode:

```
config system global
    set vdom-mode multi-vdom
end
```

You will be logged out of the device when VDOM mode is enabled.

2. Create the VDOMs:

```
config vdom
    edit VDOM-A
    next
    edit VDOM-B
    next
end
```

3. Assign interfaces to the VDOMs:

```
config global
    config system interface
        edit port1
            set vdom VDOM-A
        next
        edit port2
            set vdom VDOM-B
        next
        edit wan1
            set vdom VDOM-A
        next
        edit wan2
```

```
        set vdom VDOM-B
    next
end
end
```

4. Add the firewall addresses to VDOM-A:

```
config vdom
    edit VDOM-A
        config firewall address
            edit internal-network
                set associated-interface port1
                set subnet 192.168.10.0 255.255.255.0
            next
        end
    next
end
```

5. Add a default route to VDOM-A:

```
config vdom
    edit VDOM-A
        config router static
            edit 0
                set gateway 172.20.201.254
                set device wan1
            next
        end
    next
end
```

6. Add the firewall policy to VDOM-A:

```
config vdom
    edit VDOM-A
        config firewall policy
            edit 1
                set name "VDOM-A-Internet"
                set srcintf "port1"
                set dstintf "wan1"
                set srcaddr "internal-network"
                set dstaddr "all"
                set action accept
                set schedule "always"
                set service "ALL"
                set nat enable
            next
        end
    next
end
```

7. Add the firewall addresses to VDOM-B:

```
config vdom
    edit VDOM-B
        config firewall address
            edit FTP-server
                set associated-interface port2
                set subnet 192.168.20.10 255.255.255.255
```

```
        next
    end
    next
end
```

8. Add the virtual IP address to VDOM-B:

```
config vdom
    edit VDOM-B
        config firewall vip
            edit FTP-server-VIP
                set extip 172.20.10.2
                set extintf wan2
                set mappedip 192.168.20.10
            next
        end
    next
end
```

9. Add a default route to VDOM-B:

```
config vdom
    edit VDOM-B
        config router static
            edit 0
                set gateway 172.20.10.254
                set device wan2
            next
        end
    next
end
```

10. Add the firewall policy to VDOM-B:

```
config vdom
    edit VDOM-B
        config firewall policy
            edit 1
                set name "Access-server"
                set srcintf "wan2"
                set dstintf "port2"
                set srcaddr "all"
                set dstaddr "FTP-server-VIP"
                set action accept
                set schedule "always"
                set service "FTP"
                set nat enable
            next
        end
    next
end
```

To configure the VDOM link:**1. Configure the VDOM link:**

```
config global
    config system vdom-link
```

```
        edit "VDM-link"
        next
    end
    config system interface
        edit VDM-link0
            set vdom VDM-A
            set ip 11.11.11.1 255.255.255.252
            set allowaccess https ping ssh
            set description "VDM-A side of the VDM link"
        next
        edit VDM-link1
            set vdom VDM-B
            set ip 11.11.11.2 255.255.255.252
            set allowaccess https ping ssh
            set description "VDM-A side of the VDM link"
        next
    end
end
```

2. Configure the firewall addresses on VDM-A:

```
config vdom
    edit VDM-A
        config firewall address
            edit "FTP-server"
                set associated-interface "VDM-link0"
                set allow-routing enable
                set subnet 192.168.20.10 255.255.255.255
            next
        end
    next
end
```

3. Add the firewall policy to VDM-B:

```
config vdom
    edit VDM-B
        config firewall policy
            edit 1
                set name "Access-server"
                set srcintf "wan2"
                set dstintf "port2"
                set srcaddr "all"
                set dstaddr "FTP-server-VIP"
                set action accept
                set schedule "always"
                set service "FTP"
                set nat enable
            next
        end
    next
end
```

4. Add the static route on VDM-A:

```
config vdom
    edit VDM-A
        config router static
```

```
        edit 0
            set device VDOM-link0
            set dstaddr FTP-server
            set gateway 11.11.11.2
        next
    end
next
end
```

5. Configure the firewall addresses on VDOM-B:

```
config vdom
    edit VDOM-B
        config firewall address
            edit internal-network
                set associated-interface VDOM-link1
                set allow-routing enable
                set subnet 192.168.10.0 255.255.255.0
            next
        end
    next
end
```

6. Add the static route on VDOM-B:

```
config vdom
    edit VDOM-B
        config router static
            edit 0
                set device VDOM-link1
                set dstaddr internal-network
                set gateway 11.11.11.1
            next
        end
    next
end
```

7. Add the security policy on VDOM-A:

```
config vdom
    edit VDOM-A
        config firewall policy
            edit 0
                set name Access-FTP-server
                set srcintf port1
                set dstintf VDOM-link0
                set srcaddr internal-network
                set dstaddr FTP-server
                set action accept
                set schedule always
                set service FTP
            next
        end
    next
end
```

8. Add the firewall policy on VDOM-B:

```
config vdom
  edit VDOM-B
    config firewall policy
      edit 0
        set name Internal-server-access
        set srcintf VDOM-link1
        set dstintf port2
        set srcaddr internal-network
        set dstaddr FTP-server
        set action accept
        set schedule always
        set service FTP
      next
    end
  next
end
```

High Availability

Whether your FortiGate is used as a security gateway, an internal segmentation firewall, in the cloud, or in an MSSP environment, as long as there is critical traffic passing through it, there is risk of it being a single point of failure. Physical outages can occur due to power failures, physical link failures, transceiver failures, or power supply failures. Non-physical outages can be caused by routing, resource issues, or kernel panic.

Network outages cause disruptions to business operations, downtime, and frustration for users and in some situations may have financial setbacks. In designing your network and architecture, it is important to weigh the risks and consequences associated with unexpected outages.

There are many ways to build redundancy and resiliency. In a switching network, you can accomplish this by adding redundant links and switches in partial or full mesh topologies. Using redundant and aggregate links, you can avoid a single link failure causing a network to go down. Using SD-WAN, you can build redundant and intelligent WAN load balancing and failover architectures.

FortiGate HA offers several solutions for adding redundancy in the case where a failure occurs on the FortiGate, or is detected by the FortiGate through monitored links, routes, and other health checks. These solutions support fast failover to avoid lengthy network outages and disruptions to your traffic.

FortiGate Clustering Protocol (FGCP)

FGCP provides a solution for two key requirements of critical enterprise networking components: enhanced reliability and increased performance. Enhanced reliability is achieved through device failover protection, link failover protection, and remote link failover protection. Session failover protection for most IPv4 and IPv6 sessions also contributes to enhanced reliability. Increased performance is achieved through active-active HA load balancing.

FortiGate Session Life Support Protocol (FGSP)

In a network that already includes load balancing (either with load balancers or routers) for traffic redundancy, two entities (either standalone FortiGates or FGCP clusters) can be integrated into the load balancing configuration using the FortiGate Session Life Support Protocol (FGSP). The external load balancers or routers can distribute sessions among

the FortiGate and the FGSP performs session synchronization of IPv4 and IPv6 TCP, SCTP, UDP, ICMP, expectation, and NAT sessions to keep the session tables of both entities synchronized. In the event of a failure, the load balancer can detect the failed unit and failover the sessions to other active members to continue processing the traffic.

VRRP

FortiGate can function as primary or backup Virtual Router Redundancy Protocol (VRRP) routers. The FortiGate can quickly and easily integrate into a network that has already deployed VRRP. A FortiGate can be integrated into a VRRP group with any third-party VRRP devices, and VRRP can provide redundancy between multiple FortiGate. FortiOS supports VRRP version 2 and 3.

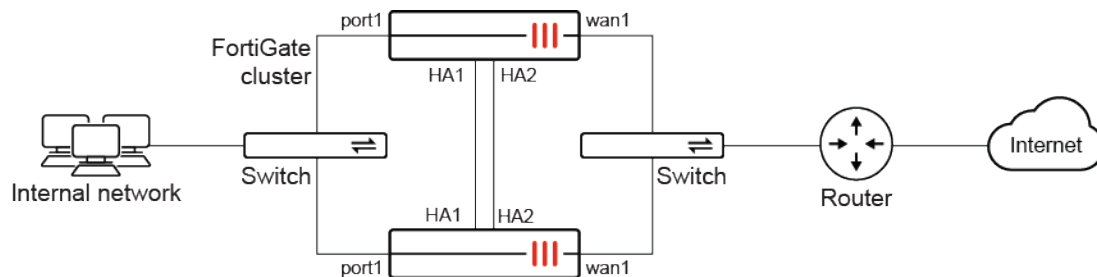

The following topics provide more information about each HA solution and other HA related topics:

- [FGCP on page 2515](#)
- [FGSP on page 2594](#)
- [Standalone configuration synchronization on page 2645](#)
- [VRRP on page 2649](#)

FGCP

High availability (HA) is usually required in a system where there is high demand for little downtime. There are usually hot-swaps, backup routes, or standby backup units and as soon as the active entity fails, backup entities will start functioning. This results in minimal interruption for the users.

The FortiGate Clustering Protocol (FGCP) is a proprietary HA solution whereby FortiGate can find other member FortiGate to negotiate and create a cluster. A FortiGate HA cluster consists of at least two FortiGate (members) configured for HA operation. All FortiGate in the cluster must be the same model and have the same firmware installed. Cluster members must also have the same hardware configuration (such as the same number of hard disks). All cluster members share the same configurations except for their host name and priority in the HA settings. The cluster works like a device but always has a hot backup device.

Critical cluster components

The following are critical components in an HA cluster:

- Identical heartbeat connections and interfaces: members will use this to communicate with each other. In general, a two-member cluster is most common. We recommend double back-to-back heartbeat connections (as demonstrated in the topology).
- Identical connections for internal and external interfaces: we recommend similar connections from each member to the switches for the cluster to function properly (as demonstrated in the topology).

The HA heartbeat interface communicates with each unit in the cluster using the same heartbeat interface for each member.

For example, if port1 and port2 are the heartbeat interfaces for the HA cluster, then in a cluster consisting of two members:

- port1 of the primary FortiGate should be connected to port1 of the secondary FortiGate.
- port2 of the primary FortiGate should be connected to port2 of the secondary FortiGate.

General operation

The following are best practices for general cluster operation:

- Ensure that heartbeat communication is present (see [HA heartbeat interface on page 2519](#)).
- Enable the session synchronization option in daily operation (see [FGSP basic peer setup on page 2597](#)).
- Monitor traffic flowing in and out of the interfaces.

Failover

FGCP provides failover protection in the following scenarios:

- The active device loses power.
- A monitored interface loses a connection.

After failover occurs, the user will not notice any difference, except that the active device has changed. See [Failover protection on page 2517](#) for more information.

Synchronizing the configuration

FGCP uses a combination of incremental and periodic synchronization to make sure that the configuration of all cluster units is synchronized to that of the primary unit.

The following settings are not synchronized between cluster units:

- The FortiGate host name
- GUI Dashboard widgets
- HA override
- HA device priority
- The virtual cluster priority
- The HA priority setting for a ping server (or dead gateway detection) configuration
- The system interface settings of the HA reserved management interface
- The HA default route for the reserved management interface, set using the `ha-mgmt-interface-gateway` option of the `config system ha` command

Most subscriptions and licenses are not synchronized, as each FortiGate must be licensed individually. FortiToken Mobile is an exception; they are registered to the primary unit and synchronized to the secondary units.

The primary unit synchronizes all other configuration settings, including the other HA configuration settings.

All synchronization activity takes place over the HA heartbeat link using TCP/703 and UDP/703 packets.

Failover protection

The FortiGate Clustering Protocol (FGCP) provides failover protection, meaning that a cluster can provide FortiGate services even when one of the devices in the cluster encounters a problem that would result in the complete loss of connectivity for a stand-alone FortiGate unit. Failover protection provides a backup mechanism that can be used to reduce the risk of unexpected downtime, especially in mission-critical environments.

FGCP supports failover protection in four ways:

1. If a link fails.
2. If a device loses power.
3. If an SSD fails.
4. If memory utilization exceeds the threshold for a specified amount of time.

When session-pickup is enabled in the HA settings, existing TCP sessions are kept, and users on the network are not impacted by downtime as the traffic can be passed without reestablishing the sessions.

When and how the failover happens

1. Link fails

Before triggering a failover when a link fails, the administrator must ensure that monitor interfaces are configured.

Normally, the internal interface that connects to the internal network, and an outgoing interface for traffic to the internet or

outside the network, should be monitored. Any of those links going down will trigger a failover.

2. Loss of power for active unit

When an active (primary) unit loses power, a backup (secondary) unit automatically becomes the active, and the impact on traffic is minimal. There are no settings for this kind of fail over.

3. SSD failure

An HA failover can be triggered by an SSD failure.

To enable an SSD failure triggering HA fail over:

```
config system ha
    set ssd-failover enable
end
```

4. Memory utilization

An HA failover can be triggered when memory utilization exceeds the threshold for a specific amount of time.

Memory utilization is checked at the configured sample rate (`memory-failover-sample-rate`). If the utilization is above the threshold (`memory-failover-threshold`) every time that it is sampled for the entire monitor period (`memory-failover-monitor-period`), then a failover is triggered.

If the FortiGate meets the memory utilization conditions to cause failover, but the last memory triggered failover happened within the timeout period (`memory-failover-flip-timeout`), then the failover does not occur. Other HA cluster members can still trigger memory based failovers if they meet the criteria and have not already failed within the timeout period.

After a memory based failover from FortiGate A to FortiGate B, if the memory usage on FortiGate A goes down below the threshold but the memory usage on FortiGate B is still below the threshold, then a failover is triggered, and FortiGate A becomes the primary device.

When you disable memory based failover, a new HA primary selection occurs to determine the primary device.

To configure memory based HA failover:

```
config system ha
    set memory-based-failover {enable | disable}
    set memory-failover-threshold <integer>
    set memory-failover-monitor-period <integer>
    set memory-failover-sample-rate <integer>
    set memory-failover-flip-timeout <integer>
end
```

<code>memory-based-failover {enable disable}</code>	Enable/disable memory based failover (default = disable).
<code>memory-failover-threshold <integer></code>	The memory usage threshold to trigger a memory based failover, in percentage (0 - 95, 0 = use the conserve mode threshold, default = 0).
<code>memory-failover-monitor-period <integer></code>	The duration of the high memory usage before a memory based failover is triggered, in seconds (1 - 300, default = 60).

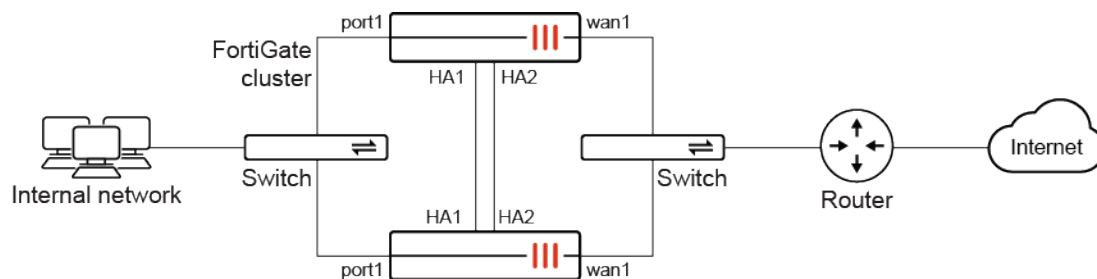

<code>memory-failover-sample-rate <integer></code>	The rate at which memory usage is sampled in order to measure memory usage, in seconds (1 - 60, default = 1).
<code>memory-failover-flip-timeout <integer></code>	The time to wait between subsequent memory based failovers, in minutes (6 - 2147483647, default = 6).

Configuring HA failover time

On supported models, the HA heartbeat interval unit can be changed from the 100ms default to 10ms. This allows for a failover time of less than 50ms, depending on the configuration and the network.

```
config system ha
    set hb-interval-in-milliseconds {100ms | 10ms}
end
```

In this example, the HA heartbeat interval unit is changed from 100ms to 10ms. As the default heartbeat interval is two, this means that a heartbeat is sent every 20ms. The number of lost heartbeats that signal a failure is also changed to two. So, after two consecutive heartbeats are lost, a failover will be detected in 40ms.

To configure the HA failover time:

```
config system ha
    set group-id 240
    set group-name "300D"
    set mode a-p
    set hbdev "port3" 50 "port5" 100
    set hb-interval 2
    set hb-interval-in-milliseconds 10ms
    set hb-lost-threshold 2
    set override enable
    set priority 200
end
```

HA heartbeat interface

The HA heartbeat allows cluster units to communicate with each other. The heartbeat consists of hello packets that are sent at regular intervals by the heartbeat interface of all cluster units. The hello packets describe the state of the cluster unit (including communication sessions) and are used by other cluster units to keep the cluster synchronized. While the cluster is operating, the HA heartbeat confirms that all cluster units are functioning normally.

HA heartbeat packets are Layer 2 Ethernet frames that use EtherType values of 0x8890 and 0x8891 rather than 0x0800 for normal 802.3 IP packets. The default time interval between HA heartbeats is 200 ms.

As a best practice, it is recommended to isolate the heartbeat devices from the user networks by connecting the heartbeat devices to a dedicated switch that is not connected to any network. The heartbeat packets contain sensitive information about the cluster configuration and may use a considerable amount of network bandwidth. If the cluster consists of two FortiGates, connect the heartbeat device interfaces back-to-back using a crossover cable. If there are more than two FortiGates, each heartbeat interface should be connected to a dedicated switch. For example, in a four-member HA cluster with two heartbeat interfaces, there would be two switches (one switch dedicated to each interface).

Upon starting up, a FortiGate configured for HA broadcasts HA heartbeat hello packets from its HA heartbeat interface to find other FortiGates configured to operate in HA mode. If two or more FortiGates operating in HA mode connect with each other, they compare HA configurations (mode, password, and group ID). If the HA configurations match, then the units negotiate to form a cluster.

The HA heartbeat interface communicates with each unit in the cluster using the same heartbeat interface for each member.

For example, if port1 and port2 are the heartbeat interfaces for the HA cluster, then in a cluster consisting of two members:

- port1 of the primary FortiGate should be connected to port1 of the secondary FortiGate.
- port2 of the primary FortiGate should be connected to port2 of the secondary FortiGate.

Configuring an HA heartbeat interface

A heartbeat interface is an Ethernet network interface in a cluster that is used by the FGCP for HA heartbeat communications between cluster units.

By default, two interfaces are configured to be heartbeat interfaces on most FortiGate models. The heartbeat interface configuration can be changed to select an additional or different heartbeat interface. It is possible to select only one heartbeat interface; however, this is not a recommended configuration (see [Split brain scenario on page 2521](#)).

Another important setting in the HA configuration is the heartbeat interface priority. In all cases, the heartbeat interface with the highest priority is used for all HA heartbeat communication. If the interface fails or becomes disconnected, then the selected heartbeat interface with the next highest priority handles all HA heartbeat communication.

If more than one heartbeat interface has the same priority, the heartbeat interface with the highest priority that is also highest in the heartbeat interface list is used for all HA heartbeat communication. If this interface fails or becomes disconnected, then the selected heartbeat interface with the highest priority that is next highest in the list handles all heartbeat communication (see [Selecting heartbeat packets and interfaces on page 2521](#)).

The default heartbeat interface configuration sets the priority of both heartbeat interfaces to 50, and the range is 0 to 512. When selecting a new heartbeat interface, the default priority is 0. The higher the number, the higher the priority.

In most cases, the default heartbeat interface configuration can be maintained as long the heartbeat interfaces are connected. Configuring HA heartbeat interfaces is the same for virtual clustering and for standard HA clustering. Up to eight heartbeat interface can be selected. This limit only applies to FortiGates with more than eight physical interfaces.

Heartbeat communications can be enabled on physical interfaces, but not on switch ports, VLAN subinterfaces, IPsec VPN interfaces, redundant interfaces, or 802.3ad aggregate interfaces.

To change the heartbeat interfaces in the GUI:

1. Go to *System > HA* and select a *Mode*.
2. Click the + in the *Heartbeat interfaces* field to select an interface.
3. Click *OK*.

To configure two interfaces as heartbeat interfaces with the same priority in the CLI:

```
config system ha
    set hbdev port4 150 port5 150
end
```

In this example, port4 and port5 are configured as the HA heartbeat interfaces and they both have a priority of 150.

To configure two interfaces as heartbeat interfaces with different priorities in the CLI:

```
config system ha
    set hbdev port4 100 port1 50
end
```

In this example, port4 and port1 are configured as the HA heartbeat interfaces. The priority for port4 is higher (100) than port1 (50), so port4 is the preferred HA heartbeat interface.

Split brain scenario

At least one heartbeat interface must be selected for the HA cluster to function correctly. This interface must be connected to all the units in the cluster. If heartbeat communication is interrupted and cannot fail over to a second heartbeat interface, then the cluster units will not be able to communicate with each other and more than one cluster unit may become a primary unit. As a result, the cluster stops functioning normally because multiple devices on the network may be operating as primary units with the same IP and MAC addresses creating a split brain scenario. See [Split brain scenario: on page 2593](#) for more information.

Sharing heartbeat interfaces with traffic ports

HA heartbeat and data traffic is supported on the same cluster interface. In NAT mode, if the heartbeat interfaces are used for processing network traffic, then the interface can be assigned any IP address. The IP address does not affect HA heartbeat traffic.

In transparent mode, the heartbeat interface can be connected to the network with management access enabled on the same interface. A management connection would then be established to the interface using the transparent mode management IP address. This configuration does not affect HA heartbeat traffic.

While these configurations are allowable, they are not recommended. When possible, use dedicated interfaces for heartbeat traffic.

Selecting heartbeat packets and interfaces

HA heartbeat hello packets are sent constantly by all of the enabled heartbeat interfaces. Using these hello packets, each cluster unit confirms that the other cluster units are still operating. The FGCP selects one of the heartbeat interfaces to be used for communication between the cluster units. This interface is used for heartbeat communication and is based on the linkfail states of the heartbeat interfaces, the heartbeat interface priority, and the interface index. The connected heartbeat interface with the highest priority is selected for heartbeat communication.

If more than one connected heartbeat interface has the highest priority, then the FGCP selects the heartbeat interface with the lowest interface index. The interface index order is visible in the CLI by running the `diagnose netlink interface list` command.

If the interface that is processing heartbeat traffic fails or becomes disconnected, the FGCP uses the same criteria to select another heartbeat interface for heartbeat communication. If the original heartbeat interface is fixed or reconnected, the FGCP selects this interface again for heartbeat communication.

The HA heartbeat interface communicates cluster session information, synchronizes the cluster configuration, synchronizes the cluster kernel routing table, and reports individual cluster member statuses. The HA heartbeat constantly communicates HA status information to make sure that the cluster is operating properly.

Modifying heartbeat timing

The heartbeat interval and heartbeat lost threshold are two variables that dictate the length of time one cluster unit will wait before determining a peer is dead.

```
config system ha
    set hb-interval <integer>
    set hb-interval-in-milliseconds {100 | 10}
    set hb-lost-threshold <integer>
end
```

<code>hb-interval <integer></code>	Set the time between sending heartbeat packets; increase to reduce false positives (1 - 20, default = 2).
<code>hb-interval-in-milliseconds {100 10}</code>	Set the number of milliseconds for each heartbeat interval (100 or 10, default = 100).
<code>hb-lost-threshold <integer></code>	Set the number of lost heartbeats to signal a failure; increase to reduce false positives (1 - 60, default = 20).

Heartbeats are sent out every 2×100 ms, and it takes 20 consecutive lost heartbeats for a cluster member to be detected as dead. Therefore, it takes by default $2 \times 100 \text{ ms} \times 20 = 4000 \text{ ms}$, or 4 seconds, for a failure to be detected.

Sub-second heartbeat failure detection can be achieved by lowering the interval and threshold or lowering the heartbeat interval unit of measurement from 100 ms to 10 ms.

If the primary unit does not receive a heartbeat packet from a subordinate unit before the heartbeat threshold expires, the primary unit assumes that the subordinate unit has failed.

If a subordinate unit does not receive a heartbeat packet from the primary unit before the heartbeat threshold expires, the subordinate unit assumes that the primary unit has failed. The subordinate unit then begins negotiating to become the new primary unit.

The HA heartbeat packets consume more bandwidth if the heartbeat interval is short. But if the heartbeat interval is very long, the cluster is not as sensitive to topology and other network changes. Therefore, gauge your settings based on the amount of traffic and CPU usage sustainable by the cluster units versus the tolerance for an outage when the primary unit fails. Avoid using the heartbeat interfaces as traffic ports to prevent congesting the interfaces.

Changing the time to wait in the hello state

The hello state hold down time is the number of seconds that a cluster unit waits before changing from hello state to work state. After a failure or when starting up, cluster units operate in the hello state to send and receive heartbeat packets so

that all the cluster units can find each other and form a cluster. A cluster unit should change from the hello state to work state after it finds all the other FortiGates to form a cluster with.

If all cluster units cannot find each other during the hello state, then some cluster units may join the cluster after it has formed. This can cause disruptions to the cluster and affect how it operates. A delay could occur if the cluster units are located at different sites or if communication is delayed between the heartbeat interfaces. If delays occur, increase the cluster units wait time in the hello state.

```
config system ha
    set hello-holddown <integer>
end
```

<code>hello-holddown <integer></code>	Set the time to wait before changing from hello to work state, in seconds (5 - 300, default = 20).
---	--

Configuring HA heartbeat encryption and authentication

HA heartbeat encryption and authentication to encrypt and authenticate HA heartbeat packets can be enabled. HA heartbeat packets should be encrypted and authenticated if the cluster interfaces that send HA heartbeat packets are also connected to the networks. HA heartbeat encryption and authentication are disabled by default. Note that enabling these settings could reduce cluster performance.

```
config system ha
    set authentication {enable | disable}
    set encryption {enable | disable}
end
```

If HA heartbeat packets are not encrypted, the cluster password and changes to the cluster configuration could be exposed. An attacker may be able to sniff HA packets to get cluster information. Enabling HA heartbeat message authentication prevents an attacker from creating false HA heartbeat messages. False HA heartbeat messages could affect the stability of the cluster.

HA authentication and encryption uses AES-128 for encryption and SHA1 for authentication. Heartbeat messages are encrypted and encapsulated in ESP packets for transfer in an IPsec tunnel between the cluster members.

Heartbeat bandwidth requirements

The majority of the traffic processed by the HA heartbeat interface is session synchronization traffic. Other heartbeat interface traffic required to synchronize IPsec states, IPsec keys, routing tables, configuration changes, and so on is usually negligible.

The amount of traffic required for session synchronization depends on the connections per second (CPS) that the cluster is processing, since only new sessions (and session table updates) need to be synchronized.

Another factor to consider is that if session pickup is enabled, the traffic on the heartbeat interface surges during a failover or when a unit joins or re-joins the cluster. When one of these events occurs, the entire session table needs to be synchronized. Lower throughput HA heartbeat interfaces may increase failover time if they cannot handle the higher demand during these events.

The amount of heartbeat traffic can also be reduced by:

- Turning off session pickup if it is not needed
- Enabling `session-pickup-delay` to reduce the number of sessions that are synchronized
- Using the `session-sync-dev` option to move session synchronization traffic off of the heartbeat link

Heartbeat packet EtherTypes

Normal 802.3 IP packets have an EtherType field value of 0x0800. EtherType values other than 0x0800 are understood as Layer 2 frames rather than IP packets.

HA heartbeat packets use the following EtherTypes:

Field value	Function	Description
0x8890	Heartbeat	Heartbeat packets are used by cluster units to find other cluster units, and to verify the status of other cluster units while the cluster is operating. Use the <code>ha-eth-type</code> option to change the EtherType.
0x8891	Traffic redistribution from primary to subordinate	These are used when the HA primary needs to redistribute traffic packets and the corresponding session information to the subordinate units in A-A mode. Use the <code>hc-eth-type</code> option to change the EtherType.
0x8892	Session synchronization	Session synchronization uses the heartbeat interfaces for communication, unless session synchronization devices are specified. See Session synchronization on page 2524 for more information.
0x8893	HA Telnet sessions (configuration synchronization)	The Telnet sessions are used to synchronize the cluster configurations, and to connect from one cluster unit's CLI to another when an administrator uses the <code>execute ha manage</code> command. Use the <code>l2ep-eth-type</code> option to change the EtherType.

Session synchronization

Since large amounts of session synchronization traffic can increase network congestion, it is recommended to keep this traffic off of the network and separate from the HA heartbeat interfaces by using dedicated connections for it. The interfaces are configured in the `session-sync-dev` setting.

The session synchronization device interfaces must be connected together by directly using the appropriate cable or using switches. If one of the interfaces becomes disconnected, then the cluster uses the remaining interfaces for session synchronization. If all the session synchronization interfaces become disconnected, then session synchronization reverts to using the HA heartbeat link.

All session synchronization traffic is between the primary unit and each subordinate unit. Session synchronization always uses UDP/708, but this will be encapsulated differently depending on the `session-sync-dev` setting. If `session-sync-dev` is specified, the packets will use 0x8892 and will exit over the mentioned port. If `session-sync-dev` is not specified, the packets will use 0x8893 and will exit the heartbeat port.

Session synchronization packets are typically processed by a single CPU core because all source and destination MAC addresses of the L2 frames are the same. Hashing based on the L2 addresses maps the processing of the frames to the same core. When large amounts of session synchronization traffic must be processed, enable the `sync-packet-balance` setting to distribute the processing to more cores. This effectively uses a larger set of MAC addresses for the hashing to map to multiple cores.

Troubleshooting heartbeat packets

Understanding the different types of heartbeat packets will ease troubleshooting. Heartbeat packets are recognized as Layer 2 frames. The switches and routers on the heartbeat network that connect to heartbeat interfaces must be configured to allow them to pass through. If Layer 2 frames are dropped by these network devices, then the heartbeat traffic will not be allowed between the cluster units.

For example, some third-party network equipment may not allow EtherType 0x8893. The unit can still be found in the HA cluster, but you would be unable to run `execute ha manage` to manage the other unit. Use the following settings to change the EtherTypes of the HA heartbeat packets, if they require changing them for the traffic to be forwarded on the connected switch.

```
config system ha
    set ha-eth-type <hex_value>
    set hc-eth-type <hex_value>
    set l2ep-eth-type <hex_value>
end
```

To change the EtherType values of the heartbeat and HA Telnet session packets:

```
config system ha
    set ha-eth-type 8895
    set l2ep-eth-type 889f
end
```

For troubleshooting issues with packets sent or received on the HA heartbeat ports, use the following diagnostic command to sniff the traffic by EtherType.

```
# diagnose sniffer packet any 'ether proto <EtherType_in_hex>' 6 0 1
```

To sniff the traffic on EtherType 0x8890:

```
# diagnose sniffer packet any 'ether proto 0x8890' 6 0 1
Using Original Sniffing Mode
interfaces=[any]
filters=[ether proto 0x8890]
2022-10-19 16:22:26.512813 port5 out Ether type 0x8890 printer hasn't been added to sniffer.

Interface IP addresses

An FGCP cluster communicates heartbeat packets using Layer 2 frames over the physical heartbeat interface, but it also communicates other synchronization traffic, logs, and locally generated traffic from subordinate devices over Layer 3 IP packets. Additional virtual interfaces are created in the hidden vsys_ha VDOM, which need to be addressed with IPv4 addresses.

The FGCP uses link-local IPv4 addresses (see [RFC 3927](#)) in the 169.254.0.x range for the virtual HA heartbeat interface (port_ha) and for the inter-VDOM link interfaces between the vsys_ha and management VDOM. When members join an HA cluster, each member's heartbeat interface (port_ha) is assigned an IP address from the range of 169.254.0.1 to 169.254.0.63/26. HA inter-VDOM link interfaces (havdlink0 and havdlink1) are assigned IP address from the range of 169.254.0.65 to 169.254.0.66/26.

The IP address that is assigned to a virtual heartbeat interface depends on the serial number priority of the member. Higher serial numbers have a higher priority, and therefore a lower serialno_prio number, for example:

```
# diagnose sys ha status
...
FGVM08TM20002002:      Secondary, serialno_prio=0, usr_priority=128, hostname=FGVM08TM20002002
FGVM08TM19003001:      Primary, serialno_prio=1, usr_priority=128, hostname=FGVM08TM19003001
```

The member with serialno_prio=0 is assigned IP address 169.254.0.1, serialno_prio=1 is assigned 169.254.0.2, and so forth.

To view the HA heartbeat interface IP address of the primary unit:

```
# get system ha status
...
vcluster 1: work 169.254.0.2
...
```

To view all the assigned IP addresses of a device:

```
# diagnose ip address list
IP=172.16.151.84->172.16.151.84/255.255.255.0 index=3 devname=port1
IP=192.168.2.204->192.168.2.204/255.255.255.0 index=6 devname=port2
IP=10.10.10.1->10.10.10.1/255.255.255.0 index=9 devname=port3
IP=127.0.0.1->127.0.0.1/255.0.0.0 index=13 devname=root
IP=127.0.0.1->127.0.0.1/255.0.0.0 index=16 devname=vsys_ha
IP=169.254.0.2->169.254.0.2/255.255.255.192 index=17 devname=port_ha
IP=127.0.0.1->127.0.0.1/255.0.0.0 index=18 devname=vsys_fgfm
IP=169.254.0.65->169.254.0.65/255.255.255.192 index=19 devname=havdlink0
IP=169.254.0.66->169.254.0.66/255.255.255.192 index=20 devname=havdlink1
```

When generating traffic from a subordinate unit, traffic will be routed to the primary unit's port_ha virtual heartbeat interface. From there, if traffic is destined to another network, the traffic is routed from the vsys_ha VDOM to the management VDOM by the havdlink interfaces.

Use the `execute traceroute` command on the subordinate unit to display HA heartbeat IP addresses and the HA inter-VDOM link IP addresses.

To trace the route to an IP address on a subordinate unit:

```
# execute ha manage 1
# execute traceroute 172.20.20.10
traceroute to 172.20.20.10 (172.20.20.10), 32 hops max, 72 byte packets
 1 169.254.0.1 0 ms 0 ms 0 ms
 2 169.254.0.66 0 ms 0 ms 0 ms
 3 172.20.20.10 0 ms 0 ms 0 ms
```

To run a sniffer trace on the primary unit to view the traffic flow:

```
# diagnose sniffer packet any 'net 169.254.0.0/24' 4 0 1
```

Unicast HA heartbeat

In virtual machine (VM) and cloud environments that do not support heartbeat communication with Layer 2 Ethernet frames (see [HA heartbeat interface on page 2519](#)), you can set up a Layer 3 unicast HA heartbeat when configuring HA. This consists of enabling the feature and adding a peer IP address. The peer IP address is the IP address of the HA heartbeat interface of the other FortiGate VM in the HA cluster.

Unicast HA is only supported between two FortiGate VMs in active-passive (A-P) mode. The heartbeat interfaces must be connected to the same network, and the IP addresses must be added to these interfaces.

In the following example, unicast HA heartbeat is enabled over the port3 interface.

To enable unicast HA heartbeat in the GUI:

1. Go to *System > HA*.
2. Enable *Unicast Heartbeat* and enter the *Peer IP*, such as *172.30.3.12*.
3. Click *OK*.

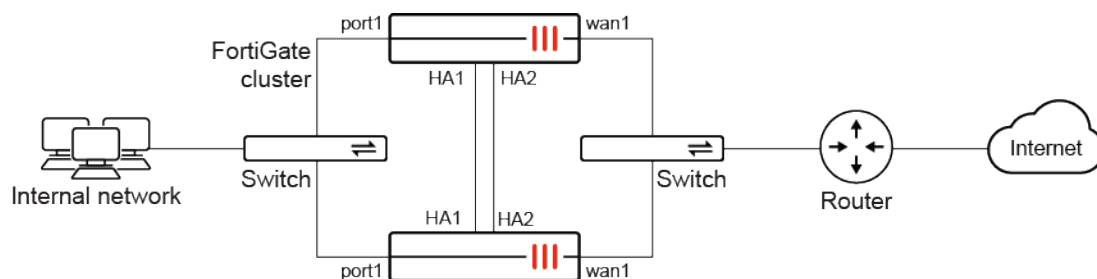

To enable unicast HA heartbeat in the CLI:

```
config system ha
    set hbdev port3 50
    set unicast-hb enable
    set unicast-hb-peerip 172.30.3.12
end
```

HA active-passive cluster setup

An HA Active-Passive (A-P) cluster can be set up using the GUI or CLI.

This example uses the following network topology:

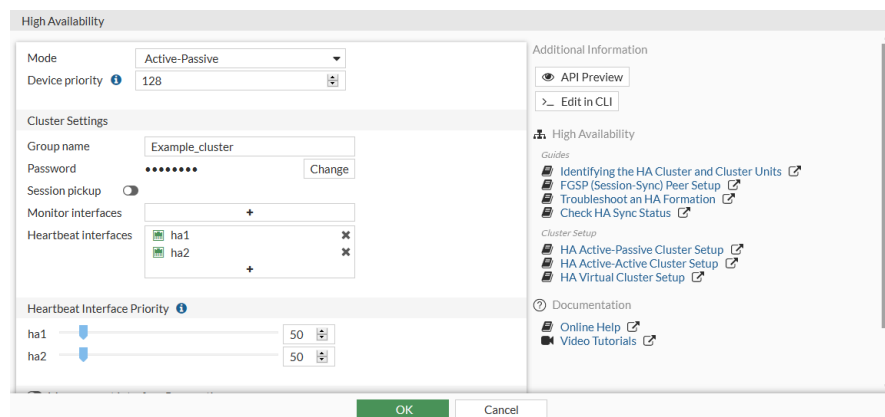

To set up an HA A-P cluster using the GUI:

1. Make all the necessary connections as shown in the topology diagram.
2. Log into one of the FortiGates.
3. Go to *System > HA* and set the following options:

Mode	Active-Passive
Device priority	128 or higher
Group name	Example_cluster
Heartbeat interfaces	ha1 and ha2

Except for the device priority, these settings must be the same on all FortiGates in the cluster.

4. Leave the remaining settings as their default values. They can be changed after the cluster is in operation.
5. Click **OK**.
The FortiGate negotiates to establish an HA cluster. Connectivity with the FortiGate may be temporarily lost as the HA cluster negotiates and the FGCP changes the MAC addresses of the FortiGate's interfaces.
6. Factory reset the other FortiGate that will be in the cluster, configure GUI access, then repeat steps 1 to 5, omitting setting the device priority, to join the cluster.

To set up an HA A-P cluster using the CLI:

1. Make all the necessary connections as shown in the topology diagram.
2. Log into one of the FortiGates.

3. Change the hostname of the FortiGate:

```
config system global
    set hostname Example1_host
end
```

Changing the host name makes it easier to identify individual cluster units in the cluster operations.

4. Enable HA:

```
config system ha
    set mode a-p
    set group-name Example_cluster
    set hbdev ha1 10 ha2 20
end
```

5. Leave the remaining settings as their default values. They can be changed after the cluster is in operation.

6. Repeat steps 1 to 5 on the other FortiGate devices to join the cluster, giving each device a unique hostname.

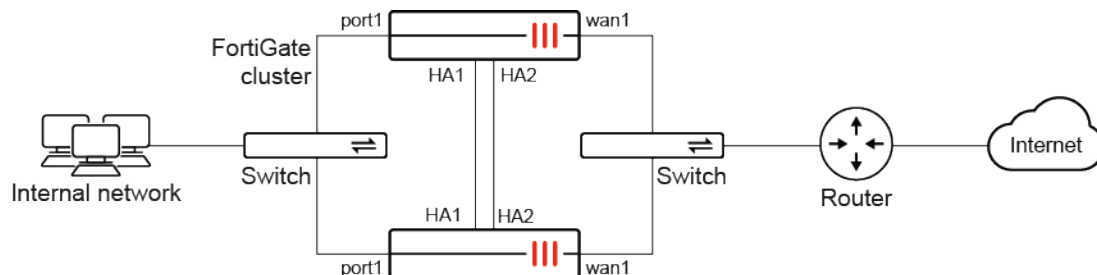

HA active-active cluster setup

An HA Active-Active (A-A) cluster can be set up using the GUI or CLI.

FGCP in Active-Active mode cannot load balance any sessions that traverse NPU VDOM links or regular VDOM links. If Active-Active session load balancing between VDOMs is required, use an external router to handle the inter-VDOM routing.

This example uses the following network topology:

To set up an HA A-A cluster using the GUI:

1. Make all the necessary connections as shown in the topology diagram.
2. Log into one of the FortiGates.
3. Go to *System > HA* and set the following options:

Mode	Active-Active
Device priority	128 or higher
Group name	Example_cluster
Heartbeat interfaces	ha1 and ha2

Except for the device priority, these settings must be the same on all FortiGates in the cluster.

4. Leave the remaining settings as their default values. They can be changed after the cluster is in operation.
5. Click OK.
The FortiGate negotiates to establish an HA cluster. Connectivity with the FortiGate may be temporarily lost as the HA cluster negotiates and the FGCP changes the MAC addresses of the FortiGate's interfaces.
6. Factory reset the other FortiGate that will be in the cluster, configure GUI access, then repeat steps 1 to 5, omitting setting the device priority, to join the cluster.

To set up an HA A-A cluster using the CLI:

1. Make all the necessary connections as shown in the topology diagram.
2. Log into one of the FortiGates.
3. Change the hostname of the FortiGate:

```
config system global
    set hostname Example1_host
end
```

Changing the host name makes it easier to identify individual cluster units in the cluster operations.

4. Enable HA:

```
config system ha
    set mode a-a
    set group-name Example_cluster
    set hbdev ha1 10 ha2 20
end
```

5. Leave the remaining settings as their default values. They can be changed after the cluster is in operation.
6. Repeat steps 1 to 5 on the other FortiGate devices to join the cluster.

HA and load balancing

FGCP active-active HA uses a technique similar to unicast load balancing where the primary unit is associated with the cluster HA virtual MAC addresses and cluster IP addresses. The primary unit is the only cluster unit that receives packets sent to the cluster. The primary unit uses a load balancing schedule to distribute sessions to all cluster units (including the primary unit). Subordinate unit interfaces retain their actual MAC addresses, and the primary unit communicates with the subordinate units using these MAC addresses. Packets exiting the subordinate units proceed directly to their destination and do not pass through the primary unit.

By default, active-active HA load balancing distributes proxy-based security profile processing to all cluster units. Proxy-based security profile processing is CPU and memory-intensive, so FGCP load balancing may result in higher throughput because resource-intensive processing is distributed among all cluster units.

The following proxy-based security profile processing is load balanced:

- Virus scanning
- Web filtering
- Email filtering
- Data leak prevention (DLP) of HTTP, FTP, IMAP, IMAPS, POP3, POP3S, SMTP, SMTPS, IM, and NNTP sessions accepted by firewall policies

Other features enabled in firewall policies such as endpoint security, traffic shaping, and authentication have no effect on active-active load balancing.

The `load-balance-all` option can be enabled to have the primary unit load balance all TCP sessions. Load balancing TCP sessions increases overhead and may actually reduce performance. This setting is disabled by default.

To configure TCP session load balancing:

```
config system ha
    set load-balance-all {enable | disable}
end
```

NP6 and NP7 processors can offload and accelerate load balancing. See [NP session offloading in HA active-active configuration](#) for more information.

During active-active HA load balancing, the primary unit uses the configured load balancing schedule to determine which cluster unit will process a session. The primary unit stores the load balancing information for each load balanced session in the cluster load balancing session table. Using the information in this table, the primary unit can then forward all of the remaining packets in each session to the appropriate cluster unit. The load balancing session table is synchronized among all cluster units.

ICMP, multicast, and broadcast sessions are never load balanced and are always processed by the primary unit. The following sessions are only processed by the primary unit:

- IPS
- Application control
- Flow-based virus scanning
- Flow-based web filtering
- Flow-based DLP
- Flow-based email filtering
- VoIP
- IM
- P2P
- IPsec VPN
- SSL VPN
- HTTP multiplexing
- SSL offloading
- WAN optimization

- Explicit web proxy
- WCCP

In addition to load balancing, active-active HA provides the same session, device, and link failover protection as active-passive HA. If the primary unit fails, a subordinate unit becomes the primary unit and resumes operating the cluster. Active-active HA maintains as many load balanced sessions as possible after a failover by continuing to process the load balanced sessions that were being processed by the cluster units that are still operating.

Load balancing schedules

The load balancing schedule controls how the primary unit distributes packets to all cluster units.

To configure the load balancing schedule:

```
config system ha
    set schedule {none | leastconnection | round-robin | weight-round-robin | random | ip |
ipport}
end
```

The following table outlines the load balancing schedule options.

Schedule	Description
None	<p>Use no load balancing. Select this option when the cluster interfaces are connected to load balancing switches.</p> <p>The primary unit does not load balance traffic, and the subordinate units process incoming traffic that does not come from the primary unit.</p> <p>For all other load balancing schedules, all traffic is received first by the primary unit and then forwarded to the subordinate units. The subordinate units only receive and process packets sent from the primary unit.</p>
Least connection	Distribute network traffic to the cluster unit currently processing the fewest connections.
Round robin	Distribute network traffic to the next available cluster unit.
Weighted round robin	<p>This is similar to round robin, but weighted values are assigned to each cluster unit based on their capacity and how many connections they are currently processing.</p> <p>For example, the primary unit should have a lower weighted value because it handles scheduling and forwards traffic. Weighted round robin distributes traffic more evenly because units that are not processing traffic will be more likely to receive new connections than units that are very busy.</p>
Random	Randomly distribute traffic to cluster units.
IP	Distribute traffic to cluster units based on the source and destination IP of the packet.
IP port	Distribute traffic to cluster units based on based on the source IP, source port, destination IP, and destination port of the packet.

Once a packet has been propagated to a subordinate unit, all packets are part of that same communication session are propagated to that same subordinate unit. Traffic is distributed according to the communication session, not just an individual packet.

Any subordinate unit that receives a forwarded packet processes it without applying load balancing. Note that subordinate units are still considered to be active because they perform routing, virus scanning, and other tasks on their share of the traffic. Active subordinate units share their session and link status information with all cluster units. Active subordinate units do not make load balancing decisions.

The primary unit is responsible for the load balancing process, and still performs other FortiGate tasks. Depending on the load balancing schedule used, the primary unit may assign itself a smaller share of the total load.

Active-active failover

If a subordinate unit fails, the primary unit redistributes the sessions that the subordinate was processing among the remaining active cluster members. If the primary unit fails, the subordinate units negotiate to select a new primary unit. The new primary unit continues to distribute packets among the remaining active cluster units.

Failover works in a similar way if the cluster consists of only two units. If the primary unit fails, the subordinate unit negotiates and becomes the new primary unit. If the subordinate unit fails, the primary unit processes all traffic. In both cases, the single remaining unit continues to function as a primary unit, maintaining the HA virtual MAC address for all of its interfaces.

HTTPS sessions and active-active load balancing

Active-active HA does not load balance HTTPS sessions that have SSL deep packet scanning enabled. This is to prevent HTTPS web filtering problems. The FortiGate identifies HTTPS sessions as all sessions received on the HTTPS TCP port. The default HTTPS port is 443. If the HTTPS port is changed in the SSL/SSH inspection profile applied in the firewall policy, FGCP stops load balancing all sessions that use the custom HTTPS port.

HTTPS traffic passing through a firewall policy that does not have UTM enabled, or has UTM enabled without deep inspection, can still be load balanced when `load-balance-all` is enabled.

HA virtual cluster setup

Virtual clustering is an extension of FGCP HA to allow multiple clusters to be formed between your HA members. In effect, each cluster consists of the same HA members, with the option to prioritize different members as the primary unit. Each cluster operates as its own active-passive FGCP HA cluster, with different virtual domains residing in the virtual cluster. The following custom settings can be configured per cluster:

```
config system ha
    set vcluster-status enable
    config vcluster
        edit <id>
            set override {enable | disable}
            set priority <integer>
            set vdom <vdom_1>, ... [vdom_n]
            set monitor <interface_1>, ... [interface_n]
            set pingserver-monitor-interface <interface_1>, ... [interface_n]
        next
    end
end
```

<code>override {enable disable}</code>	Enable/disable override and increase the priority of the unit that should always be the primary.
<code>priority <integer></code>	Increase the priority to select the primary unit (0 - 255, default = 128).
<code>vdom <vdom_1>, ... [vdom_n]</code>	Set the virtual domains in the virtual cluster.
<code>monitor <interface_1>, ... [interface_n]</code>	Set the interfaces to check for port monitoring (or link failure).
<code>pingserver-monitor-interface <interface_1>, ... [interface_n]</code>	Set the interfaces to check for remote IP monitoring.

Active-passive virtual clustering uses VDOM partitioning to send traffic for some VDOMs to the primary FortiGate and traffic for other VDOMs to the secondary FortiGates. Traffic distribution between FortiGates can potentially improve throughput. If a failure occurs and only one FortiGate continues to operate, all traffic fails over to that FortiGate, similar to normal HA. If the failed FortiGates rejoin the cluster, the configured traffic distribution is restored.

In an active-passive virtual cluster of two FortiGates, the primary and secondary FortiGates share traffic processing according to the VDOM partitioning configuration. The following is an example of two virtual clusters, with each member acting as primary for different vclusters.

If you add a third or fourth FortiGate, the primary and first secondary FortiGate process all traffic and the other one or two FortiGates operate in standby mode. If the primary or first secondary FortiGate fails, one of the other FortiGates becomes the new primary or secondary FortiGate and begins processing traffic.

For better load balancing, it is recommended to have as many vclusters as there are HA members. This way, each HA member can be a primary unit for each cluster, thereby processing traffic while standing by for the other vcluster as secondary. The following is an example of four FortiGates in an FGCP cluster, with four vclusters and four VDOMs. Each FortiGate is the primary unit for a vcluster and actively processes traffic as the primary member.

Virtual clustering and heartbeat interfaces

The HA heartbeat provides the same HA services in a virtual clustering configuration as in a standard HA configuration. One set of HA heartbeat interfaces provides HA heartbeat services for all of the VDOMs in the cluster. You do not have to add a heartbeat interface for each VDOM.

Special considerations for NPU-based VLANs in a virtual cluster

In an FGCP cluster, the primary FortiGate uses virtual MAC addresses when forwarding traffic, and the secondary uses the physical MAC addresses when forwarding traffic. In a virtual cluster, packets are sent with the cluster's virtual MAC addresses. However, in the case of NPU offloading on a non-root VDOM, traffic that leaves an NPU-based VLAN will use the physical MAC address of its parent interface rather than the virtual MAC address. If this behavior is not desired, disable `auto-asic-offload` in the firewall policy where the VLAN interface is used.

Support up to 30 virtual clusters

FortiOS supports up to 30 virtual clusters, which allows more VDOMs to be spread across different virtual clusters without overlapping. Each virtual cluster supports its own failover conditions. Prior to 7.2.0, only two virtual clusters were supported.

When configuring virtual clusters, the `group-id` is limited to a value from 0 to 7. If the HA `group-id` is greater than 7, use the command line first to change the `group-id` before enabling virtual clusters.

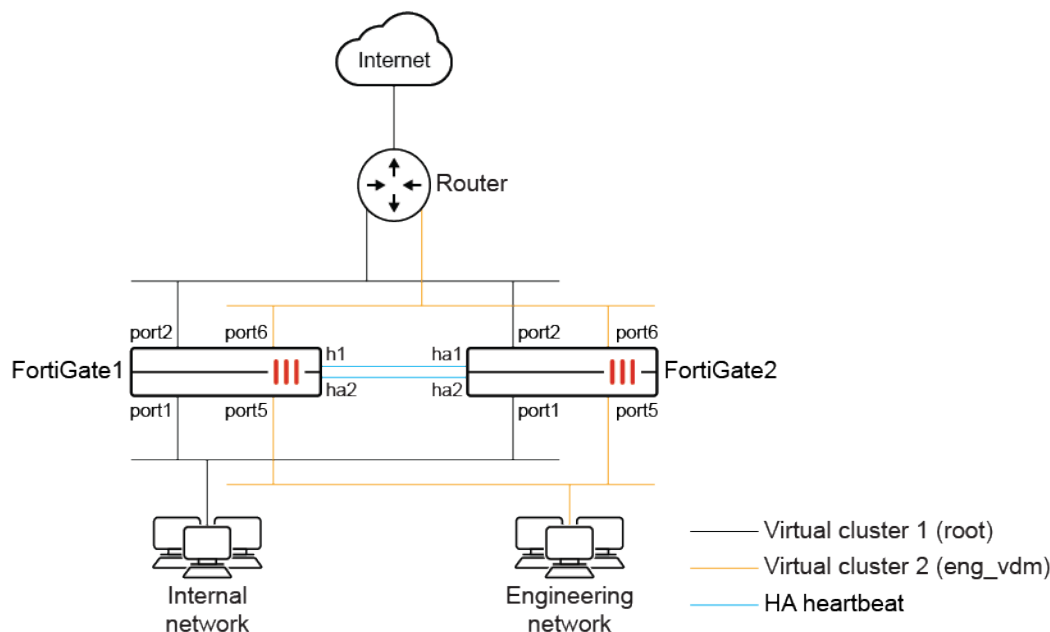

```
config system ha
    set group-id <integer>
end
```

When upgrading from 7.0 or earlier, old virtual clusters will be lost if the `group-id` is larger than 7.

Basic configuration

This example shows a virtual cluster configuration consisting of two FortiGates. The virtual cluster has two VDOMs, root and `eng_vdm`.

The root VDOM can only be associated with virtual cluster 1.

The VDOM that is assigned as the management VDOM can also only be associated with virtual cluster 1.

To set up an HA virtual cluster using the GUI:

1. Make all the necessary connections as shown in the topology diagram.
2. Configure a regular A-P cluster:
 - a. Log in to one of the FortiGates.
 - b. Go to *System > HA* and set the following options:

Mode	Active-Passive
Device priority	128 or higher
Group name	Example_cluster
Heartbeat interfaces	ha1 and ha2

Except for the device priority, these settings must be the same on all FortiGates in the cluster.

- c. Leave the remaining settings as their default values. They can be changed after the cluster is in operation.
 - d. Click **OK**.
The FortiGate negotiates to establish an HA cluster. Connectivity with the FortiGate may be temporarily lost as the HA cluster negotiates and the FGCP changes the MAC addresses of the FortiGate's interfaces.
 - e. Factory reset the other FortiGate that will be in the cluster, configure GUI access, then repeat step 2 (omitting setting the device priority) to join the cluster.
3. On the primary FortiGate, go to *System > Settings* and enable *Virtual Domains*.
4. Click *Apply*. You will be logged out of the FortiGate.
5. Log back in to the FortiGate, and ensure that you are in the global VDOM.

6. Create the eng_vdm VDOM:
 - a. Go to *System > VDOM* and click *Create New*. The *New Virtual Domain* pane opens.
 - b. Enter the name in the *Virtual Domain* field, then click *OK*.
7. Implement a virtual cluster by moving the new VDOM to virtual cluster 2:
 - a. Go to *System > HA* and enable *VDOM Partitioning*.
 - b. In the table, click *Create New*. The *New Virtual Cluster* pane opens.
 - c. Click the + and add the *eng_vdm* VDOM.
 - d. Click *OK* to save the virtual cluster.

- e. Click *OK* to save the HA configuration.

To set up an HA virtual cluster using the CLI:

1. Make all the necessary connections as shown in the topology diagram.
2. Configure a regular A-P cluster. See [HA active-passive cluster setup on page 2528](#).
3. Enable VDOMs:

```
config system global
    set vdom-mode multi-vdom
end
```

You will be logged out of the FortiGate.

4. Create the eng_vdm VDOM:

```
config vdom
    edit eng_vdm
    next
end
```

5. Reconfigure the HA settings to be a virtual cluster:

```
config system ha
    set vcluster-status enable
    config vcluster
        edit 1
            set vdom root
            set override disable
        next
        edit 2
            set vdom eng_vdm
            set override disable
        next
    end
end
```

Configuration with 30 virtual clusters

In this example, there are 30 customers managed by an MSSP on an HA cluster, and each customer VDOM needs to failover independently of other customer VDOMs. Each customer is assigned to a different virtual cluster with its own virtual cluster configurations. This may include different monitored interfaces, ping servers, and priority for the primary and secondary cluster members. Each virtual cluster will fail over according to their own virtual cluster configurations.

This example assumes an A-P cluster and VDOMs have already been configured. See [HA active-passive cluster setup on page 2528](#) and [Virtual Domains on page 2475](#) for more information.

For each virtual cluster, this example assumes that unit 1 has an HA priority of 200, while unit 2 has an HA priority of 100. By default, unit 1 will be the primary cluster member of all the virtual clusters.

To configure multiple virtual clusters in the GUI:

1. Go to *System > HA* and enable *VDOM Partitioning*.
2. Create a virtual cluster:
 - a. In the table, click *Create New*. The *New Virtual Cluster* pane opens.
 - b. Set the *Device priority* to 200.
 - c. Click the + and add the *Virtual domains*.
 - d. Optionally, click the + and add the *Monitor interfaces*.
 - e. Click *OK*.
3. Repeat step 2 to create the remaining virtual clusters.
4. Click *OK* to save the HA configuration. The *HA* page summary displays the multiple virtual clusters, each with a *Primary* and *Secondary* HA member.
5. Edit the priority settings for the secondary members to be 100:
 - a. Select the *Secondary* member in the table, and click *Edit*.
 - b. Set the *Priority* to 100.
 - c. Click *OK*.
6. Repeat step 5 for the remaining secondary members.

To configure multiple virtual clusters in the CLI:

1. Configure the primary FortiGate:

```
config system ha
    set vcluster-status enable
    config vcluster
        edit 1
            set override disable
            set priority 200
            set vdom "vdom1"
        next
        edit 2
            set override disable
            set priority 200
            set vdom "vdom2"
        next
        ...
        edit 30
            set override disable
            set priority 200
            set vdom "vdom30"
        next
    end
end
```

2. Configure the secondary FortiGate:

```
config system ha
    set vcluster-status enable
    config vcluster
        edit 1
            set override disable
            set priority 100
            set vdom "vdom1"
        next
        edit 2
            set override disable
            set priority 100
            set vdom "vdom2"
        next
        ...
        edit 30
            set override disable
            set priority 100
            set vdom "vdom30"
        next
    end
end
```

Check HA synchronization status

The HA synchronization status can be viewed in the GUI through either a widget on the *Dashboard* or on the *System > HA* page. It can also be confirmed through the CLI. When a cluster is out of synchronization, administrators should correct the issue as soon as possible as it affects the configuration integrity and can cause issues to occur.

When units are out of synchronization in an HA cluster, the GUI will compare the HA checksums and display the tables that caused HA to be out of synchronization. This can be visualized on the HA monitor page and in the HA status widget.

HA synchronization status in the GUI

Following HA setup, the *HA Status* widget can be added to the *Dashboard* that shows the HA synchronization statuses of the members.

A green checkmark is shown next to each member that is in synchronization.

HA synchronization status in the CLI

In the CLI, run the `get system ha status` command to see if the cluster is in synchronization. The synchronization status is reported under *Configuration Status*.

When both members are in synchronization:

```
# get system ha status
HA Health Status: OK
Model: FortiGate-VM64
Mode: HA A-P
Group Name: docs
Group ID: 0
Debug: 0
Cluster Uptime: 0 days 0:52:39
Cluster state change time: 2021-04-29 13:17:03
Primary selected using:
  <2021/04/29 13:17:03> FGVMEV0000000002 is selected as the primary because its uptime is
  larger than peer member FGVMEV7000000005.
  <2021/04/29 12:37:17> FGVMEV0000000002 is selected as the primary because it's the only
  member in the cluster.

Out-of-band management with reserved management interfaces

As part of an HA configuration, you can reserve up to four management interfaces to provide direct management access to all cluster units. For each reserved management interface, you can configure a different IP address, administrative access, and other interface settings, for each cluster unit. By connecting these interfaces to your network, you can separately manage each cluster unit from different IP addresses.

- Reserved management interfaces provide direct management access to each cluster unit, and give each cluster unit a different identity on your network. This simplifies using external services, such as SNMP, to monitor separate cluster units.
- Reserved management interfaces are not assigned HA virtual MAC addresses. They retain the permanent hardware address of the physical interface, unless you manually change it using the `config system interface` command.
- Reserved management interfaces and their IP addresses should not be used for managing a cluster using FortiManager. To manage a FortiGate HA cluster with FortiManager, use the IP address of one of the cluster unit interfaces.
- Configuration changes to a reserved management interface are not synchronized to other cluster units. Other configuration changes are automatically synchronized to all cluster units.

You can configure an in-band management interface for a cluster unit. See [In-band management on page 2552](#) for information. In-band management does not reserve the interface exclusively for HA management.

Management interface

Enable HTTPS or HTTP administrative access on the reserved management interfaces to connect to the GUI of each cluster unit. On secondary units, the GUI has the same features as the primary unit, except for unit specific information, for example:

- The System Information widget on the Status dashboard shows the secondary unit's serial number.
- In the cluster members list at *System > HA*, you can change the HA configuration of the unit that you are logged into. You can only change the host name and device priority of the primary and other secondary units.
- The system events logs show logs for the device that you are logged into. Use the HA device drop down to view the log messages for other cluster units, including the primary unit.

Enable SSH administrative access on the reserved management interfaces to connect to the CLI of each cluster unit. The CLI prompt includes the host of the cluster unit that you are connected to. Use the `execute ha manage` command to connect to other cluster unit CLIs.

Enable SNMP administrative access on a reserved management interface to use SNMP to monitor each cluster unit using the interface's IP address. Direct management of cluster members must also be enabled, see [Configuration examples on page 2547](#).

Reserved management interfaces are available in both NAT and transparent mode, and when the cluster is operating with multiple VDOMs.

FortiCloud, FortiSandbox, and other management services

By default, management services such as FortiCloud, FortiSandbox, SNMP, remote logging, and remote authentication, use a cluster interface. This means that communication from each cluster unit will come from a cluster interface of the primary unit, and not from the individual cluster unit's interface.

You can configure HA reserved management interfaces to be used for communication with management services by enabling the `ha-direct` option. This separates management traffic for each cluster unit, and allows each unit to be individually managed. This is especially useful when cluster units are in different physical locations.

The following management features will then use the HA reserved management interface:

- Remote logging, including syslog, FortiAnalyzer, and FortiCloud
- Remote authentication and certificate verification
- Communication with FortiSandbox
- Netflow and sflow, see [Routing NetFlow data over the HA management interface on page 2567](#) for information.
- SNMP queries and traps

Syntax for HA reserved management interfaces is as follows:

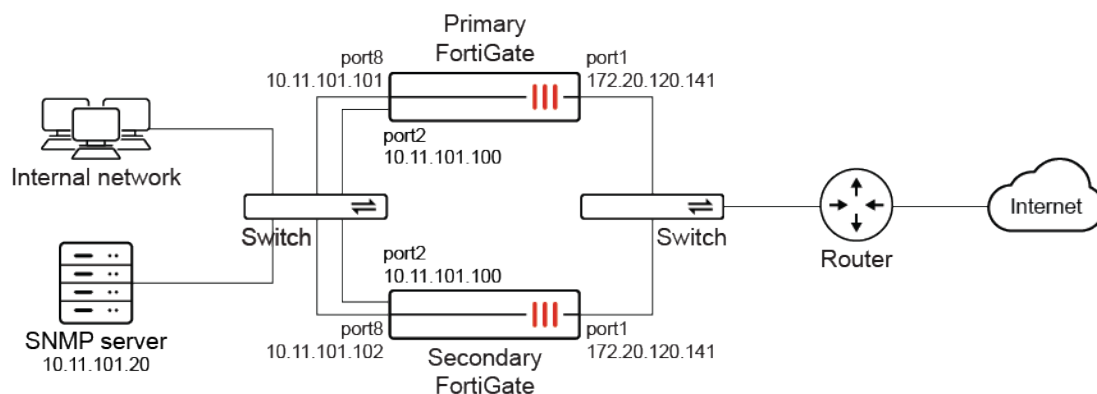

```
config system ha
    set ha-direct enable
    set ha-mgmt-status enable
    config ha-mgmt-interfaces
        edit 1
            set interface <interface>
            set dst <destination IP>
            set gateway <IPv4 gateway>
            set gateway6 <IPv6 gateway>
        next
    end
end
```

The `ha-direct` option is a pre-requisite for allowing communication on each HA reserved management interface for various management services listed above. Once enabled, all `source-ip` settings will be unset from log related, netflow and sflow management services. SNMP requires `ha-direct` to be configured under SNMP settings only. See below for more configuration options.

Configuration examples

The configuration examples below will use the following topology:

Two FortiGate units are already operating in a cluster. On each unit, port8 is connected to the internal network through a switch and configured as an out-of-band reserved management interface.

Configuration changes to the reserved management interface are not synchronized to other cluster units.

Administrative access and default route for HA management interface

To configure the primary unit's reserved management interface, configure an IP address and management access on port8. Then, configure the necessary HA settings to enable the HA reserved management interface and its route. To configure the secondary unit's reserved management interface, access the unit's CLI through the primary unit, and configure an IP address, management access on port8, and the necessary HA settings. Configuration changes to the reserved management interface are not synchronized to other cluster units.

To configure the primary unit reserved management interface to allow HTTPS, SSH, and ICMP access:

1. From a computer on the internal network, connect to the CLI at 10.11.101.100 on port2.
2. Change the port8 IP address and management access:

```
config system interface
  edit port8
    set ip 10.11.101.101/24
    set allowaccess https ping ssh
  next
end
```

3. Configure the HA settings for the HA reserved management interface by defining a default route to route to the gateway 10.11.101.2:

```
config system ha
  set ha-mgmt-status enable
  config ha-mgmt-interfaces
    edit 1
      set interface port8
      set gateway 10.11.101.2
    next
  end
end
```

You can now log into the primary unit's GUI by browsing to <https://10.11.101.101>. You can also log into the primary unit's CLI by using an SSH client to connect to 10.11.101.101.

To configure secondary unit reserved management interfaces to allow HTTPS, SSH, and ICMP access:

1. From a computer on the internal network, connect to the primary unit's CLI.
2. Connect to the secondary unit with the following command:

```
execute ha manage <unit id> <username> <password>
```

3. Change the port8 IP address and management access:

```
config system interface
  edit port8
    set ip 10.11.101.102/24
    set allowaccess https ping ssh
  next
end
exit
```

4. Configure the HA settings for the HA reserved management interface by defining a default route to route to the gateway 10.11.101.2:

```
config system ha
  set ha-mgmt-status enable
  config ha-mgmt-interfaces
    edit 1
      set interface port8
      set gateway 10.11.101.2
    next
  end
end
```

You can now log into the secondary unit's GUI by browsing to <https://10.11.101.102>. You can also log into the secondary unit's CLI by using an SSH client to connect to 10.11.101.102.

SNMP monitoring

The SNMP server can get status information from the cluster members. To use the reserved management interfaces, you must add at least one HA direct management host to an SNMP community. If the SNMP configuration includes SNMP users with user names and passwords, HA direct management must be enabled for the users.

To configure the cluster for SNMP management using the reserved management interfaces in the CLI:

1. Allow SNMP on port8 on both primary and secondary units:

```
config system interface
  edit port8
    append allowaccess snmp
  next
end
```

2. Add an SNMP community with a host for the reserved management interface of each cluster member. The host includes the IP address of the SNMP server.

```

config system snmp community
  edit 1
    set name "Community"
    config hosts
      edit 1
        set ip 10.11.101.20 255.255.255.255
        set ha-direct enable
      next
    end
  next
end

```

Enabling `ha-direct` in a non-HA environment will make SNMP unusable.

3. Add an SNMP user for the reserved management interface:

```

config system snmp user
  edit "1"
    set notify-hosts 10.11.101.20
    set ha-direct enable
  next
end

```

The SNMP configuration is synchronized to all cluster units.

To get CPU, memory, and network usage information from the SNMP manager for each cluster unit using the reserved management IP addresses:

1. Connect to the SNMP manager CLI.
2. Get resource usage information for the primary unit using the MIB fields:

```

snmpget -v2c -c Community 10.11.101.101 fgHaStatsCpuUsage
snmpget -v2c -c Community 10.11.101.101 fgHaStatsMemUsage
snmpget -v2c -c Community 10.11.101.101 fgHaStatsNetUsage

```

3. Get resource usage information for the primary unit using the OIDs:

```

snmpget -v2c -c Community 10.11.101.101 1.3.6.1.4.1.12356.101.13.2.1.1.3.1
snmpget -v2c -c Community 10.11.101.101 1.3.6.1.4.1.12356.101.13.2.1.1.4.1
snmpget -v2c -c Community 10.11.101.101 1.3.6.1.4.1.12356.101.13.2.1.1.5.1

```

4. Get resource usage information for the secondary unit using the MIB fields:

```

snmpget -v2c -c Community 10.11.101.102 fgHaStatsCpuUsage
snmpget -v2c -c Community 10.11.101.102 fgHaStatsMemUsage
snmpget -v2c -c Community 10.11.101.102 fgHaStatsNetUsage

```

5. Get resource usage information for the primary unit using the OIDs:

```
snmpget -v2c -c Community 10.11.101.102 1.3.6.1.4.1.12356.101.13.2.1.1.3.1
snmpget -v2c -c Community 10.11.101.102 1.3.6.1.4.1.12356.101.13.2.1.1.4.1
snmpget -v2c -c Community 10.11.101.102 1.3.6.1.4.1.12356.101.13.2.1.1.5.1
```

Firewall local-in policies for the reserved management interface

Enabling `ha-mgmt-intf-only` applies the local-in policy only to the VDOM that contains the reserved management interface. The incoming interface is set to match any interface in the VDOM.

To add local-in policies for the reserved management interface:

```
config firewall local-in-policy
  edit 0
    set ha-mgmt-intf-only enable
    set intf any
    set srcaddr internal-net
    set dstaddr mgmt-int
    set action accept
    set service HTTPS
    set schedule weekdays
  next
end
```

NTP over reserved management interfaces

When NTP is enabled in an HA cluster, the primary unit will always be the unit to contact the NTP server and synchronize system time to the secondary units over the HA heartbeat interface. However, in the event that the primary should contact the NTP server over the HA reserved management interface, then the `ha-direct` option should be enabled under the `config system ha` settings.

```
config system interface
  edit port5
    set ip 172.16.79.46 255.255.255.0
  next
end

config system ha
  set group-name FGT-HA
  set mode a-p
  set ha-mgmt-status enable
  config ha-mgmt-interfaces
    edit 1
      set interface port5
      set gateway 172.16.79.1
    next
  end
  set ha-direct enable
end

config system ntp
  set ntpsync enable
  set syncinterval 5
end
```

In-band management

In-band management IP addresses are an alternative to reserved HA management interfaces, and do not require reserving an interface exclusively for management access. They can be added to multiple interfaces on each cluster unit.

The in-band management IP address is accessible from the network that the cluster interface is connected to. It should be in the same subnet as the interface that you are adding it to. It cannot be in the same subnet as other interface IP addresses.

In-band management interfaces support ping, HTTP, HTTPS, and SNMP administrative access options.

Primary and secondary units can respond on the management IP to traffic from different networks by using the routing table. The secondary unit uses the kernel routing table synchronized from the primary to route the traffic.

In-band management IP address configuration is not synchronized to other cluster units.

To add an in-band management IP address to port23 with HTTPS, SSH, and SNMP access:

```
config system interface
  edit port23
    set management-ip 172.25.12.5/24
    set allowaccess https ssh snmp
  next
end
```

Upgrading FortiGates in an HA cluster

You can upgrade the firmware on an HA cluster in the same way as on a standalone FortiGate. During a firmware upgrade, the cluster upgrades the primary unit and all of the subordinate units to the new firmware image.

Before upgrading a cluster, back up your configuration ([Configuration backups on page 72](#)), schedule a maintenance window, and make sure that you are using a supported upgrade path (<https://docs.fortinet.com/upgrade-tool>).

Uninterrupted upgrade

An uninterrupted upgrade occurs without interrupting communication in the physical or virtual cluster.

To upgrade the cluster firmware without interrupting communication, use the following steps. These steps are transparent to the user and the network, and might result in the cluster selecting a new primary unit.

1. The administrator uploads a new firmware image using the GUI or CLI. See [Upgrading individual device firmware on page 2423](#) for details.
2. The firmware is upgraded on all of the subordinate units.
3. A new primary unit is selected from the upgraded subordinates.
4. The firmware is upgraded on the former primary unit.
5. Primary unit selection occurs, according to the standard primary unit selection process.

If all of the subordinate units crash or otherwise stop responding during the upgrade process, the primary unit will continue to operate normally, and will not be upgraded until at least one subordinate rejoins the cluster.

Interrupted upgrade

An interrupted upgrade upgrades all cluster members at the same time. This takes less time than an uninterrupted upgrade, but it interrupts communication in the cluster. Interrupted upgrade is disabled by default.

To enable interrupted upgrade:

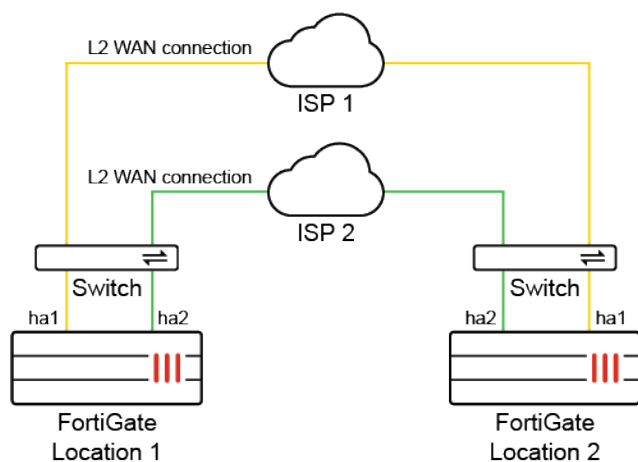

```
config system ha
    set uninterruptible-upgrade disable
end
```

Distributed HA clusters

FGCP HA supports cluster units installed in different physical locations to achieve geo-redundancy. This may be desirable in large enterprises that deploy multiple data centers and network infrastructure to prevent interruptions caused by downtime in one location or region. Distributed clusters (or geographically distributed clusters) can have cluster units in different rooms in the same building, different buildings in the same location, or different geographical regions (cities, countries, or continents). When disruption is detected in one location, traffic can be routed to another location and failed over to the HA unit in the same cluster to prevent major downtime.

Just like any FGCP HA cluster, distributed clusters require heartbeat communication between cluster units over a Layer 2 network. In a distributed cluster, this heartbeat communication can take place over a dedicated lease-line, MPLS, or other L2 WAN solutions. Most Data Center Interconnect (DCI) or MPLS-based solutions that support Layer 2 extensions between the remote data centers should also support HA heartbeat communication between the FortiGates in the distributed locations.

For more information about FGCP HA heartbeats, see [HA heartbeat interface on page 2519](#).

Because of the possible distance between the cluster members, it may take longer for heartbeat packets to be transmitted between cluster units. If the time it takes and the possible latency and packet losses cause the configured heartbeat lost threshold to be exceeded, then a split brain scenario can occur (see [Split brain scenario](#)).

To avoid this, you can increase the heartbeat interval (the time between the sending of heartbeat packets) so that the cluster expects extra time between heartbeat packets. A general rule is to configure the failover time to be longer than

the maximum latency. You could also increase the `hb-lost-threshold`, which is the number of lost heartbeats to signal a failure, in order to tolerate losing more heartbeat packets if the network connection is less reliable.

To configure the heartbeat interval and lost threshold:

```
config system ha
    set hb-interval <integer>
    set hb-lost-threshold <integer>
end
```

A longer interval and threshold can lead to slower failover time, and a shorter interval and threshold may lead to false positives. Therefore, these settings should be fine-tuned based on individual network scenarios. Additional options include:

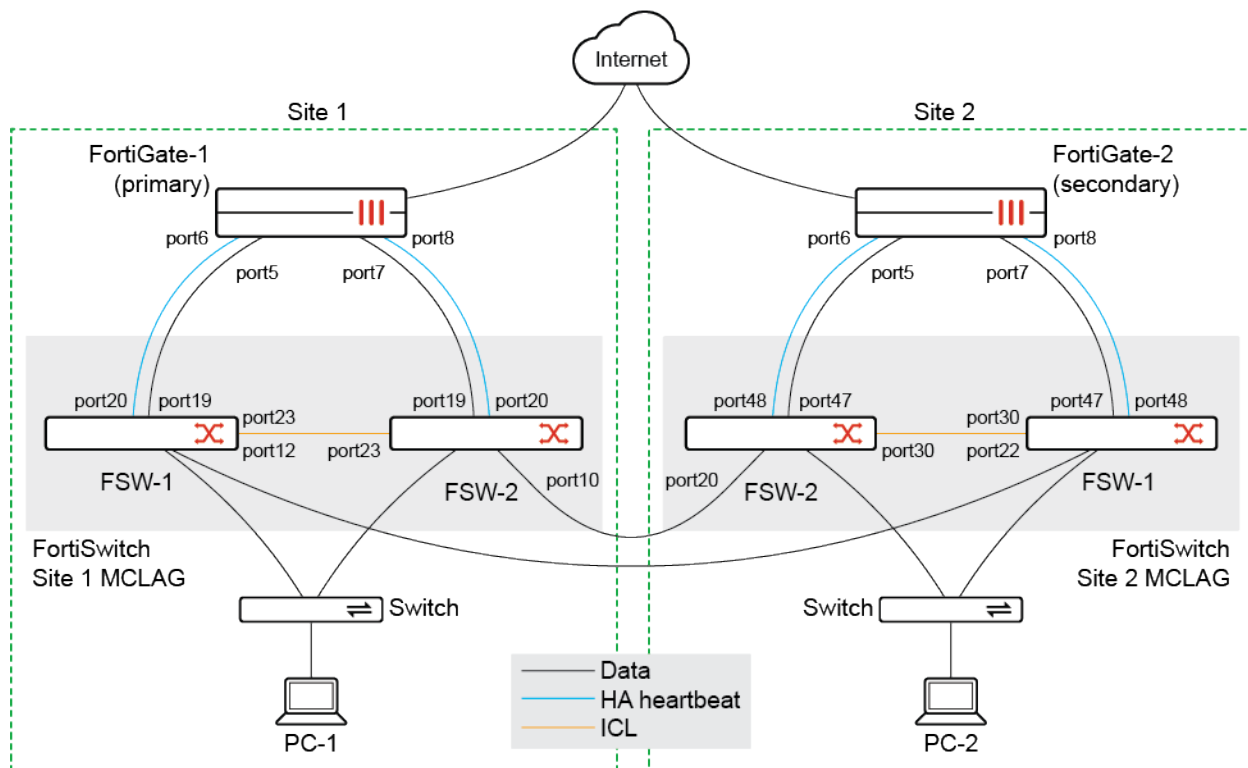

- Using multiple heartbeat interfaces and different link paths for heartbeat packets to optimize HA heartbeat communication.
- Configuring QoS on the links used for HA heartbeat traffic to make sure heartbeat communication has the highest priority.

For information about changing the heartbeat interval and other heartbeat related settings, see [Modifying heartbeat timing](#).

HA between remote sites over managed FortiSwitches

In a multi-site FortiGate HA topology that uses managed FortiSwitches in a multi-chassis link aggregation group (MCLAG) to connect between sites, HA heartbeat signals can be sent through the switch layer of the FortiSwitches, instead of through back-to-back links between the heartbeat interfaces. This means that two fiber connections can be used, instead of four (two back-to-back heartbeat fiber connections and two connections for the FortiSwitches). The FortiSwitches can be different models, but must all support MCLAG and be running version 6.4.2 or later.

This example shows how to configure heartbeat VLANs to assign to the access ports that the heartbeat interfaces connect to, passing over the trunk between the FortiSwitches on the two sites.

FortiGate HA is with two FortiGates in separate locations and the switch layer connection between the FortiSwitches is used for the heartbeat signal.

To configure the example:

1. Disconnect the physical connections between Site 1 and Site 2:
 - Disconnect the cable on Site 1 FSW-1 port 12.
 - Disconnect the cable on Site 1 FSW-2 port 10.
2. Configure Site 1:
 - a. On the FortiGate, go to *WiFi & Switch Controller > FortiLink Interface* and configure FortiLink:

The screenshot shows the 'Edit FortiLink Interface' configuration page. The interface is configured with the following details:

- Name:** fortilink
- Alias:** FortiLink (802.3ad Aggregate)
- Type:** FortiLink (802.3ad Aggregate)
- VRF ID:** 0
- Interface members:** port5, port7
- Address:** 169.254.1.1/255.255.255.0
- Connected devices:** 2 FortiSwitch(es)
- Automatically authorize devices:** Enabled
- FortiLink split interface:** Disabled
- IoT scanning:** Disabled
- DHCP Server:** Enabled
- DHCP status:** Enabled
- Address range:** 169.254.1.2-169.254.1.254
- Netmask:** 255.255.255.0
- Default gateway:** Same as Interface IP

- b. Go to *System > HA* and configure HA:
 - i. Set the heartbeat ports to the ports that are connected to FortiSwitch.
 - ii. Adjust the priority and enable override so that this FortiGate becomes the primary.

- d. Assign the native VLAN of the switch ports that are connected to the heartbeat ports to the created VLAN. Each HA heartbeat should be in its own VLAN.
 - i. Go to *WiFi & Switch Controller > FortiSwitch Ports*.
 - ii. In the *Native VLAN* column for the heartbeat port that is connected to FSW-1, click the edit icon and select the *Heartbeat VLAN*.

<div> <div>+ Create New</div> <div>Edit</div> <div>Delete</div> <div>Search</div> <div>Q</div> </div> <div>Port Trunk Faceplates</div>

port17		Normal	<div> <div>✓</div> <div>Edge Port</div> </div> <div> <div>✓</div> <div>Spanning Tree Protocol</div> </div>	S248EPTF18000000			
port18		Normal	<div> <div>✓</div> <div>Edge Port</div> </div> <div> <div>✓</div> <div>Spanning Tree Protocol</div> </div>	default	quarantine		
port19		Normal	<div> <div>✓</div> <div>Edge Port</div> </div> <div> <div>✓</div> <div>Spanning Tree Protocol</div> </div>	FGT3HD999000000			
port20		Normal	<div> <div>✓</div> <div>Edge Port</div> </div> <div> <div>✓</div> <div>Spanning Tree Protocol</div> </div>	Heartbeat	quarantine		

iii. In the *Native VLAN* column for the heartbeat port that is connected to FSW-2, click the edit icon and select the *Heartbeat2* VLAN.

e. On each FortiSwitch, enable MCLAG-ICL on the trunk port:

```
config switch trunk
  edit D243Z17000032-0
    set mclag-icl enable
  next
end
```

3. Configure Site 2 the same as Site 1, except set the HA priority so that the FortiGate becomes the secondary.

4. Disconnect the physical connections for FortiGate HA and FortiLink interfaces on Site 2:

- Disconnect the cable on Site 2 FSW-1 ports 47 and 48.
- Disconnect the cable on Site 2 FSW-2 ports 47 and 48.

5. Connect cables between the FortiSwitch MCLAG in Site 1 and Site 2:

- Connect a cable from Site 1 FSW-1 port 12 to Site 2 FSW-1 port 22.
- Connect a cable from Site 1 FSW-2 port 10 to Site 2 FSW-2 port 20.

6. On all of the FortiSwitches, configure the `auto-isl-port-group`. The group must match on both sides.

a. Site 1 FSW-1:

Set `members` to the port that is connected to Site 2 FSW-1:

```
config switch auto-isl-port-group
  edit 1
    set members port12
  next
end
```

b. Site 1 FSW-2:

Set `members` to the port that is connected to Site 1 FSW-1:

```
config switch auto-isl-port-group
  edit 1
    set members port22
  next
end
```

c. Site 2 FSW-1:

Set members to the port that is connected to Site 2 FSW-2:

```
config switch auto-isrl-port-group
  edit 1
    set members port10
  next
end
```

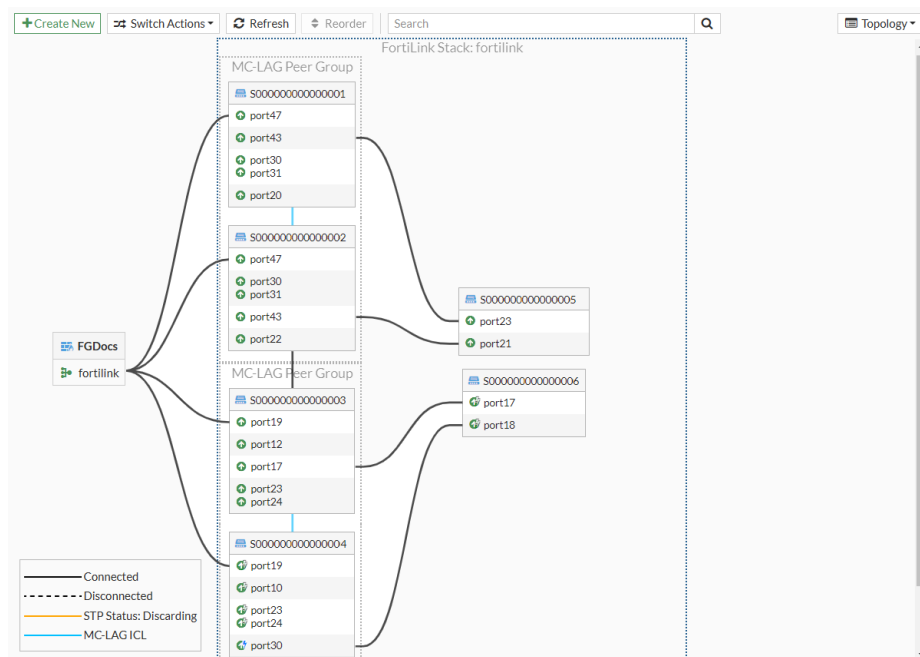

d. Site 2 FSW-2:

Set members to the port that is connected to Site 1 FSW-2:

```
config switch auto-isrl-port-group
  edit 1
    set members port20
  next
end
```

7. Connect the FortiGate HA and FortiLink interface connections on Site 2.
8. Configure a firewall policy and route for traffic so that the client can reach the internet.
9. Wait for HA to finish synchronizing and for all of the FortiSwitches to come online, then on FortiGate-1, go to *WiFi & Switch Controller > Managed FortiSwitches* and select the Topology view from the drop-down on the right.

The page should look similar to the following:

To test the configuration to confirm what happens when there is a failover:

1. On both PC-1 and PC-2, access the internet and monitor traffic. The traffic should be going through the primary FortiGate.
2. Perform a continuous ping to an outside IP address, then reboot any one of the FortiSwitches. Traffic from both Site 1 and Site 2 to the internet should be recovered in approximately five seconds.
3. Perform a continuous ping to an outside IP address, then force an HA failover (see [Force HA failover for testing and demonstrations on page 2569](#)).

Traffic from both Site 1 and Site 2 to the internet should be recovered in approximately five seconds.

4. After an HA failover, on the new primary FortiGate, go to *WiFi & Switch Controller > Managed FortiSwitch*.

The switch layer tiering will be changed so that the directly connected FortiSwitches are at the top of the topology.

HA using a hardware switch to replace a physical switch

An HA cluster can be deployed without physical switches connecting the traffic interfaces on the primary and secondary members. This setup may be desirable in certain environments where the network infrastructure must be kept to a bare minimum.

Generally, using a hardware switch to replace a physical switch is not recommended, as it offers no redundancy or interface monitoring.

- If one FortiGate loses power, all of the clients connected to that FortiGate device cannot go to another device until that FortiGate recovers.
- A hardware switch cannot be used as a monitor interface in HA. Any incoming or outgoing link failures on hardware member interfaces will not trigger failover; this can affect traffic.

Therefore, assess your environment thoroughly before applying this solution.

Examples

The examples use the following topology:

Traffic between hardware switches

When using Hardware switch in HA environment, a client device connected to the hardware switch on the primary FortiGate can communicate with client devices connected to the hardware switch on secondary FortiGates as long as there is a direct connection between the two switches.

To configure the FortiGate devices:

1. Connect the LAN side of the FortiGate cluster as shown in the topology diagram.
2. On each FortiGate, configure HA:

```
config system ha
set mode a-a
```

```
        set group-name Example_cluster
        set hbdev ha1 10 ha2 20
    end
```

3. On the primary FortiGate, configure the hardware switch:

```
config system virtual-switch
    edit Hardware-SW
        set physical-switch sw0
        config port
            edit port3
            next
            edit port4
            next
        end
    next
end
```

4. On each FortiGate, configure the IP addresses on the hardware switches:

```
config system interface
    edit Hardware-SW
        set ip 192.168.10.1 255.255.255.0
        set allowaccess ping ssh http https
    next
end
```

After configuring the hardware switches, PC1 and PC2 can now communicate with each other.

Traffic passes through FortiGate

If client device needs to send traffic through the FortiGate, additional firewall configuration on the FortiGate is required.

All traffic from the hardware switches on either the primary or secondary FortiGate reaches the primary FortiGate first. The traffic is then directed according to the HA mode and firewall configuration.

On the WAN side, in order for both HA members to reach the upstream router without connecting to a switch, a hardware switch must be configured with a direct connection between the cluster members.

To configure the FortiGate devices:

1. Connect the WAN side of the FortiGate cluster as shown in the topology diagram.
2. On the primary FortiGate, configure another hardware switch for the WAN connection:

```
config system virtual-switch
    edit Hardware-SW2
        set physical-switch sw0
        config port
            edit port1
            next
            edit port2
            next
        end
    next
end
```

3. On each FortiGate, configure the IP addresses on the hardware switch:

```
config system interface
    edit Hardware-SW2
        set ip 172.16.200.1 255.255.255.0
        set allowaccess ping ssh http https
    next
end
```

4. On each FortiGate, configure a firewall policy:

```
config firewall policy
    edit 1
        set srcintf Hardware-SW
        set dstintf Hardware-SW2
        set srcaddr all
        set dstaddr all
        set service ALL
        set action accept
        set schedule always
        set nat enable
    next
end
```

5. On each FortiGate, configure a static route:

```
config router static
    edit 1
        set device Hardware-SW2
        set gateway 172.16.200.254
    next
end
```

Traffic from PC1 and PC2 can now reach destinations outside of the FortiGate cluster.

VDOM exceptions

VDOM exceptions are settings that can be selected for specific VDOMs or all VDOMs that are not synchronized to other HA members. This can be required when cluster members are not in the same physical location, subnets, or availability zones in a cloud environment.

Some examples of possible use cases include:

- You use different source IP addresses for FortiAnalyzer logging from each cluster member. See [Override FortiAnalyzer and syslog server settings on page 2563](#) for more information.
- You need to keep management interfaces that have specific VIPs or local subnets that cannot transfer from being synchronized.
- In a unicast HA cluster in the cloud, you use NAT with different IP pools in different subnets, so IP pools must be exempt.

When a VDOM exception is configured, the object will not be synchronized between the primary and secondary devices when the HA forms. Different options can be configured for every object.

When VDOM mode is disabled, the configured object is excluded for the entire device. To define a scope, VDOM mode must be enabled and the object must be configurable in a VDOM.

VDOM exceptions are synchronized to other HA cluster members.

To configure VDOM exceptions:

```

config global
    config system vdom-exception
        edit 1
            set object <object name>
            set scope {all* | inclusive | exclusive}
            set vdom <vdom name>
        next
    end
end

```

object	The name of the configuration object that can be configured independently for some or all of the VDOMs. See Objects on page 2562 for a list of available settings and resources.
scope	Determine if the specified object is configured independently for all VDOMs or a subset of VDOMs. <ul style="list-style-type: none"> • all: Configure the object independently on all VDOMs. • inclusive: Configure the object independently only on the specified VDOMs. • exclusive: Configure the object independently on all of the VDOMs that are not specified.
vdom	The names of the VDOMs that are included or excluded.

Objects

The following settings and resources can be exempt from synchronization in an HA cluster:

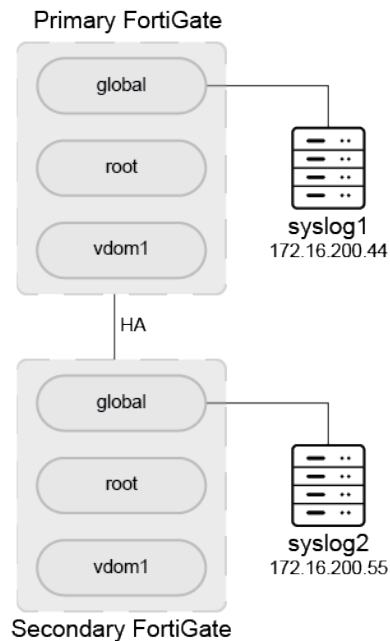

log.fortianalyzer.setting	user.radius
log.fortianalyzer.override-setting	system.interface*
log.fortianalyzer2.setting	vpn.ipsec.phase1-interface*
log.fortianalyzer2.override-setting	vpn.ipsec.phase2-interface*
log.fortianalyzer3.setting	router.bgp*
log.fortianalyzer3.override-setting	router.route-map*
log.fortianalyzer-cloud.setting	router.prefix-list*
log.fortianalyzer-cloud.override-setting	firewall.ippool*
log.syslogd.setting	firewall.ippool6*
log.syslogd.override-setting	router.static*
log.syslogd2.setting	router.static6*
log.syslogd2.override-setting	firewall.vip*
log.syslogd3.setting	firewall.vip6*
log.syslogd3.override-setting	system.sdwan*
log.syslogd4.setting	system.saml*
log.syslogd4.override-setting	router.policy*
system.central-management	router.policy6*
system.csf	

* This setting can only be configured on cloud VMs.

Override FortiAnalyzer and syslog server settings

In an HA cluster, secondary devices can be configured to use different FortiAnalyzer devices and syslog servers than the primary device. VDOMs can also override global syslog server settings.

Configure a different syslog server on a secondary HA device

To configure the primary HA device:

1. Configure a global syslog server:

```
config global
    config log syslog setting
        set status enable
        set server 172.16.200.44
        set facility local6
        set format default
    end
end
```

2. Set up a VDOM exception to enable setting the global syslog server on the secondary HA device:

```
config global
    config system vdom-exception
        edit 1
            set object log.syslogd.setting
        next
    end
end
```

To configure the secondary HA device:**1. Configure a global syslog server:**

```
config global
    config log syslogd setting
        set status enable
        set server 172.16.200.55
        set facility local5
    end
end
```

2. After the primary and secondary device synchronize, generate logs on the secondary device.**To confirm that logs are been sent to the syslog server configured on the secondary device:****1. On the primary device, retrieve the following packet capture from the secondary device's syslog server:**

```
# diagnose sniffer packet any "host 172.16.200.55" 6
interfaces=[any]
filters=[host 172.16.200.55]

266.859494 port2 out 172.16.200.2.7434 -> 172.16.200.55.514: udp 278
0x0000  0000 0000 0000 0009 0f09 0004 0800 4500      .....E.

0x0110  7420 6669 6c65 7320 6465 6c65 7465 6422      t.files.deleted"
0x0120  206d 7367 3d22 4465 6c65 7465 2031 206f      .msg="Delete.1.o
0x0130  6c64 2072 6570 6f72 7420 6669 6c65 7322      ld.report.files"
```

Configure a different syslog server in the root VDOM on a secondary HA device

To configure the primary HA device:

1. Configure a global syslog server:

```
config global
    config log syslog setting
        set status enable
        set server 172.16.200.44
        set facility local6
        set format default
    end
end
```

2. Set up a VDOM exception to enable `syslog-override` in the secondary HA device root VDOM:

```
config global
    config system vdom-exception
        edit 1
            set object log.syslogd.override-setting
            set scope inclusive
            set vdom root
        next
    end
end
```

3. In the VDOM, enable `syslog-override` in the log settings, and set up the override syslog server:

```
config root
    config log setting
        set syslog-override enable
    end
    config log syslog override-setting
        set status enable
    end
end
```

```

        set server 172.16.200.44
        set facility local6
        set format default
    end
end

```

After `syslog-override` is enabled, an override syslog server must be configured, as logs will not be sent to the global syslog server.

To configure the secondary HA device:

1. Configure an override syslog server in the root VDOM:

```

config root
    config log syslogd override-setting
        set status enable
        set server 172.16.200.55
        set facility local5
        set format default
    end
end

```

2. After the primary and secondary device synchronize, generate logs in the root VDOM on the secondary device.

To confirm that logs are been sent to the syslog server configured for the root VDOM on the secondary device:

1. On the primary device, retrieve the following packet capture from the syslog server configured in the root VDOM on the secondary device:

```

# diagnose sniffer packet any "host 172.16.200.55" 6
interfaces=[any]
filters=[host 172.16.200.55]

156.759696 port2 out 172.16.200.2.1165 -> 172.16.200.55.514: udp 277

```

Routing NetFlow data over the HA management interface

In an HA environment, the `ha-direct` option allows data from services such as syslog, FortiAnalyzer, SNMP, and NetFlow to be routed over the outgoing interface.

The following example shows how NetFlow data can be routed over the HA management interface `mgmt1`.

To route NetFlow data over the HA management interface:

1. On the primary unit (FortiGate A), configure the HA and `mgmt1` interface settings:

```
(global) # config system ha
    set group-name "test-ha"
    set mode a-p
    set password *****
    set hbdev "port6" 50
    set hb-interval 4
    set hb-lost-threshold 10
    set session-pickup enable
    set ha-mgmt-status enable
    config ha-mgmt-interfaces
        edit 1
            set interface "mgmt1"
        next
    end
    set override enable
    set priority 200
    set ha-direct enable
end

(global) # config system interface
    edit "mgmt1"
        set ip 10.6.30.111 255.255.255.0
        set allowaccess ping https ssh http telnet fgfm
        set type physical
        set dedicated-to management
        set role lan
        set snmp-index 1
    next
end
```

2. On the secondary unit (FortiGate B), configure the HA and `mgmt1` interface settings:

```
(global) # config system ha
    set group-name "test-ha"
    set mode a-p
    set password *****
    set hbdev "port6" 50
    set hb-interval 4
    set hb-lost-threshold 10
    set session-pickup enable
    set ha-mgmt-status enable
    config ha-mgmt-interfaces
        edit 1
            set interface "mgmt1"
        next
    end
```

```

        set override enable
        set priority 100
        set ha-direct enable
    end

(global) # config system interface
    edit "mgmt1"
        set ip 10.6.30.112 255.255.255.0
        set allowaccess ping https ssh http telnet fgfm
        set type physical
        set dedicated-to management
        set role lan
        set snmp-index 1
    next
end

```

3. On the primary unit (FortiGate A), configure the NetFlow setting:

```

(global) # config system netflow
    set collector-ip 10.6.30.59
end

```

4. Verify that NetFlow uses the mgmt1 IP:

```

(global) # diagnose test application sflowd 3

```

5. Verify that the NetFlow packets are being sent by the mgmt1 IP:

```

(vdom1) # diagnose sniffer packet any 'udp and port 2055' 4
interfaces=[any]
filters=[udp and port 2055]
8.397265 mgmt1 out 10.6.30.111.1992 -> 10.6.30.59.2055: udp 60
23.392175 mgmt1 out 10.6.30.111.1992 -> 10.6.30.59.2055: udp 188
23.392189 mgmt1 out 10.6.30.111.1992 -> 10.6.30.59.2055: udp 60
...
3 packets received by filter
0 packets dropped by kernel

```

6. On the secondary device (FortiGate B), change the priority so that it becomes the primary:

```

(global) # config system ha
    set priority 250
end

```

7. Verify the NetFlow status on FortiGate A, which is using the new primary's mgmt1 IP:

```

(global) # diagnose test application sflowd 3

```

8. Verify that the NetFlow packets use the new source IP on FortiGate B:

```

(vdom1) # diagnose sniffer packet any 'udp and port 2055' 4
interfaces=[any]
filters=[udp and port 2055]
7.579574 mgmt1 out 10.6.30.112.3579 -> 10.6.30.59.2055: udp 60
22.581830 mgmt1 out 10.6.30.112.3579 -> 10.6.30.59.2055: udp 60
29.038336 mgmt1 out 10.6.30.112.3579 -> 10.6.30.59.2055: udp 1140
^C
3 packets received by filter
0 packets dropped by kernel

```

Force HA failover for testing and demonstrations

This command should only be used for testing, troubleshooting, maintenance, and demonstrations.

Do not use it in a live production environment outside of an active maintenance window.

HA failover can be forced on an HA primary device. The device will stay in a failover state (secondary) regardless of the conditions. The only way to remove the failover status is by manually turning it off.

Syntax

```
execute ha failover set <cluster_id>
execute ha failover unset <cluster_id>
```

Variable	Description
<cluster_id>	The cluster ID is 1 for any cluster that is not in virtual cluster mode, and can be 1 or 2 if virtual cluster mode is enabled.

Example

To manually force an HA failover:

```
# execute ha failover set 1
Caution: This command will trigger an HA failover.
It is intended for testing purposes.
Do you want to continue? (y/n)y
```

To view the failover status:

```
# execute ha failover status
failover status: set
```

To view the system status of a device in forced HA failover:

```
# get system ha status
HA Health Status: OK
Model: FortiGate-300D
Group Name:
Group ID: 240
Debug: 0
Cluster Uptime: 0 days 2:11:46
Cluster state change time: 2020-03-12 17:38:04
Primary selected using:
<2020/03/12 17:38:04> FGT3HD3914800153 is selected as the primary because EXE_FAIL_OVER
flag is set on peer member FGT3HD3914800069.
<2020/03/12 15:27:26> FGT3HD3914800069 is selected as the primary because it has the
largest value of override priority.
ses_pickup: disable
override: enable
Configuration Status:
FGT3HD3914800069(updated 4 seconds ago): in-sync
```

```

Disabling stateful SCTP inspection

There is an option in FortiOS to disable stateful SCTP inspection. This option is useful when FortiGates are deployed in a high availability (HA) cluster that uses the FortiGate Clustering Protocol (FGCP) and virtual clustering in a multihoming topology. In this configuration, the primary stream control transmission protocol (SCTP) path traverses the primary FortiGate node by using its active VDOM (for example, VDOM1), and the backup SCTP path traverses the other passive FortiGate node by using its active VDOM (for example, VDOM2).

When stateful SCTP inspection is enabled, SCTP heartbeat traffic fails by means of the backup path because the primary path goes through a different platform and VDOM. Since there is no state sharing between VDOMs, the passive FortiGate is unaware of the original SCTP session and drops the heartbeats because of no associated sessions. When stateful SCTP inspection is disabled, the passive node permits the SCTP heartbeats to pass.

When set to `enable`, SCTP session creation without SCTP INIT is enabled. When set to `disable`, SCTP session creation without SCTP INIT is disabled (this is the default setting):

```

config system settings
    set sctp-session-without-init {enable | disable}
end

```

The following is an example topology and scenario:

In this example, FGT_A and FGT_B are in HA a-p mode with two virtual clusters. Two primaries exist on different FortiGate units. PC1 eth1 can access PC5 eth1 through VDOM1, and PC1 eth2 can access PC5 eth2 through VDOM2.

On PC5, to listen for an SCTP connection:

```
sctp_darn -H 172.16.200.55 -B 172.17.200.55 -P 2500 -l
```

On PC1, to start an SCTP connection:

```
sctp_darn -H 10.1.100.11 -B 20.1.100.11 -P 2600 -c 172.16.200.55 -c 172.17.200.55 -p 2500 -s
```

An SCTP four-way handshake is on one VDOM, and a session is created on that VDOM. With the default configuration, there is no session on any other VDOM, and the heartbeat on another path (another VDOM) is dropped. After enabling `sctp-session-without-init`, the other VDOM creates the session when it receives the heartbeat, and the heartbeat is forwarded:

```
config system settings
  set sctp-session-without-init enable
end
```

Resume IPS scanning of ICCP traffic after HA failover

After HA failover occurs, the IPS engine will resume processing ICCP sessions and keep the traffic going on the new primary unit. `session-pickup` must be enabled in an active-passive cluster to pick up the ICCP sessions.

Example

The following example uses an active-passive cluster. See [HA active-passive cluster setup on page 2528](#) for more information.

To configure HA:

```
config system ha
  set group-name "HA-APP"
  set mode a-p
  set password *****
  set hbdev "port3" 100
  set session-pickup enable
  set override enable
end
```

Session states before failover

When HA is working, the ICCP session information is stored in the HA session cache on the secondary FortiGate.

To verify the HA session cache on the secondary FortiGate:

```
# diagnose ips share list
HA Session Cache
client=10.1.100.178:57218 server=172.16.200.177:102
service=39, ignore_app_after=0, last_app=76919, buffer_len=32
stock tags: nr=981, hash=e68dc8120970448
custom tags: nr=0, hash=1a49b996b6a42aa2
tags [count=2]: s-737, s-828,
```

The ICCP session information can be found in the IPS session list and the session table on the primary FortiGate.

To verify the IPS session information on the primary FortiGate:

```
# diagnose ips session list
SESSION id:1 serial:35487 proto:6 group:6 age:134 idle:1 flag:0x800012a6

Session states after failover

After HA failover, the IPS engine on the new primary picks up the related ICCP sessions and continues passing the traffic. The HA session cache disappears on the new primary. The ICCP session now appears on the IPS session list and session table on the new primary.

To verify the IPS session information on the new primary FortiGate:

```
# diagnose ips session list
SESSION id:1 serial:35487 proto:6 group:6 age:90 idle:2 flag:0x820012a3
    feature:0x4 encap:0 ignore:1,0 ignore_after:204800,0
    tunnel:0 children:0 flag:....-....-..i.
C-10.1.100.178:57218, S-172.16.200.177:102
state: C-ESTABLISHED/9114/0/0/0/0, S-ESTABLISHED/0/0/0/0/0 pause:0, paws:0
expire: 28
app: unknown:0 last:44684 unknown-size:0
```

The server and client IPs, ports, and protocols remain the same.

To verify the system information on the primary FortiGate:

```
# diagnose sys session list
session info: proto=6 proto_state=11 duration=569 expire=3577 timeout=3600 flags=00000000

```

Querying autoscale clusters for FortiGate VM

When a FortiGate VM secondary device is added to a cluster, the new secondary member can query the cluster about its autoscale environment. FortiManager can then run this query on the new secondary member to update its autoscale record.

To view cluster information from a secondary member:

```
# diagnose sys ha checksum autoscale-cluster
```

Cluster information sample

Sample cloud topology:

```
FGT_BYOL; primary; 10.0.0.6; FGVM04TM000000066
FGT_BYOL; secondary; 10.0.0.7; FGVM00000000056
FGT_PAYG; secondary; 10.0.0.4; FGTAZ000000000CD
FGT_PAYG; secondary; 10.0.0.5; FGTAZ0000000003D
```

From the secondary device, you can see cluster checksums and the primary device:

```
# diagnose sys ha checksum autoscale-cluster

    10.0.0.6, timeo=31430, serial_no=FGVM04TM19001766
    10.0.0.7, timeo=31430, serial_no=FGVM04TM19008156
    10.0.0.5, timeo=31430, serial_no=FGTAZR7UZRKKNR3D

```

Cluster virtual MAC addresses

In a cluster, the FGCP assigns virtual MAC addresses (VMACs) to each primary device interface. HA uses VMAC addresses so that if a failover occurs, the new primary device interfaces will have the same VMAC addresses and IP addresses as the failed primary device. As a result, most network equipment will identify the new primary device as the same device as the failed primary device and still be able to communicate with the cluster.

If a cluster is operating in NAT mode, the FGCP assigns a different VMAC address to each primary device interface. VLAN subinterfaces are assigned the same VMAC address as the physical interface that the VLAN subinterface is added to. Redundant or 802.3ad aggregate interfaces are assigned the VMAC address of the first interface in the redundant or aggregate list.

If a cluster is operating in transparent mode, the FGCP assigns a VMAC address to the primary device's management IP address. Since you can connect to the management IP address from any interface, all FortiGate interfaces appear to have the same VMAC address.

The MAC address of a reserved management interface does not change to a VMAC address; it keeps its original MAC address.

Subordinate device MAC addresses do not change. Use `diagnose hardware deviceinfo nic <interface>` on the subordinate device to display the MAC addresses of each interface.

A MAC address conflict can occur when two clusters are operating on the same network using the same group ID (see [Diagnosing packet loss](#)). It is recommended that each cluster in the same network and broadcast domain uses a unique group ID.

Failover

When the new primary device is selected after a failover, the primary device sends gratuitous ARP packets to update the devices connected to the cluster interfaces (usually layer 2 switches) with the VMAC addresses. This is sometimes called using gratuitous ARP packets (or GARP packets) to train the network. The gratuitous ARP packets sent from the primary unit are intended to make sure that the layer 2 switch forwarding databases (FDBs) are updated as quickly as possible.

Sending gratuitous ARP packets is not a requirement because connected devices will eventually learn of the new ports to forward the packets to. However, many network switches will update their FDBs more quickly after a failover if the new primary device sends gratuitous ARP packets.

Configuring ARP packet settings

The following settings can be configured.

```
config system ha
    set arps <integer>
    set arps-interval <integer>
    set gratuitous-arps {enable | disable}
    set link-failed-signal {enable | disable}
end
```

<code>arps <integer></code>	Set the number of gratuitous ARPs; lower the value to reduce traffic, and increase the value to reduce failover time (1 - 60, default = 5).
<code>arps-interval <integer></code>	Set the time between gratuitous ARPs; lower the value to reduce failover time, and increase the value to reduce traffic, in seconds (1 - 20, default = 8).
<code>gratuitous-arps {enable disable}</code>	Enable/disable gratuitous ARPs (default = enable).
<code>link-failed-signal {enable disable}</code>	Enable/disable shutting down all interfaces for one second after a failover. Use if gratuitous ARPs do not update the network (default = disable).

If you disable sending gratuitous ARP packets, it is recommended to enable the `link-failed-signal` setting. The `link-failed-signal` alerts the connected switches of a failed link, which triggers them to react immediately to the changes.

For more information about gratuitous ARP packets see [RFC 826](#) and [RFC 3927](#).

Determining VMAC addresses

A VMAC address is determined based on following formula:

`<group-prefix>:<group-id_hex>:(<vcluster_integer> + <idx>)`

The `<group-prefix>` is determined by the following set of group IDs:

- Set 1: group IDs 0 - 255: group prefix 00:09:0f:09
- Set 2: group IDs 256 - 511: group prefix e0:23:ff:fc
- Set 3: group IDs 512 - 767: group prefix e0:23:ff:fd
- Set 4: group IDs 768 - 1023: group prefix e0:23:ff:fe

The `<group-id_hex>` is determined by the group ID % 256, converted to hexadecimal. For example:

Group ID	Hexadecimal ID
0: $0 \% 256 = 0$	00
255: $255 \% 256 = 255$	ff
256: $256 \% 256 = 0$	00
511: $511 \% 256 = 255$	ff
512: $512 \% 256 = 0$	00
...	...

The `<vcluster_integer>` is 00 for virtual cluster 1, and 20 for virtual cluster 2. If VDOMs are not enabled, HA sets the virtual cluster to 1 and by default all interfaces are in the root VDOM. Including virtual cluster and VDOM factors in the VMAC address formula means that the same formula can be used whether or not VDOMs and virtual clustering are enabled.

The `<idx>` is the index number of the interface. Interfaces are numbered from 0 to x (where x is the number of interfaces). Interfaces are numbered according to their map order. The first interface has an index of 0. The second interface in the list has an index of 1, and so on.

The following table compares the VMAC addresses for interfaces with an unchanged HA group ID (0) with VDOMs not enabled and interfaces when the group ID is changed to 34:

Interface	VMAC address with unchanged group ID (0)	VMAC address with changed group ID (34)
port5	00-09-0f-09-00-0a	00-09-0f-09-22-0a
port6	00-09-0f-09-00-0b	00-09-0f-09-22-0b
port7	00-09-0f-09-00-0c	00-09-0f-09-22-0c
port8	00-09-0f-09-00-0d	00-09-0f-09-22-0d

Using the same interfaces, a cluster with VDOMs is enabled and the group ID changes to 35. The root VDOM contains port5 and port6 (virtual cluster 1), and vdom_1 contains port7 and port8 (virtual cluster 2). The interfaces have the following VMAC addresses:

Interface	VMAC address with group ID 35
port5	00-09-0f-09-23-0a
port6	00-09-0f-09-23-0b
port7	00-09-0f-09-23-2c
port8	00-09-0f-09-23-2d

Displaying VMAC addresses

Each FortiGate physical interface has two MAC addresses: the permanent and current hardware addresses. The permanent hardware address cannot be changed, as it is the actual MAC address of the interface hardware. The current hardware address can be changed, as it is the address seen by the network.

To change the current hardware address on a FortiGate not operating in HA:

```
config system interface
    edit <name>
        set macaddr <address>
    next
end
```

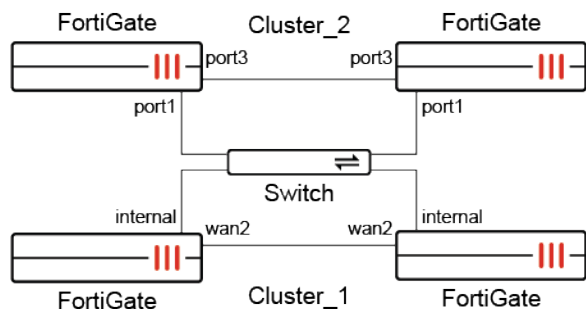

In an operating cluster, the current hardware address of each cluster device interface is changed to the HA virtual MAC address by the FGCP. The `macaddr` option is not available for a functioning cluster.

To display MAC addresses on a FortiGate operating in HA:

```
# diagnose hardware deviceinfo nic port1
...
Current_HWaddr 00:09:0f:09:ff:02
Permanent_HWaddr 08:5b:0e:72:3b:b2
```

Diagnosing packet loss

A network can experience packet loss when two FortiGate HA clusters are deployed in the same broadcast domain due to MAC address conflicts. You can resolve the MAC address conflict by changing the HA group ID (or cluster ID) configuration of the two clusters.

You can diagnose packet loss by pinging from one cluster to the other, or by pinging both of the clusters from a device within the broadcast domain.

To check for a MAC address conflict in a HA cluster:

1. On Cluster_1 and Cluster_2, check the VMAC address (Current_HWaddr) used in an interface on the primary device:

```
# diagnose hardware deviceinfo nic <interface>
```

If the group prefix and group hexadecimal ID are identical, there will be MAC address conflicts.

2. Change one of the clusters to use a different group ID:

```
config system ha
    set group-id <integer>
end
```

Abbreviated TLS handshake after HA failover

TLS sessions that pass through an HA A-A or A-P cluster can use an abbreviated TLS handshake instead of a full TLS handshake upon failover from a primary HA unit to a secondary HA unit. This reduces session pickup delays by reducing the time needed to renegotiate the TLS session, given that the TLS session ticket can be re-used.

To accomplish this, FortiOS uses the web proxy global `ssl-ca-cert` to generate the key used in the TLS session ticket:

```
config web-proxy global
    set ssl-ca-cert "Fortinet_CA_SSL"
end
```

The certificate can be synchronized to the secondary HA unit, which allows the secondary unit to generate the same session key for a TLS session. When a TLS session reconnects after HA failover using the same session ticket as the first session, the new primary unit is able to generate the same key matching that session ticket and allow an abbreviated handshake.

Example

In this example, OpenSSL is used to create a TLS session between the client and the server through the primary FortiGate. The session ticket is outputted and saved. Upon failover, the same session ticket is reused to create a TLS session through the new primary unit. Because the new primary unit uses the same certificate to generate the key for the TLS session ticket, it allows the connection to be made using an abbreviated TLS handshake.

This example is for demonstration purposes only. In a normal failover, TLS sessions from clients will automatically be able to re-establish using an abbreviated handshake through the new primary unit.

To verify if an abbreviated TLS handshake is used after HA failover:

1. On the client using OpenSSL, open a new session to 172.16.200.44:443 and output the session ticket to a file called `aaa.txt`. This session will pass through the current HA primary unit:

```
# openssl s_client -connect 172.16.200.44:443 -sess_out aaa.txt
```

2. Fail over the primary unit to the secondary unit. The HA secondary unit starts handling the traffic.
3. On the client, try connecting to 172.16.200.44:443 using the same saved session ticket as before (aaa.txt):

```
# openssl s_client -connect 172.16.200.44:443 -sess_in aaa.txt
```

4. Verify whether the session succeeds in using the original session ticket:

```
Reused, TLSv1.3, Cipher is TLS_AES_256_GCM_SHA384
Server public key is 4096 bit
Secure Renegotiation IS NOT supported
Compression: NONE
Expansion: NONE
No ALPN negotiated
Early data was not sent
Verify return code: 19 (self signed certificate in certificate chain)
...
```

If the session is established using the same ticket, **Reused, TLSv1.3, Cipher is <name>** is displayed. If session is established using a new ticket, **New, TLSv1.3, Cipher is <name>** is displayed.

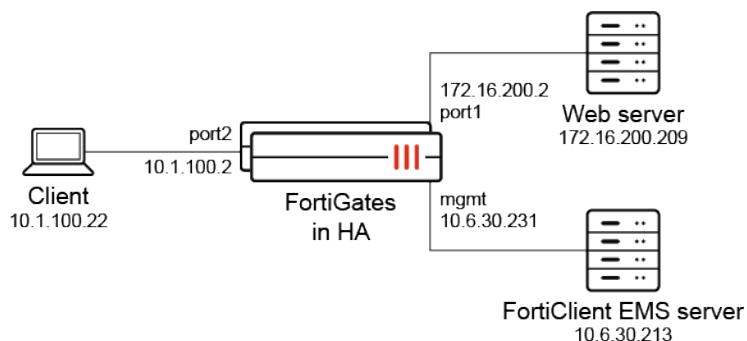

The new primary is able to use the web proxy global `ssl-ca-cert` to generate the same key as the old primary that was used in the session ticket. So, the second TLS connection that reuses the TLS session ticket from the first session can complete an abbreviated TLS handshake.

Session synchronization during HA failover for ZTNA proxy sessions

User information and TLS sessions are synchronized between HA members for ZTNA proxy sessions. When a failover occurs, the new primary unit will continue allowing sessions from the logged in users without asking for the client certificate and re-authentication again.

Example

In this example, a FortiGate HA pair is acting as a ZTNA access proxy. Clients that are trying to access the web server on `qa.test.com` are proxied by the ZTNA access proxy. Remote clients must be registered to the EMS server, and pass a client certificate check and user authentication in order to connect. Upon HA member failure, a failover occurs and the new primary unit will continue to allow connections without requesting client certificate check and user authentication for existing users and devices.

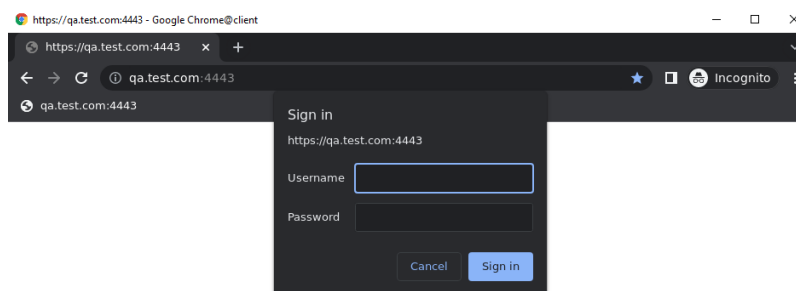

This example assumes ZTNA and EMS server settings are already configured.

To configure the HA settings:

```
config system ha
    set group-name "501E"
    set mode a-p
    set password *****
    set hbdev "ha" 0
    set session-pickup enable
    set override disable
    set monitor "port1" "port2"
end
```

To verify that the proxy sessions are synchronized between HA members:

1. On the client, access the web server. The ZTNA access proxy challenges the user for a client certificate and user authentication.

2. On the primary FortiGate, verify that the user information and TLS sessions are synchronized between HA members.
 - a. Verify the list of proxy users:

```
501E-primary # diagnose wad user list
ID: 1, VDOM: root, IPv4: 10.1.100.22
  user name   : localuser1
  worker      : 0
  duration    : 8
  auth_type   : IP
  auth_method : Basic
  pol_id      : 1
  g_id        : 0
  user_based  : 1
  expire      : 597
LAN:
  bytes_in=2093 bytes_out=5753
WAN:
  bytes_in=2024 bytes_out=1235
```

- b. Apply a filter to WAD debug to diagnose the wad informer process:

```
501E-primary # diagnose test application wad 2400
Set diagnosis process: type=informer index=0 pid=305
```

- c. Show the user cache from the WAD informer. Verify that the localuser1 entry exists:

```
501E-primary # diagnose test application wad 110
users:
[1]      localuser1@10.1.100.22:0 upn_domain= from:worker worker:6 vf:0 ref:1 stale=0
ntlm:0, has_fsae:0, guest:0
```

```

        user_node:(0x7fe18dcf0048) user:1[max=65536](0x7fe18dd08048) ip:1
(0x7fe18dd00048) scheme:0 outofsync:0(0) id:1
...

```

- d. Verify using WAD real-time debugs on the secondary FortiGate. The user information is synchronized to the secondary FortiGate:

```

501E-secondary # diagnose wad debug enable category all
501E-secondary # diagnose wad debug enable level verbose
501E-secondary # diagnose debug enable
[I][p:296]          wad_proc_informer_ha_dgram_on_read:2811 Got HA msg: type=0,
sizeof(msg)=8, dlen=80, sz=88
[I][p:296]          wad_proc_informer_on_ha_user_add :1493 reader:
ip=10.1.100.22:45852 vf=0 seq=0 grp_type=0 scheme=0 is_ntlm=0 has_fsae=0 concur_
user=65536 domain=''
[I][p:296]          wad_informer_update_user_ext :782
ip=10.1.100.22:45852 name=localuser1 from=worker
[I][p:296]          wad_informer_find_user_ip_entries :621 find=false(1) vf=0
ip=10.1.100.22:45852 pr=(nil)
mapping user_node:0x7fc1c84dd048, user_ip:0x7fc1c84ed048(0), user:0x7fc1c84f5048(0).

```

3. Verify the user cache from the WAD informer:

```

501E-secondary # diagnose test application wad 110
users:
[1]    localuser1@10.1.100.22:0 upn_domain= from:worker worker:-126 vf:0 ref:1 stale=0
ntlm:0, has_fsae:0, guest:0
        user_node:(0x7fa3eb07d048) user:1[max=65536](0x7fa3eb095048) ip:1
(0x7fa3eb08d048) scheme:0 outofsync:0(0) id:7
...

```

If the client tries to access the web server again after failover occurs, the client certificate check and authentication prompt does not appear. ZTNA allows the traffic to pass.

The ZTNA logs for both FortiGates contain the same user information.

Primary FortiGate log:

FGCP HA between FortiGates of the same model with different AC and DC PSUs

To improve power redundancy, FGCP HA clusters can support forming HA between units of the same model but with different AC PSU and DC PSU power supplies. This enables redundancy in a situation where power is completely lost on the AC grid, but traffic can fail over to a cluster member running on an independent DC grid.

The cluster members must be the same model with the same firmware installed, and must have the same hardware configuration other than the PSU.

In the following examples, there is an FGCP cluster with AC and DC PSU members: a FortiGate 1800F-DC (primary) and FortiGate 1800F (secondary).

Basic configuration

To configure the FGCP cluster in the GUI:

1. On the primary FortiGate (FG-1800F-DC), go to *System > HA*.
2. Configure the following settings:

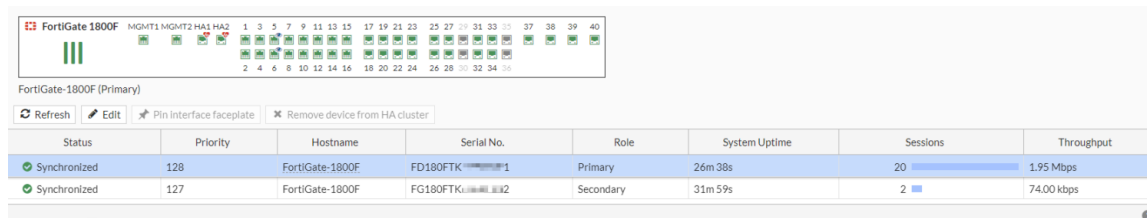

Mode	<i>Active-Passive</i>
Device priority	<i>128</i>
Group ID	<i>0</i>
Group name	<i>Example_cluster</i>

Password	Enter a password.
Session pickup	Enable this setting.
Monitor interfaces	Click the + to add <i>port5</i> and <i>port6</i> .
Heartbeat interfaces	Click the + to add <i>ha1</i> and <i>ha2</i> .

- Click *OK*.
- On the secondary FortiGate (FG-1800F), go to *System > HA*.
- Configure the following settings:

Mode	<i>Active-Passive</i>
Device priority	<i>127</i>
Group ID	<i>0</i>
Group name	<i>Example_cluster</i>
Password	Enter a password.
Session pickup	Enable this setting.
Monitor interfaces	Click the + to add <i>port5</i> and <i>port6</i> .
Heartbeat interfaces	Click the + to add <i>ha1</i> and <i>ha2</i> .

- Click *OK*.
- Verify that the cluster status is *Synchronized*.

Status	Priority	Hostname	Serial No.	Role	System Uptime	Sessions	Throughput
Synchronized	128	FortiGate-1800F	FD180FTK1	Primary	26m 38s	20	1.95 Mbps
Synchronized	127	FortiGate-1800F	FG180FTK2	Secondary	31m 59s	2	74.00 kbps

To configure the FGCP cluster in the CLI:

- Configure the primary FortiGate (FG-1800F-DC):

```
config system ha
    set group-name "Example_cluster"
    set mode a-p
    set password *****
    set hbdev "ha2" 0 "ha1" 0
    set session-pickup enable
    set override disable
    set monitor "port5" "port6"
end
```

- Configure the secondary FortiGate (FG-1800F):

```
config system ha
    set group-name "Example_cluster"
    set mode a-p
```

```

    set password *****
    set hbdev "ha2" 0 "ha1" 0
    set session-pickup enable
    set override disable
    set priority 127
    set monitor "port5" "port6"
end

```

3. Verify the cluster status on the primary FortiGate:

```

# get system ha status
HA Health Status: OK
Model: FortiGate-1800F
Mode: HA A-P
Group Name: Example_cluster
Group ID: 0
Debug: 0
Cluster Uptime: 0 days 0:56:11
Cluster state change time: 2023-05-29 19:11:14

Primary: FG180FTK*****1, HA operating index = 0

```

Testing synchronization in the cluster

Based on the preceding example, the interface and firewall policy configurations are changed on the primary FortiGate. These configuration changes and sessions are synchronized to the secondary FortiGate. If the switch interface connected to the primary's port5 is down (port2), this triggers the monitor interface to be down, and the PC1 traffic will fail over to the secondary FortiGate.

To test configuration synchronization in the FGCP cluster:**1. Modify configurations on the primary FortiGate (FG-1800F-DC).****a. Edit the interface settings:**

```
config system interface
  edit "port5"
    set ip 10.1.100.1 255.255.255.0
    set allowaccess ping https ssh http telnet
    set alias "To_Client_PC"
    config ipv6
      set ip6-address 2000:10:1:100::1/64
      set ip6-allowaccess ping https ssh http
    end
  next
  edit "port6"
    set ip 172.16.200.1 255.255.255.0
    set allowaccess ping https ssh http fgfm
    set alias "To_Server"
    config ipv6
      set ip6-address 2000:172:16:200::1/64
      set ip6-allowaccess ping https ssh http
    end
  next
end
```

b. Edit the firewall policy settings:

```
config firewall policy
  edit 1
    set name "to_server_policy"
    set srcintf "port5"
    set dstintf "port6"
    set action accept
    set srcaddr "all"
    set dstaddr "all"
    set schedule "always"
    set service "ALL"
    set logtraffic-start enable
  next
end
```

2. On the secondary FortiGate (FG-1800F), verify that the settings were synchronized.**a. Verify the interface settings:**

```
show system interface
config system interface
...
edit "port5"
  set vdom "root"
  set ip 10.1.100.1 255.255.255.0
  set allowaccess ping https ssh http telnet
  set type physical
  set alias "To_Client_PC"
  set snmp-index 9
config ipv6
  set ip6-address 2000:10:1:100::1/64
```

```

        set ip6-allowaccess ping https ssh http
    end
next
edit "port6"
    set vdom "root"
    set ip 172.16.200.1 255.255.255.0
    set allowaccess ping https ssh http fgfm
    set type physical
    set alias "To_Server"
    set snmp-index 10
    config ipv6
        set ip6-address 2000:172:16:200::1/64
        set ip6-allowaccess ping https ssh http
    end
next
end

```

b. Verify the firewall policy settings:

```

show firewall policy
config firewall policy
    edit 1
        set name "to_server_policy"
        set uuid 82a05e78-fe90-51ed-eb16-ee7bdea60de0
        set srcintf "port5"
        set dstintf "port6"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set logtraffic-start enable
    next
end

```

c. Verify the HA checksum:

```

# diagnose sys ha checksum show
is_manage_primary()=0, is_root_primary()=0
debugzone
global: 4e 15 af c3 c6 87 32 f5 69 5c b7 33 b1 8b 27 12
root: 4a 52 e4 f1 6a 2b eb 7d 84 7d f1 48 50 93 fe d9
all: 95 4e 92 c3 39 75 8e 0e db 83 8d b7 b2 b1 9f 04

checksum
global: 4e 15 af c3 c6 87 32 f5 69 5c b7 33 b1 8b 27 12
root: 4a 52 e4 f1 6a 2b eb 7d 84 7d f1 48 50 93 fe d9
all: 95 4e 92 c3 39 75 8e 0e db 83 8d b7 b2 b1 9f 04

```

To test session synchronization in the FGCP cluster:

1. On PC1, verify the IP address and gateway:

```

root@pcl:~# ifconfig eth1
eth1      Link encap:Ethernet  HWaddr 00:0c:29:a0:60:d6
          inet addr:10.1.100.11  Bcast:10.1.100.255  Mask:255.255.255.0
          ...

```

```

root@pcl:~# route -n
Kernel IP routing table
Destination      Gateway         Genmask         Flags Metric Ref    Use Iface
0.0.0.0          10.1.100.1     0.0.0.0         UG      0      0      0 eth1
10.1.100.0       0.0.0.0        255.255.255.0   U       0      0      0 eth1
10.6.30.0        0.0.0.0        255.255.255.0   U       0      0      0 eth0
169.254.0.0      0.0.0.0        255.255.0.0     U      1000    0      0 eth0

```

2. Using Wget, initiate a large file download with HTTP that will maintain a long session:

```

root@pcl:~# wget http://172.16.200.55/big100MB.html --keep-session-cookies --limit-
rate=128k --progress=dot -S -r --delete-after
--2023-05-29 14:55:33-- http://172.16.200.55/big100MB.html
Connecting to 172.16.200.55:80... connected.

no_ofld_reason:
total session: 1
```

To test failover in the FGCP cluster:

1. On the switch connected to port5 of the primary FortiGate, change port2's status to be down:

```
config switch physical-port
    edit port2
        set status down
    next
end
```

2. Check the HA status on the primary FortiGate (FG-1800F-DC), which now becomes the secondary device:

```
# get system ha status
HA Health Status:
    WARNING: FG180FTK*****1 has mondev down;
Model: FortiGate-1800F
Mode: HA A-P
Group Name: Example_cluster
Group ID: 0
Debug: 0
Cluster Uptime: 0 days 1:16:13
Cluster state change time: 2023-05-29 20:08:56
Primary selected using:
    <2023/05/29 20:08:56> vcluster-1: FG180FTK*****2 is selected as the primary
```

because the value 0 of link-failure + pingsvr-failure is less than peer member FG180FTK***1.**

<2023/05/29 19:11:14> vcluster-1: FG180FTK*****1 is selected as the primary because its uptime is larger than peer member FG180FTK*****2.

<2023/05/29 18:59:45> vcluster-1: FG180FTK*****2 is selected as the primary because its uptime is larger than peer member FG180FTK*****1.

<2023/05/29 18:59:45> vcluster-1: FG180FTK*****1 is selected as the primary because its override priority is larger than peer member FG180FTK*****2.

75150K	75%	100K	3m10s

Troubleshoot an HA formation

The following are requirements for setting up an HA cluster or FGSP peers.

Cluster members must have:

- The same model.
- The same hardware configuration.
- The same connections.
- The same generation.

The requirement to have the same generation is done as a best practice as it avoids issues that can occur later on. If you are unsure if the FortiGates are from the same generation, please contact customer service.

Troubleshooting common HA formation errors

One member keeps shutting down during HA setup (hard drive failure):

If one member has a hard drive failure but the other does not, the one with the hard drive failure will be shut down during HA setup. In this case, RMA the member to resolve the issue.

Split brain scenario:

A split brain scenario occurs when two or more members of a cluster cannot communicate with each other on the heartbeat interface, causing each member to think it is the primary. As a result, each member assumes the primary HA role and applies the same IP and virtual MAC addresses on its interfaces. This causes IP and MAC conflicts on the network, and causes flapping on L2 devices when they learn the same MAC address on ports connected to different FortiGates.

A split brain scenario is usually caused by a complete lost of the heartbeat link or links. This can be a physical connectivity issue, or less commonly, something blocking the heartbeat packets between the HA members. Another cause is congestion and latency in the heartbeat links that exceeds the heartbeat lost intervals and thresholds.

The following are common symptoms of a split brain scenario:

- The connections to the FortiGates in the cluster work intermittently when trying to connect with administrative access.
- Sessions cannot be established through the FortiGate, and the traffic drops.
- When logging in to the FortiGates using the console, `get system ha status` shows each FortiGate as the primary.

To resolve a split brain scenario:

- Be physically on-site with the FortiGates (recommended). If this is not possible, connect to the FortiGates using console access.
- Identify the heartbeat ports, and verify that they are physically connected and up.
- Verify that heartbeat packets are being sent and received on the heartbeat ports.
- Verify that the HA configurations match between the HA members. The HA mode, group-name, group-id, and password settings should be the same. Different group-id values will result in different virtual MAC addresses, which might not cause a MAC conflict. However, an IP conflict can still occur.
- If everything seems to be in working order, run `get system ha status` to verify that HA has formed successfully.

To avoid a split brain scenario:

- In a two-member HA configuration, use back-to-back links for heartbeat interface instead of connecting through a switch.
- Use redundant HA heartbeat interfaces.
- In a configuration where members are in different locations, ensure the heartbeat lost intervals and thresholds are longer than the possible latency in the links.

FGSP

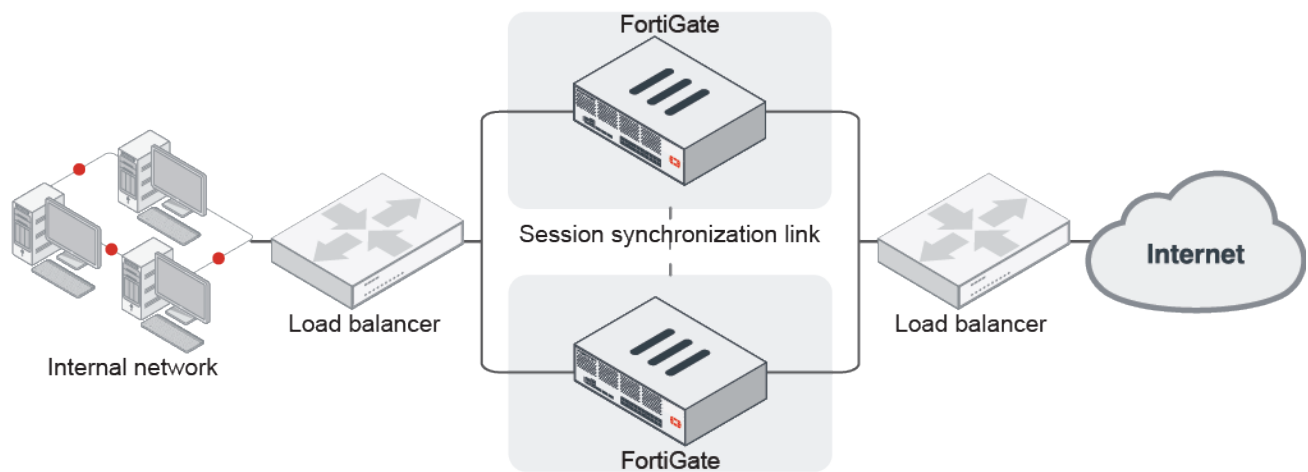

Standalone FortiGates or FGCP clusters can be integrated into the load balancing configuration using the FortiGate Session Life Support Protocol (FGSP) in a network where traffic is load balanced by an upstream load balancer and scanned by downstream FortiGates. FGSP can perform session synchronization of IPv4 and IPv6 TCP, SCTP, UDP, ICMP, expectation, and NAT sessions to keep the session tables synchronized on all entities. If one of the FortiGates fails, the upstream load balancer should detect the failed member and stop distributing sessions to it. Session failover occurs and active sessions fail over to the peers that are still operating. Traffic continues to flow on the new peer without data loss because the sessions are synchronized.

The FortiGates in FGSP operate as peers that process traffic and synchronize sessions. An FGSP deployment can include two to 16 standalone FortiGates, or two to 16 FortiGate FGCP clusters of two members each. Adding more FortiGates increases the CPU and memory required to keep all of the FortiGates synchronized, and it increases network synchronization traffic. Exceeding the numbers of members is not recommended and may reduce overall performance. By default, FGSP synchronizes all IPv4 and IPv6 TCP sessions, and IPsec tunnels. You can optionally add filters to control which sessions are synchronized, such as synchronizing packets from specific source and destination addresses, source and destination interfaces, or services.

FGSP is also compatible with FortiGate VRRP.

FGSP is primarily used instead of FGCP when external load balancers are part of the topology, and they are responsible for distributing traffic amongst the downstream FortiGates. FGSP provides the means to synchronize sessions between the FortiGate peers without needing a primary member to distribute the sessions like in FGCP active-active mode. If the external load balancers direct all sessions to one peer, the effect is similar to active-passive FGCP HA. If external load balancers balance traffic to both peers, the effect is similar to active-active FGCP HA. The load balancers should be configured so that all packets for any given session are processed by the same peer, including return packets whenever possible.

Session pickup

Session pickup is an optional setting that can be enabled to synchronize connectionless (UDP and ICMP) sessions, expectation sessions, and NAT sessions. If session pickup is not enabled, the FGSP does not share session tables for the particular session type, and sessions do not resume after a failover. All sessions are interrupted by the failover and must be re-established at the application level. Many protocols can successfully restart sessions with little, or no, loss of data. Others may not recover as easily. Enable session pickup for sessions that may be difficult to reestablish. Since session pickup requires FortiGate memory and CPU resources, only enable this feature for sessions that need to synchronize.

Session synchronization link

The session synchronization link is an optional configuration that allows peers to synchronize sessions over a dedicated interface instead of the interface in which the peer IP is routed. In this configuration, communications occur over L2 instead of L3. Configuring session synchronization links is recommended when you want to minimize traffic over the peering interface when there are many sessions that need to be synchronized.

Expectation sessions

FortiOS session helpers keep track of the communication of layer 7 protocols, such as FTP and SIP, that have control sessions and expectation sessions. The control sessions establish the link between the server and client, and negotiate the ports and protocols that will be used for data communications. The session helpers then create expectation sessions through the FortiGate for the ports and protocols negotiated by the control session.

The expectation sessions are the sessions that actually communicate data. For FTP, the expectation sessions transmit files being uploaded or downloaded. For SIP, the expectation sessions transmit voice and video data. Expectation sessions usually have a timeout value of 30 seconds. If the communication from the server is not initiated within 30 seconds, the expectation session times out and traffic will be denied.

By default, FGSP does not synchronize expectation sessions; if a failover occurs, the sessions will have to be restarted.

To synchronize expectation sessions so they continue after a failover:

```
config system ha
    set session-pickup enable
    set session-pickup-expectation enable
end
```

NAT session synchronization

NAT sessions are not synchronized by default. You can enable NAT session synchronization by entering the following command:

```
config system ha
    set session-pickup enable
    set session-pickup-nat enable
end
```

After a failover with this configuration, all sessions that include the IP addresses of interfaces on the failed FortiGate unit will have nowhere to go since the IP addresses of the failed FortiGate unit will no longer be on the network. If you want NAT sessions to resume after a failover you should not configure NAT to use the destination interface IP address, since the FGSP FortiGate units have different IP addresses. To avoid this issue, you should use IP pools with the type set to overload (which is the default IP pool type), as shown in this example:

```
config firewall ippool
    edit FGSP-pool
        set type overload
        set startip 172.20.120.10
        set endip 172.20.120.20
    next
end
```

In NAT mode, only sessions for route mode security policies are synchronized. FGSP is also available for FortiGate units or virtual domains operating in transparent mode. Only sessions for normal transparent mode policies are synchronized.

The following topics provide more information about FGSP:

FGSP basic peer setup

The FortiGate Session Life Support Protocol (FGSP) is a proprietary HA solution for only sharing sessions between entities based on peer-to-peer communications. The entities could be standalone FortiGates or an FGCP cluster. Sessions are load balanced by an upstream load balancer. Each peer will synchronize its sessions with the other peers so that if a failure occurs, sessions will continue to flow as the load balancer redirects the traffic to the other peers.

Basic requirements and limitations

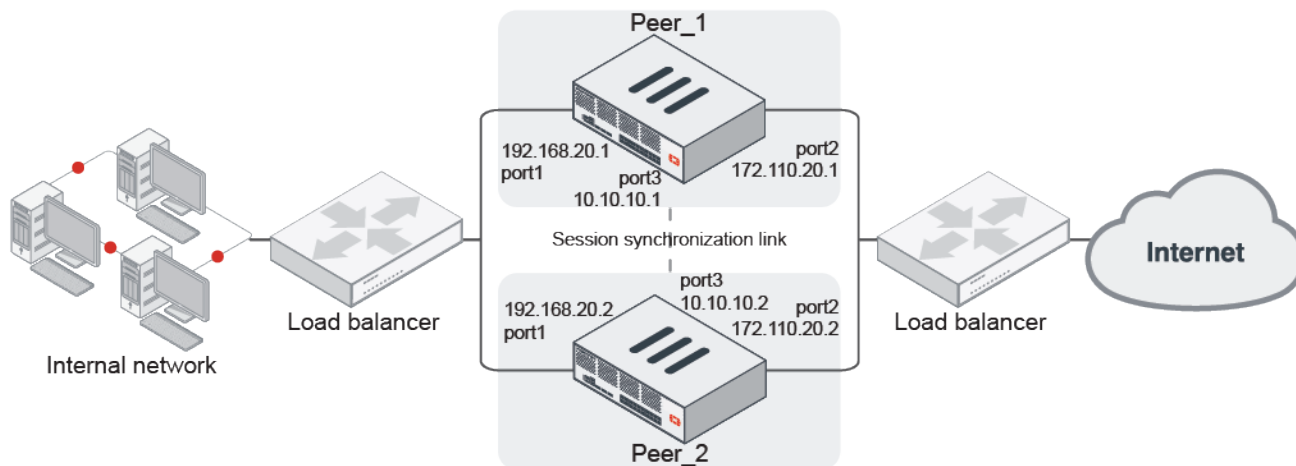

In most production environments, the following requirements should be met:

- The peers are FortiGates of the same model.
- The peers are running the same firmware version.
- There are 2 to 16 standalone FortiGates, or 2 to 16 FortiGate FGCP clusters of two members each.

Two FortiGates must have similar capabilities so that data structures used in session synchronization will match, and are capable of delivering similar performance. Therefore, the same model and firmware version is highly recommended for most production deployments. The limitation on the number of FortiGates in FGSP also ensures that session synchronization will occur smoothly.

Example

This example uses two peer FortiGates. The load balancer is configured to send all sessions to Peer_1, and if Peer_1 fails, all traffic is sent to Peer_2.

To configure a basic FGSP peer setup:

These instructions assume that all FortiGates have been factory reset.

1. Make all the necessary connections as shown in the topology diagram.
2. On Peer_1, configure the peer IP in which this device will peer with:

```
config system standalone-cluster
  config cluster-peer
    edit 1
      set peerip 10.10.10.2
    next
```

```

        end
        set standalone-group-id 1
        set group-member-id 1
    end
end

```

If there are multiple peer IPs from the same peer, enter them as separate entries. If there are multiple peers, enter the IP of each peer in separate entries. See [Optimizing FGSP session synchronization and redundancy on page 2609](#) for an example.

Sessions by default will be synchronized over layer 3 on the interface in which the current unit connects to the peer's IP.

3. On Peer_2, configure session synchronization:

```

config system standalone-cluster
    config cluster-peer
        edit 1
            set peerip 10.10.10.1
        next
    end
    set standalone-group-id 1
    set group-member-id 2
end

```

4. Configure identical firewall policies on each peer, such as for traffic going from the same incoming interface (port1) to the outgoing interface (port2).

To test the FGSP peer setup:

1. Initiate TCP traffic (like HTTP access) to go through Peer_1.
2. Check the session information:

```

# diagnose sys session filter src <IP_address>
# diagnose sys session list

```

3. Enter the same commands on Peer_2 to verify if the same session information appears.

Optional filters

Filters can be added to synchronize certain types of sessions that meet the filter criteria.

To add filters for session synchronization:

```

config system standalone-cluster
    config cluster-peer
        edit <id>
            config session-sync-filter
                set srcintf <interface>
                set dstintf <interface>
                set srcaddr <IPv4_address>
                set dstaddr <IPv4_address>
                set srcaddr6 <IPv6_address>
                set dstaddr6 <IPv6_address>
            end
        next
    end
end

```

Filter examples

To synchronize only sessions with a particular source subnet:

```
config system standalone-cluster
  config cluster-peer
    edit 1
      config session-sync-filter
        set srcaddr 192.168.20.0/24
      end
    next
  end
end
```

To synchronize only sessions with a particular source address range:

```
config system standalone-cluster
  config cluster-peer
    edit 1
      config session-sync-filter
        set srcaddr 192.168.20.10 192.168.20.20
      end
    next
  end
end
```

To synchronize only sessions with a particular destination address range:

```
config system standalone-cluster
  config cluster-peer
    edit 1
      config session-sync-filter
        set dstaddr6 2001:db8:0:2::/64
      end
    next
  end
end
```

Session pickup

You can enable this setting to synchronize connectionless (UDP and ICMP) sessions, expectation sessions, and NAT sessions. If session pickup is not enabled, the FGSP does not share session tables for the particular session type, and sessions do not resume after a failover.

To enable UDP and ICMP session synchronization:

```
config system ha
  set session-pickup enable
  set session-pickup-connectionless enable
end
```

Session synchronization

You can specify interfaces used to synchronize sessions in L2 instead of L3 using the `session-sync-dev` setting. For more information about using session synchronization, see [Session synchronization interfaces in FGSP on page 2602](#).

To configure session synchronization over redundant L2 connections:

```
config system standalone-cluster
    set session-sync-dev <interface 1> [<interface 2>] ... [<interface n>]
end
```

VDOM synchronization

When multi-VDOM mode is enabled, you can specify the peer VDOM and the synchronized VDOMs. The peer VDOM contains the session synchronization link interface on the peer unit. The synchronized VDOMs' sessions are synchronized using this session synchronization configuration.

To synchronize between VDOMs:

```
config system standalone-cluster
    config cluster-peer
        edit 1
            set peerip <IP address>
            set peervd <vdom>
            set syncvd <vdom 1> [<vdom 2>] ... [<vdom n>]
        next
    end
end
```

Configuring unique group and member ID

FGSP can function between standalone FortiGates or between FGCP clusters. In either case, peers should use different group ID and member ID to uniquely identify each member. This allows each member to actively process traffic without any conflict.

To configure FGSP peering between standalone FortiGates, follow the steps under [To configure a basic FGSP peer setup](#).

To configure FGSP peering between different FGCP clusters:

These instructions assume Peer_1 and Peer_2 are in cluster 1, and Peer_3 and Peer_4 are in cluster 2.

1. On Peer_1, configure the first group ID:

```
config system standalone-cluster
    set standalone-group-id 1
    set group-member-id 1
end
```

2. On Peer_2, configure the same group ID but a different member ID:

```
config system standalone-cluster
    set standalone-group-id 1
    set group-member-id 2
end
```

3. On Peer_3, configure the second group ID:

```
config system standalone-cluster
  set standalone-group-id 2
  set group-member-id 1
end
```

4. On Peer_4, configure the same group ID but a different member ID:

```
config system standalone-cluster
  set standalone-group-id 2
  set group-member-id 2
end
```

Synchronizing sessions between FGCP clusters

Synchronizing sessions between FGCP clusters is useful when data centers in different locations are used for load balancing, and traffic must be shared and flow freely based on demand.

There are some limitations when synchronizing sessions between FGCP clusters:

- All FortiGates must have the same model and generation, hardware configuration, and FortiOS version.
- A total of 16 clusters can share sessions.

To configure session synchronization between two clusters:

1. Configure the two clusters (see [HA active-passive cluster setup on page 2528](#) or [HA active-active cluster setup on page 2530](#)).

2. On cluster A, configure the peer IP for the interface:

```
config system interface
    edit "port5"
        set vdom "root"
        set ip 10.10.10.1 255.255.255.0
        set allowaccess ping https ssh snmp http telnet
    next
end
```

In this example, cluster A uses port5 and its IP address, 10.10.10.1, is reachable from another cluster.

3. On cluster A, configure FGSP, including cluster and session synchronization:

```
config system standalone-cluster
    set standalone-group-id 1
    set group-member-id 0
    set session-sync-dev <interface>
    config cluster-peer
        edit 1
            set peerip 10.10.10.2
        next
    end
end
```

The standalone-group-id must match between FGSP members. The group-member-id is unique for each FGSP cluster. session-sync-dev is an optional command to specify the interfaces to sync sessions.

4. On cluster B, configure the peer IP for the interface:

```
config system interface
    edit "port5"
        set vdom "root"
        set ip 10.10.10.2 255.255.255.0
        set allowaccess ping https ssh snmp http telnet
    next
end
```

In this example, cluster B uses port5 and its IP address, 10.10.10.2, is reachable from another cluster.

5. On cluster B, configure FGSP, including cluster and session synchronization:

```
config system standalone-cluster
    set standalone-group-id 1
    set group-member-id 1
    set session-sync-dev <interface>
    config cluster-peer
        edit 1
            set peerip 10.10.10.1
        next
    end
end
```

Session synchronization interfaces in FGSP

When peering over FGSP, by default, the FortiGate or FGCP clusters share information over L3 between the interfaces that are configured with Peer IP addresses. When a session synchronization interface is configured and FGSP peers are directly connected on this interface, then session synchronization is done over L2, only falling back to L3 if the session synchronization interface becomes unavailable.

When FGSP peers are formed between standalone FortiGates, the session synchronization process is performed by the kernel with UDP encapsulation. When using a FGSP session synchronization interface, the synchronization process is also offloaded to the kernel, albeit more efficiently without the UDP encapsulation. Therefore, a fast, dedicated, and stable L2 connection is recommended for the session synchronization interface between the FGSP peers. For redundancy, multiple synchronization interfaces can be configured. The session synchronization interface or interfaces should always be the same on each FGSP peer.

To configure session-sync interfaces:

```
config system standalone-cluster
    set session-sync-dev <interface 1> [<interface 2>] ... [<interface n>]
    set layer2-connection {available | unavailable}
    set encryption {enable | disable}
end
```

The `layer2-connection` setting is for forwarded traffic between FGSP peers. Set it to `available` if the peer interface user for traffic forwarding is directly connected and supports L2 forwarding. See [UTM inspection on asymmetric traffic in FGSP on page 2605](#) for more information.

Session synchronization in FGCP over FGSP

To provide full redundancy, FGCP clusters can be used in FGSP peering. This is called FGCP over FGSP. In these complex environments, as well as in high performance, low latency data centers, using the FGCP session synchronization interface is recommended, as it offloads the session synchronization process to the kernel.

To offload the session synchronization process to the kernel and synchronize sessions using connected interfaces directly:

```
config system ha
    set session-sync-dev <interface 1> [<interface 2>] ... [<interface n>]
end
```

This is optimal when any of the following conditions apply:

- The session rate is high.
- Low network latency is required.
- There is a complex environment with FGCP clusters synchronizing over FGSP using L3 only in the presence of asymmetric traffic.

Configuring the FGCP `session-sync-dev` effectively offloads the session synchronization from the `session-sync` daemon into the kernel and reduces the session synchronization latency.

The following topology uses multiple session synchronization interfaces with a full mesh backbone to prevent any single point of failure.

The state diagram summarizes the session synchronization of a TCP session. It assumes that the session is connected over FGCP Cluster 1 and processed entirely by the primary unit, Cluster-1A.

1. The session starts with the Client SYN packet.
2. As the session is established, Cluster-1A synchronizes the session with Cluster-1B over the heartbeat interface, and with Cluster-2A over the session synchronization interface.
3. Cluster-2A then synchronizes the session with Cluster-2B over its heartbeat interface.
4. The process then repeats as it transitions to different states.

Session synchronization if links fail

In the previous topology, if any single session synchronization link fails on the primary member of each cluster, session synchronization will continue on the second link from the pair of session synchronization interfaces.

If the second link on the primary member of the same cluster then fails, L2 session synchronization over the session synchronization interface stops, and synchronization fails over to L3 between the peer IP links.

If the Peer IP link then fails, the FGSP peers are effectively disconnected, and no session synchronization will occur.

UTM inspection on asymmetric traffic in FGSP

When traffic passes asymmetrically through FGSP peers, UTM inspection can be supported by always forwarding traffic back to the session owner for processing. The session owner is the FortiGate that receives the first packet of the session.

In this example, traffic from the internal network first hits FGT_1, but the return traffic is routed to FGT_2. Consequently, traffic bounces from FGT_2 port1 to FGT_1 port1 using FGT_1's MAC address. Traffic is then inspected by FGT_1.

This example requires the following settings:

- The internal and outgoing interfaces of both FortiGates in the FGSP pair are in the same subnet.
- Both peers have layer 2 access with each other.

To configure FTG_1:

1. Configure FGSP cluster attributes, including setting the peer IP to the IP address of FGT_2:

```
config system standalone-cluster
    set standalone-group-id 1
    set group-member-id 0
```

```
    set layer2-connection available
    unset session-sync-dev
    config cluster-peer
        edit 1
            set peerip 10.2.2.2
        next
    end
end
```

2. Configure the firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set av-profile "default"
        set logtraffic all
        set nat enable
    next
end
```

To configure FTG_2:

1. Configure FGSP cluster attributes, including setting the peer IP to the IP address of FGT_1:

```
config system standalone-cluster
    set standalone-group-id 1
    set group-member-id 1
    set layer2-connection available
    unset session-sync-dev
    config cluster-peer
        edit 1
            set peerip 10.2.2.1
        next
    end
end
```

2. Configure the firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set av-profile "default"
        set logtraffic all
        set nat enable
```

```

    next
end

```

Results

Capture packets on FGT_2 to see that traffic bounced from FGT_2 to FGT_1 over the traffic interface.

```

FGT_2 # diagnose sniffer packet any 'host 10.1.100.15 and host 172.6.200.55' 4
interfaces=[any]
filters=[host 10.1.100.15 and host 172.16.200.55]
91.803816 port1 in 172.16.200.55.80 -> 10.1.100.15.40008: syn 2572073713 ack 261949279
92.800480 port1 in 172.16.200.55.80 -> 10.1.100.15.40008: syn 2572073713 ack 261949279

92.800818 port1 out 172.16.200.55.80 -> 10.1.100.15.40008: syn 2572073713 ack 261949279

```

UTM inspection on asymmetric traffic on L3

When traffic passes asymmetrically through FGSP peers, UTM inspection can be supported by always forwarding traffic back to the session owner for processing. The session owner is the FortiGate that receives the first packet of the session.

For networks where L2 connectivity is not available, such as cloud environments, traffic bound for the session owner are forwarded through the peer interface using a UDP connection.

In this example, traffic from the internal network first hits FGT_1, but the return traffic is routed to FGT_2. Consequently, return traffic is packed and sent from FGT_2 to FGT_1 using UDP encapsulation between two peer interfaces (port 3). Traffic is then inspected by FGT_1.

To configure FTG_1:

1. Configure FGSP cluster attributes, including setting the peer IP to the IP address of FGT_2:

```

config system standalone-cluster
    set standalone-group-id 1
    set group-member-id 0
    set layer2-connection unavailable
    unset session-sync-dev

```

```
    config cluster-peer
        edit 1
            set peerip 10.2.2.2
        next
    end
end
```

2. Configure the firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set av-profile "default"
        set logtraffic all
        set nat enable
    next
end
```

To configure FTG_2:

1. Configure FGSP cluster attributes, including setting the peer IP to the IP address of FGT_1:

```
config system standalone-cluster
    set standalone-group-id 1
    set group-member-id 1
    set layer2-connection unavailable
    unset session-sync-dev
    config cluster-peer
        edit 1
            set peerip 10.2.2.1
        next
    end
end
```

2. Configure the firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set av-profile "default"
        set logtraffic all
        set nat enable
    next
end
```

Encryption for L3 on asymmetric traffic in FGSP

In scenarios where asymmetric routing between FGSP members occurs, the return traffic can be encrypted and routed back to the session owner on Layer 3 (L3).

To encrypt L3 traffic in FGSP:

1. Run the following on both FortiGates:

```
config system standalone-cluster
    set encryption enable
    set psksecret xxxxxxxxxx
end
```

Optimizing FGSP session synchronization and redundancy

In this example where standalone FortiGates are peered in FGSP, using `session-sync-dev` optimizes session synchronization as it eliminates UDP encapsulation and offloads session synchronization processing to the kernel. FGSP session synchronization can be supported to handle heavy loads.

For more information about session synchronization, see [Session synchronization interfaces in FGSP on page 2602](#).

Topology

In this topology, there are three FGSP peer groups for each FortiGate. Sessions are synchronized between each FortiGate and its peer groups. Redundancy is achieved by using two dedicated session sync device links for each peer setup. There are a total of six peer IPs for each session synchronization device link in each FGSP peer. When one link is fails, session synchronization is not affected.

For optimization, `sync-packet-balance` is enabled to distribute synchronization packets processing to multiple CPUs. The session synchronization process is offloaded to the kernel, and sessions are synchronized over layer 2 over the connected interfaces (`set session-sync-dev "port5" "port6"`). Jumbo frame MTU 9216 is configured on each session synchronization device link to reduce the number of packets; however, setting MTU to 9216 is entirely optional.

To configure FGT_A:**1. Configure HA:**

```
config system ha
    set sync-packet-balance enable
    set session-pickup enable
    set session-pickup-connectionless enable
    set session-pickup-expectation enable
    set session-pickup-nat enable
end
```

2. Configure the layer 2 session synchronization links:

```
config system standalone-cluster
    set session-sync-dev "port5" "port6"
end
```

3. Configure the session TTL default timeout:

```
config system session-ttl
    set default 300
end
```

4. Configure the interfaces:

```
config system interface
    edit port5
        set ip 10.1.1.1/24
        set mtu-override enable
        set mtu 9216
    next
    edit port6
        set ip 10.2.2.1/24
        set mtu-override enable
        set mtu 9216
    next
end
```

5. Configure FGSP session synchronization:

```
config system standalone-cluster
    config cluster-peer
        edit 1
            set peerip 10.1.1.2
        next
        edit 2
            set peerip 10.2.2.2
        next
        edit 3
            set peerip 10.1.1.3
        next
        edit 4
            set peerip 10.2.2.3
        next
        edit 5
            set peerip 10.1.1.4
        next
        edit 6
```

```
        set peerip 10.2.2.4
    next
end
end
```

To configure FGT_B:

1. Configure HA:

```
config system ha
    set sync-packet-balance enable
    set session-pickup enable
    set session-pickup-connectionless enable
    set session-pickup-expectation enable
    set session-pickup-nat enable
end
```

2. Configure the layer 2 session synchronization links:

```
config system standalone-cluster
    set session-sync-dev "port5" "port6"
end
```

3. Configure the session TTL default timeout:

```
config system session-ttl
    set default 300
end
```

4. Configure the interfaces:

```
config system interface
    edit port5
        set ip 10.1.1.2/24
        set mtu-override enable
        set mtu 9216
    next
    edit port6
        set ip 10.2.2.2/24
        set mtu-override enable
        set mtu 9216
    next
end
```

5. Configure FGSP session synchronization:

```
config system standalone-cluster
    config cluster-peer
        edit 1
            set peerip 10.1.1.1
        next
        edit 2
            set peerip 10.2.2.1
        next
        edit 3
            set peerip 10.1.1.3
        next
        edit 4
            set peerip 10.2.2.3
    end
end
```

```
        next
        edit 5
            set peerip 10.1.1.4
        next
        edit 6
            set peerip 10.2.2.4
        next
    end
end
```

To configure FGT_C:

1. Configure HA:

```
config system ha
    set sync-packet-balance enable
    set session-pickup enable
    set session-pickup-connectionless enable
    set session-pickup-expectation enable
    set session-pickup-nat enable
end
```

2. Configure the layer 2 session synchronization links:

```
config system standalone-cluster
    set session-sync-dev "port5" "port6"
end
```

3. Configure the session TTL default timeout:

```
config system session-ttl
    set default 300
end
```

4. Configure the interfaces:

```
config system interface
    edit port5
        set ip 10.1.1.3/24
        set mtu-override enable
    set mtu 9216
    next
    edit port6
        set ip 10.2.2.3/24
        set mtu-override enable
    set mtu 9216
    next
end
```

5. Configure FGSP session synchronization:

```
config system standalone-cluster
    config cluster-peer
        edit 1
            set peerip 10.1.1.1
        next
        edit 2
            set peerip 10.2.2.1
        next
    end
end
```

```
        edit 3
            set peerip 10.1.1.2
        next
        edit 4
            set peerip 10.2.2.2
        next
        edit 5
            set peerip 10.1.1.4
        next
        edit 6
            set peerip 10.2.2.4
        next
    end
end
```

To configure FGT_D:

1. Configure HA:

```
config system ha
    set sync-packet-balance enable
    set session-pickup enable
    set session-pickup-connectionless enable
    set session-pickup-expectation enable
    set session-pickup-nat enable
end
```

2. Configure the layer 2 session synchronization links:

```
config system standalone-cluster
    set session-sync-dev "port5" "port6"
end
```

3. Configure the session TTL default timeout:

```
config system session-ttl
    set default 300
end
```

4. Configure the interfaces:

```
config system interface
    edit port5
        set ip 10.1.1.4/24
        set mtu-override enable
        set mtu 9216
    next
    edit port6
        set ip 10.2.2.4/24
        set mtu-override enable
        set mtu 9216
    next
end
```

5. Configure FGSP session synchronization:

```
config system standalone-cluster
    config cluster-peer
        edit 1
```

```
        set peerip 10.1.1.1
    next
    edit 2
        set peerip 10.2.2.1
    next
    edit 3
        set peerip 10.1.1.2
    next
    edit 4
        set peerip 10.2.2.2
    next
    edit 5
        set peerip 10.1.1.3
    next
    edit 6
        set peerip 10.2.2.3
    next
end
end
```

Firmware upgrades in FGSP

The following steps are recommended to upgrade the firmware of FortiGates in an FGSP deployment. Follow these steps whether or not you have enabled standalone configuration synchronization.

This example FGSP deployment has two FortiGates, FGT-1 and FGT-2.

To upgrade the firmware in an FGSP deployment:

1. Switch all traffic to FGT-1:
 - a. Configure the load balancer or router that distributes traffic between the FortiGates to send all traffic to FGT-1.
2. Disconnect FGT-2 from the network.

Make sure to also disconnect the interfaces that allow heartbeat and synchronization communication with FGT-1. This is to prevent FGT-2 from communicating with FGT-1.
3. Upgrade the firmware on FGT-2.
4. Reconnect the traffic interfaces on FGT-2, but not the interfaces used for heartbeat and synchronization communication with FGT-1.
5. Switch all traffic to the newly upgraded FGT-2:
 - a. Configure the load balancer or router that distributes traffic between the FortiGates to send all traffic to FGT-2.
6. Upgrade the firmware on FGT-1 (while heartbeat and synchronization communication with FGT-2 remains disconnected).
7. Reconnect the FGT-2 interfaces that allow heartbeat and synchronization communication between FGT-1 and FGT-2.
8. Restore the original traffic distribution between FGT-1 and FGT-2:
 - a. Configure the load balancer or router to distribute traffic to both FortiGates in the FGSP deployment.

FGSP session synchronization between different FortiGate models or firmware versions

FGSP HA deployments are generally meant for interoperating between FortiGates with the same model and firmware version. However, situations may arise where individual members or FGCP clusters running over FGSP use different models or firmware versions. For example, to avoid downtime while upgrading the members, some FGSP members or clusters may be upgraded first and then re-join the FGSP peers after a successful upgrade. Or while performing maintenance, sessions may need to be offloaded to a temporary member or FGCP cluster of a different model.

Being able to perform FGSP session synchronization between members of different models or firmware versions is helpful to transition the traffic smoothly and causes minimal disruptions. This topic outlines requirements to be aware of before assessing whether FGSP session synchronization may work between members with different models or firmware versions.

Different FortiGate models

The general guideline is to only use FortiGate models in a similar tier and family. Vastly different models have different performance and capabilities, which may not be compatible. The goal is for two models to have similar capabilities so that data structures used in session synchronization will match, and are capable of delivering similar performance.

When considering FGSP session synchronization between two FortiGates, ensure that:

- The FortiGates use the same 32-bit kernel or 64-bit kernel.
- The FortiGates use the same type of CPU (such as ARM or x86).
- For network interfaces:
 - The same type of physical interface should be used on each member.
 - The physical interfaces should be capable of the same speeds.
- The device memory should be similar in size. If the FortiGates have vastly different memory sizes, their performance may be different if one device supports more sessions than the other.
- The configurations related to session tables should match. For example, the logical names used in firewall policies, IPsec interface names, VDOM names, firewall policy tables, and so on.

Virtual clusters and asymmetric routing are not supported.

Different firmware versions

When operating in FGSP, the firmware needs to have compatible data structures and session synchronization packet headers. The firmware is generally able to handle different data structures between old and new FortiOS sessions. Session synchronization packets are typically the same between versions.

Note the following exceptions and guidelines when assessing FGSP session synchronization compatibility between different firmware versions:

- FortiOS 7.0.2 added support for widening the HA virtual MAC address range. This change updated the session synchronization packet header structure.
 - FortiGates running 7.0.2 or later, and FortiGates running 7.0.1 or earlier will not accept session synchronization packets from each other.

- If the traffic uses a new feature only available in a newer FortiOS version, it may not work when synchronized to an older FortiOS version.
 - For example, PFCP (Packet Forwarding Control Protocol) support was added in 7.0.1, and a PFCP profile name was added to the sessions. When the sessions are synchronized to an older firmware version, the PFCP profile name will be lost and the sessions will not be able to handle the traffic as they would in 7.0.1.
- FortiOS 7.2.1 added `group-id` into the protocol header. This means that FortiGates running 7.2.1 and later cannot perform session synchronization with FortiGates running earlier versions.

Session synchronization interfaces

Session synchronization between FGSP members uses an L3 connection over the peer IP by default.

Session synchronization between FGSP members uses an L2 connection when a session synchronization interface (`session-sync-dev`) is used. The synchronization process is also offloaded to the kernel.

FGSP is also compatible with FortiGate VRRP.

Applying the session synchronization filter only between FGSP peers in an FGCP over FGSP topology

When the session synchronization filter is applied on FGSP, the filter will only affect sessions synchronized between the FGSP peers. When virtual clustering is used, sessions synchronized between each virtual cluster can also be synchronized to FGSP peers. All peers' `syncvd` must be in the same HA virtual cluster.

Example

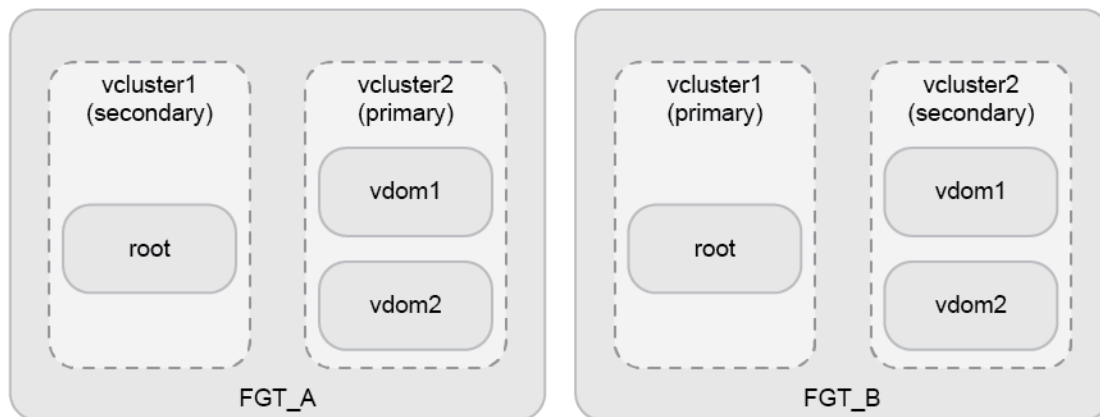

In this example, there is a simplified configuration where there is no router or load balancer performing balancing between the FGSP peers, but it demonstrates the following:

- When sessions pass through FGCP A-P Cluster 1, all sessions are synchronized between the FGT_A and FGT_B regardless of the session synchronization filter.
- Session synchronization between the FGSP peers (FGCP A-P Cluster 1 and 2) only occurs for the service specified in the filter, which is HTTP/80.
- The preceding behavior is applicable when virtual clustering is configured. This example focuses on vdom2, which belongs to vcluster2. FGT_A is the primary for vcluster2.

Each FGSP A-P cluster is connected on ha as the FGCP cluster heartbeat device. The FGSP peers are connected on mgmt over 10.1.1.1-2/24.

Virtual clustering between FGT_A and FGT_B:

Interface	FGT_A	FGT_B	FGT_C	FGT_D
wan1	172.16.200.1/24	172.16.200.1/24	172.16.200.3/24	172.16.200.3/24
port1	10.1.100.1/24	10.1.100.1/24	10.1.100.2/24	10.1.100.2/24
mgmt	10.1.1.1/24	10.1.1.1/24	10.1.1.2/24	10.1.1.2/24
ha	FGCP cluster heartbeat device		FGCP cluster heartbeat device	

To configure the HA clusters:**1. Configure FGCP A-P Cluster 1 (use the same configuration for FGT_A and FGT_B):**

```
config system ha
    set group-id 146
    set group-name "FGT_HA1"
    set mode a-p
    set hbdev "wan2" 100 "ha" 50
    set session-pickup enable
    set session-pickup-nat enable
    set vcluster-status enable
    config vcluster
        edit 1
            set override enable
            set priority 25
            set monitor "wan1" "port1"
            set vdom "root"
        next
        edit 2
            set override disable
            set priority 150
            set monitor "wan1"
            set vdom "vdom2" "vdom1"
        next
    end
end
```

2. Configure FGCP A-P Cluster 2 (use the same configuration for FGT_C and FGT_D):

```
config system ha
    set group-id 200
    set group-name "FGT_HA2"
    set mode a-p
    set hbdev "wan2" 100 "ha" 50
    set session-pickup enable
    set session-pickup-nat enable
    set vcluster-status enable
    config vcluster
        edit 1
            set override enable
            set priority 120
            set monitor "wan1" "port1"
            set vdom "root"
        next
        edit 2
            set override disable
            set priority 150
            set monitor "wan1"
            set vdom "vdom2" "vdom1"
        next
    end
end
```

To configure the FGSP peers:**1. Configure FGT_A:**

```
config system standalone-cluster
    set standalone-group-id 1
    set group-member-id 1
    config cluster-peer
        edit 1
            set peervd "vdom2"
            set peerip 10.1.1.2
            set syncvd "vdom2"
            config session-sync-filter
                config custom-service
                    edit 1
                        set dst-port-range 80-80
                    next
                end
            end
        next
    end
end
```

The configuration is automatically synchronized to FGT_B.

2. Configure FGT_C:

```
config system standalone-cluster
    set standalone-group-id 1
    set group-member-id 2
    config cluster-peer
        edit 1
            set peervd "vdom2"
            set peerip 10.1.1.1
            set syncvd "vdom2"
            config session-sync-filter
                config custom-service
                    edit 1
                        set dst-port-range 80-80
                    next
                end
            end
        next
    end
end
```

The configuration is automatically synchronized to FGT_D.

To verify the configuration:**1. Verify the FGSP peer information on Cluster 1:**

```
FGT_A (global) # diagnose sys ha fgsp-zone
Local standalone-member-id: 1
FGSP peer_num = 1
    peer[1]: standalone-member-id=2, IP=10.1.1.2, vd=vdom2, prio=1
```

2. Verify the FGSP peer information on Cluster 2:

```
FGT_C (global) # diagnose sys ha fgsp-zone
Local standalone-member-id: 1
FGSP peer_num = 1
    peer[1]: standalone-member-id=1, IP=10.1.1.1, vd=vd0m2, prio=1
```

3. Initiate two sessions, HTTP and SSH.

4. Verify that the HTTP session is synchronized from Cluster 1 to Cluster 2.

a. Verify the session list of vdom2 on FGT_A:

```
FGT_A (vdom2) # diagnose sys session list

session info: proto=6 proto_state=01 duration=693 expire=3593 timeout=3600

no_ofld_reason:
total session 1

```

Session synchronization filters are designed to be configured symmetrically on all of the FGSP peers. In cases where the filters are configured asymmetrically, note the following differences:

- In an FGCP over FGSP topology, session filtering will be applied on the FGSP peer that has the filtering configured and is receiving the session synchronization.
- In an FGSP topology between standalone peers, the filtering will be applied on the FGSP peer that has the filtering configured and is sending out the session synchronization.

FGSP static site-to-site IPsec VPN setup

When configuring static site-to-site IPsec VPN between FGSP FortiGates and a remote gateway, the FGSP peers must have the `passive-mode` setting enabled in the `vpn ipsec phase1-interface` configuration to function as an IPsec responder. This is a required configuration in this setup. If the FGSP peers act as initiators for tunnel setup when `passive-mode` is disabled and both FGSP peers initiate the tunnel with the same gateway IP, the remote IPsec gateway will be unable to process this, and the tunnel negotiation will fail. Likewise, when a failover occurs in FGSP and a new peer begins to initiate tunnel traffic, the remote IPsec gateway will be unable to handle the traffic initiated from the new peer.

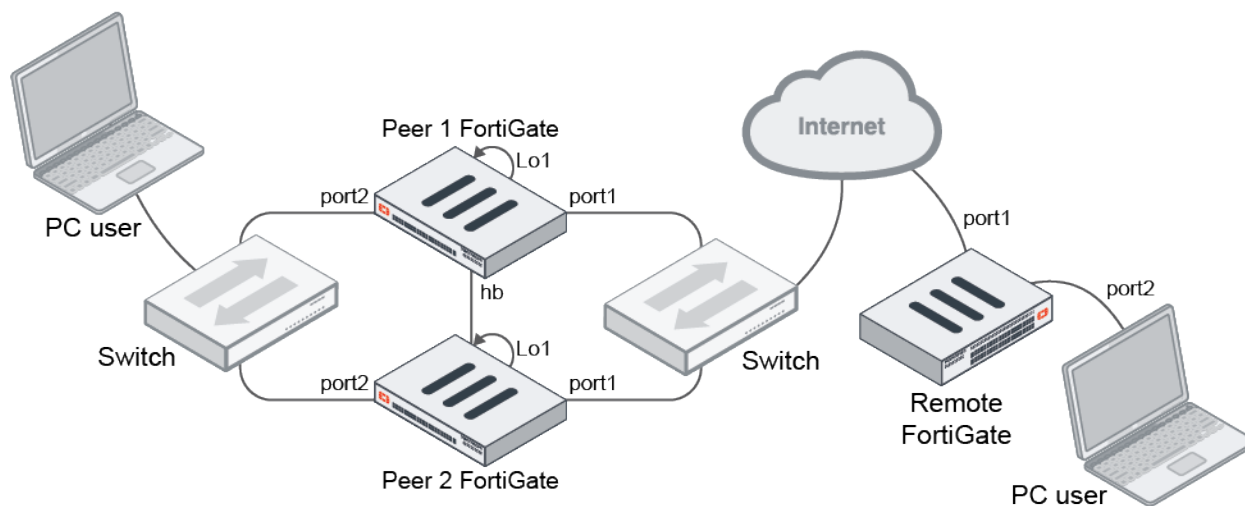

Enabling `passive-mode` ensures the FGSP peers only respond to tunnel initiations from the remote IPsec gateway and do not initiate tunnel negotiations. This way, the preceding situations will not occur.

For dynamic tunnel configuration examples on FGSP peers, see the following topics:

- [FGSP per-tunnel failover for IPsec on page 2624](#)
- [FGCP over FGSP per-tunnel failover for IPsec on page 2630](#)
- [Allow IPsec DPD in FGSP members to support failovers on page 2639](#)

Example

In this example, the FGSP peer has a loopback interface (Lo1) configured with the same IP address (192.168.202.31/32). All other interface IP addresses are different between the peers.

To configure IPsec on the FGSP peer FortiGates:

1. Configure the phase 1 settings:

```
config vpn ipsec phase1-interface
  edit "IPsec"
    set type static
    set set interface "port1"
    set ike-version 2
    set local-gw 192.168.202.31
    set net-device disable
    set proposal aes256-sha256
    set dhgrp 14
```

```
        set passive-mode enable
        set remote-gw 10.10.100.100
    next
end
```

2. Configure the phase 2 settings:

```
config vpn ipsec phase2-interface
    edit "IPsec"
        set phaselname "IPsec"
        set proposal aes256-sha256
        set dhgrp 14
    next
end
```

To configure IPsec on the remote FortiGate:

1. Configure the phase 1 settings:

```
config vpn ipsec phase1-interface
    edit "IPsec"
        set type static
        set set interface "port1"
        set ike-version 2
        set net-device disable
        set proposal aes256-sha256
        set dhgrp 14
        set remote-gw 192.168.202.31
    next
end
```

2. Configure the phase 2 settings:

```
config vpn ipsec phase2-interface
    edit "IPsec"
        set phaselname "IPsec"
        set proposal aes256-sha256
        set dhgrp 14
    next
end
```

FGSP per-tunnel failover for IPsec

During FGSP per-tunnel failover for IPsec, the same IPsec dialup server configured on each FGSP member may establish tunnels with dialup clients as the primary gateway. The IPsec SAs are synchronized to all other FGSP peers that have FGSP synchronization for IPsec enabled. Other FGSP members may establish a tunnel with other clients on the same dialup server and synchronize their SAs to other peers.

Upon the failure of the FGSP member that is the primary gateway for a tunnel, the upstream router will fail over the tunnel traffic to another FGSP member. The other FGSP member will move from standby to the primary gateway for that tunnel and continue to forward traffic.

```
config vpn ipsec phase1-interface
    edit <name>
        set fgsp-sync {enable | disable}
    next
end
```

Example

In this example, the FGSP peers are connected on port4 over 172.31.1.1-4/24. Each peer has a loopback interface, lb1, with the same IP address. This loopback interface is used as the local gateway on each of the phase 1 connections to avoid each FGSP member having different IPs on port2. The DC Router uses ECMP to distribute traffic to each FGSP peer. It is assumed that the networking addresses are already configured properly.

Interface/setting	DC1_VM1	DC1_VM2	DC1_VM3	DC1_VM4
port2	192.168.125.254/24	192.168.126.254/24	192.168.127.254/24	192.168.128.254/24
port3	172.31.125.254/24	172.31.126.254/24	172.31.127.254/24	172.31.128.254/24
port4	172.31.1.1/24	172.31.1.2/24	172.31.1.3/24	172.31.1.4/24
lb1	192.168.202.31/32	192.168.202.31/32	192.168.202.31/32	192.168.202.31/32
fgsp-sync	Enabled	Enabled	Enabled	Disabled

Out of the four FGSP peers, DC1_VM1, DC1_VM2, and DC1_VM3 have `fgsp-sync` enabled in their IPsec phase 1 configurations. This allows the three FGSP members to synchronize IPsec SAs as clients establish dialup tunnels to them individually. DC1_VM4, which does not have `fgsp-sync` configured, will not participate in synchronizing IPsec SAs or establishing tunnels. The DC Router uses ECMP to route traffic to the destination 192.168.202.31 through each of the participating FGSP peers.

In a larger scale there may be many more IPsec dialup clients connecting, with each eligible FGSP peer being the primary gateway for a set of dialup tunnels, and is in standby for the rest of the tunnels. If an FGSP peer fails, traffic will fail over to other peers, and these peers will become primary gateways for the respective dialup tunnels.

To configure the FGSP peers (DC1_VM1):

The following steps are to configure DC1_VM1. The other peers have similar configurations based on the preceding table. In the `config vpn ipsec phase1-interface` settings, all peers should have the same local gateway external interface (192.168.202.31).

1. Configure the FGSP settings:

```
config system standalone-cluster
  set standalone-group-id 1
  set group-member-id 1
  config cluster-peer
    edit 1
      set peerip 172.31.1.2
    next
    edit 2
      set peerip 172.31.1.3
    next
    edit 3
      set peerip 172.31.1.4
    next
  end
end
```

2. Configure the VPN tunnel phase 1 settings:

```
config vpn ipsec phase1-interface
  edit "vpn1"
    set type dynamic
    set interface "port2"
    set ike-version 2
    set local-gw 192.168.202.31
    set keylife 90000
    set peertype one
    set net-device disable
    set proposal aes128-sha1
    set dpd on-idle
    set dhgrp 2
    set fgsp-sync enable
    set nat traversal disable
    set peerid "Nokia_Peer"
    set psksecret xxxxx
    set dpd-retryinterval 60
  next
end
```

3. Configure the VPN tunnel phase 2 settings:

```
config vpn ipsec phase2-interface
  edit "vpn1"
    set phase1name "vpn1"
    set proposal aes128-sha1
    set keylifeseconds 10800
  next
end
```

To verify the configuration:

1. Once the FGSP members establish peering with each other, verify the standalone peers on DC1_VM1:

```
DC1_VM1 # diagnose sys ha standalone-peers
Group=1, ID=1
Detected-peers=3
Kernel standalone-peers: num=3.
peer0: vfid=0, peerip:port = 172.31.1.2:708, standalone_id=2
    session-type: send=0, recv=0
    packet-type: send=0, recv=0
peer1: vfid=0, peerip:port = 172.31.1.3:708, standalone_id=3
    session-type: send=0, recv=0
    packet-type: send=0, recv=0
peer2: vfid=0, peerip:port = 172.31.1.4:708, standalone_id=4
    session-type: send=0, recv=0
    packet-type: send=0, recv=0
Kernel standalone dev_base:
    standalone_id=0:
    standalone_id=1:

    standalone_id=15:

```

2. Initiate a dialup tunnel connection from the IPsec Client 2 FortiGate (192.168.1.2).
3. Verify the tunnel list for vpn1_1 on each peer. The output shows the bi-directional SAs for that particular tunnel are synchronized to all participating FGSP peers.

```

d. DC1_VM4:

```

DC1_VM4 # diagnose vpn tunnel list name vpn1_1
list ipsec tunnel by names in vd 0

```

The IPsec tunnel `role=sync-primary` on DC1_VM1 indicates that the IPsec tunnel was established on the FortiGate and traffic is being forwarded. On DC1_VM2 and DC1_VM3, the IPsec tunnel `role=standby` indicates

that they are synchronized from the FGSP peer and are in standby for traffic forwarding.

The IPsec SAs do not synchronize to DC1_VM4 because `fgsp-sync` is disabled.

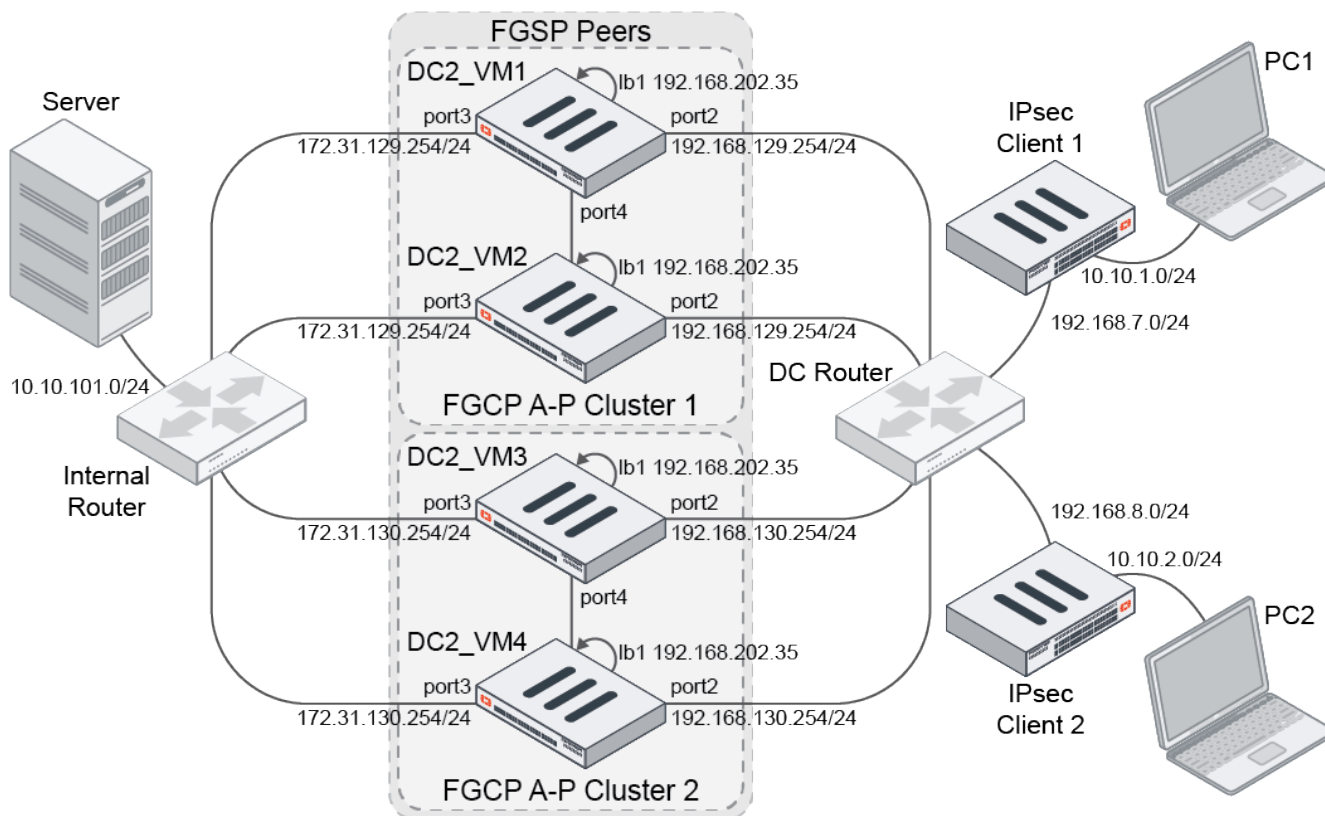

- When a failure occurs on DC1_VM1, the tunnel traffic will fail over to either DC1_VM2 or DC1_VM3. Its tunnel role will become `role=sync-primary`.

FGCP over FGSP per-tunnel failover for IPsec

For additional redundancy, an FGCP cluster on one site may form FGSP peering with FGCP clusters on other sites. The FGCP over FGSP peers can still synchronize IPsec SAs and act as the primary gateway for individual tunnels for the same dialup servers. When failover happens within an FGCP cluster, tunnel traffic will failover to the other FGCP cluster member. When an FGCP cluster fails, tunnel traffic will failover to the other FGSP peer.

Example

In this example, each FGCP A-P cluster is connected on port4 as the heartbeat interface. The FGSP peers are connected on port5 over 172.31.2.1-2/24. Each FGSP peer and FGCP cluster has a loopback interface, lb1, with the same IP address. This loopback interface is used as the local gateway on each of the phase 1 connections to avoid each FGSP member having different IPs on port2. The DC Router uses ECMP to distribute traffic to each FGSP peer. It is assumed that the networking addresses are already configured properly.

Interface/setting	DC2_VM1	DC2_VM2	DC2_VM3	DC2_VM4
port2	192.168.129.254/24	192.168.129.254/24	192.168.130.254/24	192.168.130.254/24
port3	172.31.129.254/24	172.31.129.254/24	172.31.130.254/24	172.31.130.254/24

Interface/setting	DC2_VM1	DC2_VM2	DC2_VM3	DC2_VM4
port4	FGCP HA heartbeat interface	FGCP HA heartbeat interface	FGCP HA heartbeat interface	FGCP HA heartbeat interface
port5	172.31.2.1/24	172.31.2.1/24	172.31.2.2/24	172.31.2.2/24
lb1	192.168.202.35/32	192.168.202.35/32	192.168.202.35/32	192.168.205.35/32
fgsp-sync	Enabled	Enabled	Enabled	Enabled

There are two pairs of FGCP A-P HA clusters that form FGSP peering with each other. This is a typical FGCP over FGSP configuration used in large enterprises and service provider environments where high redundancy is needed. Each cluster uses the same loopback address for the local gateway. The DC Router uses ECMP to route traffic to the destination 192.168.202.31 through each of the participating FGSP peers.

In a larger scale there may be many more members in the FGCP clusters, more FGSP peers, and more IPsec dialup clients connecting. Each eligible FGSP peer will be the primary gateway for a set of dialup tunnels, and is in standby for the rest of the tunnels. When the FGCP cluster is configured in A-P mode, the tunnels will be established on the primary unit and synchronized to the standby unit.

The following configurations and example demonstrates PC1 initiating traffic to the Server. First, a dialup tunnel is formed between FortiGate IPsec Client 1 and DC2_VM1, which allows traffic to go through. IPsec SAs are synchronized to the FGCP standby unit, and to the FGSP peer. Upon failure of DC2_VM1, DC2_VM2 takes over as the primary of the HA cluster, and assumes the primary role for the failover tunnels.

If both DC2_VM1 and DC2_VM2 fail, the tunnels that were formed on this FGSP peer will now be re-routed to the other FGSP peer. The primary FGCP cluster member, DC2_VM3, will now pick up the tunnel traffic and assume the primary role for the failover tunnels.

To configure the HA clusters:

1. Configure FGCP A-P Cluster 1 (use the same configuration for DC2_VM1 and DC2_VM2):

```
config system ha
    set group-id 1
    set group-name "DC2_VM12"
    set mode a-p
    set password *****
    set hbdev "port4" 50
    set session-pickup enable
    set uninterruptible-upgrade disable
    set override disable
    set priority 100
end
```

2. Configure FGCP A-P Cluster 2 (use the same configuration for DC2_VM3 and DC2_VM4):

```
config system ha
    set group-id 2
    set group-name "DC2_VM34"
    set mode a-p
    set password *****
    set hbdev "port4" 50
    set session-pickup enable
    set uninterruptible-upgrade disable
    set override disable
```

```
    set priority 100
end
```

To configure the FGSP peers:

1. Configure DC2_VM1:

```
config system standalone-cluster
    set standalone-group-id 2
    set group-member-id 1
    config cluster-peer
        edit 1
            set peerip 172.31.2.2
        next
    end
end
```

The configuration is automatically synchronized to DC2_VM2.

2. Configure DC2_VM3:

```
config system standalone-cluster
    set standalone-group-id 2
    set group-member-id 2
    config cluster-peer
        edit 1
            set peerip 172.31.2.1
        next
    end
end
```

The configuration is automatically synchronized to DC2_VM4.

3. To configure the IPsec VPN settings (use the same configuration for DC2_VM1 and DC2_VM3).

a. Configure the VPN tunnel phase 1 settings:

```
config vpn ipsec phase1-interface
    edit "vpn1"
        set type dynamic
        set interface "port2"
        set ike-version 2
        set local-gw 192.168.202.35
        set keylife 90000
        set peertype one
        set net-device disable
        set proposal aes128-sha1
        set add-route disable
        set dpd on-idle
        set dhgrp 2
        set fgsp-sync enable
        set nattraversal disable
        set peerid "Nokia_Peer"
        set psksecret *****
        set dpd-retryinterval 60
    next
end
```

b. Configure the VPN tunnel phase 2 settings:

```

config vpn ipsec phase2-interface
    edit "vpn1"
        set phase1name "vpn1"
        set proposal aes128-sha1
        set keylifeseconds 10800
    next
end

```

To verify the configuration:

1. The FGCP HA cluster and the FGSP peering have formed. Verify the respective HA statuses.

a. Verify the FGCP cluster status on DC2_VM1:

```

DC2_VM1 # diagnose sys ha status

HA information
Statistics
    traffic.local = s:0 p:439253 b:89121494

enc_npuid=0

```

The IPsec tunnel `role=sync-primary` on DC2_VM1 indicates that it is being used to carry IPsec traffic. On DC2_VM2, DC2_VM3, and DC2_VM4, the IPsec tunnel `role=standby` indicates that they are in standby for traffic forwarding.

To test failover scenarios:

1. Verify the sniffer trace on DC2_VM1 before FGCP HA failover:

```

DC2_VM1 # diagnose sniffer packet any icmp 4
Using Original Sniffing Mode
interfaces=[any]
filters=[icmp]
0.171753 vpn1 in 10.10.1.2 -> 10.10.101.2: icmp: echo request
0.171763 port3 out 10.10.1.2 -> 10.10.101.2: icmp: echo request
0.171941 port3 in 10.10.101.2 -> 10.10.1.2: icmp: echo reply
0.171947 vpn1 out 10.10.101.2 -> 10.10.1.2: icmp: echo reply

```

Traffic passes through DC2_VM1.

2. Reboot the primary FortiGate, DC2_VM1.

3. Verify the sniffer trace on DC2_VM2 after FGCP HA failover:

```

DC2_VM2 # diagnose sniffer packet any icmp 4
Using Original Sniffing Mode
interfaces=[any]
filters=[icmp]
0.111107 vpn1 in 10.10.1.2 -> 10.10.101.2: icmp: echo request
0.111118 port3 out 10.10.1.2 -> 10.10.101.2: icmp: echo request

```

```
0.111293 port3 in 10.10.101.2 -> 10.10.1.2: icmp: echo reply
0.111298 vpn1 out 10.10.101.2 -> 10.10.1.2: icmp: echo reply
^C
16 packets received by filter
0 packets dropped by kernel
```

Traffic passes through DC2_VM2.

4. Verify the tunnel list for vpn1_1 on DC2_VM2:

```
DC2_VM2 # diagnose vpn tunnel list
list all ipsec tunnel in vd 0
-----
name=vpn1_1 ver=2 serial=4 192.168.202.35:0->192.168.7.2:0 tun_id=192.168.7.2 tun_
id6=:10.0.0.4 dst_mtu=1500 dpd-link=on weight=1
bound_if=6 lgwy=static/1 tun=intf/0 mode=dial_inst/3 encap=none/8840 options[2288]=npu
rgwy-chg frag-rfc run_state=0 role=sync-primary accept_traffic=1 overlay_id=0

parent=vpn1 index=1
proxyid_num=1 child_num=0 refcnt=5 ilast=0 olast=0 ad=/0
stat: rxp=58 txp=31 rxb=4872 txb=2604
dpd: mode=on-idle on=1 idle=60000ms retry=3 count=0 seqno=169
natt: mode=none draft=0 interval=0 remote_port=0
fec: egress=0 ingress=0
proxyid=vpn1 proto=0 sa=1 ref=3 serial=3
  src: 0:0.0.0.0-255.255.255.255:0
  dst: 0:10.10.1.0-10.10.1.255:0
  SA: ref=3 options=602 type=00 soft=0 mtu=1438 expire=10730/0B replaywin=2048
    seqno=20 esn=0 replaywin_lastseq=0000003b qat=0 rekey=0 hash_search_len=1
  life: type=01 bytes=0/0 timeout=10790/10800
  dec: spi=37f426c1 esp=aes key=16 ef61b49078b6ab3e00a4d3a048d779f5
    ah=sha1 key=20 ee2e8de9c522d89b6481c37faa73a7bb54163645
  enc: spi=10aa4d58 esp=aes key=16 4cb95f12657ca8e269b9f8a25f9b19c1
    ah=sha1 key=20 326744c4e5b4a0758397725464593d94ba9390dc
  dec:pkts/bytes=116/9744, enc:pkts/bytes=62/7316
  npu_flag=00 npu_rgwy=192.168.7.2 npu_lgwy=192.168.202.35 npu_selid=1e dec_npuid=0 enc_
npuid=0
```

The role has changed to role=sync-primary.

5. Shut down DC2_VM1 and the DC2_VM2 IPsec uplink interface.

6. Verify the sniffer trace on DC2_VM3. As expected, traffic now passes through DC2_VM3:

```
DC2_VM3 # diagnose sniffer packet any icmp 4
Using Original Sniffing Mode
interfaces=[any]
filters=[icmp]
0.165088 vpn1 in 10.10.1.2 -> 10.10.101.2: icmp: echo request
0.165102 port3 out 10.10.1.2 -> 10.10.101.2: icmp: echo request
0.165294 port3 in 10.10.101.2 -> 10.10.1.2: icmp: echo reply
0.165301 vpn1 out 10.10.101.2 -> 10.10.1.2: icmp: echo reply
^C
14 packets received by filter
0 packets dropped by kernel
```

7. Verify the tunnel list for vpn1_1 on DC2_VM3:

```
DC2_VM3 # diagnose vpn tunnel list
list all ipsec tunnel in vd 0
```

```

-----
name=vpn1_1 ver=2 serial=4 192.168.202.35:0->192.168.7.2:0 tun_id=192.168.7.2 tun_

The role has changed to role=sync-primary.

Allow IPsec DPD in FGSP members to support failovers

In conjunction with support for [FGSP per-tunnel failover for IPsec on page 2624](#), configuring DPD (dead peer detection) on an FGSP member is permitted. This allows a failed FGSP member to send out DPD probes during failover to detect unreachable remote peers and to flush the corresponding tunnels.

Example

In this example, using the same configuration as in [FGSP per-tunnel failover for IPsec on page 2624](#), a tunnel can be established from one of the remote IPsec clients to one of the FGSP members (DC1_VM1). DPD can be set to `on-idle`, with a configured `dpd-retryinterval` of 60 seconds. When a client disappears, whether it is due to remote client failures or server-side routing failures, the FGSP member or gateway (DC1_VM1) will send out DPD probes for detection. Once the three iterations are complete and no responses are detected, the FGSP member will flush the tunnel and remove any routing to that peer.

Interface/setting	DC1_VM1	DC1_VM2	DC1_VM3	DC1_VM4
port2	192.168.125.254/24	192.168.126.254/24	192.168.127.254/24	192.168.128.254/24
port3	172.31.125.254/24	172.31.126.254/24	172.31.127.254/24	172.31.128.254/24
port4	172.31.1.1/24	172.31.1.2/24	172.31.1.3/24	172.31.1.4/24
lb1	192.168.202.31/32	192.168.202.31/32	192.168.202.31/32	192.168.202.31/32
fgsp-sync	Enabled	Enabled	Enabled	Disabled

To configure the FGSP peers (DC1_VM1):

The following steps are to configure DC1_VM1. The other peers have similar configurations based on the preceding table. In the `config vpn ipsec phase1-interface` settings, all peers should have the same local gateway external interface (192.168.202.31). For DC1_VM4, `fgsp-sync` is disabled in the VPN tunnel phase 1 settings.

1. Configure the FGSP settings:

```
config system standalone-cluster
  set standalone-group-id 1
  set group-member-id 1
  config cluster-peer
    edit 1
      set peerip 172.31.1.2
    next
```

```
        edit 2
            set peerip 172.31.1.3
        next
        edit 3
            set peerip 172.31.1.4
        next
    end
end
```

2. Configure the VPN tunnel phase 1 settings:

```
config vpn ipsec phase1-interface
    edit "vpn1"
        set type dynamic
        set interface "port2"
        set ike-version 2
        set local-gw 192.168.202.31
        set keylife 90000
        set peertype one
        set net-device disable
        set proposal aes128-sha1
        set dpd on-idle
        set dhgrp 2
        set fgsp-sync enable
        set nattraversal disable
        set peerid "Nokia_Peer"
        set psksecret xxxxx
        set dpd-retryinterval 60
    next
end
```

3. Configure the VPN tunnel phase 2 settings:

```
config vpn ipsec phase2-interface
    edit "vpn1"
        set phasename "vpn1"
        set proposal aes128-sha1
        set keylifeseconds 10800
    next
end
```

To verify the configuration:

1. Once the FGSP members establish peering with each other, verify the standalone peers on DC1_VM1:

```
DC1_VM1 # diagnose sys ha standalone-peers
Group=1, ID=1
Detected-peers=3
Kernel standalone-peers: num=3.
peer0: vfid=0, peerip:port = 172.31.1.2:708, standalone_id=2
    session-type: send=0, rcv=0
    packet-type: send=0, rcv=0
peer1: vfid=0, peerip:port = 172.31.1.3:708, standalone_id=3
    session-type: send=0, rcv=0
    packet-type: send=0, rcv=0
peer2: vfid=0, peerip:port = 172.31.1.4:708, standalone_id=4
    session-type: send=0, rcv=0
    packet-type: send=0, rcv=0
```

```

Kernel standalone dev_base:
  standalone_id=0:
  standalone_id=1:
    phyindex=0: mac=00:0c:29:22:00:6b, linkfail=1
    phyindex=1: mac=00:0c:29:22:00:75, linkfail=1

Standalone configuration synchronization

You can configure synchronization from one standalone FortiGate to another standalone FortiGate (`standalone-config-sync`). With the exception of some configurations that do not sync (settings that identify the FortiGate to the network), the rest of the configurations are synced, such as firewall policies, firewall addresses, and UTM profiles.

This option is useful in situations when you need to set up FGSP peers, or when you want to quickly deploy several FortiGates with the same configurations. You can set up `standalone-config-sync` for multiple members.

`standalone-config-sync` is an independent feature and should be used with caution as there are some limitations. We recommend disabling it once the configurations have been synced over.

Limitations

When standalone configuration synchronization is enabled, there are some limitations, including but not limited to the following:

- Network interruptions occur during firmware upgrades: when upgrading the firmware, all members in the `standalone-config-sync` group are upgraded simultaneously. This creates downtime if the FortiGates are the only outgoing gateway in the network. We recommend disabling the option before upgrading firmware.
- Some unwanted configurations might be synced: the current design and implementation of `standalone-config-sync` is based on requirements from specific customers. Thus, some users may find that unwanted parts of the configurations are synced. Should this occur, we recommend disabling the option and modifying those configurations manually.
- The wrong primary device might be selected accidentally: `standalone-config-sync` is derived from the HA primary unit selection mechanism. All members in the group will join the selection process in the same way as a the HA cluster selection process. It is important to select the correct device as the primary, otherwise the wrong device could be selected and existing configurations could be overwritten.

Setting up standalone configuration synchronization

Two or more standalone FortiGates should be connected to each other with one or more heartbeat interfaces, either back-to-back or via a switch. In the following example, the device supplying the configurations is called "conf-prim," and

the devices receiving the configurations are called "conf-secos."

To set up standalone configuration synchronization:

1. Configure the conf-prim device for the group:

```

config system ha
    set hbdev ha1 50 ha2 100
    set priority 255
    set override enable
    set standalone-config-sync enable
end
  
```

2. Configure the conf-prim device as needed to be functional.

3. Configure the other group members as conf-secos:

```

config system ha
    set standalone-config-sync enable
end
  
```

4. Wait 10–15 minutes for the configurations to sync over.

5. Verify the synchronization status:

```

# get system ha status
path=system, objname=ha, tablename=(null), size=5912
HA Health Status:
    WARNING: FG201E4Q17900771 has hbdev down;
    WARNING: FG201ETK19900991 has hbdev down;

```

If all members are `in-sync`, this means all members share the same configurations, except those that should not be synced. If any members are `out-of-sync`, this means the member failed to sync with the primary device.

Debugging is similar when a cluster is out of sync.

The following topic provides more information about standalone configuration synchronization:

- [Layer 3 unicast standalone configuration synchronization on page 2647](#)

Layer 3 unicast standalone configuration synchronization

Unicast standalone configuration synchronization is supported on layer 3, allowing peers to be synchronized in cloud environments that do not support layer 2 networking. Configuring a unicast gateway allows peers to be in different subnets.

Example

In this example, two FortiGates in different subnets are connected through a unicast gateway. Both cluster members use the same port for the heartbeat interface.

To configure unicast synchronization between peers:

1. Configure FortiGate A:

```

config system ha
    set group-name "testcs"
    set hbdev "port3" 50
    set standalone-config-sync enable
    config unicast-peers
        edit 1
            set peer-ip 10.1.100.72
        next
    end
    set override enable
    set priority 200
    set unicast-status enable

```

```

    set unicast-gateway 172.16.200.74
end

```

2. Configure FortiGate B:

```

config system ha
    set group-name "testcs"
    set hbdev "port3" 50
    set standalone-config-sync enable
    config unicast-peers
        edit 1
            set peer-ip 172.16.200.71
        next
    end
    set override enable
    set priority 100
    set unicast-status enable
    set unicast-gateway 10.1.100.74
end

```

3. Check the HA status on FortiGate A:

```

# get system ha status
HA Health Status: OK
Model: FortiGate-VM64
Mode: ConfigSync
Group Name: testcs
Group ID: 0
Debug: 0
Cluster Uptime: 2 days 3:40:25
Cluster state change time: 2021-03-08 12:00:38
Primary selected using:
    <2021/03/08 12:00:38> FGVMSLTM00000001 is selected as the primary because its
override priority is larger than peer member FGVMSLTM00000002.
    <2021/03/06 11:50:35> FGVMSLTM00000001 is selected as the primary because it's the
only member in the cluster.
ses_pickup: disable
override: enable

    FGVMSLTM21000152(updated 5 seconds ago):
        port3: physical/1000auto, up, rx-
bytes/packets/dropped/errors=48805199/85441/0/0, tx=33470286/81425/0/0
Primary      : FGT-71          , FGVMSLTM00000001, HA cluster index = 1
Secondary    : FGT-72          , FGVMSLTM00000002, HA cluster index = 0
number of vcluster: 1
vcluster 1: work 0.0.0.0

```

```
Primary: FGVMSLTM00000001, HA operating index = 0
Secondary: FGVMSLTM00000002, HA operating index = 1
```

4. Check the HA checksums on FortiGate A:

```
# diagnose sys ha checksum cluster

===== FGVMSLTM00000001 =====

is_manage_primary()=1, is_root_primary()=1
debugzone
global: 4f 2c a2 04 07 57 46 c4 47 28 ca d2 5a c5 98 ee

```

5. Verify that configuration changes on the primary FortiGate are synchronized to the secondary FortiGate:

a. Adjust the administrator timeout value on FortiGate A:

```
config system global
    set admintimeout 100
end
```

b. Check the debug messages on FortiGate B:

```
# diagnose debug cli 7
Debug messages will be on for 30 minutes.

# diagnose debug enable

create pid=15639, clictyno=0, last=1615246288
0: conf sys global
0: set admintimeout 100
0: end
```

VRRP

A Virtual Router Redundancy Protocol (VRRP) configuration can be used as a high availability solution to ensure that a network maintains connectivity with the internet (or with other networks) even if the default router for the network fails. If

a router or a FortiGate fails, all traffic to this device transparently fails over to another router or FortiGate that takes over the role of the failed device. If the failed device is restored, it will take over processing the network traffic.

FortiOS supports VRRP versions 2 and 3. VRRP domains can be created, which can include multiple FortiGates and other VRRP-compatible routers. Different FortiGate models can be added to the same VRRP domain.

FortiOS supports IPv4 and IPv6 VRRP, so IPv4 and IPv6 VRRP virtual routers can be added to the same interface. FortiGates can quickly and easily integrate into a network that has already deployed VRRP.

Basic VRRP configuration

The most common VRRP application is to provide redundant default routers between an internal network and the internet. The default routers can be FortiGates or any routers that support VRRP.

Two or more FortiGate interfaces or routers must be configured with the same virtual router ID and IP address so they can automatically join the same VRRP domain. Priorities must be assigned to each FortiGate interface or router in the VRRP domain. All of the routers in the VRRP domain should have different priorities. One FortiGate interface or router must have the highest priority to become the primary router. The other FortiGates or routers in the domain are assigned lower priorities and become backups. If the primary router fails, VRRP automatically fails over to the router in the domain with the next highest priority.

To configure VRRP:

1. Add a virtual VRRP router to the internal interface of each FortiGate and/or router. This adds the FortiGates and routers to the same VRRP domain.
2. Set the VRRP IP address of the domain to the internal network default gateway IP address.
3. Set the priorities.

See [Adding IPv4 and IPv6 virtual routers to an interface on page 2651](#) [Single-domain VRRP example on page 2658](#), and [Multi-domain VRRP example on page 2658](#) for configuration examples.

During normal operations, all traffic from the internal network to the internet passes through the primary VRRP router. The primary router also sends VRRP advertisement messages to the backup routers. A backup router will not attempt to become a primary router while receiving these messages. If the primary router fails, the backup router with the highest priority becomes the new primary router after a short delay. All packets sent to the default route are now sent to the new primary router. If the new primary router is a FortiGate, the network continues to benefit from FortiOS security features. If the new primary router is just a router, traffic continues to flow, but FortiOS security features are unavailable until the FortiGate is back online.

If the backup router is a FortiGate, during a VRRP failover as the FortiGate begins operating as the new primary router, it will not have session information for all of the failed over in-progress sessions. So, it would normally not be able to forward in-progress session traffic.

Adding IPv4 and IPv6 virtual routers to an interface

This topic describes how to add IPv4 and IPv6 virtual routers to an interface. VRRP can only be configured on physical or VLAN interfaces. VRRP cannot be configured on hardware switch interfaces where multiple physical interfaces are combined into a hardware switch interface.

IPv4 virtual router

In this example, an IPv4 VRRP router is added to port10 on the FortiGate. The VRRP virtual router has a virtual router ID of 200, uses IP address 10.31.101.200, and has a priority of 255. Since this is the highest priority in the configuration, this interface is configured to be the primary router of the VRRP domain.

To configure the interface settings:

```
config system interface
    edit port10
        config vrrp
            edit 200
                set vrip 10.31.101.200
                set priority 255
            next
        end
    next
end
```

IPv6 virtual router

In this example, an IPv6 VRRP router is added to port20 on the FortiGate. The VRRP virtual router has a virtual router ID of 220, uses IP address 2001:db8:1::12, and has a priority of 255. Since this is the highest priority in the configuration, this interface is configured to be the primary router of the VRRP domain.

To configure the interface settings:

```
config system interface
    edit port20
        config ipv6
            set vrip6_link_local <IPv6_address>
        config vrrp6
            edit 220
                set vrip 2001:db8:1::12
                set priority 255
            next
        end
    end
next
end
```

VRRP failover

VRRP routers in a VRRP domain periodically send VRRP advertisement messages to all routers in the domain to maintain one router as the primary router and the others as backup routers. The primary router has the highest priority. If

the backup routers stop receiving these packets from the primary router, the backup router with the highest priority becomes the new primary router.

The primary router stops sending VRRP advertisement messages if it fails or becomes disconnected. Up to two VRRP destination addresses can be configured to be monitored by the primary router. As a best practice, the destination addresses should be remote addresses. If the primary router is unable to connect to these destination addresses, it stops sending VRRP advertisement messages, and the backup router with the highest priority becomes the primary router.

To configure IPv4 VRRP with two destination addresses for monitoring:

```
config system interface
    edit port14
        config vrrp
            edit 12
                set vrdst 10.10.10.20 10.20.20.10
            next
        end
    next
end
```

To configure IPv6 VRRP with one destination address for monitoring:

```
config system interface
    edit port23
        config ipv6
            config vrrp6
                edit 223
                    set vrdst 2001:db8:1::12
                next
            end
        end
    next
end
```

IPv4 VRRP active failover

The `vrdst-priority` option can be used to reduce IPv4 VRRP failover times. This option causes the primary router to actively signal to the backup routers when the primary router cannot reach its configured destination addresses. The primary router sends a lower priority for itself in the VRRP advertisement messages. The backup router with the highest priority becomes the new primary router and takes over traffic processing.

In this example, the primary router is configured to have a priority of 255, so it should always become the primary router. The `vrdst-priority` is set to 10. If the primary router cannot connect to the 10.10.10.1 destination address, then the primary router informs the VRRP group that its priority is now 10.

To set the priority of the virtual router when the destination address is unreachable:

```
config system interface
    edit port10
        config vrrp
            edit 12
                set vrip 10.31.101.200
                set priority 255
            end
        end
    end
```

```
        set vrdst 10.10.10.1
        set vrdst-priority 10
    next
end
next
end
```

IPv4 VIP and IP pool failover

The `proxy-arp` option can be used to map VIPs and IP pool address ranges to each router's VMAC (virtual MAC). After failover, the IP or ranges configured in the VRRP settings are routed to the new primary router's VMAC. In this example, a single IP and an address range are added for proxy ARP.

To configure the IP addresses for proxy ARP:

```
config system interface
    edit port5
        set vrrp-virtual-mac enable
        config vrrp
            edit 1
                config proxy-arp
                    edit 1
                        set ip 192.168.62.100-192.168.62.200
                    next
                    edit 2
                        set ip 192.168.62.225
                    next
                end
            next
        end
    next
end
next
end
```

Changing the advertisement message interval

By default, VRRP advertisement messages are sent once every second. The frequency can be changed with the `adv-interval` option to change the frequency of sending these messages (1 - 255 seconds).

The `adv-interval` also affects the period of time that a backup VRRP router waits before assuming the primary router has failed. The waiting period is three times the `adv-interval`. For example, if the `adv-interval` is set to 5, then the backup router waits for up to 15 seconds to receive a VRRP advertisement from the current primary router before taking over the role as the primary router.

To configure IPv4 VRRP to send advertisement messages every 10 seconds:

```
config system interface
    edit port14
        config vrrp
            edit 12
                set adv-interval 10
            next
        end
    next
end
```

To configure IPv6 VRRP to send advertisement messages every 20 seconds:

```
config system interface
  edit port23
    config ipv6
      config vrrp6
        edit 223
          set adv-interval 20
        next
      end
    next
  end
```

Changing the VRRP startup time

The VRRP startup time is the time a backup or primary VRRP router waits before sending or receiving VRRP advertisements before potentially changing state (`start-time` in seconds, 1 - 255, default = 3). This timer is mainly visible when VRRP-monitored interfaces become up after previously been down. When this occurs, the device will wait for the time period before considering, and potentially changing its status.

There are some instances when the advertisement messages might be delayed. For example, some switches with spanning tree enabled may delay some of the advertisement message packets. If backup routers are attempting to become primary routers even though the primary router has not failed, extend the start time to ensure that the backup routers wait long enough for the advertisement messages.

To configure the IPv4 VRRP startup time to 10 seconds:

```
config system interface
  edit port14
    config vrrp
      edit 12
        set start-time 10
      next
    end
  next
end
```

To configure the IPv6 VRRP startup time to 15 seconds:

```
config system interface
  edit port23
    config ipv6
      config vrrp6
        edit 223
          set start-time 15
        next
      end
    next
  end
```

VRRP groups

If VRRP routers are added to multiple interfaces of the same FortiGate, each router will be in a different VRRP domain. If one of the VRRP routers fails, it is useful if all of the VRRP routers added to the FortiGate also fail.

VRRP can only check the routers' status in a single VRRP domain and cannot track the status of routers in other domains. For multiple VRRP domains on a single FortiGate, only one can switch to being a backup, and the others remain operating normally. Using VRRP groups resolves this issue.

All the VRRP virtual routers on the FortiGate can be added to a VRRP group. If one of the virtual routers in a VRRP group switches to the backup, the VRRP group forces all members to switch to backups. All VRRP traffic being processed by the FortiGate fails over to other devices in the network.

The status of the virtual routers in a VRRP group only changes when one or more of the virtual routers in the group changes status. A VRRP group should not be used to manually change the status of the virtual routers in the group.

To configure two IPv4 VRRP routers in a VRRP group:

```
config system interface
  edit port10
    config vrrp
      edit 200
        set vrip 10.31.101.200
        set priority 255
        set vrgrp 10
      next
    end
  next
  edit port20
    config vrrp
      edit 100
        set vrip 10.23.1.223
        set priority 20
        set vrgrp 10
      next
    end
  next
end
```

To configure two IPv6 VRRP routers in a VRRP group:

```
config system interface
  edit port11
    config ipv6
      set vrip6_link_local <IPv6_address>
    config vrrp6
      edit 220
        set vrip 2001:db8:1::12
        set priority 255
        set vrgrp 90
      next
    end
  end
```

```

        end
    next
    edit port12
        config ipv6
            set vrip6_link_local <IPv6_address>
        config vrrp6
            edit 220
                set vrip 2001:db8:1::14
                set priority 100
                set vrgrp 90
            next
        end
    end
next
end

```

VRRP virtual MACs

The VRRP virtual MAC address (or virtual router MAC address) is a shared MAC address adopted by the primary router. If the primary router fails, the same virtual MAC address is picked up by the new primary router, allowing all devices on the network to transparently connect to the default route using the same virtual MAC address. This feature must be enabled on all members in a VRRP domain.

Each VRRP router has its own virtual MAC address. The last part octet is based on the VRRP router ID using the following format:

00-00-5E-00-01-<VRID_hex>

Where <VRID_hex> is the VRRP router ID in hexadecimal format in internet standard bit-order. For more information about virtual MAC formatting, see [RFC 3768](#).

For example:

- If the VRRP router ID is 10, then the virtual MAC is 00-00-5E-00-01-0a.
- If the VRRP router ID is 200, then the virtual MAC is 00-00-5E-00-01-c8.

If the VRRP virtual MAC address feature is disabled (the default setting), the VRRP domain uses the MAC address of the primary router. On a FortiGate VRRP virtual router, this is the MAC address of the FortiGate interface that the VRRP router is added to. If the primary fails, when the new primary takes over, it sends gratuitous ARPs to associate the VRRP router IP address with the MAC address of the new primary (or the FortiGate interface that became the new primary).

When a VRRP virtual MAC address is enabled, the new primary uses the same MAC address as the old primary.

Since devices on the LAN do not have to learn a new MAC address for a new VRRP router in the event of a failover, this feature can improve network efficiency, especially in large and complex networks.

To enable virtual MAC addresses in IPv4 VRRP:

```

config system interface
    edit <name>
        set vrrp-virtual-mac enable
    next
end

```

To enable virtual MAC addresses in IPv6 VRRP:

```

config system interface
    edit <name>
        config ipv6
            set vrrp-virtual-mac6 enable
        end
    next
end

```

Preempt mode

When preempt mode is enabled (the default setting), a higher priority backup router can preempt a lower priority primary router. This can happen if the primary router fails, the backup router becomes the primary router, and the failed primary router restarts. Since the restarted router has a higher priority, if preempt mode is enabled, the restarted router replaces the current primary router becoming the new primary router. If preempt mode is disabled, a restarted router that has a higher priority would not take over as the primary router.

Based on [RFC 3768 Section 5.3.4](#), "The priority value for the VRRP router that owns the IP address(es) associated with the virtual router MUST be 255 (decimal). VRRP routers backing up a virtual router MUST use priority values between 1-254 (decimal)."

Therefore, in cases where preempt mode is disabled, but the priority is set to 255, the restarted unit will take over as the primary router.

To configure preempt mode in IPv4 VRRP:

```

config system interface
    edit <name>
        config vrrp
            edit <vrid>
                set preempt {enable | disable}
            next
        end
    next
end

```

To configure preempt mode in IPv6 VRRP:

```

config system interface
    edit <name>
        config ipv6
            config vrrp6
                edit <vrid>
                    set preempt {enable | disable}
                next
            end
        end
    next
end

```

Single-domain VRRP example

This example consists of a VRRP domain with two FortiGates that connect an internal network to the internet. The FortiGate port2 interfaces connect to the internal network, and a VRRP virtual router is added to each port2 interface with VRRP virtual MAC addresses enabled. The internal network default route is 10.31.101.120. Each FortiGate port2 interface has an IP address that is different from the virtual router IP address. Since `vrrp-virtual-mac` is enabled, upon failover, the new primary VRRP router will use the same VMAC as the previous router.

To configure the primary FortiGate:

```
config system interface
  edit port2
    set vrrp-virtual-mac enable
    config vrrp
      edit 5
        set vrip 10.31.101.120
        set priority 255
      next
    end
  next
end
```

To configure the backup FortiGate:

```
config system interface
  edit port2
    set vrrp-virtual-mac enable
    config vrrp
      edit 5
        set vrip 10.31.101.120
        set priority 50
      next
    end
  next
end
```

Multi-domain VRRP example

This example consists of two VRRP domains, and both FortiGates participate in the domains that connect an internal network to the internet. One FortiGate is the primary router of one domain and the other FortiGate is the primary router of the other domain. The network distributes traffic between two different default routes (10.31.101.120 and 10.31.101.130). One VRRP domain is configured with one of the default route IP addresses and the other VRRP domain gets the other default route IP address. During normal operation, both FortiGates process traffic, and the VRRP domains are used to load balance the traffic between the two FortiGates.

If one of the FortiGates fails, the remaining FortiGate becomes the primary router of both VRRP domains. The network sends all traffic for both default routes to this FortiGate. The result is a configuration that (under normal operational load) balances traffic between two FortiGates, but if one of the FortiGates fails, all traffic fails over to the FortiGate that is still operating.

VRRP virtual MAC address are enabled on both FortiGates' port2 interfaces so that the VRRP domains use their VRRP virtual MAC addresses.

Device	VRRP primary			VRRP backup		
	Virtual router IP	ID	Priority	Virtual router IP	ID	Priority
FortiGate A	10.31.101.120	50	255	10.31.101.130	100	50
FortiGate B	10.31.101.130	100	255	10.31.101.120	50	50

To configure FortiGate A:

```

config system interface
  edit port2
    set vrrp-virtual-mac enable
    config vrrp
      edit 50
        set vrip 10.31.101.120
        set priority 255
      next
      edit 100
        set vrip 10.31.101.130
        set priority 50
      next
    end
  next
end

```

To configure FortiGate B:

```

config system interface
  edit port2
    set vrrp-virtual-mac enable
    config vrrp
      edit 50
        set vrip 10.31.101.120
        set priority 50
      next
      edit 100
        set vrip 10.31.101.130
        set priority 255
      next
    end
  next
end

```

```

end
next
end

```

VRRP on EMAC-VLAN interfaces

Virtual Router Redundancy Protocol (VRRP) can be configured on EMAC-VLAN interfaces.

To configure the interfaces:

1. Configure FortiGate A:

```

config system interface
  edit "emac"
    set vdom "root"
    set ip 172.16.209.1 255.255.255.0
    set allowaccess ping https ssh snmp http telnet fgfm
    set type emac-vlan
    set vrrp-virtual-mac enable
    config vrrp
      edit 1
        set vrip 172.16.209.111
        set priority 200
      next
    end
    set snmp-index 61
    set interface "port1"
  next
end

```

2. Configure FortiGate B:

```

config system interface
  edit "emac"
    set vdom "root"
    set ip 172.16.209.2 255.255.255.0
    set allowaccess ping https ssh snmp http telnet fgfm
    set type emac-vlan
    set vrrp-virtual-mac enable
    config vrrp
      edit 1
        set vrip 172.16.209.111
        set priority 222
      next
    end
    set snmp-index 32
    set interface "port1"
  next
end

```

```
next
end
```

Check the VRRP information on the FortiGates:

Because FortiGate B has a higher priority, it is the primary device and FortiGate A is the backup.

1. FortiGate A:

```
# get router info vrrp
Interface: emac, primary IP address: 172.16.209.1
UseVMAC: 1, SoftSW: 0, EmacVlan: 1 BrPortIdx: 0, PromiscCount: 0
HA mode: primary (0:0:1) VRRP master number: 0
VRID: 1 version: 2
  vrip: 172.16.209.111, priority: 200 (200,0), state: BACKUP
  adv_interval: 1, preempt: 1, ignore_dft: 0 start_time: 3
  master_adv_interval: 100, accept: 1
  vrmac: 00:00:5e:00:01:01
  vrdst:
  vrgrp: 0
```

2. FortiGate B:

```
# get router info vrrp
Interface: emac, primary IP address: 172.16.209.2
UseVMAC: 1, SoftSW: 0, EmacVlan: 1 BrPortIdx: 0, PromiscCount: 1
HA mode: primary (0:0:1) VRRP master number: 1
VRID: 1 version: 2
  vrip: 172.16.209.111, priority: 222 (222,0), state: PRIMARY
  adv_interval: 1, preempt: 1, ignore_dft: 0 start_time: 3
  master_adv_interval: 100, accept: 1
  vrmac: 00:00:5e:00:01:01
  vrdst:
  vrgrp: 0
```

SNMP

SNMP enables you to monitor hardware on your network. You can configure the hardware, such as the FortiGate SNMP agent, to report system information and send traps (alarms or event messages) to SNMP managers. SNMP traps alert you to events that happen, such as when a log disk is full or a virus is detected.

The FortiGate SNMP implementation is read-only. SNMP v1/v2c, and v3 compliant SNMP managers have read-only access to FortiGate system information through queries, and can receive trap messages from the FortiGate unit.

- [Interface access on page 2662](#)
- [MIB files on page 2662](#)
- [SNMP agent on page 2663](#)
- [SNMP v1/v2c communities on page 2663](#)
- [SNMP v3 users on page 2665](#)
- [Access control for SNMP on page 2666](#)
- [Important SNMP traps on page 2668](#)
- [SNMP traps and query for monitoring DHCP pool on page 2670](#)

Interface access

Before a remote SNMP manager can connect to the FortiGate SNMP agent, you must configure one or more FortiGate interfaces to accept SNMP connections.

To configure a FortiGate interface to accept SNMP connections in the GUI:

1. Go to *Network > Interfaces*.
2. Edit the interface.
3. In the *Administrative Access* options, enable *SNMP*.
4. Click *OK*.

To configure a FortiGate interface to accept SNMP connections in the CLI:

```
config system interface
    edit <interface>
        append allowaccess snmp
        set snmp-index <integer>
        config ipv6
            append ip6-allowaccess snmp
        end
    next
end
```

MIB files

The FortiGate SNMP agent supports Fortinet proprietary MIBs, as well as the parts of RFC 2665 and RFC 1213 that apply to FortiGate unit configuration.

Your SNMP manager may already include standard and private MIBs in a compiled database that is ready to use. You must add the Fortinet proprietary MIBs to this database to have access to Fortinet specific information.

MIB file or RFC	Description
FORTINET-CORE-MIB.mib	<p>The Fortinet core MIB includes all system configuration and trap information that is common to all Fortinet products.</p> <p>Your SNMP manager requires this information to monitor Fortinet device settings and receive traps from the FortiGate SNMP agent.</p>
FORTINET-FORTIGATE-MIB.mib	<p>The FortiGate MIB includes all system configuration information and trap information that is specific to FortiGate units.</p> <p>Your SNMP manager requires this information to monitor FortiGate settings and receive traps from the FortiGate SNMP agent.</p>
RFC-1213 (MIB II)	<p>The FortiGate SNMP agent supports MIB II groups with the following exceptions:</p> <ul style="list-style-type: none"> • No support for the EGP group from MIB II (RFC 1213, section 3.11 and 6.10). • Protocol statistics returned for MIB II groups (IP/ICMP/TCP/UDP/etc.) do not accurately capture all Fortinet traffic activity. More accurate information can be obtained from the information reported by the Fortinet MIB.
RFC-2665 (Ethernet-like MIB)	The FortiGate SNMP agent supports Ethernet-like MIB information.

MIB file or RFC	Description
	FortiGate SNMP does not support for the dot3Tests and dot3Errors groups.

To download the MIB files:

1. Go to *System > SNMP*.
2. Click *Download FortiGate MIB File* and save the file to the management computer.
3. Click *Download Fortinet Core MIB File* and save the file to the management computer.

SNMP agent

The SNMP agent sends SNMP traps originating on the FortiGate to an external monitoring SNMP manager defined in a SNMP community. The SNMP manager can monitor the FortiGate system to determine if it is operating properly, or if any critical events occurring.

The description, location, and contact information for this FortiGate system will be part of the information that the SNMP manager receives. This information is useful if the SNMP manager is monitoring many devices, and enables faster responses when the FortiGate system requires attention.

To configure the SNMP agent in the GUI:

1. Go to *System > SNMP*.
2. Enable *SNMP Agent*.
3. Enter a description of the agent.
4. Enter the location of the FortiGate unit.
5. Enter a contact or administrator for the SNMP Agent or FortiGate unit.
6. Click *Apply*.

To configure the SNMP agent in the CLI:

```
config system snmp sysinfo
    set status enable
    set description <string>
    set contact-info <string>
    set location <string>
end
```

SNMP v1/v2c communities

An SNMP community is a grouping of equipment for network administration purposes. A single device can belong to multiple communities.

You must add an SNMP community to the FortiGate so that the SNMP manager can receive traps and system information. Up to three communities can be added.

To create a n SNMP v1/v2c community in the GUI:

1. Go to *System > SNMP*.
2. In the *SNMP v1/v2c* table, click *Create New*.

3. Enter a *Community Name* and enable the community.
4. In the *Hosts* section, enter the *IP Address* and select the *Host Type* for each SNMP manager.
5. In the *Queries* section, enable or disable v1 and v2c queries, then enter the port numbers that the SNMP managers in this community use for them.
6. In the *Traps* section, enable or disable v1 and v2c traps, then enter the local and remote port numbers that the SNMP managers in this community use for them.
7. In the *SNMP Events* section, enable or disable the events that activate traps in this community.
8. Click *OK*.

To create a n SNMP v1/v2c community in the CLI:

```
config system snmp community
  edit 2
    set name <string>
    set status {enable | disable}
    config hosts
      edit <host_id>
        set ip <ip/mask>
        set source-ip <class_ip>
        set ha-direct {enable | disable}
        set host-type {any | query | trap}
      next
    end
    set query-v1-port <port_number>
    set query-v1-status {enable | disable}
    set query-v2c-port <port_number>
    set query-v2c-status {enable | disable}
    set trap-v1-lport <port_number>
```

```

        set trap-v1-rport <port_number>
        set trap-v1-status {enable | disable}
        set trap-v2c-lport <port_number>
        set trap-v2c-rport <port_number>
        set trap-v2c-status {enable | disable}
        set events <events>
    next
end

```

SNMP v3 users

Authentication is used to ensure the identity of users. Privacy allows for encryption of SNMP v3 messages to ensure confidentiality of data. These protocols provide a higher level of security than is available in SNMP v1 and v2c, which use community strings for security. Both authentication and privacy are optional.

To create a n SNMP v3 user in the GUI:

1. Go to *System > SNMP*.
2. In the *SNMP v3* table, click *Create New*.

3. Enter a *User Name* and enable the user.
4. In the *Security Level* section, configure the security level:
 - *No Authentication*: No authentication or encryption.
 - *Authentication*: Select the authentication algorithm and password.
 - *Authentication and Private*: Select both the authentication and encryption algorithms and password.
5. In the *Hosts* section, enter the *IP Address* for each SNMP manager.
6. In the *Queries* section, enable or disable queries, then enter the port number that the SNMP managers use for them.
7. In the *Traps* section, enable or disable traps, then enter the local and remote port numbers that the SNMP managers use for them.

8. In the *SNMP Events* section, enable or disable the events that activate traps.
9. Click **OK**.

To create an SNMP v3 user in the CLI:

```
config system snmp user
    edit <user>
        set status {enable | disable}
        set trap-status {enable | disable}
        set trap-lport <port_number>
        set trap-rport <port_number>
        set queries {enable | disable}
        set query-port <port_number>
        set notify-hosts <class_ip> ... <class_ip>
        set source-ip <class_ip>
        set ha-direct {enable | disable}
        set events <events>
        set security-level {no-auth-no-priv | auth-no-priv | auth-priv}
        set auth-proto {md5 | sha | sha224 | sha256 | sha384 | sha512}
        set auth-pwd <password>
        set priv-proto {aes | des | aes256 | aes256cisco}
        set priv-pwd <password>
    next
end
```

Access control for SNMP

Administrators can provide access control to SNMP users and communities based on restricting a MIB view to specific OID subtrees. They can also define access based on the VDOM. This allows multi-tenant FortiGate deployments to provide restricted access per VDOM.

- MIB view access control allows the SNMP clients to query specific OIDs that are filtered by the MIB view settings.
- VDOM access control allows the SNMP clients to query data from specific VDOMs that are filtered by the VDOM settings.

When access control is enabled, the users can only access the information that is allowed by the access control, and all other information is inaccessible. Administrators have granular control, and can easily restrict specific information based on access control.

To configure MIB views:

```
config system snmp mib-view
    edit <name>
        set include <OIDs>
        set exclude <OIDs>
    next
end
```

include <OIDs>

Enter the OID subtrees to be included in the view. A maximum of 16 subtrees can be added.

exclude <OIDs>

Enter the OID subtrees to be excluded in the view. A maximum of 64 subtrees can be added.

To configure access control based on MIB views and VDOMs for SNMP users and communities:

```

config system snmp user
    edit <user>
        set mib-view <view>
        set vdoms <vdoms>
    next
end

config system snmp community
    edit <community>
        set mib-view <view>
        set vdoms <vdoms>
    next
end

```

mib-view <view>	Set the SNMP access control MIB view.
vdoms <vdoms>	Set the SNMP access control VDOMs.

Example

In this example, two MIB views are created and, with VDOMs, used to control access for SNMP users and communities.

To configure access control for SNMP users and communities:**1. Configure two MIB views:**

```

config system snmp mib-view
    edit "view1"
        set include "1.3.6.1.2"
    next
    edit "view2"
        set include "1.3.6.1.2.1"
        set exclude "1.3.6.1.2.1.2.1" "1.3.6.1.2.1.4.31" "1.3.6.1.2.1.1.9.1"
    next
end

```

2. Add the MIB view and VDOM restrictions to SNMP users:

```

config system snmp user
    edit "v3user"
        set mib-view "view1"
    next
    edit "v3user1"
        set vdom "vdom1"
    next
    edit "v3user2"
        set mib-view "view1"
        set vdoms "root" "vdom1"
    next
end

```

3. Add the MIB view and VDOM restrictions to SNMP communities:

```

config system snmp community
  edit 1
    set name "REGR-SYS"
    set vdoms "vdom1"
  next
  edit 2
    set name "REGR-SYS1"
    set mib-view "view2"
  next
  edit 3
    set name "REGR-SYS2"
    set mib-view "view1"
    set vdoms "root" "vdom1"
  next
end

```

Important SNMP traps

Link Down and Link Up traps

This trap is sent when a FortiGate port either goes down or is brought up.

For example, the following traps are generated when the state of port34 is set to down using `set status down`, and then brought up using `set status up`:

```

NET-SNMP version 5.7.3 2019-01-31 14:11:48 10.1.100.1(via UDP: [10.1.100.1]:162->
[10.1.100.11]:162) TRAP, SNMP v1, community REGR-SYS SNMPv2-MIB::snmpTraps Link Down Trap
(0) Uptime: 0:14:44.95 IF-MIB::ifIndex.42 = INTEGER: 42 IF-MIB::ifAdminStatus.42 = INTEGER:
down(2) IF-MIB::ifOperStatus.42 = INTEGER: down(2) FORTINET-CORE-MIB::fnSysSerial.0 =
STRING: FG140P3G15800330 SNMPv2-MIB::sysName.0 = STRING: FortiGate-140D-POE

2019-01-31 14:11:48 <UNKNOWN> [UDP: [10.1.100.1]:162->[10.1.100.11]:162]: DISMAN-EVENT-
MIB::sysUpTimeInstance = Timeticks: (88495) 0:14:44.95 SNMPv2-MIB::snmpTrapOID.0 = OID: IF-
MIB::linkDown IF-MIB::ifIndex.42 = INTEGER: 42 IF-MIB::ifAdminStatus.42 = INTEGER: down(2)
IF-MIB::ifOperStatus.42 = INTEGER: down(2) FORTINET-CORE-MIB::fnSysSerial.0 = STRING:
FG140P3G15800330 SNMPv2-MIB::sysName.0 = STRING: FortiGate-140D-POE 2019-01-31 14:12:01
10.1.100.1(via UDP: [10.1.100.1]:162->[10.1.100.11]:162) TRAP, SNMP v1, community REGR-SYS
SNMPv2-MIB::snmpTraps Link Up Trap (0) Uptime: 0:14:57.98 IF-MIB::ifIndex.42 = INTEGER: 42
IF-MIB::ifAdminStatus.42 = INTEGER: up(1) IF-MIB::ifOperStatus.42 = INTEGER: up(1) FORTINET-

MIB::ifOperStatus.42 = INTEGER: up(1) FORTINET-CORE-MIB::fnSysSerial.0 = STRING:
FG140P3G15800330 SNMPv2-MIB::sysName.0 = STRING: FortiGate-140D-POE

```

fgFmTrapIfChange trap

This trap is sent when any changes are detected on the interface. The change can be very simple, such as giving an IPV4 address.

For example, the user has given the IP address of 1.2.3.4/24 to port 1 and the EMS Manager has detected the following trap:

```
DISMAN-EXPRESSION-MIB::sysUpTimeInstance = Timeticks: (7975058) 22:09:10.58 SNMPv2-MIB::snmpTrapOID.0 = OID: FORTINET-FORTIGATE-MIB::fgFmTrapIfChange FORTINET-CORE-MIB::fnSysSerial.0 = STRING: FG140P3G15800330 IF-MIB::ifName.45 = STRING: port1 FORTINET-FORTIGATE-MIB::fgManIfIp.0 = IpAddress: 1.2.3.4 FORTINET-FORTIGATE-MIB::fgManIfMask.0 = IpAddress: 255.255.255.0 FORTINET-FORTIGATE-MIB::fgManIfIp6.0 = STRING: 0:0:0:0:0:0:0:0
```

entConfigChange trap

The change to the interface in the previous example has also triggered the *ConfChange Trap* which is sent along with the *fgFmTrapIfChange* trap:

```
2018-11-15 09:30:23 FGT_A [UDP: [172.16.200.1]:162->[172.16.200.55]:162]: DISMAN-EXPRESSION-MIB::sysUpTimeInstance = Timeticks: (8035097) 22:19:10.97 SNMPv2-MIB::snmpTrapOID.0 = OID: ENTITY-MIB::entConfigChange
```

fgTrapDeviceNew trap

This trap is triggered when a new device, like a FortiSwitch, is connected to the FortiGate.

For example, the following scenario has given the device a new trap for adding FortiAP on a PoE interface a FortiGate 140D-POE. The trap has important information about the device name, device MAC address, and when it was last seen.

```
2018-11-15 11:17:43 UDP/IPv6: [2000:172:16:200::1]:162 [UDP/IPv6: [2000:172:16:200::1]:162]: DISMAN-EXPRESSION-MIB::sysUpTimeInstance = Timeticks: (520817) 1:26:48.17 SNMPv2-MIB::snmpTrapOID.0 = OID: FORTINET-FORTIGATE-MIB::fgTrapDeviceNew FORTINET-CORE-MIB::fnSysSerial.0 = STRING: FG140P3G15800330 SNMPv2-MIB::sysName.0 = STRING: FGT_A IF-MIB::ifIndex.0 = INTEGER: 0 FORTINET-FORTIGATE-MIB::fgVdEntIndex.0 = INTEGER: 0 FORTINET-FORTIGATE-MIB::fgDeviceCreated.0 = Gauge32: 5 FORTINET-FORTIGATE-MIB::fgDeviceLastSeen.0 = Gauge32: 5 FORTINET-FORTIGATE-MIB::fgDeviceMacAddress.0 = STRING: 90:6c:ac:f9:97:a0
```

```
2018-11-15 11:17:43 FGT_A [UDP: [172.16.200.1]:162->[172.16.200.55]:162]: DISMAN-EXPRESSION-MIB::sysUpTimeInstance = Timeticks: (520817) 1:26:48.17 SNMPv2-MIB::snmpTrapOID.0 = OID: FORTINET-FORTIGATE-MIB::fgTrapDeviceNew FORTINET-CORE-MIB::fnSysSerial.0 = STRING: FG140P3G15800330 SNMPv2-MIB::sysName.0 = STRING: FGT_A IF-MIB::ifIndex.0 = INTEGER: 0 FORTINET-FORTIGATE-MIB::fgVdEntIndex.0 = INTEGER: 0 FORTINET-FORTIGATE-MIB::fgDeviceCreated.0 = Gauge32: 5 FORTINET-FORTIGATE-MIB::fgDeviceLastSeen.0 = Gauge32: 5 FORTINET-FORTIGATE-MIB::fgDeviceMacAddress.0 = STRING: 90:6c:ac:f9:97:a0
```

fgTrapAvOversize trap

The *fgTrapAvOversize* trap is generated when the antivirus scanner detects an oversized file:

```
019-01-31 13:22:04 10.1.100.1(via UDP: [10.1.100.1]:162->[10.1.100.11]:162) TRAP, SNMP v1, community REGR-SYS FORTINET-FORTIGATE-MIB::fgt140P Enterprise Specific Trap (602) Uptime: 1 day, 3:41:10.31 FORTINET-CORE-MIB::fnSysSerial.0 = STRING: FG140P3G15800330 SNMPv2-MIB::sysName.0 = STRING: FortiGate-140D-POE 2019-01-31 13:22:29 <UNKNOWN> [UDP: [10.1.100.1]:162->[10.1.100.11]:162]: DISMAN-EVENT-MIB::sysUpTimeInstance = Timeticks: (9967031) 1 day, 3:41:10.31 SNMPv2-MIB::snmpTrapOID.0 = OID: FORTINET-FORTIGATE-MIB::fgTrapAvOversize FORTINET-CORE-MIB::fnSysSerial.0 = STRING: FG140P3G15800330 SNMPv2-MIB::sysName.0 = STRING: FortiGate-140D-POE
```

SNMP traps and query for monitoring DHCP pool

The SNMP DHCP event contains three traps and one query.

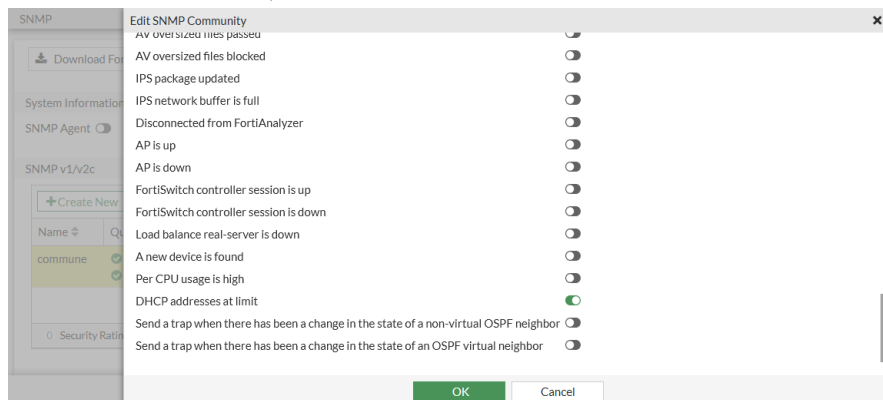

Traps are sent when:

- DHCP server IP pool usage reaches 90%
- DHCP server detect an IP address that is already in use
- DHCP client receives DHCP NAK

SNMP queries are accepted for DHCP lease usage information (OID = 1.3.6.1.4.1.12356.101.23). The query result is based on the leased out percentage.

To enable the SNMP DHCP event in the GUI:

1. Go to *System > SNMP*.
2. Click *Create New* in either the *SNMP v1/v2c* table or *SNMP v3* table, or edit an existing community or user.
3. Configure the settings as required.
4. In the *SNMP Events* list, enable *DHCP addresses at limit*.

5. Click **OK**.

To enable the SNMP DHCP event in the CLI:

```
config system snmp community
  edit 1
    set name "REGR-SYS"
    config hosts
      edit 1
        set ip 10.1.100.11 255.255.255.255
      next
      edit 2
        set ip 172.16.200.55 255.255.255.255
      next
    end
    set events dhcp
  next
end

config system snmp user
  edit "1"
    set notify-hosts 172.10.1.0 172.20.1.0
```

```

    set events dhcp
    set security-level auth-priv
    set auth-proto sha384
    set auth-pwd *****
    set priv-proto aes256
    set priv-pwd *****
next
end

```

Replacement messages

FortiOS has replacement messages that are HTML and text files. These messages can be customized to meet user requirements. The content can be modified, and images can be added.

Modifying replacement messages

The *Replacement Messages* page has two views. *Simple View* (the default view) shows the most commonly used replacement messages. *Extended View* shows the entire list and all replacement message categories.

To modify a replacement message in the GUI:

1. Go to *System > Replacement Messages*.
2. Select a replacement message and click *Edit*.

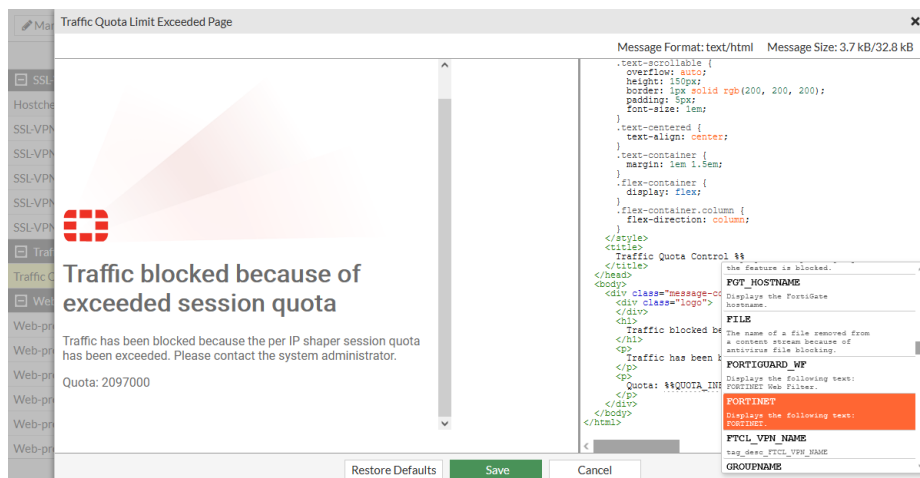

If the message you want to edit is not visible, click *Extended View* in the upper right-hand corner of the top menu.

Name	Description	Modified
Sender Address block message		
replacement text for emails block due to blocked sender address		
SSL-VPN		
Hostcheck Error Message	Replacement text for hostcheck error message	
SSL-VPN Limit Page	Replacement HTML for SSL-VPN connection limit exceeded page	
SSL-VPN Login Page	Replacement HTML for SSL-VPN login page	
SSL-VPN Portal Header	Replacement HTML for SSL-VPN portal page header	
SSL-VPN Provision User Email	Replacement HTML for SSL-VPN provision user email template	
SSL-VPN Provision User SMS	Replacement text for SSL-VPN provision user SMS template	
Traffic Quota		
Traffic Quota Limit Exceeded Page	Replacement HTML for traffic quota limit exceeded block page	
Web-proxy		
Web-proxy Authentication Failed Page	Replacement HTML for web-proxy authentication failed page	
Web-proxy Authorization Group Query Failed Page	Replacement HTML for web-proxy authorization group query failed page	
Web-proxy Block Page	Replacement HTML for web-proxy block page	
Web-proxy Challenge Page	Replacement HTML for web-proxy authentication required block page	
Web-proxy HTTP Error Page	Replacement HTML for web-proxy HTTP error page	
Web-proxy IP Blackout Page	Replacement HTML for web-proxy IP Blackout page	
Web-proxy User Limit Page	Replacement HTML for web-proxy user limit block page	

3. Edit the HTML code.

The message is visible on the left alongside the HTML code on the right. The message view updates in real-time as you edit the content.

When adding a variable to the code, right-click and select *Insert Tag* or type %% to view a list of the available variables, or start typing the variable name then press *Enter* or *TAB* to auto-complete the variable name.

4. Click **Save**.

Click *Restore Defaults* to return to the original message and code base.

To modify a replacement message in the CLI:

For example, to modify the *Traffic Quota Limit Exceeded Page* message:

```
config system replacemsg traffic-quota "per-ip-shaper-block"
  set buffer "<html>
<head>
  <title>
    Traffic Quota Control
  </title>
</head>
<body>
  <font size=2>
    <table width=\"100%\">
      <tr>
        <td bgcolor=#3300cc align=\"center\" colspan=2>
          <font color=#ffffff>
            <b>
              Traffic blocked because exceeded session quota
            </b>
          </font>
        </td>
      </tr>
    </table>
    <br>
    <br>
    Traffic blocked because it exceeded the per IP shaper session quota. Please contact
the system administrator.
    <br>
    %%QUOTA_INFO%%
    <br>
    <br>
    <br>
    <br>
  </body>
</html>
```

```
</font>
</body>
</html>"
set header http
set format html
end
```

Replacement message images

Images can be added to replacement messages on:

- Disclaimer pages
- Login pages
- Declined disclaimer pages
- Login failed pages
- Login challenge pages
- Keepalive pages

The supported image formats are GIF, JPEG, TIFF, and PNG. The maximum file size supported is 24 KB.

Adding images to replacement messages

To add images to replacement messages in the GUI:

1. Go to *System > Replacement Messages*.
2. In the top menu, click *Manage Images*.
3. Click *Create New*.
4. Enter a name for the image.
5. Click *Upload Image* and locate the file.

6. Click *OK*.

The file is now visible in the list.

7. Return to the replacement message list and edit a message.
8. Right-click in the message code where you want to add the image, and select *Insert Image*.
9. Select the image from the list then press *Enter*, or double-click on the image to add it to the message.
10. Click *Save*.

To add images to replacement messages in the CLI:

1. Add the image to the FortiGate:

```
config system replacemsg-image
  edit <image_name>
    set image-type {gif | jpg | tiff | png}
    set image-base64 <string>
  next
end
```

2. Edit the replacement message, and include `%%IMAGE:<image name>%%` in the code to add the image.

Replacement message groups

Replacement message groups allow users to customize replacement messages for individual policies and profiles.

There are two types of replacement message groups:

Type	Usage	Customizable categories
utm	Used with UTM settings in firewall policies.	<ul style="list-style-type: none"> • admin • alertmail • custom-message • fortiguard-wf • ftp • http • icap • mail • nac-quar • spam

Type	Usage	Customizable categories
		<ul style="list-style-type: none"> • sslvpn • traffic-quota • utm • webproxy
auth	Used with authentication pages in firewall policies.	<ul style="list-style-type: none"> • auth • webproxy

The messages added to a group do not need to be customized. The message body content, header type, and format will use the default values if not customized.

To make replacement message groups visible in the GUI:

```
config system settings
    set gui-replacement-message-groups enable
end
```

In the following example, two replacement message groups are created. The UTM message group includes custom mail-related messages and is assigned to an email filter profile. The authentication message group has a custom authentication success message that is applied to a proxy-based firewall policy that has an assigned email filter profile.

To create replacement message groups in the GUI:

1. Create the *Security* replacement message group:
 - a. Go to *System > Replacement Message Groups*.
 - b. Click *Create New*.
 - c. For *Name*, enter *newutm*.
 - d. In the *Comments* field, enter *UTM message group*.
 - e. For *Group Type*, select *Security*.
 - f. Click *OK*.

2. Customize the replacement messages in the *newutm* group:
 - a. Go to *System > Replacement Message Groups*.
 - b. Edit the *newutm* group.

c. Select the *Partial Email Block Message*.

d. Edit the message and click **Save**.

e. Select the *ASE Block Message*.

f. Edit the message and click **Save**.

3. Create the *Authentication* replacement message group:

a. Go to **System > Replacement Message Groups**.

b. Click **Create New**.

c. For **Name**, enter *newauth*.

d. In the **Comments** field, enter *Authentication message group*.

e. For **Group Type**, select *Authentication*.

f. Click **OK**.

4. Apply the *newutm* replacement message group to an email filter profile in the CLI:

```
config emailfilter profile
  edit "newmsgs"
    set replacemsg-group "newutm"
  next
end
```

5. Apply the *newauth* replacement message group and the email filter profile to a firewall policy in the CLI:

```
config firewall policy
  edit 1
    ...
    set replacemsg-override-group "newauth"
    set inspection-mode proxy
    set emailfilter-profile "newmsgs"
    ...
  next
end
```

To create replacement message groups in the CLI:**1. Create the replacement message groups:**

```
config system replacemsg-group
  edit "newutm"
    set comment "UTM message group"
    set group-type utm
    config mail
      edit "partial"
        set buffer "Fragmented emails are blocked, sorry."
      next
    end
    config spam
      edit "smtp-spam-ase"
        set buffer "This message has been blocked because ASE reports it as
spam. You\'re welcome."
      next
    end
  next
edit "newauth"
  set comment 'Authentication message group'
  set group-type auth
  config auth
    edit "auth-success-msg"
      set buffer "Welcome to the firewall. Your authentication has been
accepted, please reconnect."
    next
  end
next
end
```

2. Apply the message group to the email filter:

```
config emailfilter profile
  edit "newmsgs"
    set replacemsg-group "newutm"
  next
end
```

3. Apply the email filter and message group to the policy:

```
config firewall policy
  edit 1
    ...
    set replacemsg-override-group "newauth"
    set inspection-mode proxy
    set emailfilter-profile "newmsgs"
    ...
  next
end
```

FortiGuard

FortiGuard services comprise of signature packages and querying services that provide content, web and device security. It is delivered via various types of FortiGuard servers that are part of the FortiGuard Distribution Network (FDN).

FortiGuard service subscriptions can be purchased and registered to your FortiGate unit. The FortiGate must be connected to the Internet in order to automatically connect to the FDN to validate the license and download FDN updates or perform real-time queries.

To view FDN support contract information, go to *System > FortiGuard*. The *License Information* table shows the status of your FortiGate's entitlements and breaks down the status of each service.

The following topics contain more information:

Anycast

FortiGuard servers use Anycast addresses in order to optimize and distribute traffic across many servers. Anycast is the default access mode for FortiGates when connecting to FortiGuard which by default utilizes HTTPS and port 443.

Each type of FortiGuard servers and services have a FortiGuard domain name that resolves to a single Anycast IP address. Regardless of where the FortiGate is located, the resolution is still the same. Fortinet maintains the network in the background to ensure routes to the FortiGuard servers are optimized. In the below diagram, several servers have the same Anycast IP, but the FortiGate will connect to the one with the least hops.

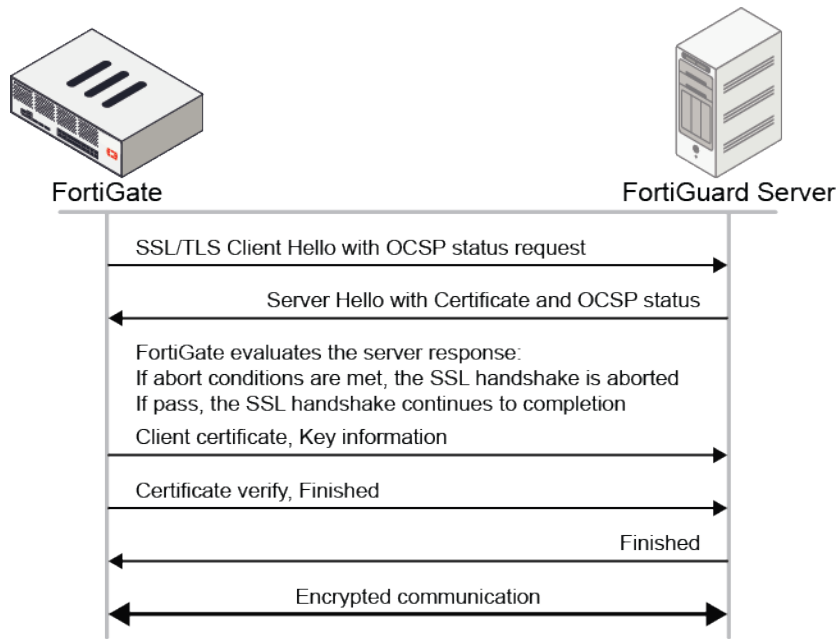

Connection and OCSP stapling

When the FortiGate connects to a FortiGuard server, it is important for it to validate the server is indeed a real FortiGuard server. Hence, FortiGuard servers provide the following security:

- The domain name of each FortiGuard service is the common name in that service's certificate, which is signed by a third-party intermediate CA.
- The FortiGuard server also applies Online Certificate Status Protocol (OCSP) stapling check, in which it attaches a time-stamped OCSP status of the server certificate from the OCSP server to the TLS response.

This ensures FortiGate can validate the FortiGuard server certificate efficiently during the TLS handshake.

The following illustrates the connection process:

FortiGate will only complete the TLS handshake with an anycast server when abort conditions are not met. Abort conditions include:

- The CN in the server's certificate does not match the domain name resolved from the DNS.
- The OCSP status is revoked or unknown.
- The issuer-CA is revoked by the root-CA.

To configure the anycast FortiGuard access mode:

```
config system fortiguard
    set fortiguard-anycast enable
end
```

If FortiGuard is not reachable via Anycast, choose between the following options to work around this issue:

1. Switch to other Anycast servers:

```
config system fortiguard
    set fortiguard-anycast enable
    set fortiguard-anycast-source aws
end
```

2. Disable Anycast and use HTTPS:

```
config system fortiguard
    set fortiguard-anycast disable
    set protocol https
    set port 8888
end
```

3. Disable Anycast and use UDP:

```
config system fortiguard
    set fortiguard-anycast disable
    set protocol udp
    set port 53
end
```

Configuring FortiGuard updates

To configure FortiGuard updates:

1. Go to *System > FortiGuard*
2. Scroll down to the *FortiGuard Updates* section.
3. Configure the options for connecting and downloading definition files:

Immediately download updates

The option can be enabled on 2U and larger hardware models when the FortiGuard servers are connected in anycast mode.

The FortiGate forms a secure, persistent connection with FortiGuard to get notifications of new updates through an HTTPS connection. The FortiGate uses the `fds_notify` daemon to wait for the notification, then makes another connection to the FortiGuard server to download the updates.

Scheduled Updates

Enable to schedule updates to be sent to the FortiGate at the specified time or automatically. See [Scheduled updates on page 2684](#) and [Automatic updates on page 2683](#).

Improve IPS quality

Enable to send information to the FortiGuard servers when an attack occurs. This can help keep the FortiGuard database current as attacks evolve, and improve IPS signatures.

Use extended IPS signature package

Enable to use the extended IPS database, that includes protection from legacy attacks, along with the regular IPS database that protects against the latest common and in-the-wild attacks.

AntiVirus PUP/PUA

Enable antivirus grayware checks for potentially unwanted applications.

Update server location

The FortiGuard update server location. See [Update server location on page 2686](#) for details.

The screenshot shows the 'FortiGuard Distribution Network' configuration page. On the left, there are several toggle switches and dropdown menus for configuring updates. On the right, there is a table titled 'Fortinet Service Communications' showing traffic volume for various services.

Service	Traffic Volume (Last 24 hours)
FortiCare	0 B
FortiCloud Log	715.61 kB
FortiGuard.com	3.10 MB
FortiGuard Download	57.22 MB
FortiGuard Query	51.16 kB
FortiGate Cloud Sandbox	0 B
OCVPN	0 B
SDNS	0 B
FortiToken Registration	0 B
SMS Service	0 B

4. Click *Apply*.

Configuring a proxy server for FortiGuard updates

You can configure FortiOS to use a proxy server to connect to the FortiGuard Distribution Network (FDN).

Proxy tunneling is supported only for registration, AV, and IPS updates. For FortiGate virtual machines, proxy tunneling can also be used for license validation. For web filtering or spam filtering, UDP protocol is used on ports 53 or 8888. UDP protocol traffic cannot be directed over a proxy server, even if you are using versions of FortiOS that support web filtering over port 443.

Consider the following before configuring FortiOS to use a proxy server to connect to FDN:

- FortiOS connects to the proxy server using the HTTP CONNECT method. For information about the HTTP CONNECT method, see [RFC 2616](#).
- The proxy server must not inspect the HTTPS traffic used for FortiOS communication.
- FortiOS sends to the proxy server an HTTP CONNECT request that specifies the IP address and port required for the FDN connection. Authentication information is optional for the request.
- FortiOS or the proxy server must be configured to use DNS servers that resolve the addresses of FDN servers to support AV and IPS updates.
- The proxy server establishes the connection to FDN and passes information between FortiOS and FDN.

Use the following syntax to configure a proxy server in the CLI:

```
config system autoupdate tunneling
    set address <proxy_address>
    set port <proxy_port>
    set username <username>
    set password <password>
    set status {enable | disable}
end
```

In the following example, a proxy server with IP address 10.1.1.1 is configured to listen on port TCP/3128 without authentication.

To configure a proxy server:

```
config system autoupdate tunneling
    set address 10.1.1.1
    set port 3128
    set status enable
end
```

In a closed network without direct internet connection for web filtering or spam filtering, you can use FortiManager as a FortiGuard server. FortiManager supports proxy for both updates and rating, and FortiOS retrieves its updates and ratings through FortiManager. See [Using FortiManager as a local FortiGuard server on page 2689](#).

Manual updates

When needed, FortiGuard Distribution Network (FDN) updates can be manually uploaded.

To manually update the signature definitions files:

1. Log in to the [Fortinet Support](#) website.
2. Go to *Support > Service Updates*.
3. Select your *OS Version* from the dropdown list.

4. Locate your device in the table, and download the signature definitions files.
5. On the FortiGate, go to *System > FortiGuard*.
6. In the *License Information* table, locate and expand the definitions that you are updating.
7. From the *Actions* menu in the rightmost column, select *Upgrade Database*.
8. In the pane that opens, click *Upload*, locate the downloaded definitions file on your computer, then click *Open*. The download may take a few minutes to complete.

9. Click *OK*.

AV and IPS manual updates

To execute the update:

```
# execute restore ips tftp nids-720-19.261.pkg 172.16.200.55
```

To verify the manual AV and IPS package updates:

```
# diagnose debug app updated -1  
# diagnose debug enable
```

Security levels are pre-configured on the BIOS. See [BIOS-level signature and file integrity checking on page 2736](#) and [Real-time file system integrity checking on page 2740](#) for more information.

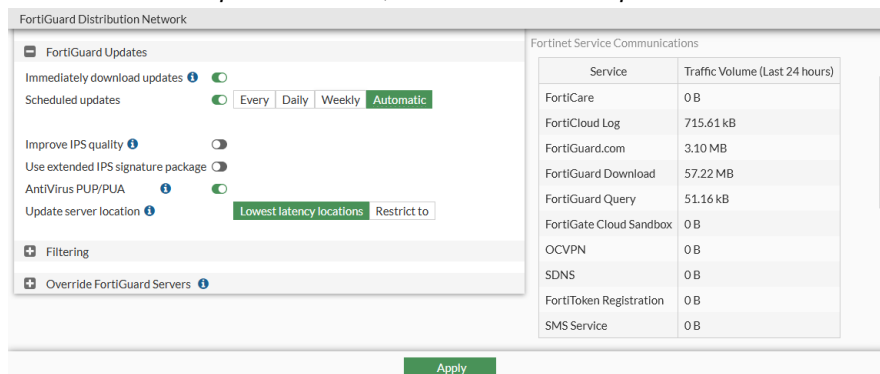

Automatic updates

The default auto-update schedule for FortiGuard packages is automatic. The update interval is calculated based on the model and percentage of valid subscriptions, within one hour.

For example, if a FortiGate 501E has 78% valid contracts, then based on this device model, the update schedule is calculated to be every 10 minutes. If you verify the system event logs (ID 0100041000), they are generated approximately every 10 minutes.

To configure automatic updates in the GUI:

1. Go to *System > FortiGuard*
2. In the *FortiGuard Updates* section, enable *Scheduled Updates* and select *Automatic*.

3. Click *Apply*.

To configure scheduled updates in the CLI:

```
config system autoupdate schedule
    set status enable
    set frequency automatic
end
```

Scheduled updates

Scheduling updates ensures that the virus and IPS definitions are downloaded to your FortiGate on a regular basis.

Updating definitions can cause a brief disruption in traffic that is currently being scanned while the FortiGate unit applies the new signature database. Updates should be scheduled during off-peak hours when network usage is at a minimum to ensure that network activity will not be affected by downloading the definitions files.

A schedule of once a week means any urgent updates will not be pushed until the scheduled time. If an urgent update is required, click the *Update Licenses & Definitions Now* button to manually update the definitions.

To configure scheduled updates in the GUI:

1. Go to *System > FortiGuard*
2. In the *FortiGuard Updates* section, enable *Scheduled Updates*.

3. Configure the update schedule:

Service	Traffic Volume (Last 24 hours)
FortiCare	0 B
FortiCloud Log	715.61 kB
FortiGuard.com	3.10 MB
FortiGuard Download	57.22 MB
FortiGuard Query	51.16 kB
FortiGate Cloud Sandbox	0 B
OCVPN	0 B
SDNS	0 B
FortiToken Registration	0 B
SMS Service	0 B

4. Click *Apply*.

To configure scheduled updates in the CLI:

```
config system autoupdate schedule
    set status enable
    set frequency {every | daily | weekly}
    set time <hh:mm>
    set day <day_of_week>
end
```

Sending malware statistics to FortiGuard

FortiGate devices periodically send encrypted antivirus, IPS, botnet IP list, and application control statistics to FortiGuard. Included with these data is the IP address and serial number of the FortiGate, and the country that it is in. This information is never shared with external parties, [Fortinet Privacy Policy](#).

The malware statistics are used to improve various aspects of FortiGate malware protection. For example, antivirus data allow FortiGuard to determine what viruses are currently active. Signatures for those viruses are kept in the Active AV Signature Database that is used by multiple Fortinet products. Inactive virus signatures are moved to the Extended AV Signature Database (see [Configuring FortiGuard updates on page 2681](#)). When events for inactive viruses start appearing in the malware data, the signatures are moved back into the AV Signature Database.

The FortiGate and FortiGuard servers go through a 2-way SSL/TLS 1.2 authentication before any data is transmitted. The certificates used in this process must be trusted by each other and signed by the Fortinet CA server.

The FortiGate only accepts data from authorized FortiGuard servers. Fortinet products use DNS to find FortiGuard servers and periodically update their FortiGate server list. All other servers are provided by a list that is updated through the encrypted channel.

Malware statistics are accumulated and sent every 60 minutes by default.

To configure sharing this information, use the following CLI command:

```
config system global
    set fds-statistics {enable | disable}
    set fds-statistics-period <minutes>
end
```

The submission of malware data is in accordance with the [Fortinet Privacy Policy](#).

There is no sensitive or personal information included in these submissions. Only malware statistics are sent.

Fortinet uses the malware statistics collected in this manner to improve the performance of the FortiGate services and to display statistics on the [Fortinet Support](#) website for customers registered FortiGate devices.

Fortinet may also publish or share statistics or results derived from this malware data with various audiences. The malware statistics shared in this way do not include any customer data.

Update server location

Administrators can specify the location of the FortiGuard update server used by FortiGate. You can set the location to only servers in the USA, only servers in the European Union (EU), or to servers with the lowest latency.

In EU locations, it can be required that certain traffic is only handled by servers located in the EU. By setting the update server location to EU only, the FortiGate will use EU domains to resolve to EU servers for FortiGuard traffic to update, URL rating, and IoT servers.

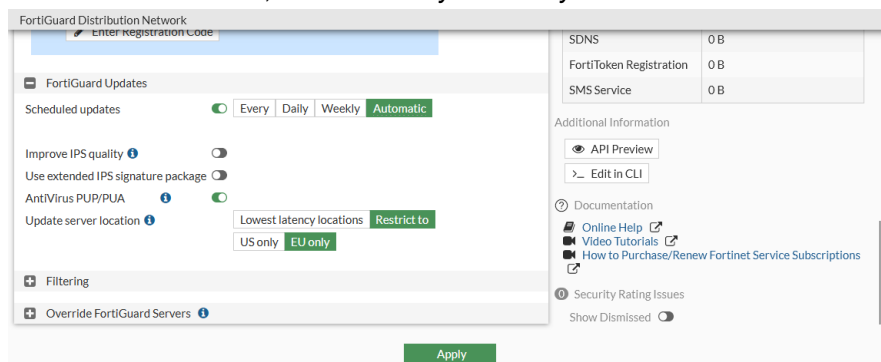

Server location	Anycast domain name	Non-Anycast FQDN addresses
EU only	euupdate.fortinet.net euguardservice.fortinet.net	
US only	usupdate.fortinet.net usguardservice.fortinet.net	usupdate.fortiguard.net UDP: usservice.fortiguard.net HTTPS: ussecurewf.fortiguard.net
Lowest latency (automatic)	globalupdate.fortinet.net globalguardservice.fortinet.net	update.fortiguard.net UDP: service.fortiguard.net HTTPS: securewf.fortiguard.net

On hardware FortiGate devices, the default is *Lowest latency locations*. On VM devices, the default is *US only*.

To configure the update server location in the GUI:

1. Go to *System > FortiGuard*
2. In the *FortiGuard Updates* section, set *Update server location* to *Lowest latency locations* or *Restrict to*.

3. If *Restrict to* is selected, choose *US only* or *EU only*.

4. Click *Apply*.

To configure the update server location in the CLI:

```
config system fortiguard
    set update-server-location {automatic | usa | eu}
end
```

Filtering

Web filtering is used to block access to harmful, inappropriate, and dangerous web sites (see [FortiGuard filter on page 1482](#)).

Email filtering is used to detect and block spam messages (see [FortiGuard-based filters on page 1632](#)).

To configure filtering in the GUI:

1. Go to *System > FortiGuard*
2. Scroll down to the *Filtering* section.
3. Configure the settings as needed:

Web Filter Cache	Enable/disable web filter cache, and set the amount of time that the FortiGate will store a blocked IP address or URL locally. After the time expires, the FortiGate contacts the FDN to verify the address.
Email Filter Cache	Enable/disable email filter cache, and set the amount of time that the FortiGate will store an email address locally.
FortiGuard filtering services	The protocol and port used to contact the FortiGuard servers. These options can be changed in the CLI.
Filtering service availability	The status of the filtering service. Click <i>Test Connectivity</i> if the filtering service is not available.
Request re-evaluation of a URL's category	Click to re-evaluate a URL category rating on the FortiGuard web filter service.

Service	Traffic Volume (Last 24 hours)
FortiCare	0 B
FortiCloud Log	584.07 kB
FortiGuard.com	4.35 MB
FortiGuard Download	63.10 MB
FortiGuard Query	47.81 kB
FortiGate Cloud Sandbox	0 B
OCVPN	0 B
SDNS	0 B
FortiToken Registration	0 B

4. Click *Apply*.

To configure filtering in the CLI:

```
config system fortiguard
    set protocol {https | udp}
    set port {443 | 53 | 8888}
    set antispam-force-off {enable | disable}
    set antispam-cache {enable | disable}
    set antispam-cache-ttl <integer>
    set antispam-cache-mpercent <percent>
    set antispam-timeout <integer>
    set webfilter-force-off {enable | disable}
    set webfilter-cache {enable | disable}
    set webfilter-cache-ttl <integer>
    set webfilter-timeout <integer>
end
```

When anycast is enabled (by default) the protocol is HTTPS and the port is 443.

Online security tools

FortiGuard Labs provides a number of online security tools, including but not limited to:

- **URL lookup**
Enter a website address to see if it has been rated and what category and classification it is filed as. If you find a site that has been wrongly categorized, use this page to request that the site be re-evaluated: <https://www.fortiguard.com/webfilter>
- **Threat Encyclopedia**
Browse FortiGuard Labs extensive encyclopedia of threats. Search for viruses, botnet C&C, IPS, endpoint vulnerabilities, and mobile malware: <https://www.fortiguard.com/encyclopedia>
- **Application Control**
Browse FortiGuard Labs extensive encyclopedia of applications: <https://www.fortiguard.com/appcontrol>

Anycast and unicast services

The following services are accessed by FortiGate:

Service	Non-Anycast FQDN addresses	Anycast Domain name
FortiGuard Object download	update.fortiguard.net	globalupdate.fortinet.net
Querying service (web-filtering, anti-spam ratings) over HTTPS	securewf.fortiguard.net	globalguardservice.fortinet.net
Querying service (web-filtering, anti-spam ratings) over UDP	service.fortiguard.net	Service only in Unicast
Device info Collection	Service only in Anycast	globaldevcollect.fortinet.net
Device info Query	Service only in Anycast	globaldevquery.fortinet.net
FortiGate Cloud logging	logctrl1.fortinet.com	globallogctrl.fortinet.net
FortiGate Cloud management	mgrctrl1.fortinet.com	globalmgrctrl.fortinet.net
FortiGate Cloud messaging	msgctrl1.fortinet.com	globalmsgctrl.fortinet.net
FortiGate Cloud sandbox	aptctrl1.fortinet.com	globalaptctrl.fortinet.net
FortiCare registration	directregistration.fortinet.com	globalregistration.fortinet.net
Secure DNS	sdns.fortinet.net	globalsdns.fortinet.net
FortiCloud FortiClient	forticlient.fortinet.net	globalfctupdate.fortinet.net
FortiMobile Tokens	directregistration.fortinet.com	globalftm.fortinet.net
EMS cloud	forticlient-emsproxy.forticloud.com	Service only in Unicast
DDNS	ddns.fortinet.net	globalddns.fortinet.net
GeoIP	gip.fortinet.net	globalgip.fortinet.net
IP blocklist	ipbl.fortinet.net	N/A

Using FortiManager as a local FortiGuard server

FortiManager can provide a local FortiGuard server with port 443 access.

Anycast FortiGuard settings force the rating process to use port 443, even with an override server. Using a unique address in the same subnet as the FortiManager access IP address, the FortiManager can provide local FortiGuard updates and rating access with a dedicated IP address and port 443.

To use a FortiManager as a local FortiGuard server in the GUI:

1. Go to *System > FortiGuard*
2. In the *Override FortiGuard Servers* table, click *Create New*. The *Create New Override FortiGuard Server* pane opens.
3. Select the server address type: *IPv4*, *IPv6*, or *FQDN*.
4. Enter the FortiManager address in the *Address* field.
5. Select the type of server: *AntiVirus & IPS Updates*, *Filtering*, or *Both*.

6. Click **OK**.

7. Click **Create New** again to add a second override FortiManager for filtering.

8. Click **OK**, then click **Apply**.

To use a FortiManager as a local FortiGuard server in the CLI:

```
config system central-management
  set type fortimanager
  set fmg "172.18.37.148"
  config server-list
    edit 1
      set server-type update
      set server-address 172.18.37.150
    next
    edit 2
      set server-type rating
      set server-address 172.18.37.149
    next
  end
  set fmg-update-port 443
  set include-default-servers enable
end
```

When `fmg-update-port` is set to 443, the update process will use port 443 to connect to the override update server, which is the local FortiGuard server in the FortiManager. If this is not set, the update process will use port 8890, and the server address setting has to be the FortiManager access IP address. Override FortiGuard services come from the server list that is the local FortiGuard server in the FortiManager, and use the traditional, non-OCSP TLS handshake. If override servers in the FortiManager are not available, the default FortiGuard servers are connected, and the anycast OCSP TLS handshake is used.

Cloud service communication statistics

Fortinet service communications statistics are displayed on the *FortiGuard* page. The statistics correspond with the output from `diagnose sys service-communication`. The traffic volume values in the GUI are the sums of data from the last 24 hours.

To view Fortinet service communications statistics:

1. Go to *System > FortiGuard*.

The *Fortinet Service Communications* statistics are displayed on the right side of the screen:

FortiGuard Distribution Network

```

IoT detection service

Internet of Things (IoT) detection is a subscription service that allows FortiGate to detect unknown devices in FortiGuard that are not detected by the local Device Database (CIDB). When the service is activated, FortiGate can send device information to the FortiGuard collection server. When a new device is detected, FortiGate queries the results from the FortiGuard query for more information about the device.

This feature requires an IoT Detection Service license.

FortiGate device requirements:

The FortiGate device must be:

- Registered with FortiCare
- Connected to an anycast FortiGuard server

How the service works:

1. Enable Device Detection on an interface.
2. FortiGate uses the interface to detect device traffic flow.
3. Upon detecting traffic from an unknown device, FortiGate sends the device data to the FortiGuard collection server.
4. The collection server returns data about the new device to the FortiGuard query server.
5. If the device signature does not appear in the local Device Database (CIDB) or some fields are not complete, FortiGate queries FortiGuard for more information about the device.

To view the latest device information in the GUI, go to *Dashboard > Assets & Identities* and expand the *Assets* widget.

To debug the daemon in the CLI:

1. Disable the local device database in order to force all queries to go to FortiGuard.

```
# diagnose cid sigs disable
```

2. Enable iotd debugs:

```
# diagnose debug application iotd -1
# diagnose debug enable
```

FortiGate sends the device data to the FortiGuard collection server:

```
# [iotd] rcv request from caller size:61
[iotd] service:collect hostname: ip: fd:-1 request tlv_len:41
[iotd] txt(.....y...w.....Jasons-iPhone6....579=23..)
[iotd] hex
(02010007017903060f77fc0203000e4a61736f6e732d6950686f6e6536020400083537393d32330cff)
[iotd] service:collect hostname:globaldevcollect.fortinet.net ip: fd:-1 got server
hostname
[iotd] service:collect hostname:globaldevcollect.fortinet.net ip:173.243.138.29 fd:-1
got server ip
[iotd] service:collect hostname:globaldevcollect.fortinet.net ip:173.243.138.29 fd:13
socket created

type 'Mobile' src fortiguard id 0 weight 100
family 'Mobile' src fortiguard id 0 weight 100
os 'iOS' src fortiguard id 0 weight 100
host 'Jasons-iPhone6' src dhcp
```

Using FortiManager as an override server for IoT query services

FortiGate can use FortiManager as an override server for IoT query services. The FortiManager must be running 7.2.1 or later.

All IoT daemon query and collected data can be sent to a FortiManager, instead of directly to FortiGuard. This is useful when there are strict policies controlling the kind of traffic that can go to the internet.

To send all IoT daemon query and collected data to a FortiManager:

```
config system central-management
  config server-list
    edit 1
      set server-type iot-query iot-collect
      set server-address <x.x.x.x>
    next
  end
end
```

```
server-type iot-query
            iot-collect

server-address <x.x.x.x>
```

Set the FortiGuard service types:

- `iot-query`: IoT query server.
- `iot-collect`: IoT device collection server.

Enter the IPv4 address of the FortiManager.

FortiAP query to FortiGuard IoT service to determine device details

A FortiAP collects packets from devices and queries FortiGuard with the help of the FortiGate. Device detection results are reported back to the FortiGate where this information is displayed. Querying the FortiGuard service requires an IoT Detection Service license.

The following attributes can be configured in `wireless-controller` setting:

Attribute	Description
<code>device-weight <integer></code>	Set the device upper limit of confidence (0 - 255, default = 1, 0 = disable).
<code>device-holdoff <integer></code>	Set the device lower limit of creation time, in minutes (0 - 60, default = 5).
<code>device-idle <integer></code>	Set the device upper limit of idle time, in minutes (0 - 14400, default = 1440).

To query the FortiGuard IoT service:

```
config wireless-controller setting
...
set device-weight 1
set device-holdoff 5
set device-idle 1440
...
end

# diagnose user device list
vd root/0 54:27:1e:e6:26:3d gen 89 req OUA/34
created 70s gen 86 seen 2s port29 gen 28
ip 10.29.1.214 src mac
hardware vendor 'Asustek compute' src fortiguard id 0 weight 21
type 'Home & Office' src fortiguard id 0 weight 21
family 'Computer' src fortiguard id 0 weight 21
os 'Linux' src dhcp id 822 weight 128
host 'test-wifi' src dhcp
```

FortiGate Cloud / FDN communication through an explicit proxy

Explicit proxy communication to FortiGate Cloud and FortiGuard servers from FortiGate is enabled. A proxy server can be configured in the FortiGuard settings so that all FortiGuard connections under the `forticldd` process can be established through the proxy server.

Not all FortiGuard services are supported by these proxy settings. For example, web filter service traffic to FortiGuard will not be directed to the configured proxy.

To configure a proxy server and communicate with FortiGate Cloud through it:

1. Configure FortiGate B as a proxy server:

```
config firewall proxy-policy
  edit 1
    set proxy explicit-web
    set dstintf "wan1"
    set srcaddr "all"
    set dstaddr "all"
    set service "webproxy"
    set action accept
    set schedule "always"
    set logtraffic all
    set users "guest1"
  next
end
config user local
  edit "guest1"
    set type password
    set passwd 123456
  next
end
config authentication scheme
  edit "local-basic"
    set method basic
    set user-database "local-user-db"
  next
end
config authentication rule
  edit "local-basic-rule"
    set srcaddr "all"
    set ip-based disable
    set active-auth-method "local-basic"
  next
end
```

2. Configure a firewall policy on FortiGate B to allow FortiGate A to get DNS resolution:

```
config firewall policy
  edit 1
    set name "dns"
    set srcintf "port18"
    set dstintf "wan1"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "DNS"
    set fsso disable
    set nat enable
```

```

    next
end

```

3. Configure the FortiGuard proxy settings on FortiGate A:

```

config system fortiguard
    set proxy-server-ip 10.2.2.2
    set proxy-server-port 8080
    set proxy-username "guest1"
    set proxy-password 123456
end

```

4. On FortiGate A, log in to FortiGate Cloud to activate the logging service:

```
execute fortiguard-log login <username> <password>
```

5. On FortiGate A, view the `forticldd` debug message to see the connection to the log controller through the proxy server:

```
# diagnose test application forticldd 1
```

FDS-only ISDB package in firmware images

FortiOS firmware images include Fortinet objects in the built-in Internet Service Database (ISDB).

```

# diagnose firewall internet-service list
List internet service in kernel(global):
Internet Service Database Kernel Table: size 14974 bytes, Entry size 5844 bytes, number of
index table entries 165 number of IP range table entries 0

Group(0): Weight(15), number of entries(162)
.....

```

This lightweight ISDB package allows firewall rules and policy routes that use ISDB to access FortiGuard servers to continue working after upgrading FortiOS. For example, the following policy will work after an upgrade:

```

config firewall policy
    edit 440
        set name "Fortinet Updates"
        set srcintf "port25"
        set dstintf "port1"
        set srcaddr "FortiAnalyzer" "FortiAuthenticator" "Tesla Management Interface"
        "BackupFortinet" "SipFW" "ConnectVPNMgrt"
        set internet-service enable
        set internet-service-id 1245187 1245326 1245324 1245325 1245193 1245192 1245190
        1245185
        set action accept
        set schedule "always"
        set logtraffic all
        set fsso disable
    next
end

```

After the FortiGate reboots after a firmware update, an automatic update will run in five minutes so that the FortiGate can get the ISDB, whether or not scheduled update is enabled.

```
# diagnose autoupdate versions | grep Internet -A 6
```

Internet-service Full Database

Licensing in air-gap environments

In the Operational Technology industry, industrial equipment is critical and must not be connected to the internet. However, the equipment is still required to be protected by a firewall in this air-gap environment. Without a gateway to FortiGuard in air-gap environments, FortiGuard packages, such as AntiVirus and IPS, must be manually uploaded to the FortiGate. FortiGate licenses can be downloaded from FortiCloud and uploaded manually to the FortiGate.

Manual licensing for air-gap environments is supported only on FortiGate hardware appliances, for both rugged and non-rugged models running FortiOS 7.2.0 or later. Manual licensing is currently not supported on FortiGate virtual machine (VM) appliances.

To manually upload FortiGate licenses in the GUI:

1. Register the FortiGuard license on FortiCloud. See [Registration](#) in the FortiOS Administration Guide for more information.
2. Download the product entitlement file in FortiCloud:
 - a. Go to *Products > Product List*.
 - b. Select the serial number of the FortiGate. The product page opens.
 - c. In the *License & Key* section, click *Get The License File*. The file downloads to your device in the format FG201E*****ProductEntitlement.lic.
3. In FortiOS, go to *System > FortiGuard*. Currently, the status for all services is *Pending*.

The screenshot displays the FortiGuard Distribution Network interface. On the left, the 'License Information' section shows a table of services and their status:

Entitlement	Status
FortiCare Support	Pending
Firmware & General Updates	Pending
AntiVirus	Pending
Web Filtering	Pending
Outbreak Prevention	Pending
SD-WAN Network Monitor	Pending
Security Rating	Pending
Industrial DB	Pending
FortiIPAM	Pending
IoT Detection Service	Pending
FortiGate Cloud	Not Activated

At the bottom of this table is an 'Activate' button. To the right, the 'FortiGuard Updates' section shows the next update time (2022/03/07 15:26:00) and buttons for 'Update Licenses & Definitions Now' and 'Upload License File'. A red error message states 'Unable to connect to FortiGuard servers.' Below this, the 'Fortinet Service Communications' table shows traffic volume for various services:

Service	Traffic Volume (Last 24 hours)
FortiCare	0 B
FortiGate Cloud Log	0 B
FortiGuard.com	0 B
FortiGuard Download	0 B
FortiGuard Query	0 B

An 'Apply' button is located at the bottom center of the interface.

4. Click *Upload License File*. The file explorer opens.
5. Navigate to the product entitlement file and click *Open*.

The license file uploads to the FortiGate. Once the upload is complete, the FortiGate shows that it is registered and licensed.

The screenshot shows the FortiGuard Distribution Network interface. On the left, the 'License Information' section displays a table of entitlements and their status. On the right, the 'FortiGuard Updates' section shows the next update time and buttons to update licenses and definitions. Below this, a red error message states 'Unable to connect to FortiGuard servers.' and a table of Fortinet Service Communications shows traffic volume for various services.

Entitlement	Status	Actions
FortiCare Support	Registered

6. Click *Apply*.

To manually upgrade the AntiVirus Database in the GUI:

- Download the static upgrade file from FortiCloud:
 - Go to support.fortinet.com.
 - Go to *Download > Download FortiGuard Service Updates > FortiGate*.
 - Select the FortiOS version from the *OS Version* dropdown.
 - Select the file from the appropriate FortiGate product model section. The file downloads to your device.
- In FortiOS, go to *System > FortiGuard* and expand the *AntiVirus* section to view the current licenses.

The screenshot shows the FortiGuard Distribution Network interface with the 'AntiVirus' section expanded. The 'License Information' table now includes details for the AntiVirus license, such as the version and the 'Upgrade Database' button. The 'FortiGuard Updates' and 'Fortinet Service Communications' sections remain visible on the right.

Apply

- Click *Upgrade Database*. The *Anti-Virus Database Upgrade* pane opens.
- Click *Upload*. The file explorer opens.
- Navigate to the static upgrade file and click *Open*.
- Click *OK*.

7. Click *Apply*.

The AntiVirus Database is upgraded.

To manually upload FortiGate licenses in the CLI:

```
# execute restore manual-license {ftp | tftp} <license file name> <server> [args]
```

License expiration

The FortiGate will still function as a firewall if any or all of the FortiGuard licenses are expired. Valid FortiGuard licenses are required to receive database and signature updates, and to perform real-time or near-real-time security lookups to detect and quickly adjust your security posture for newly discovered attacks.

FortiGuard services are designed to be continuous. Any lapses in the service will require coverage back to the contract expiration date. For more information, see [FortiCare/FortiGuard Renewal Continuous Service Policy](#).

License type	Expiration impact
Firmware & General Update	<p>Application Control, Device & OS Identification, and Internet Service Database Definitions continue to work, but the databases are not updated and no new signatures are added.</p> <p>For example, if application control is used in a firewall policy that has an internet service applied to the source or destination addresses, then the policy will continue to inspect matching traffic using the FortiGate's existing application control signatures and ISDB definitions.</p> <p>Application control, device and OS detection, and internet service database are included in the base services that are included with all FortiCare support contracts. See FortiGuard Security Services for details.</p>
Intrusion Prevention	<p>IPS scanning continues to work, but the IPS databases are not updated and no new signatures are added.</p> <p>For example, if an IPS sensor with <i>Block malicious URLs</i> enabled is used in a firewall policy, then the policy will continue to inspect matching traffic using the FortiGate's existing IPS signatures and malicious URLs database.</p> <p>An active IPS license is critical for stopping sophisticated and zero-day attacks, as FortiGuard IPS provides near-real-time intelligence with thousands of intrusion prevention rules to detect and block known and zero-day threats.</p> <p>For more information, see Intrusion prevention on page 1589.</p>
Botnet IPs/Domains	<p>IPS sensors and DNS Filter profiles with Botnet C&C configured continue to work, but the Botnet IPs and Botnet Domain databases are not updated and no new signatures are added.</p> <p>While Botnet IPs and Domain are listed in the Intrusion Prevention category, they are actually part of the Firmware & General Updates contract.</p> <p>For more information, see Botnet C&C domain blocking on page 1538 and IPS with botnet C&C IP blocking on page 1606.</p>

License type	Expiration impact
AntiVirus	<p>Antivirus scanning continues to work, but the antivirus database is not updated and no new signatures are added.</p> <p>For more information, see Antivirus on page 1432.</p>
Web and DNS Filtering	<p>Category-based Web and DNS filtering stops working, as URLs and domains are sent to FortiGuard in real-time to determine the category.</p> <p>By default, all web and DNS traffic is dropped. If allowing website or DNS requests when a rating error occurs is enabled, then all web and DNS traffic passes through without filtering.</p> <p>If static URL or domain filtering is applied in a filter profile, those filters continue to work.</p> <p>Configurations where only specific URLs and domains are allowed and all others are blocked continue to work, but this is not a scalable solution blocking websites or performing category filtering.</p> <p>For more information, see FortiGuard filter on page 1482 and FortiGuard category-based DNS domain filtering on page 1535.</p>
Email Filtering	<p>Spam filtering stops working, as it queries the FortiGuard spam filtering server in real-time to check spammer IP addresses and emails (except those that are locally configured), phishing URLs, spam URLs, spam email checksums, and spam submissions. Anti-spam signatures are not updated.</p> <p>Profile options based on local spam filtering continue to work.</p> <p>For more information, see Email filter on page 1623.</p>
Outbreak Prevention	<p>Outbreak prevention stops working, as it uses real-time lookups to the FortiGuard Global Threat Intelligence database.</p> <p>For more information, see FortiGuard outbreak prevention on page 1444.</p>
Security Rating	<p>The security rating check stops working.</p> <p>Security Rating licenses are required to run security rating checks across all of the devices in the Security Fabric. They allow rating scores to be submitted to and received from FortiGuard for network ranking. Without security rating checks, critical vulnerabilities and configuration weaknesses in the Security Fabric cannot be identified, and best practice recommendations cannot be implemented.</p> <p>For more information, see Security rating on page 2905.</p>
Operational Technology (OT) Threat Definition	<p>OT Security Services signatures continue to work, but the database attack definitions are not updated and no new signatures are added.</p> <p>OT Security Services include application control and IPS signatures for OT applications and protocols.</p> <p>For example, if an IPS sensor enabled with OT Security Service signatures is used in a firewall policy, then the policy will continue to inspect matching traffic using the FortiGate's existing OT threat definition IPS signatures.</p> <p>For more information, see OT threat definitions on page 1600.</p>

Feature visibility

Feature visibility is used to control which features are visible in the GUI. This allows features that are not in use to be hidden. Some features are also invisible by default and must be made visible before they can be configured in the GUI.

The visibility of a feature does not affect its functionality or configuration. Invisible features can still be configured using the CLI.

To change the visibility of features:

1. Go to *System > Feature Visibility*.
2. Change the visibility of the features as required.
For information about what settings each option affects, click on the + icon to the right of the feature name.
Changes are listed on the right side of the content pane.
3. Click *Apply*.

Certificates

FortiOS leverages certificates in multiple areas, such as VPNs, administrative access, and deep packet inspection. This section contains topics about uploading certificates and provides examples of how certificates may be used to encrypt and decrypt communications, and represent the identity of the FortiGate. This section assumes the reader has a high level understanding of the public key infrastructure (PKI) system, particularly how entities leverage trusted certificate authorities (CAs) to verify the authenticating party, and how public and private certificate keys work to secure communications.

The certificates feature is hidden by default in FortiOS. In the GUI, go to *System > Feature Visibility* and enable *Certificates*.

For additional capabilities and enhanced certificate management, please review the FortiAuthenticator [Administration Guide](#) and [Cookbook](#).

The following topics provide information about certificates:

- [Automatically provision a certificate on page 2703](#)
- [Generate a new certificate on page 2707](#)
- [Regenerate default certificates on page 2708](#)
- [Import a certificate on page 2709](#)
- [Generate a CSR on page 2711](#)
- [CA certificate on page 2714](#)
- [Remote certificate on page 2714](#)
- [Certificate revocation list on page 2715](#)
- [Export a certificate on page 2715](#)
- [Uploading certificates using an API on page 2716](#)

The following topics provide examples of how to use certificates:

- [Procuring and importing a signed SSL certificate on page 2721](#)
- [Microsoft CA deep packet inspection on page 2723](#)

- [Administrative access using certificates on page 2728](#)
- [Creating certificates with XCA on page 2728](#)
- [Site-to-site VPN with digital certificate on page 1800](#)
- [Configuring FortiClient EMS on page 2789](#)
- [SSL VPN with certificate authentication on page 2093](#)
- [SSL VPN with LDAP-integrated certificate authentication on page 2099](#)
- [Configuring certificates for SAML SSO on page 2893](#)
- [Protecting an SSL server on page 1727](#)
- [Using the default certificate for HTTPS administrative access on page 2471](#)

Automatically provision a certificate

The Automated Certificate Management Environment (ACME), as defined in [RFC 8555](#), is used by the public Let's Encrypt certificate authority (<https://letsencrypt.org>) to provide free SSL server certificates. The FortiGate can be configured to use certificates that are managed by Let's Encrypt, and other certificate management services, that use the ACME protocol. The server certificates can be used for secure administrator log in to the FortiGate.

- The FortiGate must have a public IP address and a hostname in DNS (FQDN) that resolves to the public IP address.
- The configured ACME interface must be public facing so that the FortiGate can listen for ACME update requests. It must not have any VIPs, or port forwarding on port 80 (HTTP) or 443 (HTTPS).
- The Subject Alternative Name (SAN) field is automatically filled with the FortiGate DNS hostname. It cannot be edited, wildcards cannot be used, and multiple SANs cannot be added.

ACME certificates do not support loopback interfaces.

This example shows how to import an ACME certificate from Let's Encrypt, and use it for secured remote administrator access to the FortiGate.

To generate a certificate using ACME and Let's Encrypt:

1. Go to **System > Certificates** and click **Create/Import > Certificate**.

2. Click **Use Let's Encrypt**.
3. Set **Certificate name** to an appropriate name for the certificate. This is what is referenced when using the certificate in FortiGate configurations.
4. Set **Domain** to the public FQDN of the FortiGate.
5. Set **Email** to a valid email address. The email is not used during the enrollment process.

6. Click **Create**.
7. Set the **ACME interface**, on which the ACME client will listen for challenges in order to provision and renew certificates. The challenge is how the certificate signing request is validated by Let's Encrypt.

8. Click **OK**. Let's Encrypt provisions the certificate and the certificate is added to the certificate list in the **Local Certificates** section.

9. Click **View Details** to verify that the FortiGate's FQDN is in the certificate's *Subject: Common Name (CN)*.

To import an ACME certificate in the CLI:

1. Set the interface that the FortiGate communicates with Let's Encrypt on:

```
config system acme
    set interface "port1"
end
```

2. Make sure that the FortiGate can contact the Let's Encrypt enrollment server:

```
# execute ping acme-v02.api.letsencrypt.org
PING ca80a1adb12a4fbdac5ffcbc944e9a61.pacloudflare.com (172.65.32.248): 56 data bytes
64 bytes from 172.65.32.248: icmp_seq=0 ttl=60 time=2.0 ms
64 bytes from 172.65.32.248: icmp_seq=1 ttl=60 time=1.7 ms
64 bytes from 172.65.32.248: icmp_seq=2 ttl=60 time=1.7 ms
64 bytes from 172.65.32.248: icmp_seq=3 ttl=60 time=2.1 ms
64 bytes from 172.65.32.248: icmp_seq=4 ttl=60 time=2.0 ms

--- ca80a1adb12a4fbdac5ffcbc944e9a61.pacloudflare.com ping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
round-trip min/avg/max = 1.7/1.9/2.1 ms
```

3. Configure the local certificate request:

```
config vpn certificate local
    edit "acme-test"
        set enroll-protocol acme2
        set acme-domain "test.ftntlab.de"
        set acme-email "techdoc@fortinet.com"
    next
By enabling this feature you declare that you agree to the Terms of Service at
https://acme-v02.api.letsencrypt.org/directory
Do you want to continue? (y/n)y
end
```

4. Verify that the enrollment was successful:

```
# get vpn certificate local details acme-test
path=vpn.certificate, objname=local, tablename=(null), size=2632
== [ acme-test ]
    Name:          acme-test
```

```
Subject:      CN = test.ftntlab.de
Issuer:       C = US, O = Let's Encrypt, CN = R3
Valid from:   2021-03-11 17:43:04 GMT
Valid to:     2021-06-09 17:43:04 GMT
Fingerprint: 9A:03:0F:41:29:D7:01:45:04:F3:16:C0:BD:63:A2:DB
Serial Num:   03:d3:55:80:d2:e9:01:b4:ca:80:3f:2e:fc:24:65:ad:7c:0c
```

ACME details:

```
Status: The certificate for the managed domain has been renewed successfully and
can be used (valid since Thu, 11 Mar 2021 17:43:04 GMT).
Staging status: Nothing in staging
```

5. Check the ACME client full status log for the CN domain:

```
# diagnose sys acme status-full test.ftntlab.de
{
  "name": "test.ftntlab.de",
  "finished": true,
  "notified": false,
  "last-run": "Thu, 11 Mar 2021 18:43:02 GMT",
  "valid-from": "Thu, 11 Mar 2021 17:43:04 GMT",
  "errors": 0,
  "last": {
    "status": 0,
    "detail": "The certificate for the managed domain has been renewed successfully and
can be used (valid since Thu, 11 Mar 2021 17:43:04 GMT). A graceful server restart now
is recommended.",
    "valid-from": "Thu, 11 Mar 2021 17:43:04 GMT"
  },
  "log": {
    "entries": [
      {
        "when": "Thu, 11 Mar 2021 18:43:05 GMT",
        "type": "message-renewed"
      },
      ...
      {
        "when": "Thu, 11 Mar 2021 18:43:02 GMT",
        "type": "starting"
      }
    ]
  }
}
```

To exchange the default FortiGate administration server certificate for the new public Let's Encrypt server certificate in the GUI:

1. Go to *System > Settings*.
2. Set *HTTPS server certificate* to the new certificate.

3. Click *Apply*.
4. Log in to the FortiGate using an administrator account from any internet browser. There should be no warnings related to non-trusted certificates, and the certificate path should be valid.

To exchange the default FortiGate administration server certificate for the new public Let's Encrypt server certificate in the CLI:

```
config system global
    set admin-server-cert "acme-test"
end
```

When you log in to the FortiGate using an administrator account there should be no warnings related to non-trusted certificates, and the certificate path should be valid.

Generate a new certificate

The FortiGate can generate a certificate using a pre-loaded, self-signed CA certificate: *Fortinet_CA_SSL*, instead of generating a CSR and providing it to a CA for signing. It is recommended that a server certificate from a well-known and trusted CA is used.

To generate a new certificate:

1. Go to *System > Certificates* and select *Create/Import > Certificate*.
2. Click *Generate Certificate*.
3. Set *Certificate name* to the name of the certificate. This is what is referenced when using the certificate in FortiGate configurations.
4. Set the *Common name* (CN) for the certificate. The common name should match the FQDN or IP of the primary SSL-VPN interface.
5. Optionally, set the *Subject alternative name*.
6. Click *Download CA Certificate* to download the CA certificate so that it can be installed or imported to all the machines that need to trust this certificate.

Create Certificate

Choose Method Certificate Details Create Certificate Review

Generate New Certificate

Certificate authority: Fortinet_CA_SSL

Certificate name: self-created-certificate

Common name: Branch1.domain.local

The common name should match the FQDN or IP of the primary SSL-VPN interface.

Subject alternative name:

Update Your List of Trusted Certificate Authorities

Fortinet_CA_SSL is a local CA certificate. To avoid certificate warnings, you must download it and install it on each client machine.

[Download CA Certificate](#)

Create **Back** **Cancel**

7. Click **Create**.

8. After the certificate is created, click **Download Certificate** to download the certificate. Click **View Details** to review the certificate details.

Create Certificate

Fortinet_CA_SSL is a local CA certificate. To avoid certificate warnings, you must download it and install it on each client machine.

[Download CA Certificate](#)

OK

9. Click **OK**.

Regenerate default certificates

The FortiGate includes default certificates that are generated the first time that the FortiGate is booted up. In some circumstances, it can be necessary to regenerate these certificates, such as when they are nearing expiry, or if the key becomes compromised.

To regenerate default certificates:

```
# execute vpn certificate local generate default-gui-mgmt-cert
# execute vpn certificate local generate default-ssl-ca
# execute vpn certificate local generate default-ssl-ca-untrusted
# execute vpn certificate local generate default-ssl-key-certs
# execute vpn certificate local generate default-ssl-serv-key
```

default-gui-mgmt-cert	Regenerate the default GUI management admin-server (Fortinet_GUI_Server) certificate.
default-ssl-ca	Regenerate the default CA certificate (Fortinet_CA_SSL) used by SSL Inspection.
default-ssl-ca-untrusted	Regenerate the default untrusted CA certificate (Fortinet_CA_Untrusted) used by SSL Inspection.
default-ssl-key-certs	Regenerate the default RSA, DSA, ECDSA, and EdDSA key certificates for SSL resign: <ul style="list-style-type: none"> • Fortinet_SSL_DSA1024 • Fortinet_SSL_DSA2048 • Fortinet_SSL_ECDSA256 • Fortinet_SSL_ECDSA384 • Fortinet_SSL_ECDSA521 • Fortinet_SSL_ED448 • Fortinet_SSL_ED25519 • Fortinet_SSL_RSA1024 • Fortinet_SSL_RSA2048 • Fortinet_SSL_RSA4096
default-ssl-serv-key	Regenerate the default server key (Fortinet_SSL) used by SSL Inspection.

Import a certificate

You can upload a certificate to the FortiGate that was generated on its own. This is typical of wildcard certificates (*.domain.tld) where the same certificate is used across multiple devices (FGT.domain.tld, FAZ.domain.tld, and so on), but can also be used for individual certificates as long as the information provided to the signing CA matches that of the FortiGate.

Any certificate uploaded to a VDOM is only accessible to that VDOM. Any certificate uploaded to the Global VDOM is globally accessible by all VDOMs.

A signed certificate that is created using a CSR that was generated by the FortiGate does not include a private key, and can be imported to the FortiGate from a the management computer or a TFTP file server.

There are three options:

- [Local certificate on page 2709](#)
- [PKCS #12 certificate on page 2710](#)
- [Certificate on page 2710](#)

Local certificate

This option allows you to upload a single file and no key. Use it when you have created a CSR on the FortiGate ([Generate a CSR on page 2711](#)), as the key is generated as part of the CSR process and remains on the FortiGate. You must upload a .CER file.

To import a local certificate in the GUI:

1. Go to *System > Certificates* and select *Create/Import > Certificate*.
2. Click *Import Certificate*.
3. Set *Type* to *Local Certificate*.
4. Click *Upload*, and locate the certificate on the management computer.

5. Click *Create*, then click *OK* on the confirmation page.

To import a local certificate in the CLI:

```
execute vpn certificate local import tftp <filename> <tftp_IP> cer
```

PKCS #12 certificate

This option takes a specific certificate file type that contains the private key. The certificate is encrypted and a password must be supplied with the certificate file. PKCS #12 certificates are .PFX files.

To import a PKCS #12 certificate in the GUI:

1. Go to *System > Certificates* and select *Create/Import > Certificate*.
2. Click *Import Certificate*.
3. Set *Type* to *PKCS #12 Certificate*.
4. Click *Upload*, and locate the certificate on the management computer.
5. Enter the password, then confirm the password.
6. Optionally, customize the *Certificate name*.
7. Click *Create*, then click *OK* on the confirmation page.

To import a PKCS #12 certificate in the CLI:

```
execute vpn certificate local import tftp <filename> <tftp_IP> p12 <password>
```

Certificate

This option is intended for certificates that were generated without using the FortiGate's CSR. Because the certificate private key is being uploaded, a password is required. This option is similar to PKCS #12 certificate, but the certificate and key file are separate files, usually .CER and .PEM files.

To import a certificate in the GUI:

1. Go to *System > Certificates* and select *Create/Import > Certificate*.
2. Click *Import Certificate*.
3. Set *Type* to *Certificate*.
4. In the *Certificate* field, click *Upload*, and locate the certificate on the management computer.
5. In the *Key file* field, click *Upload*, and locate the key file on the management computer.
6. Enter the password, then confirm the password.

7. Optionally, customize the *Certificate name*.
8. Click *Create*, then click *OK* on the confirmation page.

To import a certificate that requires a private key to a VDOM, or when VDOMs are disabled:

```
config vpn certificate {local | ca | remote | ocsf-server | crl}
```

Refer to the FortiOS CLI Reference for detailed options for each certificate type ([local](#), [CA](#), [remote](#), [OSCP server](#), [CRL](#)).

To import a global certificate that requires a private key when VDOMs are enabled:

```
config certificate {local | ca | remote | crl}
```

This command is only available when VDOMs are enabled. For details, see the [FortiOS CLI Reference](#).

Generate a CSR

Certificate signing requests (CSRs) are used to generate a certificate which is then signed by a CA to create a chain of trust. The CSR includes details about the FortiGate and its public key. A CSR is not strictly necessary; some CAs allow you to provide the details of the FortiGate manually, but a CSR helps streamline the process.

To generate a CSR in the GUI:

1. Go to *System > Certificates* and select *Create/Import > Generate CSR*.

2. Enter the following information:

Certificate Name	Enter the certificate name; this is how it will appear in the <i>Local Certificates</i> list.
Subject Information	Specify an ID type: host IP address, domain name (FQDN), or email address.
Optional Information	Although listed as optional, we recommended entering the information for each field in this section. If you are generating a CSR for a third-party CA, you need to insure that these values reflect those listed for your company or organization at said certificate authority. If you are generating a certificate for a Microsoft CA, you need to check with the administrator regarding these values.
Organization Unit	Enter the name of the organizational unit under which the certificate will be issued.
Organization	Enter the overall name of the organization.
Locality(City)	Enter the city where the SSL certificate is located.
State / Province	Some issuers will reject a CSR that has an abbreviated state or province, so enter the full name of the state or province.
Country / Region	Enable the option and select the country from the dropdown.
E-Mail	Enter the email address of the technical contact for the SSL certificate that is being requested.
Subject Alternative Name	This field allows multiple domains to be used in an SSL certificate. Select from email addresses, IP addresses, URIs, DNS names, and so on.

Password for private key	If supplied, this is used as an encryption password for the private key file.
Key Type	Select <i>RSA</i> or <i>Elliptic Curve</i> .
Key Size	When <i>Key Type</i> is <i>RSA</i> , select 1024, 1536, 2048, or 4096 for bit-size/strength. We recommend using at least 2048 if your CA can issue certificates of that size.
Curve Name	When <i>Key Type</i> is <i>Elliptic Curve</i> , select the elliptic curve type: secp256r1, secp384r1, or secp521r1.
Enrollment Method	<p>Select one of the following methods that determines how the CSR will be signed.</p> <ul style="list-style-type: none"> File Based: this will generate a certificate in the certificate menu under <i>Local Certificate</i>, which differs from the existing ones because it has no <i>Subject</i>, <i>Comments</i>, <i>Issuer</i>, or <i>Expires</i> values in the table. It will also show a <i>Pending</i> status because it is only a CSR at the moment and cannot function as a certificate just yet. You can download the CSR to provide to a CA for signing. If you open the CSR file, it should look similar to this: <pre> -----BEGIN CERTIFICATE REQUEST----- MIIC7jCCAdYCAQAwgZUxCzAJBgNVBAYT (...)HEKjDX+Hg== -----END CERTIFICATE REQUEST----- </pre> <p>Next, the CSR file is supplied to a CA for signing and the returned file from the CA should be in .CER format. This file is then uploaded to the FortiGate by going to <i>System > Certificates > Import > Local Certificate</i> and uploading the CER file.</p> Online SCEP: the Simple Certificate Enrollment Protocol (SCEP) allows devices to enroll for a certificate by using a URL and a password. The SCEP server works as a proxy to forward the FortiGate's request to the CA and returns the result to the FortiGate (setting up an SCEP server is beyond the scope of this topic). Once the request is approved by the SCEP server, the FortiGate will have a signed certificate containing the details provided in the CSR.

3. Click OK.

The CSR generated, and can be downloaded from the local certificate list.

To generate a CSR in the CLI:

```
# execute vpn certificate local generate cmp-ec <certificate_name> <key_size> <server>
<path> <server_certificate> <auth_certificate> <user> <password> <subject> [SANs] [source_IP]

# execute vpn certificate local generate cmp-rsa <certificate_name> <key_size> <server>
<path> <server_certificate> <auth_certificate> <user> <password> <subject> [SANs] [source_IP]

# execute vpn certificate local generate ec <certificate_name> <curve_name> <subject>
<country> <state/province> <city> <organization> <OU> <email> [SANs] [options]

# execute vpn certificate local generate rsa <certificate_name> <key_size> <subject>
<country> <state/province> <city> <organization> <OU> <email> [SANs] [options]
```

cmp-ec	Generate a ECDSA certificate request over CMPv2.
cmp-rsa	Generate a RSA certificate request over CMPv2.
ec	Generate an elliptic curve certificate request.
rsa	Generate a RSA certificate request.

CA certificate

FortiGates come with many CA certificates from well-known certificate authorities pre-installed, just as most modern operating systems like Windows and MacOS. Use this option to add private CA certificates to the FortiGate so that certificates signed by this private CA are trusted by the FortiGate.

For example, a private CA can be used when two FortiGates are establishing a site-to-site VPN tunnel using a certificate not signed by a public or trustworthy CA, or for your LDAPS connection to your corporate AD server that also uses a certificate signed with a private CA in your domain. It is very common to upload a private CA when using PKI user authentication, since most PKI user certificates will be signed by an internal CA.

To import a CA certificate in the GUI:

1. Go to *System > Certificates* and select *Create/Import > CA Certificate*.
2. Set the *Type* to *Online SCEP* or *File*.
 - *Online SCEP*: Enter the *URL of the SCEP server* and optionally, the *Optional CA Identifier*. The FortiGate contacts an SCEP server to request the CA certificate.
 - *File*: Upload the CA certificate file directly from the management computer.
3. Click *OK*.

To import a CA certificate in the CLI:

```
# execute vpn certificate ca import auto <CA_server> [identifier] [source_ip] [fingerprint]
# execute vpn certificate ca import bundle <filename> <tftp_IP>
# execute vpn certificate ca import tftp <filename> <server_address>
# execute vpn certificate ems_ca import tftp <filename> <server_address>
```

auto	Import CA certificate via SCEP.
bundle	Import certificate bundle from a TFTP server.
tftp	Import CA certificate from a TFTP server.

Remote certificate

Remote certificates are public certificates and contain only the public key. They are used to identify a remote device. For example, when configuring your FortiGate for SAML authentication with the FortiGate as an identity provider (IdP), you can optionally specify the service provider (SP) certificate. However, when configuring your FortiGate as a SP, you must specify the certificate used by the IdP. Both these certificates can be uploaded to the FortiGate as a remote certificate, since the private key is not necessary for its implementation.

To upload a remote certificate in the GUI:

1. Go to *System > Certificates* and select *Create/Import > Remote Certificate*.
2. Upload the remote certificate file directly from the management computer.
3. Click **OK**.

To upload a remote certificate in the CLI:

```
# execute vpn certificate remote import tftp <file_name> <server_address>
```

Certificate revocation list

Because it is not possible to recall a certificate, the certificate revocation list (CRL) details certificates signed by valid CAs that should no longer be trusted. Certificates may be revoked for many reasons, such as if the certificate was issued erroneously or if the private key of a valid certificate has been compromised.

To import a CRL in the GUI:

1. Go to *System > Certificates* and select *Create/Import > CA Certificate*.
2. Set the *Import Method* to *File Based* or *Online Updating*.
 - *File Based*: Upload the CRL file directly from the management computer. CAs publish files containing the list of certificates that should no longer be trusted.
 - *Online Updating*: This is the preferred method to keep the list of revoked certificates up to date. Configure the protocols as required.
 - *HTTP*: Enter the *URL of the HTTP server*.
 - *LDAP*: Select the *LDAP Server* and enter the *Username* and *Password*.
 - *SCEP*: Select the *Certificate* and enter the *URL of the SCEP server*.

3. Click **OK**.

To import a CRL in the CLI:

```
# execute vpn certificate crl import auto <CRL_name>
```

Export a certificate

Certificates can be downloaded to the management computer in the GUI and exported to a TFTP server in the CLI.

To back up a certificate in the GUI:

1. Go to *System > Certificates*.
2. Select the certificate from the list.
3. Click *Download*.
4. Save the file to the management computer.

To export the certificate in the CLI:

```
# execute vpn certificate ca export tftp <certificate_name> <filename> <tftp_IP>

# execute vpn certificate local export tftp <certificate_name> <file_type> <filename> <tftp_server>

# execute vpn certificate remote export tftp <certificate_name> <filename> <tftp_server>
```

Uploading certificates using an API

There are several API methods to upload a certificate based on the type and purpose of the certificate. The parameters of each method are available options, and some methods do not require all parameters to upload the certificate.

When uploading a certificate to the FortiGate using API, the certificate must be provided to the FortiGate in Base64 encoding. You must create a REST API user to authenticate to the FortiGate and use the generated API token in the request.

api/v2/monitor/vpn-certificate/ca/import

```
{
  "import_method": "[file|scep]",
  "scep_url": "string",
  "scep_ca_id": "string",
  "scope": "[vdom*|global]",
  "file_content": "string"
}
```

api/v2/monitor/vpn-certificate/crl/import

```
{
  "scope": "[vdom*|global]",
  "file_content": "string"
}
```

api/v2/monitor/vpn-certificate/local/import

```
{
  "type": "[local|pkcs12|regular]",
  "certname": "string",
  "password": "string",
  "key_file_content": "string",
  "scope": "[vdom*|global]",
  "acme-domain": "string",
  "acme-email": "string",
  "acme-ca-url": "string",
}
```

```

    "acme-rsa-key-size": 0,
    "acme-renew-window": 0,
    "file_content": "string"
}

```

api/v2/monitor/vpn-certificate/remote/import

```

{
  "scope": "[vdom*|global]",
  "file_content": "string"
}

```

api/v2/monitor/vpn-certificate/csr/generate

```

{
  "certname": "string",
  "subject": "string",
  "keytype": "[rsa|ec]",
  "keysize": [1024|1536|2048|4096],
  "curvename": "[secp256r1|secp384r1|secp521r1]",
  "orgunits": [
    "string"
  ],
  "org": "string",
  "city": "string",
  "state": "string",
  "countrycode": "string",
  "email": "string",
  "sub_alt_name": "string",
  "password": "string",
  "scep_url": "string",
  "scep_password": "string",
  "scope": "[vdom*|global]"
}

```

Example

In this example, a PKCS 12 certificate is uploaded as a local certificate using Postman as the API client. PowerShell is used for the Base64 encoding.

To upload a PKCS 12 certificate using an API:

1. In PowerShell , encode the PKCS 12 certificate to Base64:

```

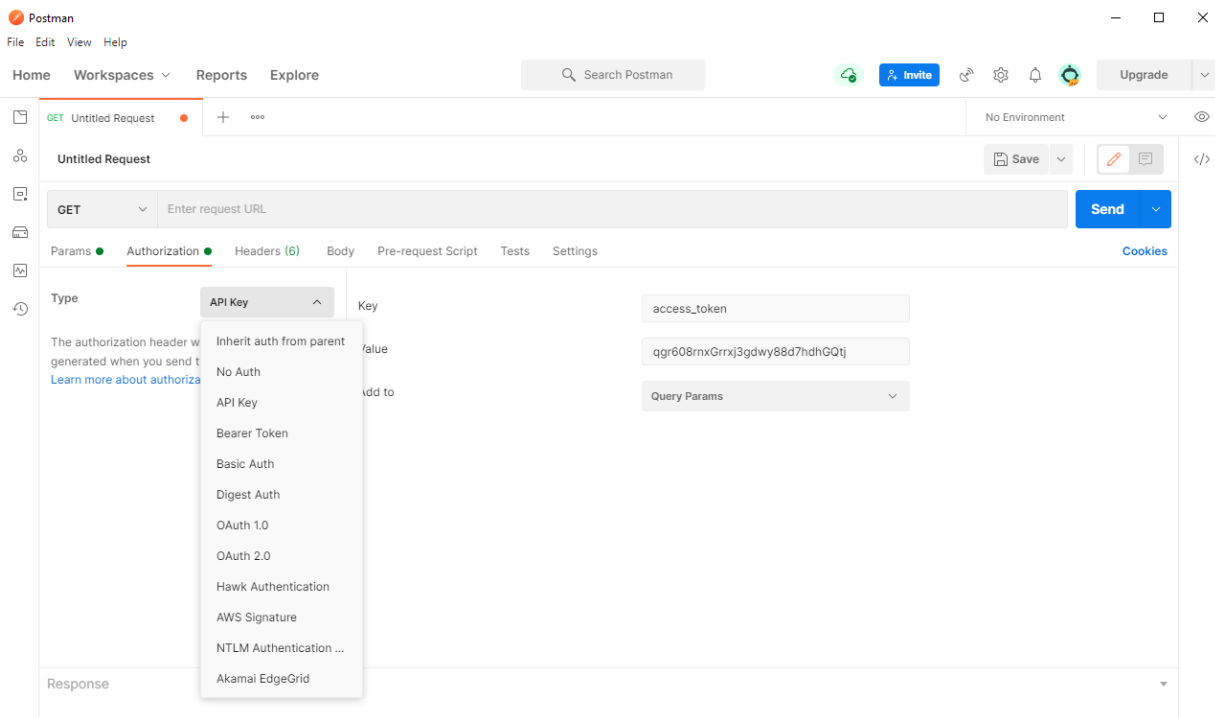

cd C:\users\username\desktop
$pkcs12cert = get-content 'C:\users\path\to\certificate\certificatename.p12' -Encoding
Byte
[System.Convert]::ToBase64String($pkcs12cert) | Out-File 'base12encodedcert.txt'

```

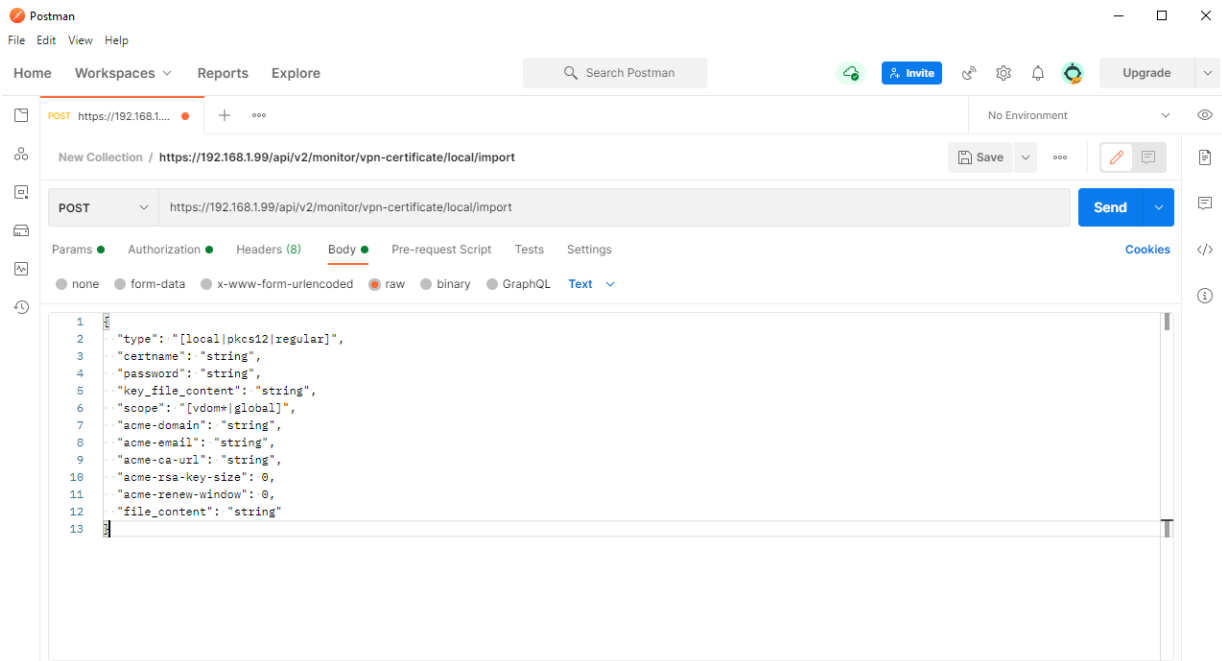

These three lines of code do the following:

- a. Changes to working directory to the location where the encoded certificate will be created. In this example, it is the desktop.
- b. Creates a variable called `pkcs12cert` and defines it as the certificate file by specifying the full path to the certificate.

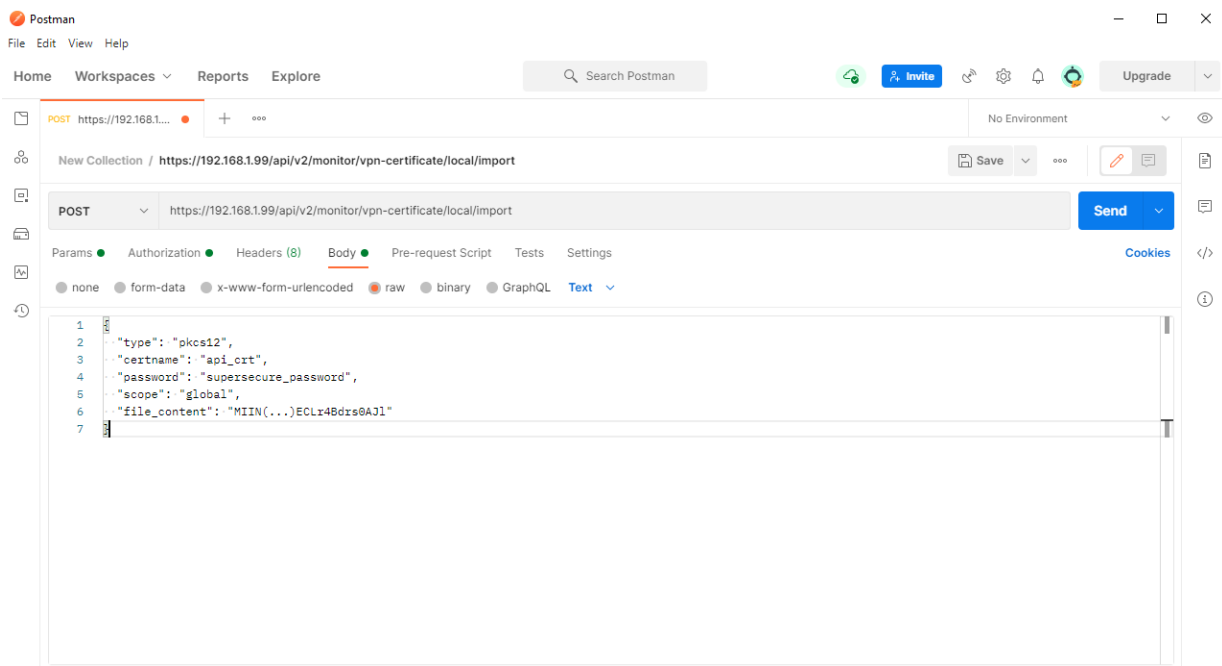

- c. Creates a text file called `base12encodedcert` at the location specified in the first step. You will copy and paste the contents of this as `file_content` later in Postman.
2. Generate an API token on the FortiGate by creating a REST API user. See [Generate an API token](#) on the Fortinet Developer Network. A [subscription to the Fortinet Developer Network](#) is required to view this topic.
3. Open Postman and create a new request:
 - a. Click the **+**.
 - b. Click the *Authorization* tab and in the *Type* dropdown, select *API Key*.
 - c. For *Key*, enter `access_token` and enter the *Value* for the API user.
 - d. For *Add to*, select *Query Params*.

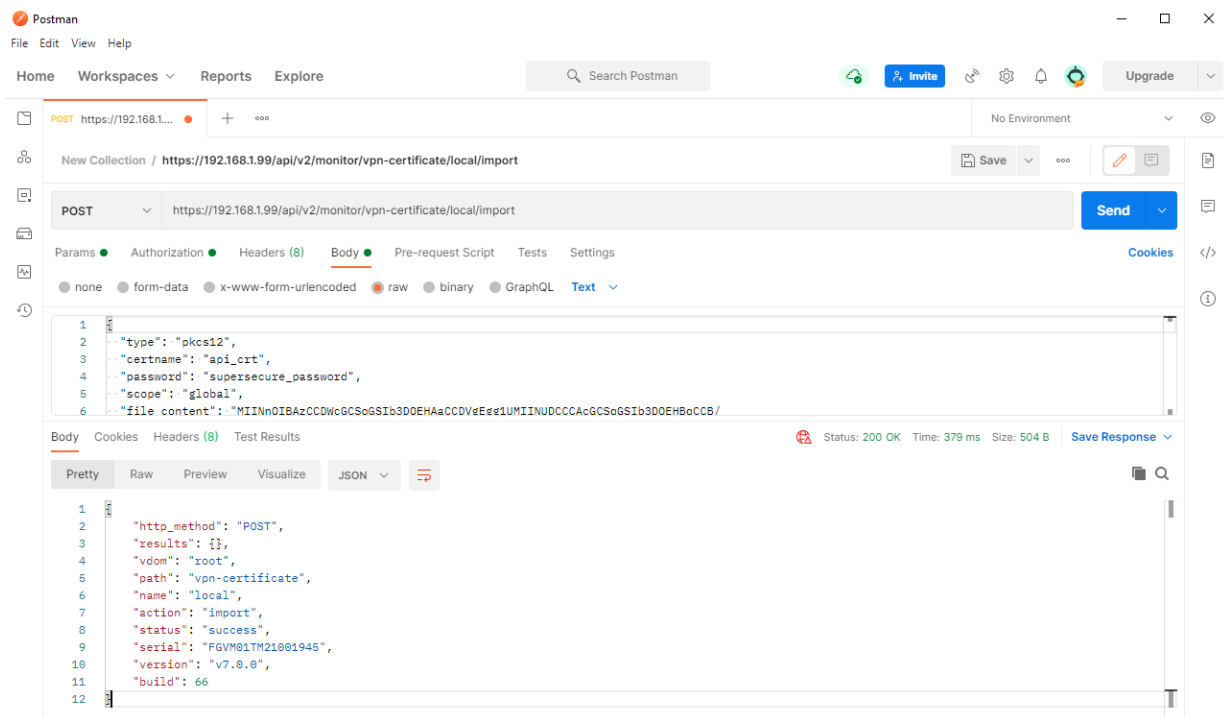

- -
 -
 4. In the HTTP request dropdown, change the request from *GET* to *POST*, and enter the FortiGate's IP address and the URL of the API call.
 5. Click the *Body* tab, and copy and paste the API parameters.

6. Remove unnecessary parameters (ACME related parameters and `key_file_content`) and enter the correct settings for your certificate. Copy and paste the contents of the file generated by PowerShell earlier into `file_content`.

7. Click **Send**. The lower window will return the results.

8. In FortiOS, go to **System > Certificates** and verify that the uploaded certificate is shown in the table (*api.crt*).

To debug using the HTTPS daemon:

```

# diagnose debug reset
# diagnose debug enable
# diagnose debug application httpsd -1
<output>
# diagnose debug disable

```

Procuring and importing a signed SSL certificate

A signed SSL certificate can be used when configuring SSL VPN, for administrator GUI access, and for other functions that require a certificate.

Before creating a certificate, you must have a registered domain. With a valid FortiGuard subscription, FortiDDNS can be used to register a domain; see [DDNS on page 276](#) for more information.

Follow these instructions to purchase, import, and use a signed SSL certificate:

- [Obtain, setup, and download an SSL certificate package from a certificate authority](#)
- [Generate a CSR](#)
- [Import the signed certificate into your FortiGate](#)
- [Configure your FortiGate to use the signed certificate](#)

Obtain, setup, and download an SSL certificate package from a certificate authority

SSL certificate packages can be purchased from any Certificate Authority (CA), such as [DigiCert](#), [GoDaddy](#), or [GlobalSign](#).

[Let's Encrypt](#) can be used to generate a free, trusted SSL certificate. See [Automatically provision a certificate on page 2703](#) for more information.

A third party CA might not sign a certificate with an intranet name or IP address. For details, see [Can I request a certificate for an intranet name or IP address?](#)

The process for purchasing, setting up, and downloading a certificate will vary depending on the CA that is used, and if a CSR must be generated on the FortiGate.

To purchase a certificate package:

1. Create an account with your chosen vendor, or use the account that you used to purchase your domain.
2. Locate the SSL Certificates page.
3. Purchase a basic SSL certificate for domain validation only. If required, a more secure SSL certificate can be purchased.
4. If required, load the CSR, either by uploading the text file or copying and pasting the contents into the requisite text box. See [Generate a CSR on page 2722](#) for information on generating the CSR on the FortiGate.
5. If required, set the server type to *Other*.
6. Verify the certificate per the requirements of the CA.
7. Download the signed certificate to your computer.
8. Import the signed certificate into your FortiGate; see [Import the signed certificate into your FortiGate on page 2722](#).

Generate a CSR

Some CAs can auto-generate the CSR during the signing process, or provide tools for creating CSRs. If necessary, a CSR can be created in your FortiGate device's GUI.

To generate a CSR on your FortiGate:

1. Go to *System > Certificates* and select *Create/Import > Generate CSR*.
2. Configure the CSR:
 - Ensure that the certificate has a unique name.
 - Set the *ID Type* to *Domain Name* and enter a *Domain Name*.
 - An email address is required.
 - Ensure that the *Key Size* is set to *2048 Bit*.
 - Set the *Enrollment Method* to *File Based*.
3. Click *OK*.
The CSR will be added to the certificate list with a status of *PENDING*.
4. In the certificate list, select the new CSR then click *Download* to save the CSR to your computer.
The CSR file can be opened in any text editor, and will resemble the following:

```
-----BEGIN CERTIFICATE REQUEST-----
MIICuTCCAaECAQAwSzEcmBoGA1UEAxMTZm9ydGlzc2x2cG5kZW1vLmNvbTEmMCkG

-----END CERTIFICATE REQUEST-----
```

Import the signed certificate into your FortiGate

To import the signed certificate into your FortiGate:

1. Unzip the file downloaded from the CA.
There should be two CRT files: a CA certificate with *bundle* in the file name, and a local certificate.
2. Import the local certificate:
 - a. Go to *System > Certificates* and select *Create/Import > Certificate*.
 - b. Click *Import Certificate*.
 - c. Set *Type* to *Local Certificate*, upload the local certificate file, then click *Create*. See [Local certificate on page 2709](#) for more information.
The status of the certificate will change from *PENDING* to *OK*.

3. Import the CA certificate:

- a. Go to *System > Certificates* and select *Create/Import > CA Certificate*.
- b. Set the *Type* to *File*, upload the CA certificate file, then click *OK*. See [CA certificate on page 2714](#) for more information.

The CA certificate will be listed in the *CA Certificates* section of the certificates list.

Configure your FortiGate to use the signed certificate

After the signed certificates have been imported, you can use it when configuring SSL VPN, for administrator GUI access, and for other functions that require a certificate.

To configure your FortiGate to use the signed certificate for SSL VPN:

1. Go to *VPN > SSL-VPN Settings*.
2. Set *Server Certificate* to the new certificate.
3. Configure other settings as needed.
4. Click *Apply*.

For more information on configuring SSL VPN, see [SSL VPN on page 2044](#) and the [Setup SSL VPN](#) video in the Fortinet Video Library.

To configure using the certificate for administrator GUI access in the CLI:

```
config system global
    set admin-server-cert fortisslvpndemo
end
```

To change the certificate that is used for administrator GUI access in the GUI:

1. Go to *System > Settings*.
2. In the *Administration Settings* section, change *HTTPS server certificate* as needed.
3. Click *Apply*. You will be logged out of FortiOS.

Microsoft CA deep packet inspection

In most production environments, you want to use a certificate issued by your own PKI for deep packet inspection (DPI).

An existing Microsoft root CA can be used to issue a subordinate CA (sub CA) certificate that is installed as a DPI certificate on the FortiGate.

Complete the following steps to create your own sub CA certificate and use it for DPI:

1. [Create a Microsoft sub CA certificate](#)
2. [Export the certificate and private key](#)
3. [Import the certificate and private key into the FortiGate](#)
4. [Configure a firewall policy for DPI](#)
5. [Verify that the sub CA certificate is being used for DPI](#)

The FortiGate firewall uses information in the original web server certificate, then issues a new certificate signed by the Microsoft DPI certificate. The FortiGate then sends this certificate with the issuing DPI certificate to the client's web browser when the SSL session is being established.

The browser verifies that the certificate was issued by a valid CA, then looks for the issuing CA of the Microsoft DPI certificate in its local trusted root CA store to complete the path to trusted root CA.

The Microsoft CA root certificate is normally deployed to all client PCs in the Windows domain, so the client can complete the certificate path up to a trusted root CA. The FortiGate now controls and can inspect the two HTTPS sessions: one with the external web server, and one with the client PC.

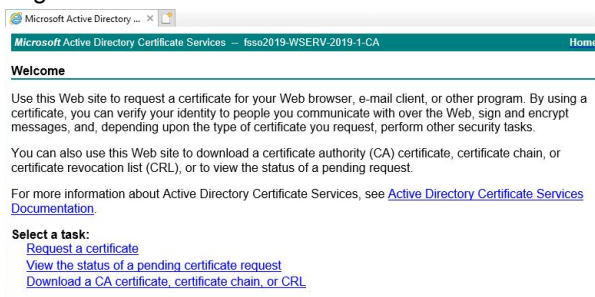

Create a Microsoft sub CA certificate

A Microsoft sub CA certificate can be created on a Microsoft CA server, or remotely using a web browser.

Creating a certificate remotely requires that the web enrollment option is configured on the Microsoft CA server. Remote certificate requests require HTTPS; requests are not allowed with HTTP.

To create a Microsoft sub CA certificate remotely:

1. Open a web browser and go to one of the following URLs:
 - <https://<FQDN-CA-server>/CertSrv>
 - <https://<IP-CA-server>/CertSrv>.
2. Log in to a domain administrator account that has web enrollment rights.

3. Click *Request a certificate*.
4. Click *advanced certificate request*.

5. Click *Create and submit a request to this CA*, then click *Yes* in the *Web Access Confirmation* warning.
6. For the *Certificate Template*, select *Subordinate Certification Authority*.
7. Enable *Mark keys as exportable*.

8. Fill out the remaining information according to your security policy.

Microsoft Active Directory Certificate Services -- fsso2019-WSERV-2019-1-CA Home

Advanced Certificate Request

Certificate Template:
Subordinate Certification Authority

Identifying Information For Offline Template:

Name: fsso2019-subc
E-Mail: support@fsso2019.com
Company: MyCompany
Department:
City: Burnaby
State: BC
Country/Region: CA

Key Options:

☒ Create new key set ☐ Use existing key set
CSP: Microsoft Enhanced Cryptographic Provider v1.0
Key Usage: ☒ Signature
Key Size: 2048 (Min: 384, Max: 10384, common key sizes: 1024, 2048, 4096, 8192, 16384)
☒ Automatic key container name ☐ User specified key container name
☒ Mark keys as exportable
☐ Enable strong private key protection

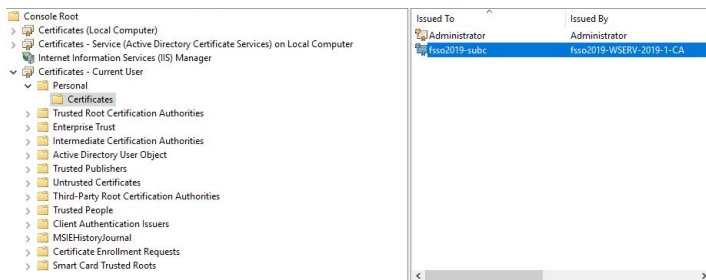

Additional Options:
Request Format: ☐ CMC ☒ PKCS10

9. Submit the request.
10. Click *Yes* in the *Web Access Confirmation* warning.
11. Click *Install this certificate*.
- The certificate and private key are located in the current user's certificate store.

Export the certificate and private key

To export the certificate and private key:

- Open the Microsoft Management Console (MMC) and add the *Certificate Snap-in*.
- Go to the user's certificate store to locate the sub CA certificate that you just installed.

- Right-click the certificate and select *All Tasks > Export*.
- Click *Next* to start the *Microsoft Certificate Export Wizard*.
- Follow the steps in the wizard:
 - When asked, select *Yes, export the private key*.
 - Only the PKCS #12 (.PFX) format is available, and it requires a password.
 - When selecting the encryption type, select *TripleDES-SHA1* if you are using an older version of FortiOS (5.6.9).

and earlier). Otherwise, select *AES256-SHA256*.

6. Complete the wizard, and save the DPI certificate to a local folder.

Import the certificate and private key into the FortiGate

The certificate can be imported from the local computer using the GUI, or from a TFTP server using the CLI.

After importing the certificate, you can view it in the GUI to verify that it was successfully imported.

To import the certificate and private key into the FortiGate in the GUI:

1. Go to *System > Certificates* and select *Create/Import > Certificate*.
2. Click *Import Certificate*.
3. Set *Type* to *PKCS #12 Certificate*.
4. Click *Upload*, and locate the certificate on the management computer.
5. Enter the password, then confirm the password.
6. Optionally, customize the *Certificate name*.

7. Click *OK*.

To import the certificate and private key into the FortiGate in the CLI:

```
execute vpn certificate local import tftp fsso2019subca-AES256.pfx <tftp_IP> p12 <password>
```

To verify that the certificate was imported:

1. Go to *System > Certificates*.
2. Locate the newly imported certificate in the table.
3. Select the certificate and click *View Details* to view the certificate details.

Configure a firewall policy for DPI

The certificate is used in an SSL/SSH inspection profile that is then used in a firewall policy.

To configure a firewall policy for DPI:

1. Go to *Security Profiles > SSL/SSH Inspection* and click *Create New*.
2. Configure the inspection profile, selecting the new certificate

3. Click *Apply*.
4. Go to *Policy & Objects > Firewall Policy*.
5. Create a new policy, or edit an existing policy.
6. In the *SSL Inspection* field, select the new SSL inspection profile.

7. Configure the remaining settings as needed.
8. Click *OK*.

Verify that the sub CA certificate is being used for DPI

You can verify that the certificate is being used for resigning web server certificates when a user connects to an external HTTPS website.

To verify that the certificate is being used:

1. On a client PC that is behind the FortiGate, go to an external HTTPS website.
When connecting to the website, no certificate warning should be shown.
2. In your web browser, view the certificate and certificate path.
The methods for doing this vary depending on the browser. See your browsers documentation for information.

Administrative access using certificates

Certificates can be used for administrative authentication.

Generated key pairs can also be used for this authentication. See [Public key SSH access on page 2409](#) for information about generating a key pair.

To log in to the FortiGate with a certificate private key:

1. On the PC, generate a certificate.
2. In FortiOS, import the PEM file for the remote certificate:

```
# execute vpn certificate remote import tftp certificate.pem 172.16.200.55
```

3. Display the imported remote certificate:

```
config certificate remote
  edit "REMOTE_Cert_1"
  next
end
```

4. Apply the remote certificate to the administrative user:

```
config system admin
  edit "admin1"
    set accprofile "prof_admin"
    set vdom "root"
    set ssh-certificate "REMOTE_Cert_1"
    set password *****
  next
end
```

5. On the PC, verify that the administrator can log in to the FortiGate with the SSH certificate:

```
root@PC05:~# ssh -i certificate-private.pem admin1@172.16.200.1
FortiGate-101F $ get system status
Version: FortiGate-101F v7.0.2,build0234,211019 (GA)
```

Creating certificates with XCA

This topic explains how to generate various certificates to be used in conjunction with a FortiGate, including:

- CA certificate
 - Signing server and client certificates
 - Issuing subordinate CAs for deep inspection

- Server certificate
 - SSL/TLS web administration authentication
 - VPN authentication
 - Internal SSL server protection
- Client certificate
 - End user authentication for SSL or IPsec VPN

XCA is an x509 certificate generation tool that handles RSA, DSA, and EC keys, as well as certificate signing requests (PKCS #10) and CRLs.

There are several options for generating and managing certificates. This topic covers basic certificate generation for XCA. It is not a comprehensive guide to its application and does not explore all options available when generating a certificate.

Creating the XCA database

Before creating any certificates, you must create an XCA database to group the certificates in. You should use a different database for each PKI you create.

To create the database:

1. Go to *File > New Database*.
2. Select a directory to store the created certificates and keys.
3. Enter a name. The provided password encrypts the private keys and is used to access the XCA database in the future.

The remaining procedures in this topic assume you are using this XCA database.

Creating a CA certificate

A CA certificate marks the root of a certificate chain. If this CA certificate is trusted by an end entity, any certificates signed by the CA certificate are also trusted.

To create a CA certificate:

1. Click the *Certificates* tab, then click *New Certificate*.
2. Edit the *Source* tab:
 - a. Set *Template for the new certificate* to *[default] CA*.
 - b. Click *Apply extensions*.

The screenshot shows the 'Create x509 Certificate' dialog box with the following settings:

- Signing request:**
 - ☐ Sign this Certificate signing request
 - ☒ Copy extensions from the request
 - ☐ Modify subject of the request
- Signing:**
 - ☒ Create a self signed certificate
 - ☐ Use this Certificate for signing
- Signature algorithm:** SHA 256
- Template for the new certificate:** [default] CA

Buttons at the bottom: OK, Cancel, Help. Buttons at the bottom right: Apply extensions, Apply subject, Apply all.

3. Edit the *Subject* tab:
 - a. Enter an *Internal Name* to reference this certificate within XCA.
 - b. Enter a *commonName*.
 - c. Optionally, click *Add* to add other distinguished name fields.
 - d. Since this XCA database does not contain any keys yet, click *Generate a new key*. The *Private key* field is now

populated.

4. Optionally, edit the *Extensions* tab:
 - a. Adjust the *Time range* if needed.
 - b. Click *Apply*.
5. Click *OK*.

Issuing a subordinate CA certificate for deep inspection

Subordinate CA certificates are similar to CA certificates because they are used to sign other certificates to establish trust of the signed certificate's content. This trust of the signed certificate is only valid if the subordinate CA is also trusted by the client.

When performing deep inspection on a FortiGate, the FortiGate proxies the connection between the endpoint and the server. This is done transparently so that the end user believes they are communicating with the server, and the server with the client. To do this, when the webpage is requested by a client, the FortiGate must present a certificate that matches the requested website and is trusted by the client.

The certificate presented by the FortiGate is generated on-demand to match the requested website and is signed by this subordinate CA to establish trust with the requesting endpoint. The subordinate CA must be installed on the FortiGate (with the private key) and on the client device (without the private key).

A subordinate CA is used in place of a CA so that it may be revoked as necessary. This is critical since the subordinate CA's private key is exported and becomes susceptible of being compromised. If the CA private key becomes compromised, you would be forced to re-create your entire PKI with a new root CA because root CAs cannot be revoked. See [Microsoft CA deep packet inspection on page 2723](#) for more information about using subordinate CA certificates.

To issue a subordinate CA certificate for deep inspection:

1. Click the *Certificates* tab, then click *New Certificate*.
2. Edit the *Source* tab:
 - a. Set *Use this Certificate for signing* to the CA created previously.
 - b. Set *Template for the new certificate* to *[default] CA*.
 - c. Click *Apply extensions*.
3. Edit the *Subject* tab:
 - a. Enter an *Internal Name* to reference this certificate within XCA.
 - b. Enter a *commonName*.
 - c. Optionally, click *Add* to add other distinguished name fields.
 - d. Click *Generate a new key* to create a new private key for the subordinate CA.

The screenshot shows the 'Create x509 Certificate' dialog box with the 'Subject' tab selected. The 'Internal Name' field contains 'VF_sub_CA'. The 'Distinguished name' section includes fields for 'countryName' (US), 'stateOrProvinceName' (PA), 'localityName' (Scranton), and 'commonName' (VF_sub_CA). The 'Private key' section shows 'VF_sub_CA (RSA:2048 bit)' selected, with a 'Generate a new key' button. The 'Add' and 'Delete' buttons are also visible in the 'Distinguished name' section.

4. Optionally, edit the *Extensions* tab:
 - a. Adjust the *Time range* if needed.
 - b. Click *Apply*.
5. Click *OK*.

Creating a server host certificate

When a CA signs a host certificate, that CA is vouching for the credentials in the certificate. These credentials are what identifies the host.

Some endpoints can generate a certificate signing request (CSR). A CSR is a certificate outline that specifies the details of the endpoint, including its public key. This allows the CA to review the details and sign the request if they are true. This request is then returned or uploaded to the generating endpoint to be used.

Since some endpoints cannot generate their own CSR, you can create the certificate manually in XCA. If you already have a CSR, use the *Certificate signing requests* tab to import and then sign it.

To create a server host certificate:

1. Click the *Certificates* tab, then click *New Certificate*.
2. Edit the *Source* tab:
 - a. Set *Template for the new certificate* to *[default] TLS_server*.
 - b. Click *Apply extensions*.
 - c. In the *Signing* section, select *Use this Certificate for signing* and select the subordinate CA certificate.
3. Edit the *Subject* tab:
 - a. Enter an *Internal Name* to reference this certificate within XCA.
 - b. Enter the distinguished name fields as needed.
 - c. Click *Generate a new key*.

The screenshot shows the 'Create x509 Certificate' window with the 'Subject' tab selected. The 'Internal Name' field contains 'HQ_FGT'. The 'Distinguished name' section includes fields for 'countryName' (US), 'stateOrProvinceName' (PA), 'commonName' (HQ_FGT), 'localityName' (Scranton), and 'organizationName'. Below these is a table with columns 'Type' and 'Content'. At the bottom, the 'Private key' section shows 'HQ_FGT (RSA:2048 bit)' selected, with a 'Generate a new key' button. The window has 'OK', 'Cancel', and 'Help' buttons at the bottom right.

4. Edit the *Extensions* tab:
 - a. For *X509v3 Subject Alternative Name*, enter *email:user@domain.tld*.
5. Click *OK*.

6. Click the *Certificates* tab to view the certificate.

This certificate may be used to identify an SSL or TLS server by uploading the certificate and key pair to the server, such as when the FortiGate presents the administrative webpage or for SSL VPN authentication (see [Configure your FortiGate to use the signed certificate on page 2723](#)). Another use case for a server host certificate is to enable SSL server protection so the FortiGate simulates the real server and brokers the connection (see [Protecting an SSL server on page 1727](#)).

Creating a client host certificate

A client host certificate is used to identify an end entity in a more secure way than a username and password. Once the client host certificate is generated, see [SSL VPN with certificate authentication on page 2093](#) for more information about using the certificate.

To create a client host certificate:

1. Click the *Certificates* tab, then click *New Certificate*.
2. Edit the *Source* tab:
 - a. In the *Signing* section, select *Use this Certificate for signing* and select the CA or subordinate CA.
 - b. Set *Template for the new certificate* to *[default] TLS_client*.
 - c. Click *Apply extensions*.
3. Edit the *Subject* tab:
 - a. Enter an *Internal Name* to reference this certificate within XCA.
 - b. Enter the distinguished name fields as needed.

- c. Click *Generate a new key*.

4. Click **OK**.
5. Click the **Certificates** tab. The FortiGate and client certificates are listed under the signing CA certificate and are ready to be exported.

Internal name	commonName	CA	Serial	Expiry date	CRL Expiration
VF_CA	VF_CA	Yes		9/24/2031	
VF_sub_CA	VF_sub_CA	Yes		9/24/2022	
BobVance	BVance	No		9/24/2022	
HQ_FGT	HQ_FGT	No		9/23/2022	

6. Select a certificate and click **Export**.
7. Enter the file name and select an export format.
8. Click **OK**.

Certificate formats

Certificate file formats indicate what is contained in the file, how it is formatted, and how it is encoded. See [Import a certificate on page 2709](#) for more information about which formats the FortiGate expects for a given certificate type.

Security

The following topics provide information about security:

- [BIOS-level signature and file integrity checking on page 2736](#)
- [Real-time file system integrity checking on page 2740](#)

BIOS-level signature and file integrity checking

The BIOS-level signature and integrity checking has been enhanced by enforcing each FortiOS GA firmware image, AV engine file, and IPS engine file to be dually-signed by the Fortinet CA and a third-party CA. The BIOS verifies that each file matches their secure hash as indicated by their certificates. Users are warned when there is a failed integrity check, and the system may be prevented from booting depending on the severity and the BIOS security level.

Signature checking occurs when the FortiOS firmware, AV, and IPS engine files are uploaded. This allows the FortiGate to warn users of potential risks involved with uploading an unauthenticated file.

The outcome of the signature and integrity check depends on the security level configured in BIOS and the certificate authority that signed the file.

The following table summarizes the use cases and the potential outcome based on the security level.

Use case	Certificate signed by		Outcome based on security level		
	Fortinet CA	Third-party CA	Level 2	Level 1	Level 0
GA-Certified (GA firmware, Beta firmware, Top3 final builds)	Yes	Yes	Accept	Accept	Accept
Non-GA certified (Special builds: Top3 and NPI quick builds)	Yes	No	Warning	Accept	Accept
Interim and Dev builds, or unknown build	No	Yes or No	Reject	Warning	Accept

The security levels on the BIOS are:

- Level 2: in order to operate normally, FortiOS requires all file signatures to match their secure checksums as indicated on both Fortinet and third-party CA signed certificates.
 - If a file has a Fortinet CA signed certificate but no third-party signed certificates, then FortiOS can still run but displays a warning in the GUI and CLI.
 - If a file has no valid certificate signed by the Fortinet CA, then FortiOS is not allowed to run.
- Level 1: in order to operate normally, FortiOS only requires all file signatures to match their secure checksums as indicated on the Fortinet CA signed certificate.
 - If a file has no valid certificate signed by the Fortinet CA, then FortiOS can still run but displays a warning in the GUI and CLI.
- Level 0 (not recommended): FortiOS does not perform code verification.

On FortiGates without supported BIOS security levels, the device acts like security level 1. For example, on a FortiGate-VM that does not have BIOS, the security level is defaulted to level 1.

To verify the BIOS security level:

```
# get system status
Version: FortiGate-101F v7.4.0,build2352,230427 (GA.F)
Security Level: 2
Firmware Signature: certified
```

The following examples outline the different use cases when upgrading firmware and AV files on a FortiGate model that supports BIOS security levels, and a FortiGate model that does not support BIOS security levels.

For more information, see the [Firmware & Registration on page 2418](#) section and [Manual updates on page 2682](#).

Upgrading on a device with BIOS security levels

The following use cases are applicable when upgrading firmware and AV files on a FortiGate with BIOS security levels. Firmware is upgraded using the *System > Firmware & Registration* page, and AV files are upgraded using the *System > FortiGuard* page. Fictitious build numbers are used to demonstrate the functionality of this feature.

Level 2

When upgrading from 7.2.4 to 7.4.0 with a dually-signed firmware image, FortiOS verifies the certificates and accepts the image. The following CLI output shows the messages displayed when a FortiGate is upgraded.

```
FortiGate_101F (global) # get system status
Version: FortiGate-101F v7.2.4,build1396,230131 (GA.F)
Firmware Signature: certified
Virus-DB: 1.00000(2018-04-09 18:07)
...
FortiGate_101F (global) # Image verification OK!
Firmware upgrade in progress ...

Done.

The system is going down NOW !!

Please stand by while rebooting the system.
Restarting system.
...

System is starting...

The config file may contain errors.
Please see details by the command 'diagnose debug config-error-log read'.

FortiGate_101F login: admin
Password:
Welcome!

FortiGate_101F (global) # get system status
Version: FortiGate-101F v7.4.0,build2352,230427 (GA.F)
Security Level: 2
Firmware Signature: certified
```

When upgrading from 7.2.4 to 7.4.0 with an unsigned firmware image in the GUI, FortiOS is unable to verify the certificates and rejects the image. A notification is displayed that *This firmware image didn't pass the signature verification*.

 **Image upgrade failed. This firmware image didn't pass the signature verification. ✕**

When running 7.4.0 and uploading a dually-signed AV engine file on the *System > FortiGuard* page, FortiOS verifies the certificates and accepts the file. A notification is displayed (*Successfully upgraded database*).

 **Successfully upgraded database ✕**

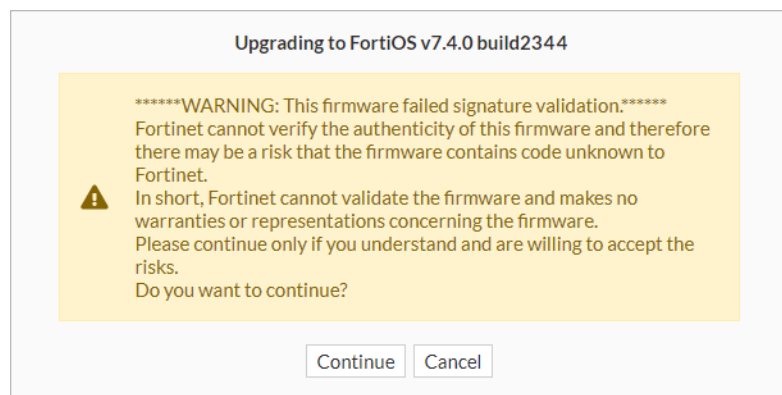

When running 7.4.0 and uploading an unsigned AV engine file on the *System > FortiGuard* page, FortiOS is unable to verify the certificates and rejects the file. A notification is displayed that the device *Failed to upgrade database*.

 **Failed to upgrade database ✕**

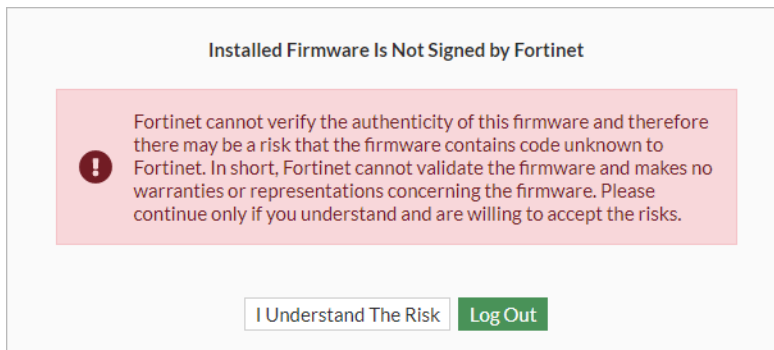

Level 1

When upgrading from 7.2.4 to 7.4.0 with a dually-signed firmware image, FortiOS verifies the certificates and accepts the image. No warning is displayed during the upgrade, or while the system is running in 7.4.0.

When upgrading from 7.2.4 to 7.4.0 with an unsigned firmware image in the GUI, FortiOS is unable to verify the certificates and the image fails verification. The upgrade will still occur. However, during the upgrade process, a warning dialog is displayed indicating that *This firmware failed signature validation*. The user can click *Continue* to upgrade the firmware.

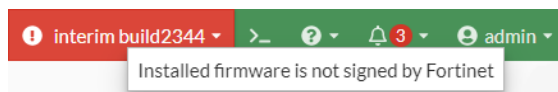

When the user logs in to the FortiGate running 7.4.0, a warning dialog is displayed indicating that the *Installed Firmware is Not Signed by Fortinet*. The user can click *I Understand The Risk* to log in.

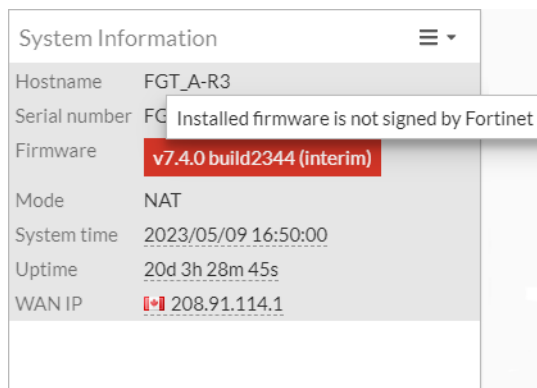

When the FortiGate is running unsigned firmware, warnings appear in the GUI and CLI.

- Top banner: the unsigned firmware version is highlighted in red. Hovering over the unsigned firmware version displays a tooltip that the *Installed firmware is not signed by Fortinet*.

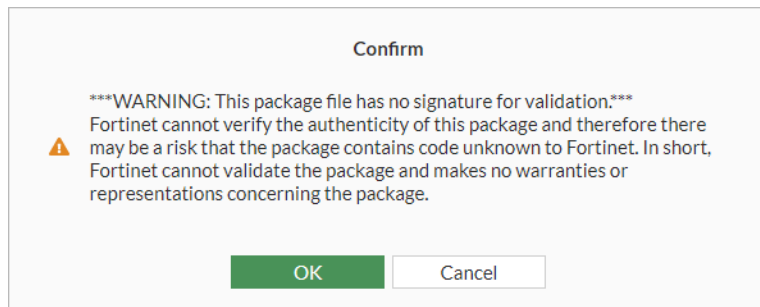

- **Dashboard > Status > System Information** widget: the unsigned firmware version is highlighted in red. Hovering over the unsigned firmware version displays a tooltip that the *Installed firmware is not signed by Fortinet*.

- Enter the following in the CLI to verify the firmware status:

```
# get system status
Version: FortiGate-VM64 v7.4.0,build2344,230418 (interim)
Security Level: 1
Firmware Signature: un-certified
Virus-DB: 91.03113(2023-05-09 15:26)
```

When running 7.4.0 and uploading an unsigned AV engine file on the **System > FortiGuard** page, FortiOS is unable to verify the certificates and the file fails verification. A warning dialog is displayed indicating that *This package file has no signature for validation*, but the user can click **OK** to use the file.

Level 0

When upgrading from 7.2.4 to 7.4.0 with a dually-signed firmware image, FortiOS verifies the certificates and accepts the image. No verification is performed.

When upgrading from 7.2.4 to 7.4.0 with an unsigned firmware image in the GUI, FortiOS does not verify the certificates. No warnings are displayed that the firmware is unverified.

When running 7.4.0 and uploading an unsigned AV engine file on the *System > FortiGuard* page, FortiOS does not verify the certificates. No warnings are displayed that the file is unverified.

Upgrading on a device without BIOS security levels

The following use cases are applicable when upgrading firmware and AV files on a FortiGate without BIOS security levels. Firmware is upgraded using the *System > Firmware & Registration* page, and AV files are upgraded using the *System > FortiGuard* page. A FortiGate 60E is used in these examples and acts like it has security level 1.

When upgrading from 7.2.4 to 7.4.0 with a dually-signed firmware image, FortiOS verifies the certificates and accepts the image.

When upgrading from 7.2.4 to 7.4.0 with an unsigned firmware image in the GUI, FortiOS is unable to verify the certificates and the image fails verification. A warning dialog is displayed indicating that *This firmware failed signature validation*, but the user can click *Continue* to use the firmware.

When running 7.4.0 and uploading an unsigned AV engine file on the *System > FortiGuard* page, FortiOS is unable to verify the certificates and the file fails verification. A warning dialog is displayed indicating that *This package file has no signature for validation*, but the user can click *OK* to use the file.

Real-time file system integrity checking

Real-time file system integrity checking has two main purposes:

- Prevent unauthorized modification of important binaries.
- Detect unauthorized binaries and prevent them from running.

How it works

When the FortiGate boots, the system performs a BIOS level integrity check on important internal files, the AV engine file, and the IPS engine file. These files are signed by the process described in [BIOS-level signature and file integrity checking on page 2736](#), and the BIOS verifies their signature against their certificates.

Once these files are verified to be authentic, the BIOS can boot the root filesystem and other executables and libraries. Once loaded, real-time protection begins. The important executables and binaries are protected from write access and any modifications. It also blocks the kernel from loading any modules. Any unauthorized loading of modules is blocked. If violations are found, logs are triggered.

A hash of all executable binaries and libraries is taken and stored in memory. If there is a hash mismatch when attempting to run a binary, that binary is blocked from running, and the system is rebooted. A log will be generated with ID 20234.

If there is a missing hash when attempting to run a binary, then the system is rebooted. A log will be generated with ID 20223.

The system also runs a periodic check to verify the integrity of important binaries and AV and IPS engines.

Log summary

The following logs are recorded when specific actions take place.

Log	Description
20230 - LOG_ID_SYS_SECURITY_WRITE_VIOLATION 432	The root filesystem is read only. Any modification triggers this log.
20231 - LOG_ID_SYS_SECURITY_HARDLINK_VIOLATION 432	An attacker trying to replace symlink triggers this log.
20232 - LOG_ID_SYS_SECURITY_LOAD_MODULE_VIOLATION 433	Only the kernel can load modules. Any unusual loading of modules triggers this log.
20233 - LOG_ID_SYS_SECURITY_FILE_HASH_MISSING 434	File hashes are generated for legitimate files during bootup. If a hash cannot be found, the file may be suspicious as it could be a new routine inserted by an attacker. The binary is blocked.
20234 - LOG_ID_SYS_SECURITY_FILE_HASH_MISMATCH 434	File hashes are generated for legitimate files during bootup. If a hash does not match when the file is exercised, it is an indication that it could have been modified by an attacker. The system is rebooted.

Detection examples

Example 1: system reboots due to mismatched hash

```
fos_ima: fos_process_appraise 110: Executable File(/bin/node) doesn't match previous hash,
it has been changed
Restarting system.
...
fos_ima: fos_process_appraise 110: Executable File(/lib/libc.so.6) doesn't match previous
hash, it has been changed
Restarting system.
...
```

Logs similar to the following are captured:

```
date="2023-06-16" time="12:01:44" id=7245222014288399309 bid=471609558 dvid=6533
itime=1686909705 euid=3 epid=3 dsteuid=3 dstepid=3 logver=604132092 logid="0100020234"
type="event" subtype="system" level="alert" msg="Hash of executable file(/bin/init) doesn't
match the previous." logdesc="Integrity check of Run/loading Executable File failed without
Integrity measure" severity="alert" eventtime=1686909705825483706 tz="+0200"
devid="xxxxxxxx" vd="root" devname="xxxxxxxx"
```

```
date="2023-06-15" time="09:57:54" id=7244819017507013700 bid=470303007 dvid=1431
itime=1686815875 euid=3 epid=3 dsteuid=3 dstepid=3 logver=604132092 logid="0100020234"
type="event" subtype="system" level="alert" msg="Hash of executable file(/lib/libc.so.6)
doesn't match the previous." logdesc="Integrity check of Run/loading Executable File failed
without Integrity measure" severity="alert" eventtime=1686815874936267770 tz="+0200" devid="
xxxxxxxx " vd="root" devname=" xxxxxxxx"
```

Example 2: suspected compromise due to an observed indicator of compromise (IoC)

```
fos_ima: fos_process_appraise 99: Suspicious Executable File(/data2/libcrashpad.so) is
missing hash
...
fos_ima: fos_process_appraise 99: Suspicious Executable File(/data2/flatkc_info) is missing
hash
...
```

No logs are found.

Corrective action

In the previous examples where a mismatched or missing hash occurs, alert technical support straight away so that they may gather information to start a forensic analysis with our internal PSIRT team. There are two possible outcomes:

1. The firewall is reporting a false positive, in which a bug causes a mismatched or missing hash.
Once verified by technical support, the corrective action may be to upgrade to a newer build where the bug is fixed.
2. An actual compromise has occurred, or is occurring.
The system could be blocking an offending binary that causes the system to malfunction, or the system could reboot to protect itself from compromise.

In either case, contact technical support for further forensic analysis. If an IoC is detected and it is determined that the persistent threat resides on the FortiGate, a reflash and reload of the firmware may be recommended.

Configuration scripts

Configuration scripts are text files that contain CLI command sequences. They can be created using a text editor or copied from a CLI console, either manually or using the *Record CLI Script* function.

Scripts can be used to run the same task on multiple devices. For example, if your devices use the same security policies, you can enter or record the commands to create those policies in a script, and then run the script on each device. You could also create the policies in the GUI, and then copy and paste the CLI commands from the *CLI Console* using the *show* command.

If the FortiGate is managed by FortiManager, scripts can be uploaded to FortiManager and then run on any other FortiGates that are managed by that FortiManager. See [Scripts](#) in the [FortiManager Administration Guide](#).

A comment line in a script starts with the number sign (#). Comments are not executed.

To run a script using the GUI:

1. Click on your username and select *Configuration > Scripts*.
2. Click *Run Script*.
3. Select the text file containing the script on your management computer, then click *OK*.
The script runs immediately, and the *Script Execution History* table is updated, showing if the script ran successfully.

Run Script	Delete	Search	Q
Name	Result	Time	
Local			
Retro.txt	Success	2021/05/04 15:33:21	
ReplicmtMsgGroups.txt	Success	2021/05/04 15:33:08	
GetSystemStatus.txt	Success	2021/05/04 15:32:57	

Workspace mode

Workspace mode allows administrators to make a batch of changes that are not implemented until the transaction is committed. Prior to committing, the changes can be reverted or edited as needed without impacting current operations.

When an object is edited in workspace mode it is locked, preventing other administrators from editing that object. A warning message will be shown to let the administrator know that the object is currently being configured in another transaction.

All administrators can use workspace mode; their permissions in workspace mode are the same as defined in their account profile.

A workspace mode transaction times out after five minutes if there is no activity. When a transaction times out, all changes are discarded. A warning message will be shown to let the administrator know that a timeout is imminent, or has already happened:

```
config transaction id=1 will expire in 30 seconds
config transaction id=1 will expire in 20 seconds
config transaction id=1 will expire in 10 seconds
config transaction id=1 has expired
```

The following commands are not changeable in a workspace transaction:

```
config system console
config system resource-limits
config system elbc
config system global
  set split-port
  set vdom-admin
  set management-vdom
  set wireless-mode
  set internal-switch-mode
```

```
end
config system settings
    set opmode
end
config system npu
config system np6
config system wireless
    set mode
end
config system vdom-property
config system storage
```

The `execute batch` command cannot be used in or to start workspace mode.

To use workspace mode:

1. Start workspace mode:

```
execute config-transaction
```

Once in workspace mode, the administrator can make configuration changes, all of which are made in a local CLI process that is not viewable by other processes.

2. Commit configuration changes:

```
execute config-transaction commit
```

After performing the commit, the changes are available for all other processes, and are also made in the kernel.

3. Abort configuration changes:

```
execute config-transaction abort
```

If changes are aborted, no changes are made to the current configuration or the kernel.

Diagnose commands

```
diagnose sys config-transaction show txn-meta
```

Show config transaction meta information. For example:

```
# diagnose sys config-transaction show txn-meta
txn_next_id=8, txn_nr=2
```

```
diagnose sys config-transaction show txn-info
```

Show config transaction information. For example:

```
# diagnose sys config-transaction show txn-info
current_jiffies=680372

txn_id=6, expire_jiffies=706104, clicmd_fpath='/dev/cmdb/txn/6_EiLl9G.conf'
txn_id=7, expire_jiffies=707427, clicmd_fpath='/dev/cmdb/txn/7_UXK6wY.conf'
```

```
diagnose sys config-transaction show txn-entity
```

Show config transaction entity. For example:

```
# diagnose sys config-transaction show txn-entity
vd='global', cli-node-oid=37(system.vdom), txn_id=7. location: fileid=0, storeid=0,
pgnr=0, pgidx=0
vd='global', cli-node-oid=46(system.interface), txn_id=7. location: fileid=3,
storeid=0, pgnr=0, pgidx=0
```

```
diagnose sys config-transaction show txn-lock
```

Show transaction lock status. For example:

```
# diagnose sys config-transaction show txn-lock  
type=-1, refcnt=0, value=256, pid=128
```

```
diagnose sys config-transaction status
```

Show the transaction status in the current CLI.

Custom languages

Custom languages can be uploaded and used for SSL VPN web portals. Custom languages must be enabled before they can be added in the GUI.

To enable custom languages:

```
config system global  
    set gui-custom-language enable  
end
```

To configure a custom language in the GUI:

1. Go to *System > Custom Languages* and click *Create New*.
2. Enter the name of the language.
3. Optionally, enter a comment.
4. Click *Upload* and upload the language JSON file from your management computer.

5. Click *OK*.

To configure a language in an SSL VPN web portal in the GUI:

1. Go to *VPN > SSL-VPN Portals*.
2. Edit an existing portal, or click *Create New* to create a new one.
3. Enable *Enable Web Mode*, then select the language from the *Language* field.

4. Click *OK*.

To configure a custom language in the CLI:

```
config system custom-language
    edit <language>
        set filename <file>
    next
end
```

To configure a language in an SSL VPN web portal in the GUI:

```
config vpn ssl web portal
    edit <portal>
        set web-mode enable
        set custom-lang <language>
    next
end
```

RAID

Most FortiGate devices with multiple disk drives (SSD or HDD) can be configured to use RAID.

Enabling or disabling RAID, and changing the RAID level, erases all data on the log disk and reboots the device.

To verify that the FortiGate has multiple disks:

- List disk devices and partitions:

```
# execute disk list

Disk SSD1 ref: 255 223.6GiB type: SSD [ATA INTEL SSDSC2KB24] dev: /dev/sda
    partition ref: 1 220.1GiB, 219.0GiB free mounted: Y label: LOGUSEDXA707476A dev:
/dev/sda1 start: 2048

Disk SSD2 ref: 16 223.6GiB type: SSD [ATA INTEL SSDSC2KB24] dev: /dev/sdb
    partition ref: 17 62.7GiB, 62.4GiB free mounted: Y label: WANOPTXX1FEBBFA1 dev:
/dev/sdb1 start: 2048
    partition ref: 18 63.7GiB, 63.7GiB free mounted: N label: dev: /dev/sdb2 start:
133625856
    partition ref: 19 85.0GiB, 85.0GiB free mounted: N label: dev: /dev/sdb3 start:
267249664
```

- Display information about all of the disks:

```
# diagnose hardware deviceinfo disk

Disk SSD1 ref: 255 223.6GiB type: SSD [ATA INTEL SSDSC2KB24] dev: /dev/sda
    partition ref: 1 220.1GiB, 219.0GiB free mounted: Y label: LOGUSEDXA707476A dev:

```

To check the RAID status:

- RAID enabled:

```
# execute disk raid status
RAID Level: Raid-1
RAID Status: OK (Background-Synchronizing) (9%)
RAID Size: 239GB

Disk 1: OK Used 228GB
Disk 2: OK Used 228GB
```

- RAID disabled:

```
# execute disk raid status
RAID Level: Unavailable
RAID Status: Unavailable
RAID Size: 0GB

Disk 1: OK Not-Used 228GB
Disk 2: OK Not-Used 228GB
```

To enable RAID:

```
# execute disk raid enable
This will erase all data on the log disk, and system will reboot!
Do you want to continue? (y/n)y

Dependent storage SSD2 removed.
Dependent storage SSD1 removed.
Raid-0 created with 2 disks.

Performing raid on the requested disk(s) and rebooting, please wait.. .

Configuring raid...
- unmounting /data2 : ok
- unmounting /var/log : ok
```

```
- unmounting /usb : ok
- unmounting /var/storage/SSD2-WANOPTXX0EA0EF17 : ok
```

```
Formatting the disk...
- unmounting /usb : ok
Formatting /dev/md0 ... done
```

The system is going down NOW !!

Please stand by while rebooting the system.
Restarting system.

To rebuild the RAID:

```
# execute disk raid rebuild
```

To rebuild the RAID to another level:

1. Check the supported RAID levels:

```
# execute disk raid rebuild-level
<RAID level> supported: Raid-0, Raid-1
```

2. Rebuild the RAID to the required level:

```
# execute disk raid rebuild-level Raid-1
This will erase all data on the log disk, and system will reboot!
Do you want to continue? (y/n)y
```

```
Dependent storage RAID removed.
Raid-1 created with 2 disks.
```

Performing raid on the requested disk(s) and rebooting, please wait...

```
Configuring raid...
- unmounting /data2 : ok
- unmounting /var/log : ok
- unmounting /usb : ok
```

```
Formatting the disk...
- unmounting /usb : ok
Formatting /dev/md0 ... done
```

The system is going down NOW !!

Please stand by while rebooting the system.
Restarting system.

To disable RAID:

```
# execute disk raid disable
This will erase all data on the log disk, and system will reboot!
Do you want to continue? (y/n)y
```

```
Dependent storage RAID removed.
```

```
Performing format on the requested disk(s) and rebooting, please wait...

Configuring raid...
- unmounting /data2 : ok
- unmounting /var/log : ok

FortiGate encryption algorithm cipher suites

FortiGates use SSL/TLS encryption for HTTPS and SSH administrative access, and SSL VPN remote access. When establishing an SSL/TLS or SSH connection, you can control the encryption level and the ciphers that are used in order to control the security level.

HTTPS access

HTTP administrative access encryption is controlled using the following commands:

```
config system global
    set strong-crypto {enable | disable}
    set admin-https-ssl-versions {tlsv1-1 tlsv1-2 tlsv1-3}
    set admin-https-ssl-ciphersuites {<cipher_1> ... <cipher_n>}
    set admin-https-ssl-banned-ciphers {<cipher_1> ... <cipher_n>}
end
```

When strong encryption is enabled, only TLS 1.2 and TLS 1.3 are allowed. If strong encryption is then disabled, TLS 1.1 has to be manually enabled.

Setting `admin-https-ssl-ciphersuites` controls which cipher suites are offered in TLS 1.3. TLS 1.2 and lower are not affected by this command. To disable all TLS 1.3 cipher suites, remove TLS1-3 from `admin-https-ssl-versions`.

Setting `admin-https-ssl-banned-ciphers` controls which cipher technologies will not be offered for TLS 1.2 and lower.

Specific cipher suites are supported by each TLS version:

TLS version	Supported cipher suites	
TLS 1.1 ¹	ECDHE-RSA-AES256-SHA ¹	AES256-SHA ¹
	ECDHE-RSA-AES128-SHA ¹	AES128-SHA ¹
TLS 1.2	ECDHE-RSA-AES256-GCM-SHA384	AES256-GCM-SHA384 ¹
	ECDHE-RSA-AES128-GCM-SHA256	AES128-GCM-SHA256 ¹
	ECDHE-RSA-CHACHA20-POLY1305	AES256-SHA256
	ECDHE-RSA-AES256-SHA384	AES128-SHA256
	ECDHE-RSA-AES128-SHA256	AES256-SHA ¹
	ECDHE-RSA-AES256-SHA ¹	AES128-SHA ¹
	ECDHE-RSA-AES128-SHA ¹	
TLS 1.3	TLS-AES-128-GCM-SHA256	TLS-AES-128-CCM-8-SHA256
	TLS-AES-256-GCM-SHA384	TLS-CHACHA20-POLY1305-SHA256
	TLS-AES-128-CCM-SHA256	

¹ Disabled if strong encryption (`strong-crypto`) is enabled.

SSH access

SSH access encryption is controlled using the following command:

```
config system global
    set admin-ssh-v1 {enable | disable}
    set strong-crypto {enable | disable}
    set ssh-enc-algo <algo_1> [<algo_2> ... <algo_n>]
    set ssh-kex-algo <algo_1> [<algo_2> ... <algo_n>]
    set ssh-mac-algo <algo_1> [<algo_2> ... <algo_n>]
end
```

The algorithms available when configuring `set ssh-enc-algo` are affected by `set strong-crypto` as follows:

Strong encryption setting	Supported ciphers	
Enabled	chacha20-poly1305@openssh.com	aes256-ctr
	aes256-gcm@openssh.com	

Strong encryption setting	Supported ciphers	
Disabled	chacha20-poly1305@openssh.com	aes128-ctr
	aes192-ctr	aes256-ctr
	arcfour256	arcfour128
	aes128-cbc	3des-cbc
	blowfish-cbc	cast128-cbc
	aes192-cbc	aes256-cbc
	arcfour	rijndael-cbc@lysator.liu.se
	aes128-gcm@openssh.com	aes256-gcm@openssh.com

The following options are available for the `ssh-kex-algo` algorithm based on the strong encryption setting:

Strong encryption setting	Supported ciphers	
Enabled	diffie-hellman-group-exchange-sha256	curve25519-sha256@libssh.org
	ecdh-sha2-nistp256	ecdh-sha2-nistp384
	ecdh-sha2-nistp521	
Disabled	diffie-hellman-group14-sha1	diffie-hellman-group-exchange-sha1
	diffie-hellman-group-exchange-sha256	curve25519-sha256@libssh.org
	ecdh-sha2-nistp256	ecdh-sha2-nistp384
	ecdh-sha2-nistp521	

The following options are available for the `ssh-mac-algo` algorithm based on the strong encryption setting:

Strong encryption setting	Supported ciphers	
Enabled	hmac-sha2-256	hmac-sha2-256-etm@openssh.com
	hmac-sha2-512	hmac-sha2-512-etm@openssh.com

Strong encryption setting	Supported ciphers	
Disabled	hmac-md5	hmac-md5-etm@openssh.com
	hmac-md5-96	hmac-md5-96-etm@openssh.com
	hmac-sha1	hmac-sha1-etm@openssh.com
	hmac-sha2-256	hmac-sha2-256-etm@openssh.com
	hmac-sha2-512	hmac-sha2-512-etm@openssh.com
	hmac-ripemd160	hmac-ripemd160@openssh.com
	hmac-ripemd160-etm@openssh.com	umac-64@openssh.com
	umac-128@openssh.com	umac-64-etm@openssh.com
	umac-128-etm@openssh.com	

SSL VPN

For SSL VPN connections, the TLS versions and cipher suites are controlled using the following commands:

```
config vpn ssl setting
    set algorithm {high | medium | low}
    set ssl-max-proto-ver {tls1-0 | tls1-1 | tls1-2 | tls1-3}
    set ssl-min-proto-ver {tls1-0 | tls1-1 | tls1-2 | tls1-3}
    set ciphersuite {TLS-AES-128-GCM-SHA256 TLS-AES-256-GCM-SHA384 TLS-CHACHA20-POLY1305-
    SHA256 TLS-AES-128-CCM-SHA256 TLS-AES-128-CCM-8-SHA256}
end
```

Only cipher suites supported by TLS 1.3 can be set using the `set ciphersuite` command.

When the SSL VPN security level (`algorithm`) is set to high, only high levels are allowed. When it is set to medium, high and medium levels are allowed. When it is set to low, any level is allowed.

The strong encryption (`strong-crypto`) command has no effect on the SSL VPN encryption level or ciphers.

Specific cipher suites are supported by each TLS version:

TLS version	Supported cipher suites	
TLS 1.0	ECDHE-RSA-AES256-SHA	DHE-RSA-CAMELLIA128-SHA
	DHE-RSA-AES256-SHA	AES128-SHA
	DHE-RSA-CAMELLIA256-SHA	SEED-SHA ¹
	AES256-SHA	CAMELLIA128-SHA
	CAMELLIA256-SHA	ECDHE-RSA-DES-CBC3-SHA ^{1*}
	ECDHE-RSA-AES128-SHA	EDH-RSA-DES-CBC3-SHA ^{1*}
	DHE-RSA-AES128-SHA ¹	DES-CBC3-SHA ^{1*}
	DHE-RSA-SEED-SHA	
TLS 1.1	ECDHE-RSA-AES256-SHA	DHE-RSA-CAMELLIA128-SHA
	DHE-RSA-AES256-SHA	AES128-SHA
	DHE-RSA-CAMELLIA256-SHA	SEED-SHA ¹
	AES256-SHA	CAMELLIA128-SHA
	CAMELLIA256-SHA	ECDHE-RSA-DES-CBC3-SHA ^{1*}
	ECDHE-RSA-AES128-SHA	EDH-RSA-DES-CBC3-SHA ^{1*}
	DHE-RSA-AES128-SHA	DES-CBC3-SHA ^{1*}
	DHE-RSA-SEED-SHA ¹	

TLS version	Supported cipher suites	
TLS 1.2	ECDHE-RSA-AES256-GCM-SHA384	ECDHE-RSA-AES128-SHA
	ECDHE-RSA-AES256-SHA384	DHE-RSA-AES128-GCM-SHA256
	ECDHE-RSA-AES256-SHA	DHE-RSA-AES128-CCM8
	DHE-RSA-AES256-GCM-SHA384	DHE-RSA-AES128-CCM
	ECDHE-RSA-CHACHA20-POLY1305	AES128-CCM8
	DHE-RSA-CHACHA20-POLY1305	AES128-CCM
	DHE-RSA-AES256-CCM8	DHE-RSA-AES128-SHA256
	DHE-RSA-AES256-CCM	DHE-RSA-AES128-SHA
	DHE-RSA-AES256-SHA256	ECDHE-RSA-CAMELLIA128-SHA256
	DHE-RSA-AES256-SHA	DHE-RSA-CAMELLIA128-SHA256
	ECDHE-RSA-CAMELLIA256-SHA384	DHE-RSA-SEED-SHA ¹
	DHE-RSA-CAMELLIA256-SHA256	DHE-RSA-CAMELLIA128-SHA
	DHE-RSA-CAMELLIA256-SHA	AES128-GCM-SHA256
	AES256-GCM-SHA384	AES128-SHA256
	AES256-CCM8	AES128-SHA
	AES256-CCM	CAMELLIA128-SHA256
	AES256-SHA256	SEED-SHA ¹
	AES256-SHA	CAMELLIA128-SHA
	CAMELLIA256-SHA256	ARIA128-GCM-SHA256
	CAMELLIA256-SHA	DHE-RSA-ARIA128-GCM-SHA256
	ARIA256-GCM-SHA384	ECDHE-ARIA128-GCM-SHA256
	DHE-RSA-ARIA256-GCM-SHA384	ECDHE-RSA-AES256-GCM-SHA384
	ECDHE-ARIA256-GCM-SHA384	ECDHE-RSA-DES-CBC3-SHA ^{1*}
	ECDHE-RSA-AES128-GCM-SHA256	EDH-RSA-DES-CBC3-SHA ^{1*}
	ECDHE-RSA-AES128-SHA256	DES-CBC3-SHA ^{1*}
TLS 1.3	TLS_AES_256_GCM_SHA384	TLS_AES_128_CCM_SHA256
	TLS_CHACHA20_POLY1305_SHA256	TLS_AES_128_CCM_8_SHA256
	TLS_AES_128_GCM_SHA256	

¹ This cipher is not available when the SSL VPN security level (`algorithm`) is set to high.

* This cipher is not available when the SSL VPN security level (`algorithm`) is set to medium.

Additional features

Security hardening for other FortiOS features can also be achieved by managing the encryption level or ciphers. See [SSL algorithm security level on page 2756](#) for more information about different levels of security.

An asterisk (*) represents the default values for each feature.

Some of these features are described next.

WAN optimization

For WAN optimization tunnel connections, the encryption algorithm is controlled using the following commands:

```
config wanopt settings
    set tunnel-ssl-algorithm {high* | medium | low}
end
```

Explicit FTP proxy

For explicit FTP proxy, the encryption algorithm is controlled using the following commands:

```
config ftp-proxy explicit
    set ssl-algorithm { high* | medium | low}
end
```

Explicit web proxy

For explicit web proxy, the encryption algorithm is controlled using the following commands:

```
config web-proxy explicit
    set ssl-algorithm {high | medium | low*}
end
```

SSL Server

For SSL server, the TLS versions and the encryption algorithm are controlled using the following commands:

```
config firewall ssl-server
    edit <name>
        set ssl-algorithm {high* |medium | low}
        set ssl-max-version {tls-1.0* |tls-1.1 | tls-1.2 | tls-1.3}
        set ssl-min-version {tls-1.0 |tls-1.1 | tls-1.2 | tls-1.3*}
    next
end
```

VIP

For VIP, the TLS versions and the encryption algorithm are controlled using the following commands:

```

config firewall vip
    set ssl-max-version {ssl-3.0|tls-1.1 | tls1-2 | tls-1.3* | client}
    set ssl-min-version {ssl-3.0|tls-1.1* | tls1-2 | tls-1.3 |client}
    set ssl-algorithm {high* | medium | low | custom}
    config ssl-cipher-suites
        edit <priority>
            set cipher {TLS-AES-128-GCM-SHA256 | TLS-AES-256-GCM-SHA384|...}
            set versions {option1}, {option2}, ...
        next
    end
    set ssl-server-max-version [ssl-3.0|tls-1.1 | tls1-2 | tls-1.3 | client*]
    set ssl-server-min-version [ssl-3.0|tls-1.1 | tls1-2 | tls-1.3 | client*]

    set ssl-server-algorithm {high | medium | low | custom | client* }
    config ssl-server-cipher-suites
        edit <priority>
            set cipher {TLS-AES-128-GCM-SHA256 | TLS-AES-256-GCM-SHA384|...}
            set versions {option1}, {option2}, ...
        next
    end
next
end

```

The commands `config ssl-server-cipher-suites` and `config ssl-cipher-suites` are only available when `set ssl-algorithm` and `set ssl-server-algorithm` are set to `custom`. It is recommended to exercise caution when manually configuring cipher suites, as selecting a cipher with an incompatible version may result in unexpected issues.

VoIP

For VoIP, the TLS versions and the encryption algorithm are controlled using the following commands:

```

config voip profile
    edit <name>
        config sip
            set ssl-algorithm {high* |medium | low}
            set ssl-max-version {ssl-3.0 | tls-1.0* |tls-1.1 | tls-1.2 | tls-1.3}
            set ssl-min-version {ssl-3.0 | tls-1.0 |tls-1.1 | tls-1.2 | tls-1.3*}
        next
    end

```

SSL algorithm security level

Option	Description
high	High encryption. Allow only AES and ChaCha.
medium	Medium encryption. Allow AES, ChaCha, 3DES, and RC4.
low	Low encryption. Allow AES, ChaCha, 3DES, RC4, and DES.

Option	Description
*custom	Custom encryption. Use <code>ssl-server-cipher-suites</code> to select the cipher suites that are allowed.
*client	Use the same encryption algorithms for both client and server sessions.

The SSL algorithm security levels marked with an asterisk (*) are not supported across different FortiOS features.

Other Products

The security level of communication to and from FortiOS can be managed by controlling the encryption level and ciphers used. See [Encryption algorithm security level on page 2758](#) for more information about different levels of security.

An asterisk (*) represents the default value for each product.

Some products that commonly interact with the FortiGate device are listed next.

syslog server

For syslog server, the TLS versions and the encryption algorithm are controlled using the following commands:

```
config log syslogd setting
    set enc-algorithm {high-medium | high | low | disable*}
    set ssl-min-proto-version {default* | SSLv3 | TLSv1 | TLSv1-1 | TLSv1-2}
end
config log syslogd override-setting
    set enc-algorithm {high-medium | high | low | disable*}
    set ssl-min-proto-version {default* | SSLv3 | TLSv1 | TLSv1-1 | TLSv1-2}
end
```

The command `ssl-min-proto-version` set to default means that the system global setting will be followed.

FortiCloud

For logging to FortiCloud, the TLS versions and the encryption algorithm are controlled using the following commands:

```
config log fortiguard setting
    set enc-algorithm {high-medium | high* | low}
    set ssl-min-proto-version {default* | SSLv3 | TLSv1 | TLSv1-1 | TLSv1-2}
end
```

FortiAnalyzer Cloud

For FortiAnalyzer Cloud, the TLS versions and the encryption algorithm are controlled using the following commands:

```
config log fortianalyzer-cloud setting
    set enc-algorithm {high-medium | high* | low}
    set ssl-min-proto-version {default* | SSLv3 | TLSv1 | TLSv1-1 | TLSv1-2 | TLSv1-3}
end
```

FortiAnalyzer

For FortiAnalyzer, the TLS versions and the encryption algorithm are controlled using the following commands:

```
config log fortianalyzer setting
    set enc-algorithm {high-medium | high* | low}
    set ssl-min-proto-version {default* | SSLv3 | TLSv1 | TLSv1-1 | TLSv1-2 | TLSv1-3}
end
config log fortianalyzer override-setting
    set enc-algorithm {high-medium | high* | low}
    set ssl-min-proto-version {default* | SSLv3 | TLSv1 | TLSv1-1 | TLSv1-2 | TLSv1-3}
end
```

FortiSandbox

For FortiSandbox, the TLS versions and the encryption algorithm are controlled using the following commands:

```
config system fortisandbox
    set enc-algorithm {default* | high | low}
    set ssl-min-proto-version {default* | SSLv3 | TLSv1 | TLSv1-1 | TLSv1-2}
end
```

FortiManager

For central management, the TLS versions and the encryption algorithm are controlled using the following commands:

```
config system central-management
    set enc-algorithm {default | high* | low}
end
```

Encryption algorithm security level

Option	Description
*high-medium/ default	SSL communication with high and medium encryption algorithms.
high	SSL communication with high encryption algorithm
low	SSL communication with low encryption algorithms.
*disable	Disable SSL communication.

Encryption algorithm security levels marked with an asterisk (*) are not supported across different products.

Conserve mode

Each FortiGate model has a specific amount of memory that is shared by all operations. If most or all of that memory is in use, system operations can be affected in unexpected ways. To control how FortiOS functions when the available memory is very low, FortiOS enters conserve mode. This causes functions, such as antivirus scanning, to change how they operate to reduce the functionality and conserve memory without compromising security.

Three memory thresholds can be configured:

```
config system global
    set memory-use-threshold-extreme <integer>
    set memory-use-threshold-green <integer>
    set memory-use-threshold-red <integer>
end
```

memory-use-threshold-extreme <integer>	The threshold at which memory usage is considered extreme and new sessions are dropped, in percent of total RAM (70 - 97, default = 95).
memory-use-threshold-green <integer>	The threshold at which memory usage forces the FortiGate to leave conserve mode, in percent of total RAM (70 - 97, default = 82).
memory-use-threshold-red <integer>	The threshold at which memory usage forces the FortiGate to enter conserve mode, in percent of total RAM (70 - 97, default = 88).

Proxy inspection in conserve mode

The FortiGate's proxy-based inspection behavior while in conserve mode is configured with the antivirus failopen command.

```
config system global
    set av-failopen {pass | off | one-shot}
end
```

pass	<p>This is the default settings.</p> <p>Bypass the antivirus proxy and allow traffic to continue to its destination. Because traffic bypasses the proxy, security profiles that require the antivirus proxy are also bypassed. Security profiles that do not use the antivirus proxy continue to function normally.</p> <p>Use this setting when access is more important than security while the issue is resolved.</p>
off	<p>Force the FortiGate to stop all traffic that uses the antivirus proxy. New sessions are blocked, but active sessions continue to be processed normally unless they request more memory and are then terminated.</p>

If a security policy is configured to use antivirus scanning, then the traffic that it permits is blocked while in conserve mode. So, a policy with only IPS scanning enabled will continue normally, but a policy with both IPS and antivirus scanning is blocked because antivirus scanning requires the antivirus proxy.

Use this setting when security is more important than access while the issue is resolved.

one-shot

Continue to bypass the antivirus proxy after the FortiGate is out of conserve mode, until the failopen setting is changed or the FortiGate is restarted.

Flow inspection in conserve mode

The FortiGate's flow-based inspection behavior while in conserve mode is configured with the IPS failopen command.

```
config ips global
    set fail-open {enable | disable}
end
```

- When disabled (default), the IPS engine drops all new sessions that require flow-based inspection.
- When enabled, the IPS engine does not perform any scans and allows new packets.

Diagnostics

When in conserve mode, FortiOS generates conserve mode log messages and SNMP traps, and a conserve mode banner is shown in the GUI.

To view current information about memory conservation status:

```
# diagnose hardware sysinfo conserve
memory conserve mode:                on
total RAM:                          997 MB
memory used:                         735 MB    73% of total RAM
memory freeable:                     173 MB    17% of total RAM
memory used + freeable threshold extreme: 947 MB    95% of total RAM
memory used threshold red:           877 MB    88% of total RAM
memory used threshold green:         817 MB    82% of total RAM
```

To view logs:

1. Go to *Log & Report > System Events* in the GUI.
2. If historical FortiView is enabled, select the *Logs* tab.
3. If the GUI is unresponsive due to high memory usage, making the logs inaccessible, they can be viewed in the CLI:

```
# execute log filter category 1
# execute log display

1: date=2022-11-02 time=16:58:37 eventtime=1667433517502192693 tz="-0700"
logid="0100022011" type="event" subtype="system" level="critical" vd="root"

2: 2022-10-27 14:22:36 green="817 MB" msg="Kernel enters memory conserve mode"
```

Using APIs

Administrators can use API calls to a FortiGate to:

- Retrieve, create, update, and delete configuration settings
- Retrieve system logs and statistics
- Perform basic administrative actions, such as a reboot or shut down through programming scripts.

Token-based authentication

There are two types of authentication used to make API calls on the FortiGate: session-based and token-based.

Token-based authentication requires the administrator to generate a token, which is then included in each API request for authentication. A token is automatically generated when a new API administrator is created in FortiOS.

Once the API administrator is created and the token displays, there is no way for the FortiGate to provide this token again. Ensure you record the token, and store it in a safe location; otherwise, you will have to generate a new token.

Creating the API administrator and generating the API token

When creating an API administrator, it is best practice to provide this account (and the associated token) with the minimum permissions required to complete the function. For example, if you only plan to use API calls to retrieve statistics or information from the FortiGate, the account should have read permissions.

The API administrator account used in this topic's examples has full permissions strictly to illustrate various call types and does not adhere to the preceding recommendation.

See [REST API administrator on page 2399](#) for detailed steps to create a REST API administrator.

Making an API call to retrieve information from the FortiGate

The newly created API token is used to query the FortiGate for all firewall addresses. Many applications can be used for this query, and this example uses a web browser to demonstrate the functionality.

General API call

One of the simplest API calls is `api/v2/cmdb/firewall/address`, which returns all information about all firewall addresses.

To make a general API call:

1. Open the web browser.
2. In the address bar, enter `https://<FortiGate_address>/api/v2/cmdb/firewall/address/?access_token=<API_token>`.
3. The browser displays the output similar to the following (output shortened for brevity):

```
{
  "http_method": "GET",
  "revision": "124.0.206.9538334086041268915.1559577065",
  "results": [
    {
      "q_origin_key": "AD-Server",
      "name": "AD-Server",
      "uuid": "*****-*****-*****-*****-*****",
      "subnet": "10.100.77.240 255.255.255.255",
      "type": "ipmask",
      "start-mac": "00:00:00:00:00:00",
      "end-mac": "00:00:00:00:00:00",
      "start-ip": "10.100.77.240",
      "end-ip": "255.255.255.255",
      "fqdn": "",
      "country": "",
      "wildcard-fqdn": "",
      "cache-ttl": 0,
      "wildcard": "10.100.99.240 255.255.255.255",
      "sdn": "",
      "interface": "",
      "tenant": "",
      "organization": "",
      "epg-name": "",
      "subnet-name": "",
      "sdn-tag": "",
      "policy-group": "",
      "comment": "",
      "visibility": "enable",
      "associated-interface": "",
      "color": 0,
      "filter": "",
      "sdn-addr-type": "private",
      "obj-id": "",
      "list": [
      ],
      "tagging": [
      ],
      "allow-routing": "disable"
    },
    {
      "q_origin_key": "AWS-us-east-1a",
      "name": "AWS-us-east-1a",

```

```
"uuid":"*****-****-****-****-*****",
```

Formatting an API call

Since a general API call for address objects returns a large amount of information, it may be beneficial to format the API call to display certain information using the `format` parameter. In this example, the `format` parameter is used to display the name and comment for each firewall address.

To use the `format` parameter in an API call:

1. Open the web browser.
2. In the address bar, enter `https://<FortiGate_address>/api/v2/cmdb/firewall/address/?access_token=<API_token>&format=name|comment`.
3. The browser displays the output similar to the following:

```
{
  "http_method": "GET",
  "revision": "160.0.206.9538334086041268915.1559577065",
  "results": [
    {
      "q_origin_key": "AD-Server",
      "name": "AD-Server",
      "comment": ""
    },
    {
      "q_origin_key": "AWS-us-east-1a",
      "name": "AWS-us-east-1a",
      "comment": ""
    },
    {
      "q_origin_key": "AWS-us-east-1b",
      "name": "AWS-us-east-1b",
      "comment": ""
    },
  ],
}
```

Filtering an API call

The filter parameter can be used to specify a field and a keyword to limit what results match and are returned by a call. In this example, the preceding call is used with a filter to return only names and comments for address objects with the word `Sales` in the name.

To use the `filter` parameter in an API call:

1. Open the web browser.
2. In the address bar, enter `https://<FortiGate_address>/api/v2/cmdb/firewall/address/?access_token=<API_token>&format=name|comment&filter=name=@Sales`.
3. The browser displays the output similar to the following:

```
{
  "http_method": "GET",
```

```
"revision":"196.0.206.9538334086041268915.1559577065",
"results":[
  {
    "q_origin_key":"Sales Network",
    "name":"Sales Network",
    "comment":""
  },
  {
    "q_origin_key":"Sales-Portal",
    "name":"Sales-Portal",
    "comment":""
  }
],
"vdom":"root",
"path":"firewall",
"name":"address",
"status":"success",
"http_status":200,
"serial":"*****",
"version":"v6.2.0",
"build":866
}
```

For a complete list of API calls, see the [Fortinet Development Network \(FNDN\)](#). A [subscription](#) is required to access the FNDN.

Fortinet Security Fabric

The Fortinet Security Fabric provides an intelligent architecture that interconnects discrete security solutions into an integrated whole to detect, monitor, block, and remediate attacks across the entire attack surface. It delivers broad protection and visibility into every network segment and device, be they hardware, virtual, or cloud based.

- The physical topology view shows all connected devices, including access layer devices. The logical topology view shows information about the interfaces that each device is connected to.
- Security rating checks analyze the Security Fabric deployment to identify potential vulnerabilities and highlight best practices to improve the network configuration, deploy new hardware and software, and increase visibility and control of the network.
- Fabric connectors provide integration with multiple SDN, cloud, and partner technology platforms to automate the process of managing dynamic security updates without manual intervention.
- Automation pairs an event trigger with one or more actions to monitor the network and take the designated actions automatically when the Security Fabric detects a threat.

Components

The Fortinet Security Fabric consists of different components that work together to secure your network.

The following devices are required to create a Security Fabric:

Device	Description
FortiGate	<p>FortiGates are the core of the Security Fabric and can have one of the following roles:</p> <ul style="list-style-type: none">• Root: the root FortiGate is the main component in the Security Fabric. It is typically located on the edge of the network and connects the internal devices and networks to the internet through your ISP. From the root FortiGate, you can see information about the entire Security Fabric on the <i>Physical</i> and <i>Logical Topology</i> pages in the GUI.• Downstream: after a root FortiGate is installed, all other FortiGate devices in the Security Fabric act as Internal Segmentation Firewalls (ISFWs), located at strategic points in your internal network, rather than on the network edge. This allows extra security measures to be taken around key network components, such as servers that contain valuable intellectual property. ISFW FortiGates create network visibility by sending traffic and information about the devices that are connected to them to the root FortiGate. <p>See Configuring the root FortiGate and downstream FortiGates on page 2770 for more information about adding FortiGate devices in the Security Fabric.</p> <p>FortiGate documentation: https://docs.fortinet.com/product/fortigate</p>
FortiAnalyzer*	<p>FortiAnalyzer gives you increased visibility into your network, centralized monitoring, and awareness of threats, events, and network activity by collecting and correlating logs from all Security Fabric devices. This gives you a deeper and more comprehensive view across the entire Security Fabric.</p>

Device	Description
	See Configuring FortiAnalyzer on page 2779 for more information about adding FortiAnalyzer devices in the Security Fabric. FortiAnalyzer documentation: https://docs.fortinet.com/product/fortianalyzer
Cloud Logging*	There are two options for cloud logging: FortiAnalyzer Cloud and FortiGate Cloud. Either can be used to enable the Security Fabric root device; however, if using FortiGate Cloud, all downstream devices must belong to the same FortiCloud account. See Configuring cloud logging on page 2782 for more information about configuring a Security Fabric with FortiGate Cloud. FortiGate Cloud documentation: https://docs.fortinet.com/product/fortigate-cloud

* FortiAnalyzer or Cloud Logging is a required component for the Security Fabric. Either FortiAnalyzer, FortiAnalyzer Cloud, or FortiGate Cloud can be used to met this requirement.

The following devices are recommended:

Device	Description
FortiClient	FortiClient adds endpoint control to devices that are located in the Security Fabric, allowing only traffic from compliant devices to flow through the FortiGate. FortiClient compliance profiles are applied by the first FortiGate that a device's traffic flows through. Device registration and on-net status information for a device that is running FortiClient appears only on the FortiGate that applies the FortiClient profile to that device. FortiClient documentation: https://docs.fortinet.com/product/forticlient
FortiClient EMS	FortiClient EMS is used in the Security Fabric to provide visibility across your network, securely share information, and assign security profiles to endpoints. See Configuring FortiClient EMS on page 2789 for more information about adding FortiClient EMS devices in the Security Fabric. FortiClient EMS documentation: https://docs.fortinet.com/product/forticlient
FortiAP	Add FortiAP devices to extend the Security Fabric to your wireless devices. Devices connected to a FortiAP appear in the Physical and Logical Topology pages in the Security Fabric menu. See Configuring LAN edge devices on page 2806 for more information about adding FortiAP devices in the Security Fabric. FortiAP documentation: https://docs.fortinet.com/product/fortiap
FortiSwitch	A FortiSwitch can be added to the Security Fabric when it is managed by a FortiGate that is in the Security Fabric with the FortiLink protocol, and connected to an interface with <i>Security Fabric Connection</i> enabled. FortiSwitch ports to become logical extensions of the FortiGate. Devices connected to the FortiSwitch appear in the Physical and Logical Topology pages in the Security Fabric menu, and security features, such as FortiClient compliance profiles, are applied to them. See Configuring LAN edge devices on page 2806 for more information about adding FortiSwitch devices in the Security Fabric. FortiSwitch documentation: https://docs.fortinet.com/product/fortiswitch

Device	Description
FortiExtender	<p>FortiExtender cellular gateways provide ultra-fast LTE and 5G wireless to connect and scale any WAN edge.</p> <p>See Configuring LAN edge devices on page 2806 for more information about adding FortiExtender devices in the Security Fabric.</p> <p>FortiExtender documentation: https://docs.fortinet.com/product/fortiextender</p>
FortiManager	<p>Add FortiManager to simplify the network management of devices in the Security Fabric by centralizing management access in a single device. This allows you to easily control the deployment of security policies, FortiGuard content security updates, firmware revisions, and individual configurations for devices in the Security Fabric.</p> <p>See Configuring central management on page 2808 for more information about adding FortiManager devices in the Security Fabric.</p> <p>FortiManager documentation: https://docs.fortinet.com/product/fortimanager</p>
FortiSandbox	<p>Add FortiSandbox to your Security Fabric to improve security with sandbox inspection. Sandbox integration allows FortiGate devices in the Security Fabric to automatically receive signature updates from FortiSandbox and add the originating URL of any malicious file to a blocked URL list.</p> <p>See Configuring sandboxing on page 2811 for more information about adding FortiSandbox devices in the Security Fabric.</p> <p>FortiSandbox documentation: https://docs.fortinet.com/product/fortisandbox</p>
FortiADC	<p>FortiADC devices optimize the availability, user experience, and scalability of enterprise application delivery. They enable fast, secure, and intelligent acceleration and distribution of even the most demanding enterprise applications.</p> <p>FortiADC documentation: https://docs.fortinet.com/product/fortiadc</p>
FortiDDoS	<p>FortiDDoS is a Network Behavior Anomaly (NBA) prevention system that detects and blocks attacks that intend to disrupt network service by overutilizing server resources.</p> <p>FortiDDoS documentation: https://docs.fortinet.com/product/fortiddos</p>
FortiDeceptor	<p>FortiDeceptor automatically lays out a layer of decoys and lures, which helps conceal sensitive and critical assets behind a fabricated deception surface to confuse and redirect attackers while revealing their presence on your network.</p> <p>See Configuring FortiDeceptor on page 2825 for more information about adding FortiDeceptor devices in the Security Fabric.</p> <p>FortiDeceptor documentation: https://docs.fortinet.com/product/fortideceptor</p>
FortiMail	<p>FortiMail antispam processing helps offload from other devices in the Security Fabric that would typically carry out this process.</p> <p>See Configuring FortiMail on page 2827 for more information about adding FortiMail devices in the Security Fabric.</p> <p>FortiMail documentation: https://docs.fortinet.com/product/fortimail</p>
FortiMonitor	<p>FortiMonitor is a holistic, SaaS-based digital experience and network performance monitoring solution. It facilitates deep analysis of both network health metrics and application performance to identify potential problem areas that impact user access.</p>

Device	Description
	<p>See Configuring FortiMonitor on page 2827 for more information about adding FortiMonitor devices in the Security Fabric.</p> <p>FortiMonitor documentation: https://docs.fortinet.com/product/fortimonitor</p>
FortiNAC	<p>FortiNAC provides visibility to all administrators to see everything connected to their network, and the ability to control those devices and users, including dynamic, automated responses.</p> <p>See Configuring FortiNAC on page 2829 for more information about adding FortiNAC devices in the Security Fabric.</p> <p>FortiNAC documentation: https://docs.fortinet.com/product/fortinac</p>
FortiNDR	<p>FortiNDR (formerly FortiAI) uses artificial neural networks (ANN) that can deliver sub-second malware detection and a verdict. Add FortiNDR to your Security Fabric to automatically quarantine attacks.</p> <p>See Configuring FortiNDR on page 2830 for more information about adding FortiNDR devices in the Security Fabric.</p> <p>FortiNDR documentation: https://docs.fortinet.com/product/fortindr</p>
FortiPolicy	<p>FortiPolicy is a containerized security platform that implements and automates security orchestration with full-flow inspection and segmented and microsegmented policy enforcement while auto-scaling to accommodate infrastructure changes.</p> <p>See Configuring FortiPolicy on page 2832 for more information about adding FortiPolicy devices in the Security Fabric.</p> <p>FortiPolicy documentation: https://docs.fortinet.com/product/fortipolicy</p>
FortiTester	<p>FortiTester can be used for performance testing and validating network security infrastructure and services. It provides a comprehensive range of application test cases to evaluate equipment and right-size infrastructure.</p> <p>See Configuring FortiTester on page 2835 for more information about adding FortiTester devices in the Security Fabric.</p> <p>FortiTester documentation: https://docs.fortinet.com/product/fortitester</p>
FortiWeb	<p>FortiWeb defends the application attack surface from attacks that target application exploits. You can also configure FortiWeb to apply web application firewall features, virus scanning, and web filtering to HTTP traffic to help offload from other devices in the Security Fabric that would typically carry out these processes.</p> <p>See Configuring FortiWeb on page 2837 for more information about adding FortiWeb devices in the Security Fabric.</p> <p>FortiWeb documentation: https://docs.fortinet.com/product/fortiweb</p>
FortiWLC	<p>FortiWLC delivers seamless mobility and superior reliability with optimized client distribution and channel utilization. Both single and multi channel deployment options are supported, maximizing efficiency to make the most of available wireless spectrum.</p> <p>FortiWLC documentation: https://docs.fortinet.com/product/wireless-controller</p>
FortiVoice	<p>FortiVoice includes integrated high-definition voice, conferencing, and fax capabilities that enables organizations to communicate and collaborate easily and securely.</p> <p>See Configuring FortiVoice on page 2836 for more information about adding FortiVoice devices in the Security Fabric.</p>

Device	Description
	FortiVoice documentation: https://docs.fortinet.com/product/fortivoice-enterprise
Other Fortinet products	Other Fortinet products can be added to the Security Fabric, including FortiAuthenticator, FortiToken, FortiCache, and FortiSIEM. Documentation: https://docs.fortinet.com/
Third-party products	Third-party products that belong to the Fortinet Fabric-Ready Partner Program can be added to the Security Fabric.

Security Fabric connectors

This section contains information about how to configure the following devices as part of the Fortinet Security Fabric:

- [Configuring the root FortiGate and downstream FortiGates](#)
- [Configuring logging and analytics on page 2778](#)
 - [Configuring FortiAnalyzer on page 2779](#)
 - [Configuring cloud logging on page 2782](#)

- [Configuring central management on page 2808](#)
- [Configuring sandboxing on page 2811](#)
- [Configuring supported connectors on page 2817](#)
 - [Configuring FortiNDR on page 2830](#)
 - [Configuring FortiDeceptor on page 2825](#)
 - [Configuring FortiMail on page 2827](#)
 - [Configuring FortiMonitor on page 2827](#)
 - [Configuring FortiNAC on page 2829](#)
 - [Configuring FortiTester on page 2835](#)
 - [Configuring FortiVoice on page 2836](#)
 - [Configuring FortiWeb on page 2837](#)
 - [Configuring FortiPolicy on page 2832](#)

System requirements

To set up the Security Fabric, the devices that you want to include must meet the Product Integration and Support requirements in the [FortiOS Release Notes](#).

Some features of the Security Fabric are only available in certain firmware versions and models. Not all FortiGate models can run the FortiGuard Security Rating Service if they are the root FortiGate in a Security Fabric. For more information, see the Special Notices in the [FortiOS Release Notes](#).

Prerequisites

- If devices are not already installed in your network, complete basic installation and configuration tasks by following the instructions in the device documentation.
- FortiGate devices must be operating in NAT mode.

Configuring the root FortiGate and downstream FortiGates

The following procedures include configuration steps for a typical Security Fabric implementation, where the edge FortiGate is the root FortiGate with other FortiGates that are downstream from the root FortiGate.

For information about the recommended number of downstream FortiGates, see the [FortiOS Best Practices](#).

Prerequisite

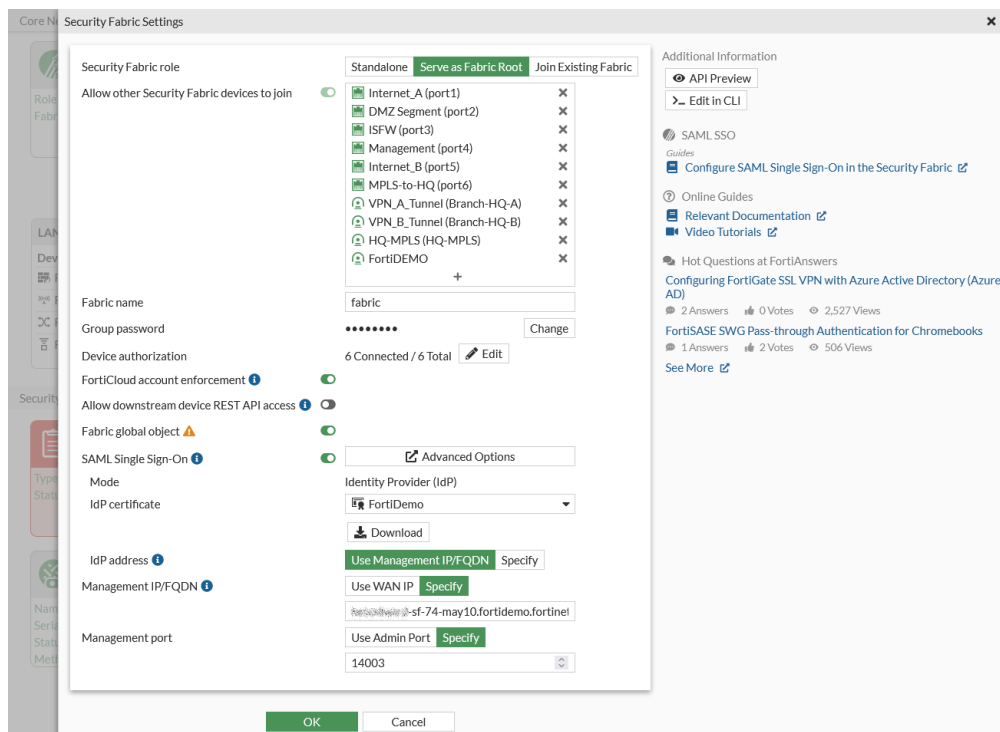

- The FortiGates must be operating in NAT mode.

Configuring the root FortiGate

The edge FortiGate is typically configured as the root FortiGate, as this allows you to view the full topology of the Security Fabric from the top down. The following steps describe how to add the FortiGate to serve as the root device.

To configure the root FortiGate:

1. On the root FortiGate, go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
2. Set the *Security Fabric role* to *Serve as Fabric Root*.
3. Enter a *Fabric name*.
4. Ensure *Allow other Security Fabric devices to join* is enabled.
5. Select the interfaces that will be listening for device join requests. Enabling an interface here has the same effect as going to *Network > Interfaces*, editing an interface, and enabling *Security Fabric Connection* under *Administrative Access*.

6. Optionally, enable *Allow downstream device REST API access* to allow access to the REST API of the root FortiGate for API requests coming from downstream Security Fabric devices. This option must be enabled to use certain supported devices (such as [FortiDeceptor](#) and [FortiMonitor](#)) and the [Fabric event](#) trigger.
7. Click OK.

Using the root FortiGate with disk to store historic user and device information

This backend implementation allows the root FortiGate in a Security Fabric to store historic user and device information in a database on its disk. This will allow administrators to visualize users and devices over a period of time.

The daemon, `user_info_history`, stores this data on the disk. The information source for the historical data will be the `user_info` daemon, which would be recorded on the disk when `user_info` notifies `user_info_history` that a user has logged out or the device is no longer connected.

Adding downstream devices

Downstream device serial numbers can be pre-authorized from the root FortiGate, or allowed to join by request. New authorization requests include the device serial number, IP address, and HA members. HA members can include up to four serial numbers and is used to ensure that, in the event of a fail over, the secondary FortiGate is still authorized. A downstream device's certificate can also be used to authorize the device by uploading the certificate to the root FortiGate.

The *LAN Edge Devices* card on the *Fabric Connectors* page displays a summary about the FortiGates, FortiAPs, FortiSwitches, and FortiExtenders in the Fabric. Information about the device type, number of devices, and number of unregistered and unauthorized devices is displayed. If there are devices that do not have a green checkmark in the *Status* column, hover over the status message to view the tooltip with required action. In this example, there is a downstream FortiGate that require authorization. The tooltip includes a link to the *System > Firmware & Registration* page to authorize the FortiGates.

Core Network Security Connectors

Security Fabric Setup
Role: Fabric Root
Fabric name: fabric

Logging & Analytics
FortiAnalyzer Cloud Logging: Connected
Cloud Logging: Connected

FortiClient EMS
EMS: Enabled
IP address: 10.100.88.5

LAN Edge Devices

Device Type	Device Count	Status
FortiGate	5	1 device require authorization
FortiAP	3	3 devices not registered
FortiSwitch	2	2 devices not registered
FortiExtender	0	None configured

Go to the Firmware & Registration page to authorize your FortiGate and handle any other device related concerns.

Supported Connectors
Icons representing various Fortinet devices supported for integration.

The *Supported Connectors* card displays the icons of different Fortinet devices that support full Security Fabric integration. See [Configuring supported connectors on page 2817](#) for more information about configuring supported Fabric connectors.

Pre-authorizing the downstream FortiGate

When a downstream Fortinet device's serial number or certificate is added to the trusted list on the root FortiGate, the device can join the Security Fabric as soon as it connects. After the new device is authorized, connected FortiAP and FortiSwitch devices are automatically included in the topology, where they can be authorized with one click.

The interface that connects to the downstream FortiGate must have *Security Fabric Connection* enabled.

To pre-authorize a FortiGate:

1. On the root FortiGate, go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
2. In the *Device authorization* field and click *Edit*. The *Device Authorization* pane opens.
3. Click *Create New* to add a new device for pre-authorization.
4. Enter the device name in the *Name* field.
5. Select the *Authorization type*, either *Serial Number* or *Certificate*.

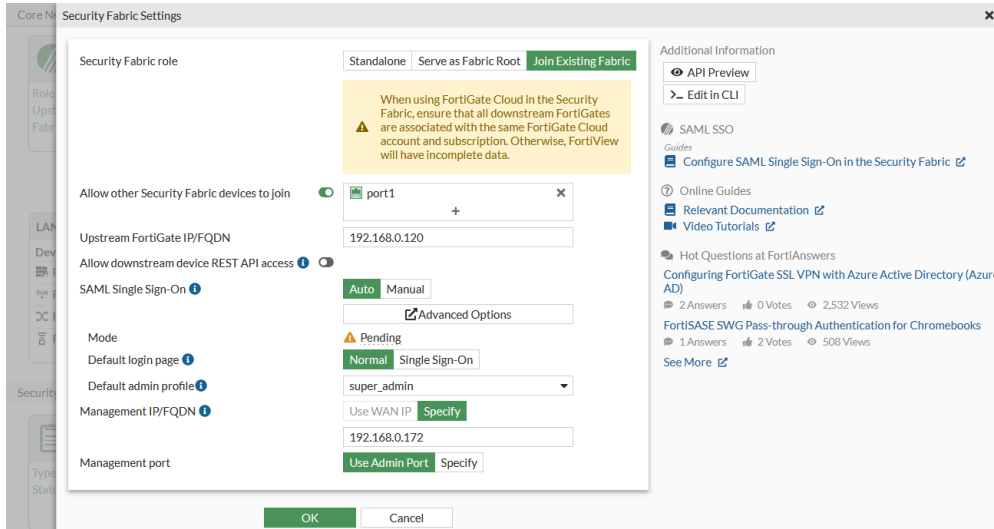

6. If *Certificate* is selected, click *Browse* to upload the downstream device's certificate from the management computer.
7. Set the *Action* to *Accept*.

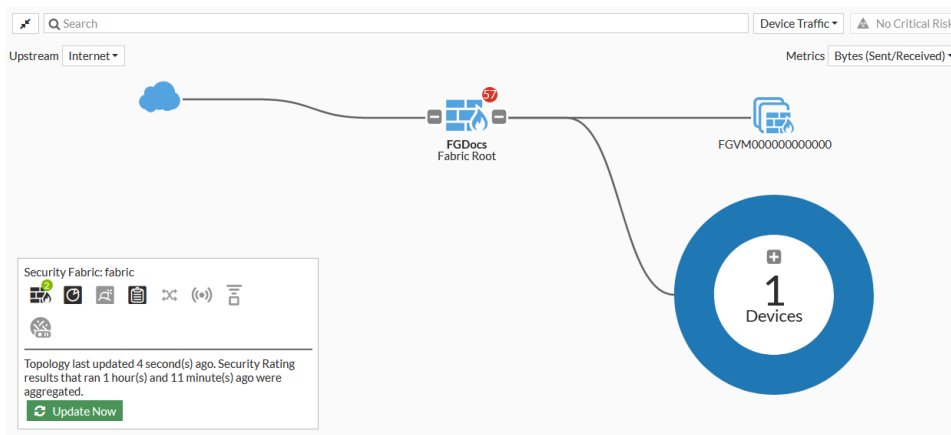

8. Click **OK** and add more devices as required.
9. Click **OK**.

To configure a downstream FortiGate to connect to an upstream FortiGate:

1. Configure the downstream FortiGate:
 - a. On the downstream FortiGate, go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
 - b. Set the *Security Fabric role* to *Join Existing Fabric*.
 - c. Enter the IP address of the root FortiGate in the *Upstream FortiGate IP/FQDN* field.

- d. Click **OK**.
2. On the root FortiGate, go to *Security Fabric > Physical Topology* and verify that the downstream FortiGate that you added appears in the Security Fabric topology.

Authorizing a downstream FortiGate

When you log in to an unauthorized downstream FortiGate, the log in prompt includes the option to authorize the device on the root FortiGate.

To authorize a downstream FortiGate:

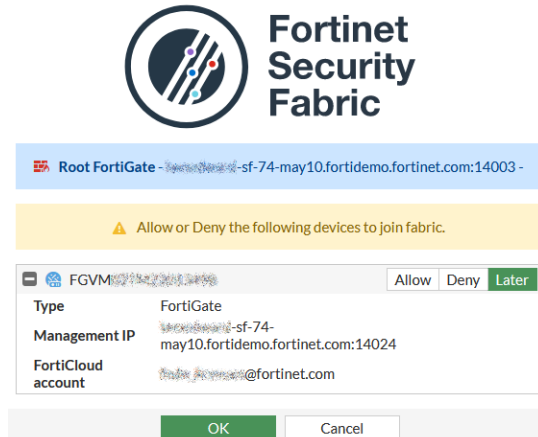

1. Log in to the unauthorized, downstream device.

2. In the *Fabric Setup* step, click *Review Authorization on Root FortiGate*.
A pop-up window opens to a log in screen for the root FortiGate.

3. Enter the log in credentials for the root FortiGate, then click *Login*.
A list of pending authorizations is shown.

4. Select *Allow* and then click *OK* to authorize the downstream FortiGate. You can also select *Deny* to reject the authorization, or *Later* to postpone the decision to the next time that you log in.
When authorization is allowed, the pop-up window closes, and the log in prompt shows that the downstream FortiGate has been authorized.

Setup Progress

- Register with FortiCare ✓
- Migrate Config with FortiConverter
- Specify Hostname ✓
- Change Your Password ✓
- Dashboard Setup ✓
- > Fabric Setup ✓

Fabric Setup

⚠ Connect this FortiGate to the detected Security Fabric via an upstream FortiGate.

Upstream FortiGate 10.100.88.1 (woodward-sf-74-may10)

Join existing fabric ☒ Successfully authorized by root FortiGate.

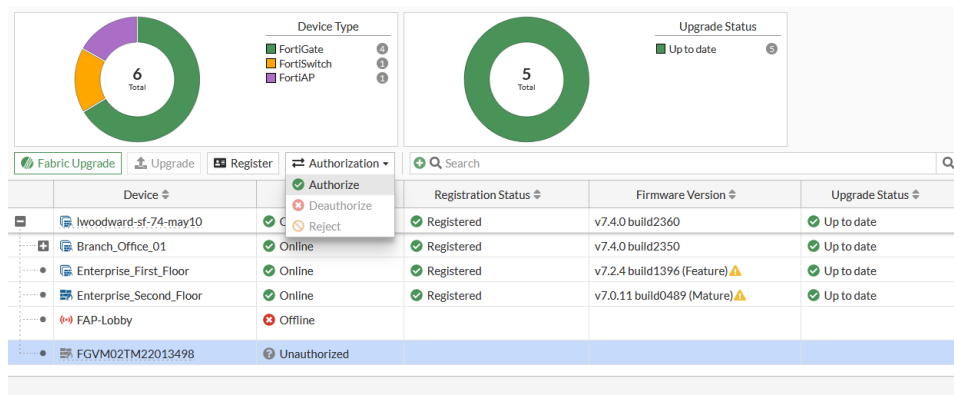

- Click *Done* to log in to the downstream FortiGate.

Triggering authorization from the GUI

A downstream device can be authorized in the root FortiGate's GUI by using the *Firmware & Registration* page (see [Authorizing devices on page 2434](#) for more information).

To authorize a downstream FortiGate from the Firmware & Registration page:

- Go to *System > Firmware & Registration*.
- Select the unauthorized device and click *Authorization > Authorize*.

A notification appears in the top-right corner once the device is authorized.

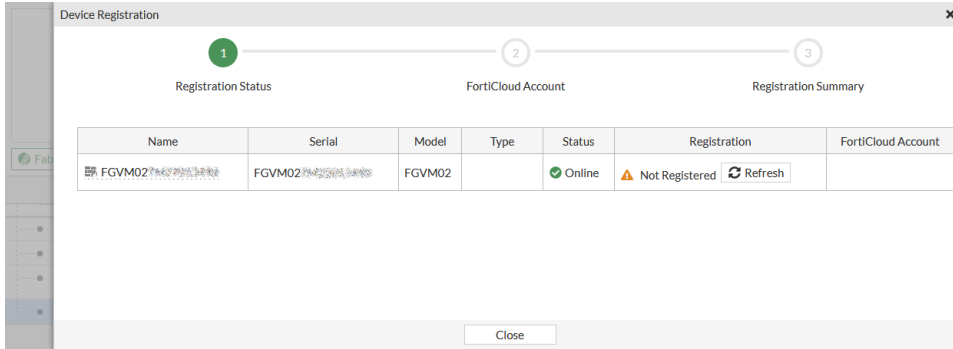

- Refresh the page. The FortiGate's status is now *Online*.

Registering the downstream devices to FortiCloud

In this example, a downstream FortiGate has just been authorized, but it is not registered to a FortiCloud account. A device can be registered on the root FortiGate to a FortiCloud account.

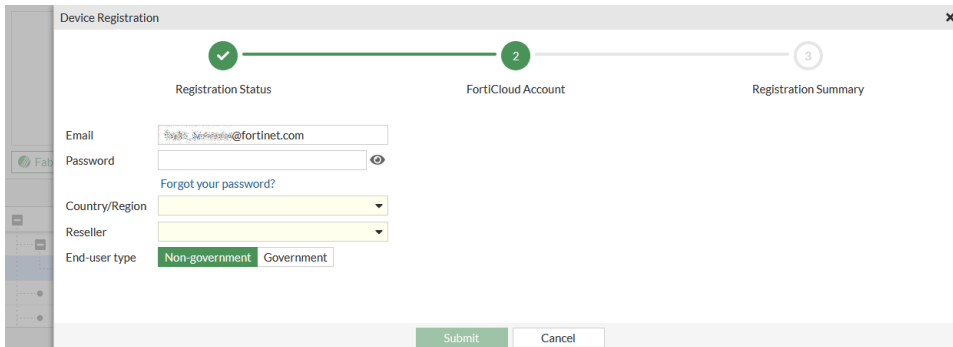

To register the downstream FortiGate from the root:

- Log in to the root FortiGate and go to *System > Firmware & Registration*
- Select an unregistered device and click *Register*. The *Device Registration* pane opens.

Name	Serial	Model	Type	Status	Registration	FortiCloud Account
FGVM02	FGVM02	FGVM02		Online	Not Registered Refresh	

3. Enter the required information (password, country/region, reseller, and end-user type).

Email:

Password:

[Forgot your password?](#)

Country/Region:

Reseller:

End-user type: ☒ Non-government ☐ Government

4. Click *Submit*. The *Registration Summary* pane opens.
5. Click *Close*.

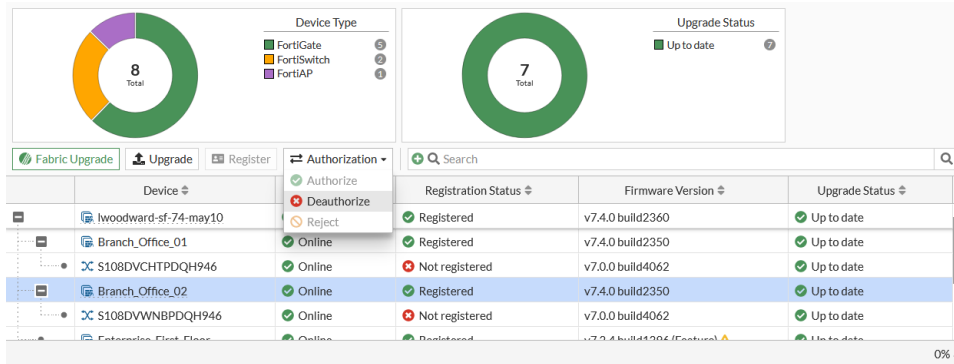

You can use IPAM to automatically assign subnets to downstream FortiGates to prevent duplicate IP addresses from overlapping within the same Security Fabric. See [Configure IPAM locally on the FortiGate on page 169](#).

Deauthorizing a device

A device can be deauthorized to remove it from the Security Fabric in the root FortiGate's GUI by using the *Firmware & Registration* page (see [Authorizing devices on page 2434](#) for more information).

To deauthorize a device from the *Firmware & Registration* page:

1. Go to *System > Firmware & Registration*.
2. Select the authorized device and click *Authorization > Deauthorize*.

A notification appears in the top-right corner once the device is deauthorized.

3. Refresh the page. The FortiGate is moved to the bottom of the list, and its status is *Unauthorized*.

After a device is deauthorized, the serial number is saved in a trusted list that can be viewed in the CLI using the `show system csf` command. For example, this result shows a deauthorized FortiSwitch:

```
show system csf
config system csf
    set status enable
    set group-name "Office-Security-Fabric"
    set group-password *****
    config trusted-list
        edit "FGT6HD391800000"
    next
        edit "S248DF3X1700000"
            set action deny
        next
    end
end
```

CLI commands

Use the following commands to view, accept, and deny authorization requests, to view upstream and downstream devices, and to list or test Fabric devices:

Command	Description
<code>diagnose sys csf authorization pending-list</code>	View pending authorization requests on the root FortiGate.
<code>diagnose sys csf authorization accept <serial number> [name]</code>	Authorize a device to join the Security Fabric.
<code>diagnose sys csf authorization deny <serial number> [name]</code>	Deny a device from joining the Security Fabric.
<code>diagnose sys csf downstream</code>	Show connected downstream FortiGates.

Command	Description
<code>diagnose sys csf downstream-devices <device type></code>	Show downstream fabric devices.
<code>diagnose sys csf upstream</code>	Show connected upstream devices.
<code>diagnose sys csf fabric-device list</code>	List all known Fabric devices.
<code>diagnose sys csf global</code>	Show a summary of all connected members in Security Fabric.

Desynchronizing settings

By default, the settings for FortiAnalyzer logging, central management, sandbox inspection, and FortiClient EMS are synchronized between all FortiGates in the Security Fabric.

To disable automatic synchronization:

```
config system csf
    set configuration-sync local
end
```

Configuring logging and analytics

FortiAnalyzer or Cloud Logging is a required component for the Security Fabric. Either FortiAnalyzer, FortiAnalyzer Cloud, or FortiGate Cloud can be used to meet this requirement. These settings are configured on the *Logging & Analytics* card on the *Security Fabric > Fabric Connectors* page. If there are multiple services enrolled on the FortiGate, the preference is: FortiAnalyzer Cloud logging, FortiAnalyzer logging, then FortiGate Cloud logging.

The following topics provide more information about configuring the logging and analytics connector:

- [Configuring FortiAnalyzer on page 2779](#)
- [Configuring cloud logging on page 2782](#)

Logs Sent daily chart for remote logging sources

The *Logs Sent* widget displays a chart for a select remote logging source (FortiAnalyzer, FortiGate Cloud, and FortiAnalyzer Cloud). Once configured, the same data is available on the *FortiAnalyzer* and *Cloud Logging* tabs of the *Logging & Analytics* card.

To add the Logs Sent widget:

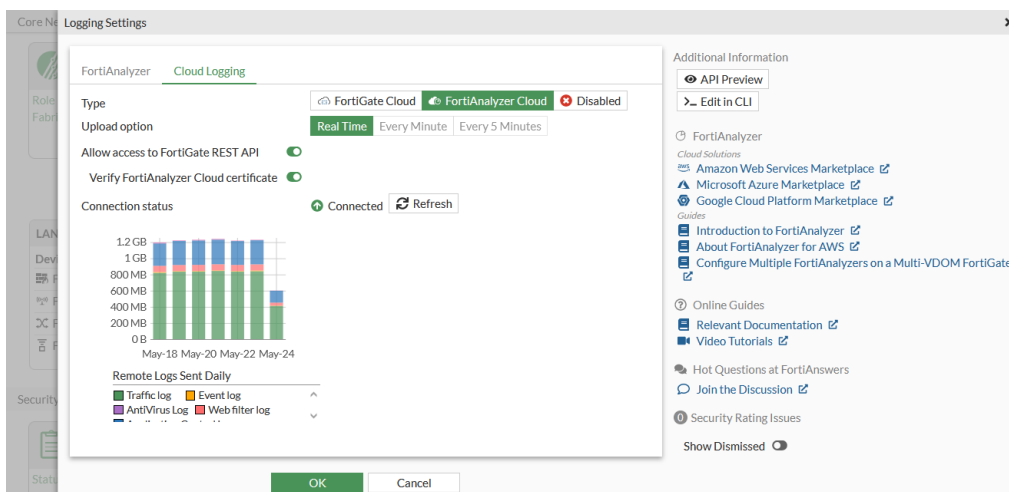

1. Go to *Dashboard > Status* and click *Add Widget*.
2. Search for *Logs Sent* and click to add the widget to the dashboard.
3. Select a *Logging Source* (*FortiAnalyzer*, *FortiAnalyzer Cloud*, or *FortiGate Cloud*). *FortiAnalyzer Cloud* is used in this example.

- Click **OK** and click **Close**. The *FortiAnalyzer Logs Sent Daily* widget is displayed in the dashboard.

To view the chart on the Logging & Analytics card:

- Go to *Security Fabric > Fabric Connectors* and double-click the *Logging & Analytics* card. The *Logging Settings* pane is displayed.
- Go to the *FortiAnalyzer* or *Cloud Logging* tabs to view the *Remote Logs Sent Daily* chart. *FortiAnalyzer Cloud* is used in this example.

- Click **OK** to close the pane.

Configuring FortiAnalyzer

FortiAnalyzer allows the Security Fabric to show historical data for the Security Fabric topology and logs for the entire Security Fabric. For more information about using FortiAnalyzer, see the [FortiAnalyzer Administration Guide](#).

To authorize a FortiAnalyzer in the Security Fabric:

- In FortiAnalyzer, configure the authorization address and port:
 - Go to *System Settings > Settings*.
 - In the *Fabric Authorization* section, enter an *Authorization Address* and *Authorization Port*. This is used to access the FortiAnalyzer login screen.

Admin Settings

Fabric Authorization ⓘ

Authorization Address: 172.16.116.221

Authorization Port: 2443

Apply

c. Click *Apply*.

- In FortiOS, go to *Security Fabric > Fabric Connectors* and double-click the *Logging & Analytics* card.
- On the *FortiAnalyzer* tab, set the *Status* to *Enabled*.
- Enter the FortiAnalyzer IP in the *Server* field.
- Optionally, configure the remaining log settings:

Upload option

Select the frequency of log uploads to the remote device:

- Real Time:** logs are sent to the remote device in real time.
- Every Minute:** logs are sent to the remote device once every minute. This option is unavailable if the Security Fabric connection is configured.
- Every 5 Minutes:** logs are sent to the remote device once every five minutes. This is the default option. This option is unavailable if the Security Fabric connection is configured.
- store-and-upload:** store logs to a local disk before uploading to FortiAnalyzer or FortiManager at a scheduled time. This option is only available in the CLI.

Allow access to FortiGate REST API

Define access to FortiGate REST API:

- Enable:** the REST API accesses the FortiGate topology and shares data and results.
- Disable:** the REST API does not share data and results.

Verify FortiAnalyzer certificate

Define the FortiAnalyzer certificate verification process:

- Enable:** the FortiGate will verify the FortiAnalyzer serial number against the FortiAnalyzer certificate. When verified, the serial number is stored in the FortiGate configuration.
- Disable:** the FortiGate will not verify the FortiAnalyzer certificate against the serial number.

- Click *OK*. The FortiAnalyzer *Connection status* is *Unauthorized* and a pane might open to verify the FortiAnalyzer's serial number.

Core N

Logging Settings

FortiAnalyzer Cloud Logging

Status: ☒ Enabled ☐ Disabled

Server: 192.168.0.173

Connection status: ☒ Unauthorized ☐ Authorized

Refresh Authorize

Allow access to FortiGate REST API: ☒

Verify FortiAnalyzer certificate: ☒

FortiAnalyzer Status

Log queued: 0

Failed logs: 0

OK Cancel

Verify FortiAnalyzer Serial Number

The FortiAnalyzer's access to the FortiGate's REST API will be authenticated by the FortiAnalyzer certificate. The serial number from the certificate must match the serial number observed on the FortiAnalyzer.

The obtained serial number from the FortiAnalyzer certificate is: FAZ-VM:1a2b3c4d5e6f7g8h

Do you wish to accept the serial number and certificate—verifying that they match the correct FortiAnalyzer?

Accept Deny

7. Click *Accept*.
 8. Double-click the *Logging & Analytics* card again.
 9. Click OK in the confirmation popup to open a window to authorize the FortiGate on the FortiAnalyzer.
- A login screen opens in a new browser window.
10. Enter the username and password, then click *Login*.

FortiAnalyzer-VM64-HV

Username

Password

Login

The authorization dialog opens.

11. Select *Approve* in the row for the FortiGate, and then click *OK* to authorize the FortiGate.

Select an action for the following unregistered devices.

FGVM02TM23004993

Device ID	Model	Management Mode	Serial Number	Firmware Version	Action
FGVM000000000000	FortiGate-VM64-HV	Logging Only	FGVM02TM23004993	FortiGate 7.4	Approve Deny Later

OK Cancel

12. In FortiOS, *Connection status* is now *Authorized* on the *Logging Settings* pane.

FortiGates with a FortiAnalyzer Cloud license can send all logs to FortiAnalyzer Cloud.

Configuring cloud logging

There are two options available in the *Cloud Logging* tab of the *Logging & Analytics* connector card: *FortiGate Cloud* and *FortiAnalyzer Cloud*. If there are multiple services enrolled on the FortiGate, the preference is: FortiAnalyzer Cloud logging, FortiAnalyzer logging, then FortiGate Cloud logging.

This topic covers the following cloud logging aspects:

- [Configuring FortiGate Cloud](#)
 - [Registration and activation](#)
 - [Enabling logging to FortiGate Cloud](#)
 - [Logging into the FortiGate Cloud portal](#)
 - [Configuring a Security Fabric with FortiGate Cloud logging](#)
 - [Cloud sandboxing](#)
- [Configuring FortiAnalyzer Cloud](#)

Configuring FortiGate Cloud

FortiGate Cloud is a hosted security management and log retention service for FortiGate devices. It provides centralized reporting, traffic analysis, configuration management, and log retention without the need for additional hardware or software.

FortiGate Cloud offers a wide range of features:

- **Simplified central management**

FortiGate Cloud provides a central GUI to manage individual or aggregated FortiGate and FortiWiFi devices. Adding a device to the FortiGate Cloud management subscription is straightforward. FortiGate Cloud has detailed traffic and application visibility across the whole network.
- **Hosted log retention with large default storage allocated**

Log retention is an integral part of any security and compliance program, but administering a separate storage system is onerous. FortiGate Cloud takes care of this automatically and stores the valuable log information in the cloud. Different types of logs can be stored, including Traffic, System Events, Web, Applications, and Security Events.
- **Monitoring and alerting in real time**

Network availability is critical to a good end-user experience. FortiGate Cloud enables you to monitor your FortiGate network in real time with different alerting mechanisms to pinpoint potential issues. Alerting mechanisms can be delivered via email.
- **Customized or pre-configured reporting and analysis tools**

Reporting and analysis are your eyes and ears into your network's health and security. Pre-configured reports are available, as well as custom reports that can be tailored to your specific reporting and compliance requirements. The reports can be emailed as PDFs, and can cover different time periods.
- **Maintain important configuration information uniformly**

The correct configuration of the devices within your network is essential for maintaining optimum performance and security posture. In addition, maintaining the correct firmware (operating system) level allows you to take advantage of the latest features.
- **Service security**

All communication (including log information) between the devices and the cloud is encrypted. Redundant data centers are always used to give the service high availability. Operational security measures have been put in place to make sure your data is secure — only you can view or retrieve it.

For more information, refer to the [FortiGate Cloud documentation](#).

Registration and activation

Before you can activate a FortiGate Cloud account, you must register your device first.

FortiGate Cloud accounts can be registered manually through the FortiGate Cloud website, <https://www.forticloud.com>, or you can easily register and activate your account directly from your FortiGate.

To activate your FortiGate Cloud account:

1. On your device, go to *Dashboard > Status*.
2. In the *FortiGate Cloud* widget, click the *Not Activated > Activate* button in the *Status* field.
3. A pane will open asking you to register your FortiGate Cloud account. Click *Create Account*, enter your information, view and accept the terms and conditions, and then click *OK*.
4. A second dialogue window opens, asking you to enter your information to confirm your account. This sends a confirmation email to your registered email. The dashboard widget then updates to show that confirmation is required.
5. Open your email, and follow the confirmation link it contains.
A FortiGate Cloud page will open, stating that your account has been confirmed. The *Activation Pending* message on the dashboard will change to state the type of account you have, and will provide a link to the FortiGate Cloud portal.

Enabling logging to FortiGate Cloud

To enable logging to FortiGate Cloud:

1. Go to *Security Fabric > Fabric Connectors* and double-click the *Logging & Analytics* card.
 2. On the *Cloud Logging* tab, set *Type* to *FortiGate Cloud*.
 3. Select an upload option:
 - *Real Time*: logs are sent to the cloud device in real time.
 - *Every Minute*: logs are sent to the cloud device once every minute.
 - *Every 5 Minutes*: logs are sent to the cloud device once every five minutes (default).
-

If the Security Fabric connection is configured, only the *Real Time* option is available.

4. Click *OK*.

Logging into the FortiGate Cloud portal

Once logging has been configured and you have registered your account, you can log into the FortiGate Cloud portal and begin viewing your logging results. There are two methods to reach the FortiGate Cloud portal:

- If you have direct network access to the FortiGate:
 - a. Go to *Dashboard > Status*.
 - b. In the *FortiGate Cloud* widget, in the *Status* field, click *Activated > Launch Portal*, or, in the *Licenses* widget, click *Support > Login to My Account*.
- If you do not have access to the FortiGate's interface, visit the FortiGate Cloud website (<https://www.forticloud.com>) and log in remotely, using your email and password. It will ask you to confirm the FortiGate Cloud account you are connecting to and then you will be granted access.

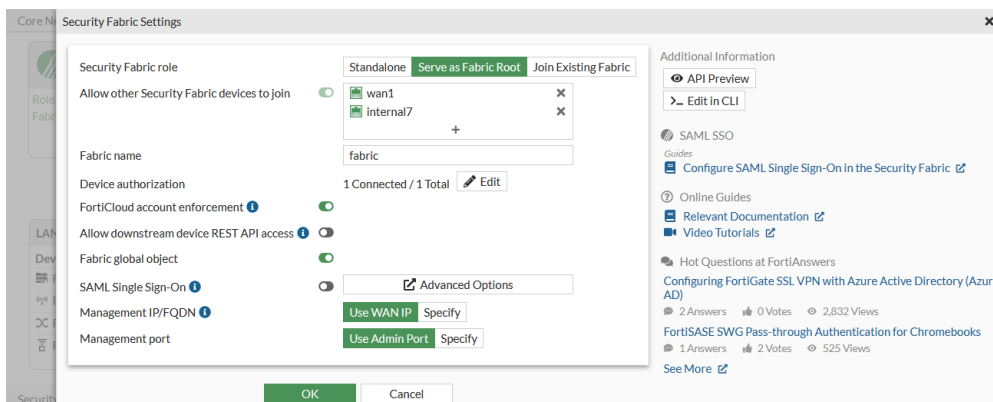

Configuring a Security Fabric with FortiGate Cloud logging

A Security Fabric can be created on the root device using FortiGate Cloud for cloud logging. When the FortiCloud account enforcement is enabled (by default), members joining the Fabric must be registered to the same FortiCloud account. Devices that are not activated with FortiCloud are also allowed.

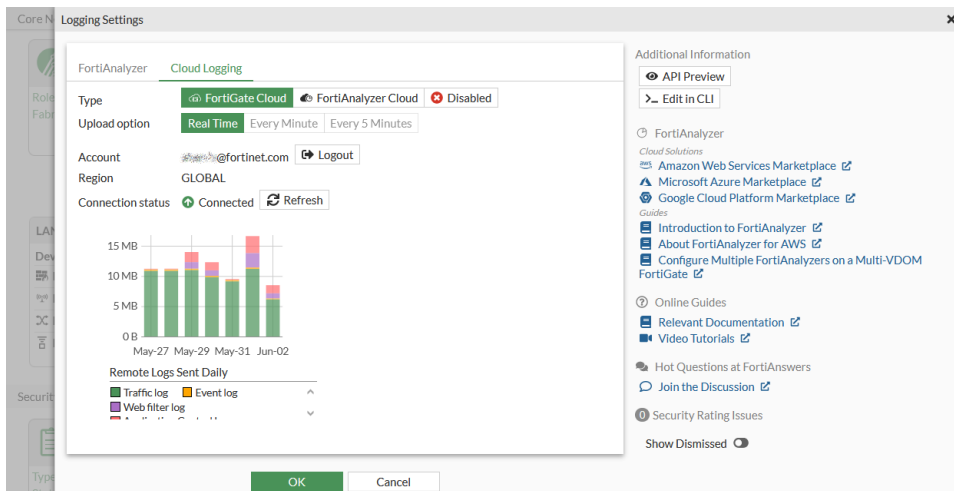

For example, the root FortiGate (FGT_10_101F) is configured with FortiGate Cloud logging. In the Security Fabric settings, the *FortiCloud account enforcement* option is enabled by default. The downstream FortiGate, FGT-F-VM, with the same FortiCloud account ID is able to join the Fabric.

To configure a Security Fabric with FortiCloud logging in the GUI:

1. Configure the Security Fabric settings on the root FortiGate (see [Configuring the root FortiGate and downstream FortiGates on page 2770](#)). The *FortiCloud account enforcement* setting is enabled by default.

2. Configure FortiCloud logging on the root FortiGate:
 - a. Go to *Security Fabric > Fabric Connectors* and double-click the *Logging & Analytics* card.
 - b. On the *Cloud Logging* tab, set *Type* to *FortiGate Cloud*.

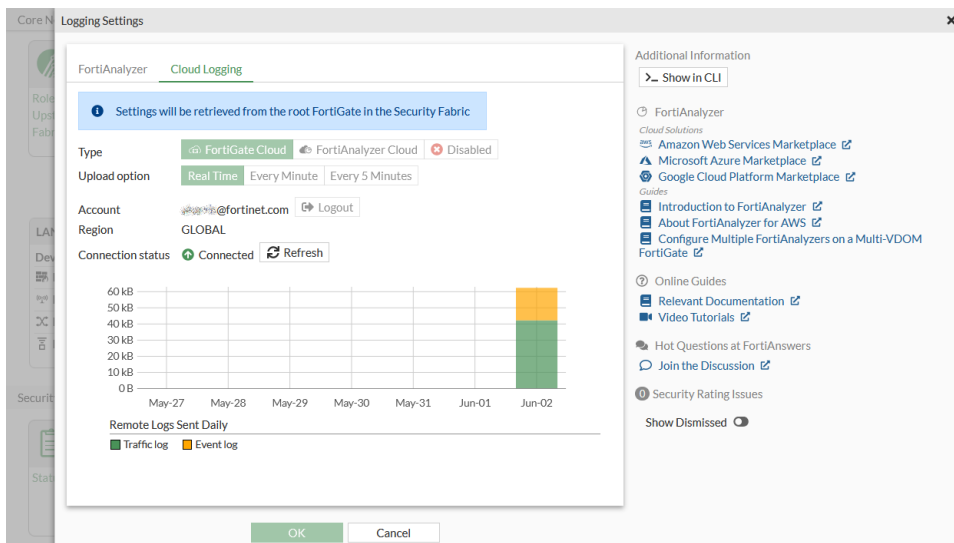

c. Click OK.

3. Configure the FGT-F-VM to join the Security Fabric:

- Go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
- Set *Security Fabric* role to *Join Existing Fabric*.
- Click OK. The FortiGate is authorized and successfully joins the Security Fabric.

4. Check the FortiCloud logging settings:

- Go to *Security Fabric > Fabric Connectors* and double-click the *Logging & Analytics* card.
- Go to the *Cloud Logging* tab. The settings are automatically retrieved from the root FortiGate and the *Account* is the same.

To configure a Security Fabric with FortiCloud logging in the CLI:

```
config log fortiguard setting
  set status enable
  set upload-option realtime
end
```

The FortiCloud account enforcement setting is enabled by default in the Security Fabric settings:

```
show system csf
config system csf
    set status enable
    set group-name "CSF_101"
    set forticloud-account-enforcement enable
end
```

Cloud sandboxing

FortiGate Cloud can be used for automated sample tracking, or sandboxing, for files from a FortiGate. This allows suspicious files to be sent to be inspected without risking network security. If the file exhibits risky behavior, or is found to contain a virus, a new virus signature is created and added to the FortiGuard antivirus signature database.

See [Configuring sandboxing on page 2811](#) for instructions to configure FortiGate Cloud Sandbox. Sandboxing results are shown on the *Sandbox* tab in the FortiGate Cloud portal.

Configuring FortiAnalyzer Cloud

FortiAnalyzer Cloud differs from FortiAnalyzer in the following ways:

- You cannot enable FortiAnalyzer Cloud in `vdom override-setting` when global FortiAnalyzer Cloud is disabled.
- You must use the CLI to retrieve and display logs sent to FortiAnalyzer Cloud. The FortiOS GUI is not supported.
- You cannot enable FortiAnalyzer Cloud and FortiGate Cloud at the same time.

For more information, see [Licensing](#) in the FortiAnalyzer Cloud Deployment Guide.

In the *Security Fabric > Fabric Connectors > Logging & Analytics* card settings, *FortiAnalyzer Cloud* is grayed out when you do not have a FortiAnalyzer Cloud entitlement. When you have a FortiAnalyzer Cloud entitlement, *FortiAnalyzer Cloud* is available and you can authenticate by the certificate.

In FortiAnalyzer Cloud, you can view logs from FortiOS in the *Event > All Types* page.

#	Date/Time	Level	Device ID	Action	Message	User	User Interface

To configure FortiAnalyzer Cloud logging in the GUI:

- Go to *Security Fabric > Fabric Connectors* and double-click the *Logging & Analytics* card.
- Select the *Cloud Logging* tab and set the *Type* to *FortiAnalyzer Cloud*.
- Optionally, configure the remaining log settings:

Upload option

Select the frequency of log uploads to the remote device:

- **Real Time:** logs are sent to the remote device in real time.
- **Every Minute:** logs are sent to the remote device once every minute. This option is unavailable if the Security Fabric connection is configured.
- **Every 5 Minutes:** logs are sent to the remote device once every five minutes. This is the default option. This option is unavailable if the Security Fabric connection is configured.

Allow access to FortiGate REST API

Define access to FortiGate REST API:

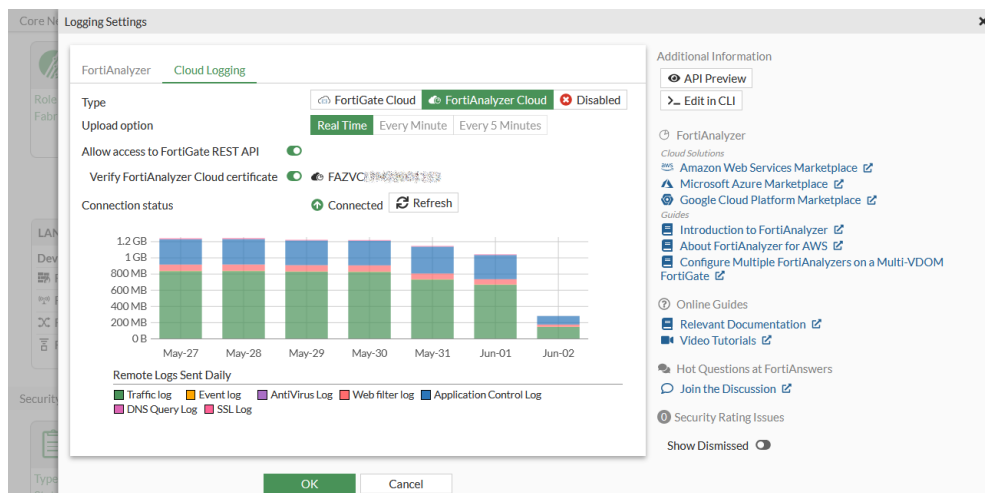

- **Enable:** the REST API accesses the FortiGate topology and shares data and results.
- **Disable:** the REST API does not share data and results.

Verify FortiAnalyzer Cloud certificate

Define the FortiAnalyzer Cloud certificate verification process:

- **Enable:** the FortiGate will verify the FortiAnalyzer Cloud serial number against the FortiAnalyzer certificate. When verified, the serial number is stored in the FortiGate configuration.
- **Disable:** the FortiGate will not verify the FortiAnalyzer Cloud certificate against the serial number.

4. Click **OK**. A prompt appears to verify the FortiAnalyzer Cloud serial number.
5. Click **Accept**.
6. The verified FortiAnalyzer Cloud certificate appears in the settings.

**To enable FortiAnalyzer Cloud logging in the CLI:**

1. Configure the FortiAnalyzer Cloud settings:

```
config log fortianalyzer-cloud setting
    set status enable
    set ips-archive disable
    set certificate-verification enable
    set serial "FAZVCLTM19000000"
    set access-config enable
    set enc-algorithm high
    set ssl-min-proto-version default
```

```
    set conn-timeout 10
    set monitor-keepalive-period 5
    set monitor-failure-retry-period 5
    set upload-option realtime
end
```

2. Configure the FortiAnalyzer Cloud filters:

```
config log fortianalyzer-cloud filter
    set severity information
    set forward-traffic disable
    set local-traffic disable
    set multicast-traffic disable
    set sniffer-traffic disable
    set anomaly disable
    set voip disable
    set dlp-archive disable
end
```

To disable FortiAnalyzer Cloud logging for a specific VDOM in the CLI:

1. Enable override FortiAnalyzer in the general log settings:

```
config log setting
    set faz-override enable
end
```

2. Disable the override FortiAnalyzer Cloud setting:

```
config log fortianalyzer-cloud override-setting
    set status disable
end
```

To set FortiAnalyzer Cloud logging to filter for a specific VDOM in the CLI:

1. Enable override FortiAnalyzer in the general log settings:

```
config log setting
    set faz-override enable
end
```

2. Enable the override FortiAnalyzer Cloud setting:

```
config log fortianalyzer-cloud override-setting
    set status enable
end
```

3. Configure the override filters for FortiAnalyzer Cloud:

```
config log fortianalyzer-cloud override-filter
    set severity information
    set forward-traffic disable
    set local-traffic disable
    set multicast-traffic disable
    set sniffer-traffic disable
    set anomaly disable
    set voip disable
    set dlp-archive disable
end
```

To display FortiAnalyzer Cloud logs in the CLI:

```
# execute log filter device fortianalyzer-cloud
# execute log filter category event
# execute log display
```

```

Configuring FortiClient EMS

The FortiGate Security Fabric root device can link to FortiClient Endpoint Management System (EMS) and FortiClient EMS Cloud (a cloud-based EMS solution) for endpoint connectors and automation. Up to seven EMS servers can be added to the Security Fabric, including a FortiClient EMS Cloud server. EMS settings are synchronized between all Fabric members.

To enable cloud-based EMS services, the FortiGate must be registered to FortiCloud with an appropriate user account. The following examples presume that the EMS certificate has already been configured.

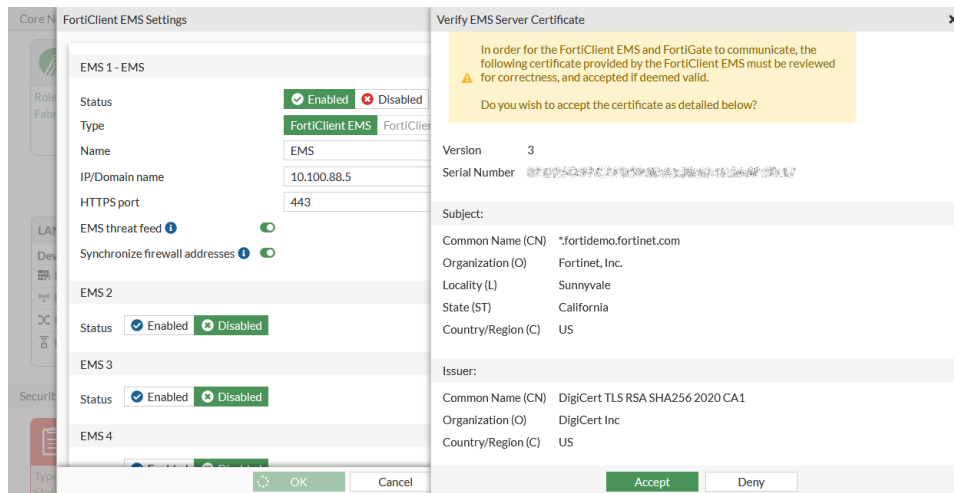

To add an on-premise FortiClient EMS server to the Security Fabric in the GUI:

1. On the root FortiGate, go to *System > Feature Visibility* and enable *Endpoint Control*.
2. Go to *Security Fabric > Fabric Connectors* and double-click the *FortiClient EMS* card.
3. Enable an EMS, and set *Type* to *FortiClient EMS*.
4. Enter a name and IP address or FQDN.

When connecting to a multitenancy-enabled EMS, Fabric connectors must use an FQDN to connect to EMS, where the FQDN hostname matches a site name in EMS (including "Default"). The following are examples of FQDNs to provide when configuring the connector to connect to the default site and to a site named SiteA, respectively: default.ems.yourcompany.com, sitea.ems.yourcompany.com. See [Multitenancy](#).

5. Optionally, enable *EMS Threat Feed*. See [Malware threat feed from EMS on page 1449](#) for more information about using this setting in an AV profile.
6. Click *OK*.

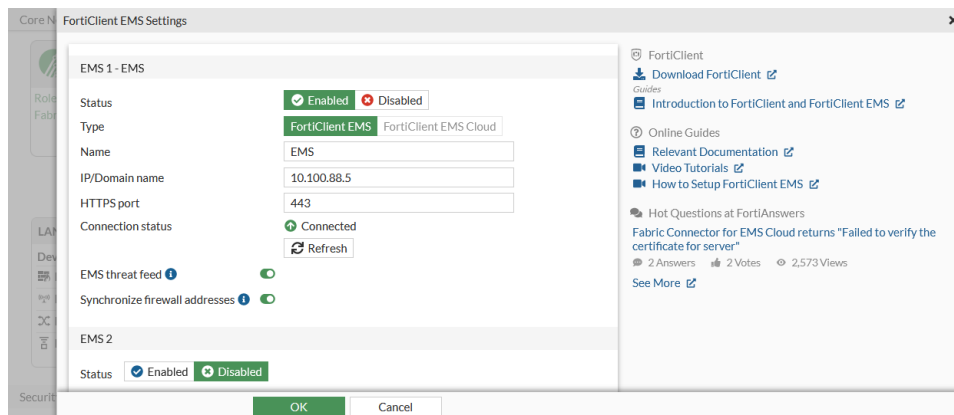

A window appears to verify the EMS server certificate:

7. Click **Accept**.

8. Click **Accept**.

The **Connection status** is now **Connected**:

9. If the device is not authorized, log in to the FortiClient EMS to authorize the FortiGate under **Administration > Fabric Devices**.

To add a FortiClient EMS Cloud server to the Security Fabric in the GUI:

FortiClient EMS Cloud can only be configured when the FortiGate is registered to FortiCloud and the EMS Cloud entitlement is verified.

If the FortiCloud account does not pass the FortiClient EMS Cloud entitlement check, the option is not selectable in the FortiClient EMS connector settings.

1. Go to **Security Fabric > Fabric Connectors** and double-click the **FortiClient EMS** card.
2. Set the **Type** to **FortiClient EMS Cloud**.
3. Enter a name.
4. Click **OK**.

A window appears to verify the EMS server certificate.

5. Click **Accept**.

The **Connection status** is now **Connected**.

To test connectivity with the EMS server:

1. Go to *Security Fabric > Fabric Connectors* and double-click the *FortiClient EMS* card.
2. In the *Connection status* section, click *Refresh*.

To add an on-premise FortiClient EMS server to the Security Fabric in the CLI:

```
config endpoint-control fctems
  edit {1 | 2 | 3 | 4 | 5}
    set status {enable | disable}
    set name <string>
    set server <ip_address>
    set certificate <string>
    set https-port <integer>
    set source-ip <ip_address>
  next
end
```

The `https-port` is the EMS HTTPS access port number, and the `source-ip` is the REST API call source IP address.

To add a FortiClient EMS Cloud server to the Security Fabric in the CLI:

```
config endpoint-control fctems
  edit {1 | 2 | 3 | 4 | 5}
    set status {enable | disable}
    set name <string>
    set fortinetone-cloud-authentication enable
    set certificate <string>
  next
end
```

To verify the EMS Cloud entitlement in the CLI:

```
# diagnose test update info
```

To verify an EMS certificate in the CLI:

```
# execute fctems verify ems137

EMS configuration needs user to confirm server certificate.
Do you wish to add the above certificate to trusted remote certificates? (y/n)y

Configuring FortiClient EMS and FortiClient EMS Cloud on a per-VDOM basis

FortiClient EMS and FortiClient EMS Cloud can be added on a per-VDOM basis. Override must be configured each VDOM that connects to an EMS server. If override is enabled for a VDOM, the global configuration will not affect the VDOM.

Each VDOM supports up to seven EMS servers, plus an additional seven in the global configuration. With override enabled on all ten VDOMs, a 10-VDOM contract would have up to 77 EMS servers. If override is enabled on only one VDOM, a 10-VDOM contract would have up to 14 EMS servers.

This functionality can be applied to MSSP (managed security service provider) configurations, and each VDOM has its own *FortiClient EMS* card for the EMS server or instance. For example:

- Separate on-premise FortiClient EMS instances

- Single FortiClient EMS multi-tenant instance based on FQDN type

- Separate on-premise FortiClient EMS instances

To configure a FortiClient EMS server per VDOM in the GUI:

1. Enable override in the FortiOS CLI on the required VDOMs:

```
config endpoint-control settings
    set override enable
end
```

2. Navigate to the desired VDOM, then go to *Security Fabric > Fabric Connectors* and double-click the *FortiClient EMS* card.
3. Configure the EMS server settings as needed (see the preceding examples for detailed steps).

To configure a FortiClient EMS server per VDOM in the CLI:

1. Enable override on the required VDOMs:

```
config endpoint-control settings
    set override enable
end
```

2. Configure the EMS server on the desired VDOM:

```
(root) config endpoint-control fctems-override
    edit 1
        set status enable
        set name "ems140_root"
        set server "172.16.200.140"
        set serial-number "FCTEMS8821*****"
        set tenant-id "00000000000000000000000000000000"
        set capabilities fabric-auth silent-approval websocket websocket-malware push-
ca-certs common-tags-api tenant-id single-vdom-connector
    next
    edit 2
        set name "ems133_root"
        set server "172.16.200.133"
    next
end
```

Troubleshooting

Certificate not trusted

When configuring a new connection to an EMS server, the certificate might not be trusted.

When you click *Authorize*, a warning displays: *The server certificate cannot be authenticated with installed CA certificates. Please install its CA certificates on this FortiGate.*

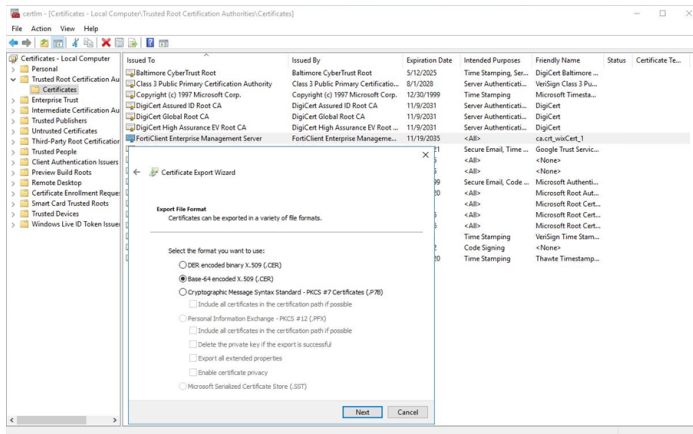

In the CLI, an error message displays when you try to verify the certificate:

```
# execute fctems verify Win2K16-EMS
certificate not configured/verified: 2
Could not verify server certificate based on current certificate authorities.
Error 1--92-60-0 in get SN call: EMS Certificate is not signed by a known CA.
```

The default FortiClient EMS certificate that is used for the SDN connection is signed by the CA certificate that is saved on the Windows server when FortiClient EMS is first installed. You can manually export and install it on the FortiGate.

To manually export and install the certificate on to the FortiGate:

1. Export the EMS certificate on the server that EMS is installed on:
 - a. On the Windows server that EMS is installed on, go to *Settings > Manage computer certificates*.
 - b. In the certificate management module, go to *Trusted Root Certification Authorities > Certificates*.
 - c. Right click on the certificate issued by FortiClient Enterprise Management Server and select *All Tasks > Export*.
 - d. The *Certificate Export Wizard* opens. Click *Next*.
 - e. Select *Base-64 encoded X.509*, then click *Next*.

- f. Enter a file name for the certificate and click **Browse** to select the folder where it will be located, then click **Next**.
- g. Review the settings, then click **Finish**. The certificate is downloaded to the specified folder.
2. On the FortiGate, import the certificate:
 - a. Go to **System > Certificate**. By default, the **Certificate** option is not visible, see [Feature visibility on page 2702](#) for information.
 - b. Click **Import > CA Certificate**.
 - c. Set **Type** to **File**, and click **Upload** to import the certificate from the management computer.
 - d. Click **OK**. The imported certificate is shown in the **Remote CA Certificate** section of the certificate table.
3. Try to authorize the certificate on the FortiGate:
 - a. Go to **Security Fabric > Fabric Connectors** and edit the FortiClient EMS connector. The connection status should now say that the certificate is not authorized.
 - b. Click **Authorize**. The following warning is shown:

The warning can also be seen in the CLI:

```
# execute fctems verify Win2K16-EMS
failure in certificate configuration/verification: -4
Could not verify EMS. Error 1--94-0-401 in get SN call: Authentication denied.
```

4. Authorize the FortiGate on EMS:
 - a. Log in to the EMS server console and go to **Administration > Fabric Devices**.
 - b. Select the serial number of the FortiGate device, then click **Authorize**.
5. Try to authorize the certificate on the FortiGate again:
 - a. On the FortiGate, go to **Security Fabric > Fabric Connectors** and edit the **FortiClient EMS** card.
 - b. Click **Refresh**.
 - c. When presented with the EMS server certificate, click **Accept** to accept the certificate.
Your connection should now be successful and authorized.
 - d. Click **OK**.

Using EMS silent approval in the Security Fabric

FortiClient EMS with Fabric authorization and silent approval capabilities can approve the root FortiGate in a Security Fabric once, and then silently approve remaining downstream FortiGates in the Fabric. Similarly in an HA scenario, an approval only needs to be made once to the HA primary unit. The remaining cluster members are approved silently.

To use EMS silent approval:

1. Configure the EMS entry on the root FortiGate or HA primary:

```
config endpoint-control fctems
  edit "ems139"
    set fortinetone-cloud-authentication disable
    set server "172.16.200.139"
    set https-port 443
    set source-ip 0.0.0.0
    set pull-sysinfo enable
    set pull-vulnerabilities enable
    set pull-avatars enable
    set pull-tags enable
    set pull-malware-hash enable
    unset capabilities
    set call-timeout 30
    set websocket-override disable
  next
end
```

When the entry is created, the capabilities are unset by default.

2. Authenticate the FortiGate with EMS:

```
# execute fctems verify ems_139
...
```

The FortiGate will enable the Fabric authorization and silent approval based on the EMS supported capabilities.

```
config endpoint-control fctems
  edit "ems139"
    set server "172.18.62.12"
    set capabilities fabric-auth silent-approval websocket
  next
end
```

3. Configure a downstream device in the Security Fabric (see [Configuring the root FortiGate and downstream FortiGates on page 2770](#) for more details). The downstream device will be silently approved.
4. Configure a secondary device in an HA system (see [HA active-passive cluster setup on page 2528](#) and [HA active-active cluster setup on page 2530](#) for more details). The secondary device will be silently approved.

Allowing deep inspection certificates to be synchronized to EMS and distributed to FortiClient

On FortiClient EMS versions that support `push CA certs` capability, the FortiGate will push CA certificates used in SSL deep inspection (see [Deep inspection on page 1724](#) for more details) to the EMS server. On the EMS server, the CA certificates can be selected in the managed endpoint profiles so they can be installed on managed endpoints. FortiClient EMS 7.0.1 and later is required to use this feature.

To configure deep inspection certificate synchronization to EMS:

1. Configure the EMS Fabric connector:

```
config endpoint-control fctems
  edit "ems138"
    set fortinetone-cloud-authentication disable
    set server "172.16.200.138"
    set https-port 443
    set source-ip 0.0.0.0
    set pull-sysinfo enable
    set pull-vulnerabilities enable
    set pull-avatars enable
    set pull-tags enable
    set pull-malware-hash enable
    set capabilities fabric-auth silent-approval websocket websocket-malware push-
ca-certs
    set call-timeout 30
    set websocket-override disable
    set preserve-ssl-session disable
  next
end
```

2. Apply the certificate to an SSL/SSH profile for deep inspection:

```
config firewall ssl-ssh-profile
  edit "deep-inspection"
    set comment "Read-only deep inspection profile."
    config https
      set ports 443
      set status deep-inspection
    end
    ...
    set server-cert-mode re-sign
    set caname "Fortinet_CA_SSL"
    set untrusted-caname "Fortinet_CA_Untrusted"
  next
end
```

The default deep inspection profile, CA certificate, and untrusted CA certificates are used in this example.

3. Configure the firewall policy:

```
config firewall policy
  edit 1
    set name "deep-inspection"
    set srcintf "port14"
    set dstintf "port13"
    set action accept
    set srcaddr "all"
    set dstaddr "all"
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set inspection-mode proxy
    set ssl-ssh-profile "deep-inspection"
    set av-profile "default"
    set nat enable
```

next
end

4. In EMS, verify that the CA certificate was pushed to EMS:
 - a. Go to *Endpoint Policy & Components > CA Certificates*.

- b. Verify the certificate table to see that the EMS server received the CA certification from the different FortiGates.
5. Select the CA certificate in the endpoint profile:
 - a. Go to *Endpoint Profiles > System Settings* and edit a profile. The default profile is used in this example.
 - b. In the *Other* section, enable *Install CA Certificate on Client* and select the *Fortinet_CA_SSL* certificate for the desired endpoint.

Save Discard Changes Revert To Default

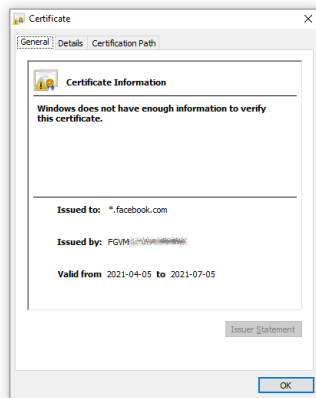

- c. Click **Save**.

After the FortiClient endpoint is registered, it receives the CA certificate. When the FortiClient endpoint tries to access the internet through the FortiGate with the firewall policy that has deep inspection, no warning message is displayed. The server certificate is trusted with the installed CA certificate to complete the certificate chain.

Verification

Before configuring deep inspection certificate synchronization, a warning message is displayed when a FortiClient endpoint accesses the internet through the FortiGate with the firewall policy that has deep inspection. The FortiClient certificate store does not have the FortiGate's CA that is used in the deep inspection SSL/SSH profile.

For example, accessing <https://www.facebook.com> in Chrome shows a warning. In the address bar, clicking *Not secure > Certificate* opens the *Certificate* dialog, which indicates that *Windows does not have enough information to verify the certificate*.

chrome from safely

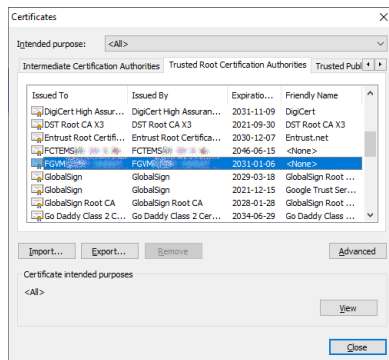

computer or network. Ask your IT

urity, [turn on enhanced protection](#)

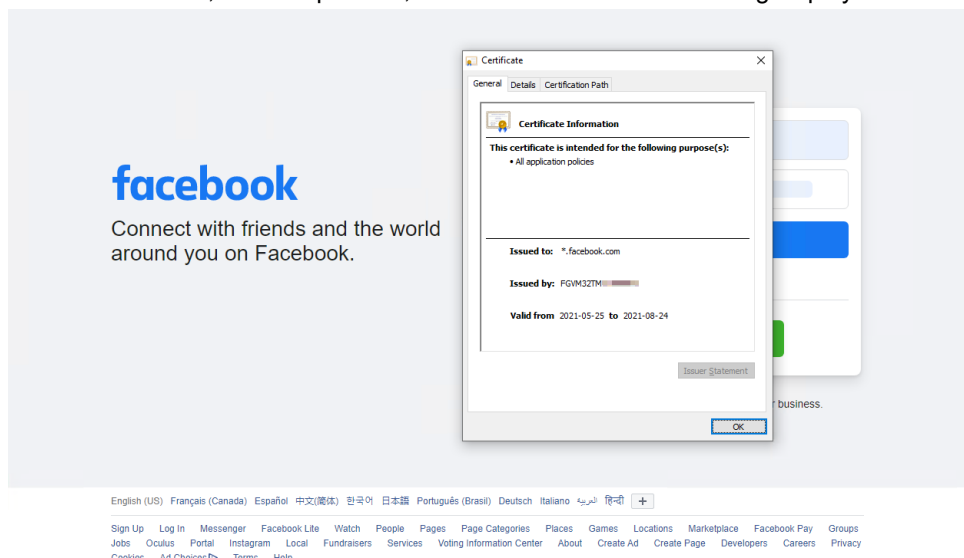

After the EMS profile is pushed to FortiClient endpoint, the expected FortiGate's certificate is shown in its certificate store.

To verify the deep inspection certificate synchronization:

1. In Chrome, go to *Settings > Privacy and security* and open *Manage certificates*.
2. Click the *Trusted Root Certification Authorities* tab. The FortiGate's certificate appears in the list.

3. On the FortiClient endpoint using Chrome, go to <https://www.facebook.com>. The website is displayed.
4. In the address bar, click the padlock, then click *Certificate*. The dialog displays the valid certificate information.

Diagnostics

Use the `diagnose endpoint fctems json deep-inspect-cert-sync` command in FortiOS to verify the certificate information. In the following example, there are multiple VDOMs with FortiGates in HA mode.

To verify the primary FortiGate:

```
FGT_EC_Primary (global) # diagnose endpoint fctems json deep-inspect-cert-sync
JSON:
""
{
  "fortigates": [
    "FG2K5E39169*****",
    "FG2K5E39169*****"
  ],
  "vdoms": [
    {
      "vdom": "root",
      "certs": [
        {
          "name": "Fortinet_CA_SSL",
          "cert": "-----BEGIN CERTIFICATE-----\nMIID5jCCAs6g...Sfu+Q8zE8Crmt6L1X\ /bv+q\n---
--END CERTIFICATE-----\n"
        },
        {
          "name": "Fortinet_CA_Untrusted",
          "cert": "-----BEGIN CERTIFICATE-----\nMIID8DCCAtig...3zBbfzP+nVUpC\nnZDPRZA==\n---
---END CERTIFICATE-----"
        }
      ]
    },
    {
      "vdom": "vdom1",
      "certs": [
        {
          "name": "Fortinet_CA_SSL",
          "cert": "-----BEGIN CERTIFICATE-----\nMIID5jCCAs6g...Sfu+Q8zE8Crmt6L1X\ /bv+q\n---
--END CERTIFICATE-----\n"
        },
        {
          "name": "Fortinet_CA_Untrusted",
          "cert": "-----BEGIN CERTIFICATE-----\nMIID8DCCAtig...3zBbfzP+nVUpC\nnZDPRZA==\n---
---END CERTIFICATE-----"
        }
      ]
    }
  ]
}
""
```

To verify the secondary FortiGate:

```
FGT_EC_Secondary(global) # diagnose endpoint fctems json deep-inspect-cert-sync
JSON:
""
```

```

{
  "fortigates": [
    "FG2K5E39169*****",
    "FG2K5E39169*****"
  ],
  "vdoms": [
    {
      "vdom": "root",
      "certs": [
        {

        },
        {
          "name": "Fortinet_CA_Untrusted",
          "cert": "-----BEGIN CERTIFICATE-----\nMIID8DCCAtig...3zBbfzP+nVUpC\nnZDPRZA==\n---
---END CERTIFICATE-----"
        }
      ]
    },
    {
      "vdom": "vdom1",
      "certs": [
        {
          "name": "Fortinet_CA_SSL",
          "cert": "-----BEGIN CERTIFICATE-----\nMIID5jCCAs6g...Sfu+Q8zE8Crmt6L1X\ /bv+q\n---
--END CERTIFICATE-----\n"
        },
        {
          "name": "Fortinet_CA_Untrusted",
          "cert": "-----BEGIN CERTIFICATE-----\nMIID8DCCAtig...3zBbfzP+nVUpC\nnZDPRZA==\n---
---END CERTIFICATE-----"
        }
      ]
    }
  ]
}

```

Allowing FortiClient EMS connectors to trust EMS server certificate renewals based on the CN field

When a FortiGate establishes a Fabric connection with FortiClient EMS, the FortiGate must trust the CA that signed the server certificate. Upon the approval of the EMS certificate, the FortiGate saves the CN field and will trust future certificates that are signed by the same CA and have the same CN field. This allows EMS servers to update their certificates at regular intervals without requiring re-authorization on the FortiGate side, as long as the CN field matches. This prevents interruptions to the EMS Fabric connection when a certificate is updated. Previously, upon the user's approval of the certificate, the certificate fingerprint was saved on the FortiGate, and this required the FortiGate to re-authorize the EMS connection each time the server certificate is updated.

```

config endpoint-control fctems
  edit <id>
    set trust-ca-cn {enable | disable}
  
```

```

    next
end

```

This feature is supported for EMS on-premise and cloud connections, and is the default setting. To authorize based on the certificate fingerprint, disable the `trust-ca-cn` setting. If the setting is changed back to be enabled at a later time, the user will have to re-approve the EMS certificate.

To configure the EMS Fabric connector to trust EMS server certificate renewals based on the CN field:

```

config endpoint-control fcitems
    edit 1
        set status enable
        set name "ems133"
        set dirty-reason none
        set fortinetone-cloud-authentication disable
        set server "172.18.62.35"
        set https-port 443
        set serial-number "FCTEMS8822000000"
        set tenant-id "00000000000000000000000000000000"
        set source-ip 0.0.0.0
        set pull-sysinfo enable
        set pull-vulnerabilities enable
        set pull-avatars enable
        set pull-tags enable
        set pull-malware-hash enable
        set capabilities fabric-auth silent-approval websocket websocket-malware push-ca-
certs common-tags-api tenant-id
        set call-timeout 30
        set out-of-sync-threshold 180
        set websocket-override disable
        set preserve-ssl-session disable
        set interface-select-method auto
        set trust-ca-cn enable
    next
end

```

To verify the configuration:

1. Download the FortiGate configuration file.
2. Verify the `ca-cn-info` entry, which lists the trusted CA certificate information. In this example, `ems133` connector has `trust-ca-cn` enabled and `ems138` connector has `trust-ca-cn` disabled. For `ems138`, the `ca-cn-info` entry does not appear, and there is a `certificate-fingerprint` field instead:

```

config endpoint-control fcitems
    edit 1
        set status enable
        set name "ems133"
        set server "172.18.62.35"
        set serial-number "FCTEMS8822000000"
        set tenant-id "00000000000000000000000000000000"
        set capabilities fabric-auth silent-approval websocket websocket-malware push-
ca-certs common-tags-api tenant-id

```

Synchronizing FortiClient ZTNA tags

ZTNA tags (formerly FortiClient EMS tags in FortiOS 6.4 and earlier) are tags synchronized from FortiClient EMS as dynamic address objects on the FortiGate. FortiClient EMS uses zero-trust tagging rules to automatically tag managed endpoints based on various attributes detected by the FortiClient. When the FortiGate establishes a connection with the FortiClient EMS server via the EMS Fabric connector, it pulls zero-trust tags containing device IP and MAC addresses and converts them to read-only dynamic address objects. It also establishes a persistent WebSocket connection to monitor for changes in zero-trust tags, which keeps the device information current. These ZTNA tags can then be used in ZTNA rules, firewall rules, and NAC policies to perform security posture checks. ZTNA tags are displayed in the *Device Inventory* widget, *FortiClient* widget, and *Asset Identity Center* page.

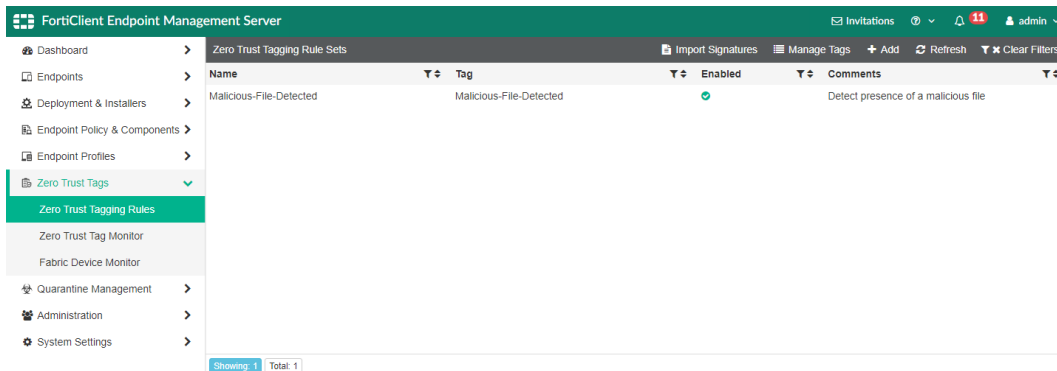

When using WebSocket, EMS pushes notifications to the corresponding FortiGate when there are updates to tags or other monitored attributes. The FortiGate then fetches the updated information using the REST API over TCP/8013. When WebSocket is not used (due to an override or unsupported EMS version), updates are triggered on demand from the FortiGate side over the REST API.

If the WebSocket capability is detected, the capabilities setting will automatically display the WebSocket option. You can use the `diagnose test application fcnacd 2` command to view the status of the WebSocket connection.

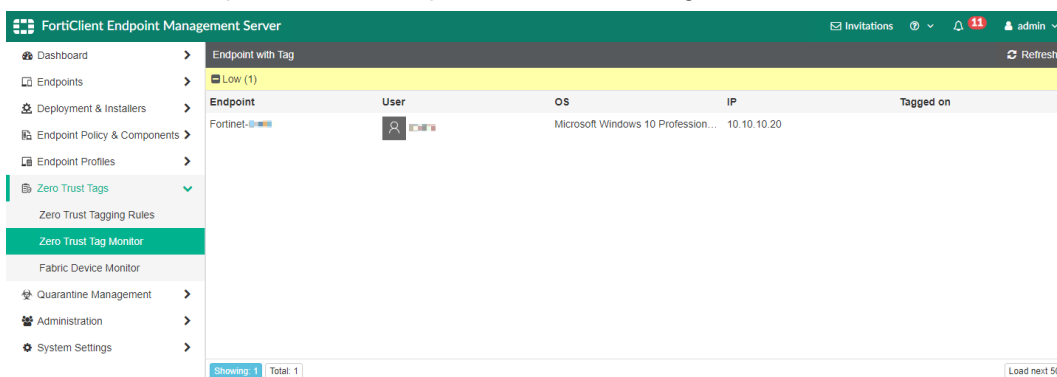

In the following example, the FortiGate connects to and retrieves ZTNA tags from a FortiClient EMS configured with tagging rules. It is assumed that zero-trust tags and rules are already created on the FortiClient EMS. For more information, see the [Zero Trust Tags](#) section of the EMS Administration Guide.

To verify zero-trust tags in FortiClient EMS:

1. Go to *Zero Trust Tags > Zero Trust Tagging Rules* to view the tags.

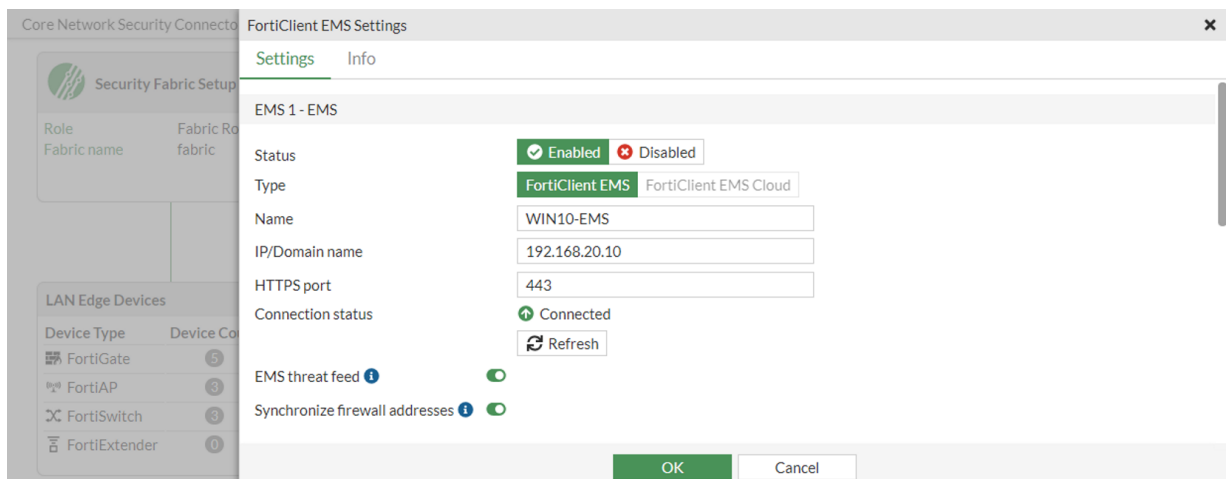

2. Go to *Zero Trust Tags > Zero Trust Tag Monitor* to view the registered users who match the defined tag.

To configure the EMS Fabric connector to synchronize ZTNA tags in the GUI:

1. Configure the EMS Fabric connector:
 - a. On the root FortiGate, go to *Security Fabric > Fabric Connectors* and double-click the *FortiClient EMS* card.
 - b. In the *Settings* tab, set the *Status* to *Enabled*.
 - c. Enable *Synchronize firewall addresses*.

- d. Configure the other settings as needed and validate the certificate.
- e. Click OK.
2. Enable ZTNA:
 - a. Go to *System > Feature Visibility* and enable *Zero Trust Network Access*.
 - b. Click *Apply*.
3. Go to *Policy & Objects > ZTNA* and select the *ZTNA Tags* tab. You will see the ZTNA IP and ZTNA MAC tags synchronized from the FortiClient EMS.

ZTNA Rules ZTNA Servers ZTNA Tags			
<div> <div>+ Create New Group</div> <div>Edit</div> <div>Delete</div> <div>Search</div> </div>			
Name	Details	Comments	Ref.
ZTNA IP Tag			
Zero-day Detections			0
Medium			0
Malicious-File-Detected			2
Low			4
IOC Suspicious			0
High			0
FCTEMS_ALL_FORTICLOUD_SERVERS			0
Critical			1
all_registered_clients			1
ZTNA MAC Tag			
Zero-day Detections			0
Medium			0
Malicious-File-Detected			0
Low			0
IOC Suspicious			0
High			0
Critical			0
all_registered_clients			0
ZTNA Tag Group			
grp_ems138	all_registered_clients Critical		0

To configure the EMS Fabric connector to synchronize ZTNA tags in the CLI:

1. Configure the EMS Fabric connector on the root FortiGate:

```

config endpoint-control fctems
  edit 1
    set status enable
    set name "WIN10-EMS"
    set server "192.168.20.10"
    set https-port 443
    set pull-sysinfo enable
    set pull-vulnerabilities enable
    set pull-avatars enable
    set pull-tags enable
    set pull-malware-hash enable
    set capabilities fabric-auth silent-approval websocket
  next
end

```

2. Verify which IPs the dynamic firewall address resolves to:

```

# diagnose firewall dynamic list
List all dynamic addresses:
FCTEMS0000100000_all_registered_clients: ID(51)
  ADDR(172.17.194.209)
  ADDR(10.10.10.20)

```

```

...

FCTEMS0000100000_Low: ID(78)
      ADDR(172.17.194.209)
      ADDR(10.10.10.20)

...

FCTEMS0000100000_Malicious-File-Detected: ID(190)
      ADDR(172.17.194.209)
      ADDR(10.10.10.20)

...

```

When running the FortiGate in multi VDOM mode, by default, EMS is configured in the global VDOM. All ZTNA tags synchronized with the globally configured EMS are shared by all VDOMs. FortiOS 7.4 and later supports configuring EMS on a per-VDOM basis. See [Configuring FortiClient EMS and FortiClient EMS Cloud on a per-VDOM basis](#) for more information.

Configuring LAN edge devices

The *LAN Edge Devices* connector card displays a summary about the FortiGates, FortiAPs, FortiSwitches, and FortiExtenders in the Security Fabric. Information about the device type, number of devices, and number of unregistered and unauthorized devices is displayed. If there are devices that do not have a green checkmark in the *Status* column, hover over the status message to view the tooltip with required action. In this example, there are FortiAPs and FortiSwitches that are not registered. The tooltip includes a link to the *System > Firmware & Registration* page to register or authorize the devices. The tooltip for FortiExtenders includes a link to the *Network > FortiExtenders > Managed FortiExtenders* page to register or authorize the devices.

Core Network Security Connectors

Security Fabric Setup		Logging & Analytics		FortiClient EMS	
Role	Fabric Root	FortiAnalyzer	Enabled	EMS	Enabled
Fabric name	fabric	Cloud Logging	Disabled	IP address	10.100.88.5

LAN Edge Devices

Device Type	Device Count	Status
FortiGate	5	All authorized & registered
FortiAP	3	3 devices not registered
FortiSwitch	3	3 devices not registered
FortiExtender	0	None configured

Go to the Firmware & Registration page to authorize your FortiGate and handle any other device related concerns.

[Firmware & Registration](#)

If the default `auto-auth-extension-device` settings on the FortiAP or FortiSwitch have been modified, manual authorization in the Security Fabric may not be required.

For more information about configuring FortiAPs, see [Configuring the FortiGate interface to manage FortiAP units](#) and [Discovering, authorizing, and deauthorizing FortiAP units](#).

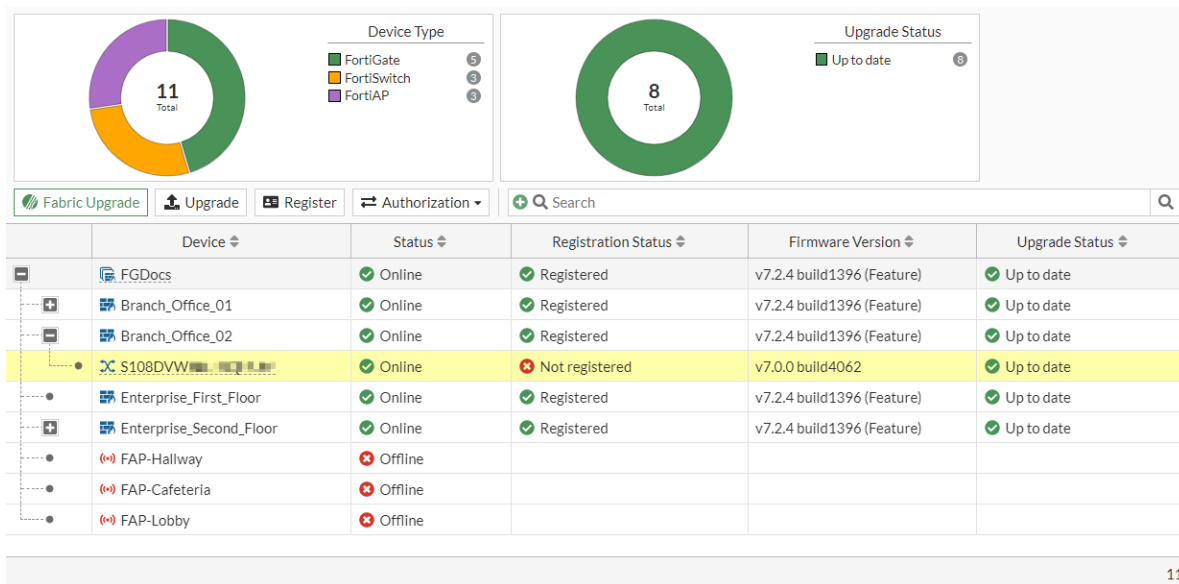

For more information about configuring FortiSwitches, see [Discovering, authorizing, and deauthorizing FortiSwitch units](#).

For more information about configuring FortiExtenders, see [Adding a FortiExtender on page 541](#) and [FortiExtender and FortiGate integration](#).

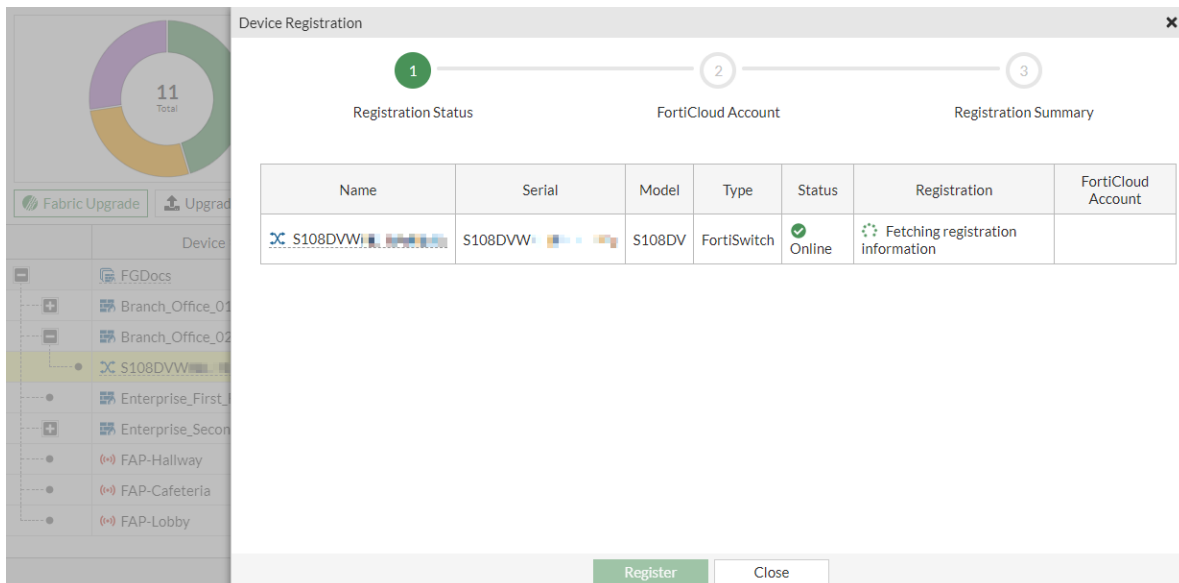

The following example shows how to register a FortiSwitch that has been authorized to join the Security Fabric. The procedure is similar for FortiAPs and FortiExtenders. If the device requires authorization, refer to [Authorizing devices on page 2434](#).

To register a FortiSwitch:

1. Connect the device to the root FortiGate.
2. On the root FortiGate, go to *System > Firmware & Registration*. (Use the same page for a FortiAP, or *Network > FortiExtenders > Managed FortiExtenders* for a FortiExtender.)
3. Select the unregistered device and click *Register*.

The *Device Registration* pane opens and the FortiGate verifies the registration information.

4. Once the registration process is complete, click *Close*.

Configuring central management

The *Central Management* Fabric connector card on the root FortiGate is used to configure the FortiManager settings, which includes on-premises FortiManager, FortiGate Cloud, and FortiManager Cloud. After the *Central Management* connector is configured, it automatically synchronizes with any connected downstream devices.

This topic covers the following central management aspects:

- [Configuring FortiManager](#)
- [Configuring FortiManager Cloud](#)

Configuring FortiManager

Once the *Central Management* Fabric connector is configured, the root FortiGate pushes this configuration to downstream FortiGates. FortiManager provides remote management of FortiGate devices over TCP port 541. The FortiManager must have internet access for it to join the Security Fabric.

Once configured, the FortiGate can receive antivirus and IPS updates, and allows remote management through FortiManager or the FortiGate Cloud service. The FortiGate management option must be enabled so that the FortiGate can accept management updates to its firmware and FortiGuard services.

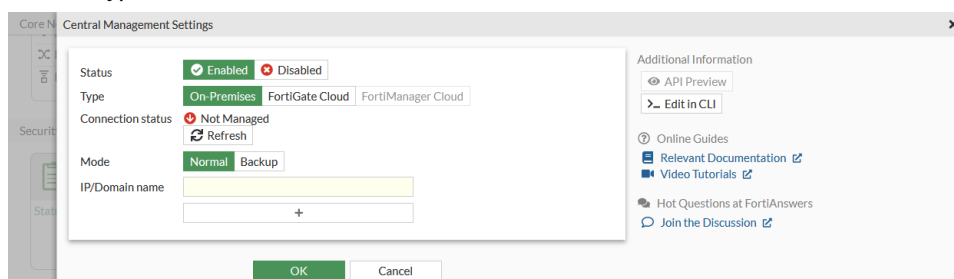

Adding a FortiManager device to the Security Fabric requires the following steps in FortiOS, which can be completed in the GUI or CLI:

- Specify the FortiManager IP address or domain name.
- Approve the FortiManager serial number that is returned by the provided IP address or domain name.

After completing the steps in FortiOS, go to FortiManager to complete the process by authorizing the FortiGate.

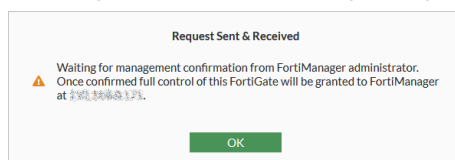

To add a FortiManager to the Security Fabric in the GUI:

1. On the root FortiGate, go to *Security Fabric > Fabric Connectors* and double-click the *Central Management* card.
2. Set the *Status* to *Enabled*.
3. Set the *Type* to *On-Premises*.

4. Enter the *IP/Domain Name* of the FortiManager.
5. Click *OK*.

The *Request Sent & Received* pane opens.

6. Review the serial number, and click *OK*.
7. Go to FortiManager and authorize the FortiGate. See [Authorizing the FortiGate in FortiManager on page 2809](#).

To add a FortiManager to the Security Fabric in the CLI:

1. Enter the FortiManager connection information:

```
config system central-management
    set type fortimanager
    set fmg {<IP_address> | <Domain name>}
end
```

2. Approve the returned FortiManager serial number.

When configuring the FortiManager connection from the CLI, no prompt is available to approve the returned FortiManager serial number. Enter the following:

```
# execute central-mgmt <fmg-serial-no> <PSK>
```

If you have not previously configured a model device in FortiManager and leveraged a pre-shared key for registration, you can enter any character for the PSK field in the `execute central-mgmt` command.

3. Go to FortiManager and authorize the FortiGate. See [Authorizing the FortiGate in FortiManager on page 2809](#).

Authorizing the FortiGate in FortiManager

After completing the GUI or CLI steps in FortiOS, go to FortiManager to authorize the FortiGate to complete the process.

To authorize the FortiGate in FortiManager:

1. On FortiManager, go to *Device Manager* and find the FortiGate in the *Unauthorized Devices* list. The unauthorized device list is located in the root ADOM, regardless of the firmware version of the root ADOM or FortiOS.
2. Select the FortiGate device or devices, and click *Authorize* in the toolbar.
3. In the *Authorize Device* pop-up, adjust the device names as needed, select the appropriate ADOM (if applicable), and click *OK*.

For more information about using FortiManager, see the [FortiManager Administration Guide](#).

Configuring FortiManager Cloud

This cloud-based SaaS management service is available through FortiManager. This service is included in FortiCloud accounts with a FortiManager Cloud account level subscription (ALCI).

Configuring a per-device license

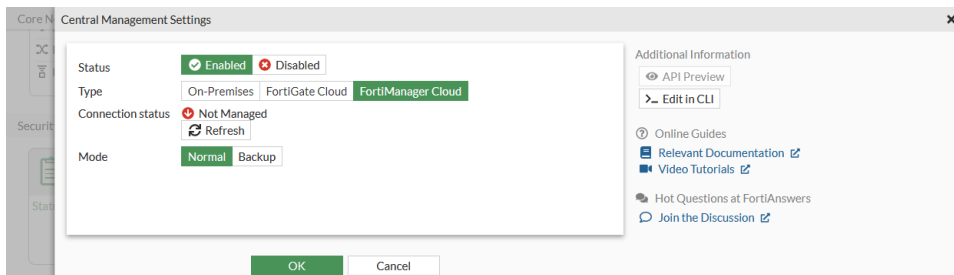

Once the FortiGate has acquired a contract named *FortiManager Cloud*, FortiCloud creates a cloud-based FortiManager instance under the user account. You can launch the portal for the cloud-based FortiManager from FortiCloud, and its URL starts with the User ID.

You can use a FortiGate with a contract for *FortiManager Cloud* to configure central management by using the FQDN of *fortimanager.forticloud.com*. A FortiGate-FortiManager tunnel is established between FortiGate and the FortiManager instance.

After the tunnel is established, you can execute FortiManager functions from the cloud-based FortiManager portal.

To configure FortiManager Cloud central management:

1. Enable FortiManager Cloud.
 - a. Go to *Security Fabric > Fabric Connectors* and double-click the *Central Management* card.
 - b. Set the *Status* to *Enabled*.
 - c. Set the *Type* to *FortiManager Cloud*.

- d. Click *OK*.

The *FortiManager Cloud* button can only be selected if you have a FortiManager Cloud product entitlement.

2. In the FortiManager Cloud instance, go to *Device Manager* and authorize the FortiGate. See [Authorizing devices](#) for more information.

When using the FortiGate to enable FortiManager Cloud, the FortiGate appears as an unauthorized device. After authorizing the FortiGate, it becomes a managed device.

In FortiOS, the *Security Fabric > Fabric Connectors* page now displays green arrow in the *Central Management* card because FortiManager Cloud is registered.

Diagnostics

To verify the contract information:

```
# diagnose test update info contract
...
System contracts:
...
Account contracts:
  FMGC,Thu Dec  2 16:00:00 2022
...
```

To verify the FortiManager Cloud instance has launched and the FortiGate is registered:

```
# diagnose fdsm central-mgmt-status
Connection status: Up
Registration status: Registered
```

Configuring sandboxing

The Security Fabric supports the following FortiSandbox deployments.

Type	Description	Requirements
FortiGate Cloud Sandbox	Files are sent to Fortinet's Cloud Sandbox cluster for processing.	<ul style="list-style-type: none"> The FortiGate must have a valid AV license. The FortiCloud account provides access to a portal to view submissions. This is not required for the Security Fabric.
FortiSandbox Cloud	Files are sent to a dedicated FortiCloud hosted instance of FortiSandbox for processing.	<ul style="list-style-type: none"> FortiCloud premium license FortiSandbox Cloud entitlement The FortiGate and FortiCloud license are registered to the same account.
FortiSandbox appliance	Files are sent to a physical appliance or VM, typically residing on premise, for processing.	<ul style="list-style-type: none"> None

To apply sandboxing in a Security Fabric, connect one of the FortiSandbox deployments, then configure an antivirus profile to submit files for dynamic analysis. The submission results supplement the AV signatures on the FortiGate. FortiSandbox inspection can also be used in web filter profiles.

In a Security Fabric environment, sandbox settings are configured on the root FortiGate. Once configured, the root FortiGate pushes the settings to other FortiGates in the Security Fabric.

FortiGate Cloud Sandbox

FortiGate Cloud Sandbox allows users to take advantage of FortiSandbox features without having to purchase, operate, and maintain a physical appliance. It also allows you to control the region where your traffic is sent to for analysis. This allows you to meet your country's compliance needs regarding data storage locations.

Users are not required to have a FortiCloud account to use FortiGate Sandbox Cloud.

The submission to the cloud with a valid FortiGuard Antivirus (AVDB) license is rate limited per FortiGate model. Refer to the Service Description for details. For those without any AVDB license, the submission is limited to only 100 per day.

To configure FortiGate Cloud Sandbox, you must first activate the connection from the CLI. Note that FortiGate Cloud Sandbox is decoupled from FortiGate Cloud logging, so you do not need to have a FortiCloud account or have cloud logging enabled.

To activate the FortiGate Cloud Sandbox connection:

```
# execute forticloud-sandbox region
0 Europe
1 Global
2 Japan
3 US
Please select cloud sandbox region[0-3]:3
```

After a region is selected, the following configuration is added:

```
config system fortiguard
  set sandbox-region {0 | 1 | 2 | 3}
end
```

Alternatively, using the `execute forticloud-sandbox update` command also works.

To obtain or renew a FortiGuard antivirus license:

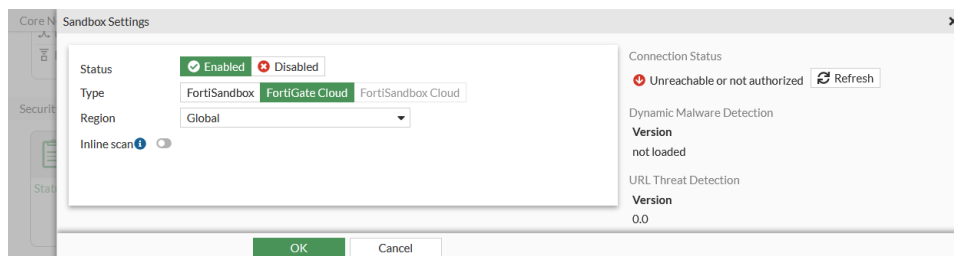

1. See the [How to Purchase or Renew FortiGuard Services](#) video for FortiGuard antivirus license purchase instructions.
2. Once a FortiGuard license is purchased and activated, users are provided with a paid FortiSandbox Cloud license.
 - a. Go to *Dashboard > Status* to view the FortiSandbox Cloud license indicator.

- b. Alternatively, go to *System > FortiGuard* to view the FortiSandbox Cloud license indicator.

To enable FortiGate Cloud Sandbox in the GUI:

1. Go to *Security Fabric > Fabric Connectors* and double-click the *Sandbox* card.
2. Set the *Status* to *Enabled*.
3. Set the *Type* to *FortiGate Cloud*.
4. Select a *Region* from the dropdown.

5. Click **OK**.

FortiSandbox Cloud

FortiSandbox Cloud offers more features and better detection capability. Connecting to FortiSandbox Cloud will automatically use the cloud user ID of the FortiGate to connect to the dedicated FortiSandbox Cloud instance. The FortiGate automatically detects if there is a valid entitlement.

The following items are required to initialize FortiSandbox Cloud:

- A FortiCloud premium account.
- A valid FortiSandbox Cloud contract on the FortiGate. To view contract information in the CLI, enter `diagnose test update info`. The `User ID` at the end of the output shows FortiCloud which FortiSandbox Cloud account the FortiGate is connected to.
- A provisioned FortiSandbox Cloud. See [Deploying FortiSandbox Cloud](#) for information.

To configure FortiSandbox Cloud in the GUI:

1. Go to *Security Fabric > Fabric Connectors* and double-click the *Sandbox* card.
2. Set the *Status* to *Enabled*.
3. Set the *Type* to *FortiSandbox Cloud*.

If the *FortiSandbox Cloud* option is grayed out or not visible, enter the following in the CLI:

```
config system global
    set gui-fortigate-cloud-sandbox enable
end
```

4. Click *OK*.

To configure FortiSandbox Cloud in the CLI:

```
config system fortisandbox
    set status enable
    set forticloud enable
    set server <string>
end
```

If the FortiGate does not detect the proper entitlement, a warning is displayed and the CLI configuration will not save.

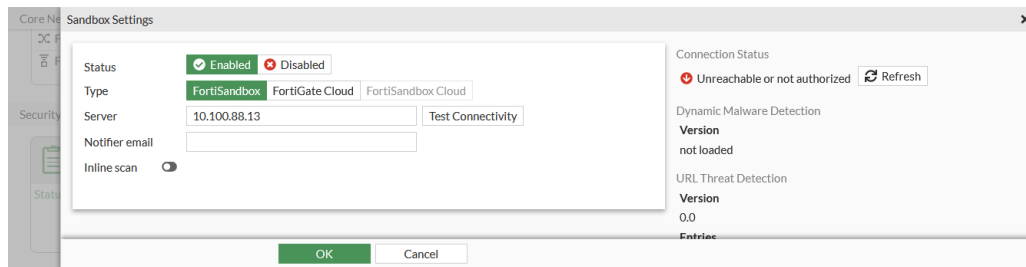

If the FortiSandbox Cloud is running version 4.0.0 and later, the FortiGate will automatically connect to `fortisandboxcloud.com`, and then discover the specific region and server to connect to based on which region the customer selected to deploy their FortiSandbox Cloud instance. The FortiGate must have a FortiCloud premium account license and a FortiSandbox Cloud VM license for this functionality.

FortiSandbox appliance

FortiSandbox appliance is the on-premise option for a full featured FortiSandbox. Connecting to a FortiSandbox appliance requires that Cloud Sandbox is disabled.

To enable FortiSandbox appliance in the GUI:

1. Go to *Security Fabric > Fabric Connectors* and double-click the *Sandbox* card.
2. Set the *Status* to *Enabled*.
3. In the *Server* field, enter the FortiSandbox device's IP address.

4. Optionally, enter a *Notifier email*.
5. Click **OK**.

To enable FortiSandbox appliance in the CLI:

```
config system fortisandbox
    set status enable
    set forticloud disable
    set server <address>
end
```

Authorizing the FortiGate from FortiSandbox Cloud and a FortiSandbox appliance

Once the FortiGate makes a connection to the FortiSandbox Cloud or appliance, the FortiGate must be authorized. See [FortiGate devices](#) in the [FortiSandbox Administration guide](#) for information.

Antivirus profiles

An antivirus profile must be configured to send files to the sandbox. Once submitted, sandbox inspection is performed on the file to detect malicious activities. The FortiGate can use the dynamic malware detection database from the sandbox to supplement the AV signature database. See [Using FortiSandbox post-transfer scanning with antivirus on page 1459](#) for more information.

FortiSandbox inline scanning is supported on FortiSandbox appliances in proxy inspection mode. When inline scanning is enabled, the client's file is held while it is sent to FortiSandbox for inspection. Once a verdict is returned, the appropriate action is performed on the held file. If there is an error or timeout on the FortiSandbox, the FortiGate's configuration determines what to do with the held file. See [Using FortiSandbox inline scanning with antivirus on page 1461](#) for more information.

Inline scanning requires a FortiSandbox appliance running version 4.2 or later. This feature is not supported on FortiSandbox Cloud or FortiGate Cloud Sandbox.

Web filter profiles

Sandbox inspection can be used in web filter profiles. The FortiGate uses URL threat detection database from the sandbox to block malicious URLs. See [Block malicious URLs discovered by FortiSandbox on page 1501](#) for more information.

FortiSandbox Files FortiView monitor

In the *FortiSandbox Files* FortiView monitor, users can select a submitted file and drill down to view its static and dynamic file analysis. The full FortiSandbox report can be downloaded in PDF format. This feature works with FortiGate Cloud Sandbox, FortiSandbox Cloud, and FortiSandbox appliance. FortiSandbox must be running version 3.2.1 and later.

PDF reports are downloaded on-demand. By default, only 10 are kept in memory. PDFs are deleted from memory after 24 hours.

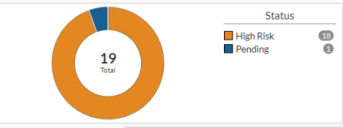

Prerequisites:

1. Add FortiSandbox to the Security Fabric.
2. Configure an AV profile with *Send files to FortiSandbox for inspection* enabled (see [Using FortiSandbox post-transfer scanning with antivirus on page 1459](#)).
3. Configure a firewall policy with the AV profile that allows traffic to the internet.
4. Add the *Top FortiSandbox Files* FortiView monitor (see [Adding FortiView monitors on page 135](#)).
5. On a client PC, attempt to download a suspicious file.

To view the FortiSandbox analysis and download the PDF:

1. Go to *Dashboard > FortiSandbox Files*. The entry appears in the table, but the analysis is not available yet because the *Status* is *Pending*. The default view is *Files*.

Drill Down to Details Search filterable columns

File Name	Device	Source	Status	Submitted
fsa_downloader_951717.exe	pc1	10.255.2.3	High	2023/04/14 15:24:03

When the file type is not supported, a warning message appears that the file was not scanned when the *Sandbox File Analysis Drill Down* pane opens.

Unable to download FortiSandbox file analysis. File may not have been scanned by the FortiSandbox due to invalid file type. Please check on the FortiSandbox to see verify if file received a VM scan.

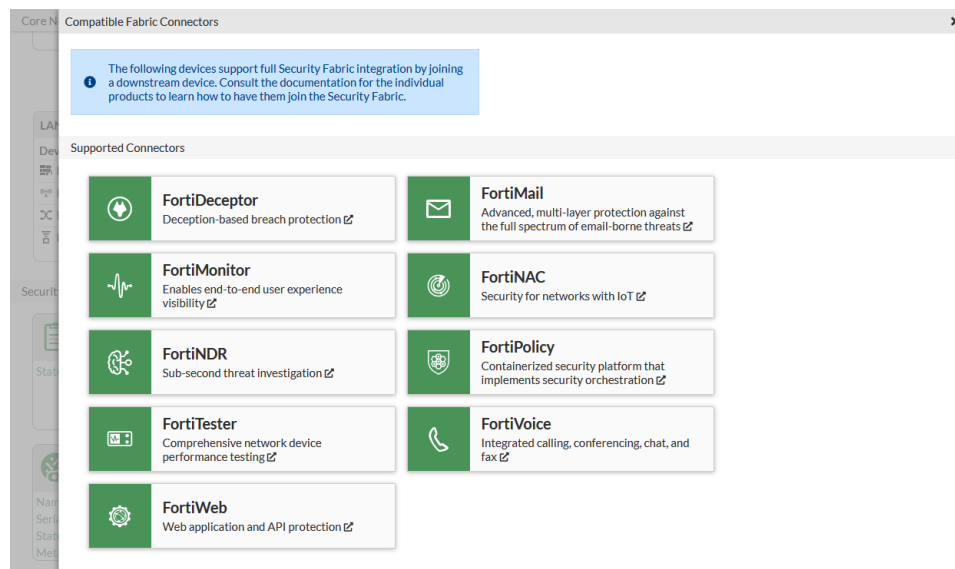

To change the maximum number of PDFs kept in memory:

```
# diagnose test analytics-pdf-report max <integer>
```

The range is 1 - 10, and the default is 10. After the FortiGate is restarted, this value will revert to the default.

Configuring supported connectors

The *Supported Connectors* card displays the icons of different Fortinet devices that support full Security Fabric integration. Configuration of supported connectors requires some configuration on FortiOS and some configuration on the supported connector device.

Click a device name card to access documentation that explains how configure it in the Security Fabric.

Supported connectors overview

The following is an overview of how to add supported connectors to the Security Fabric:

1. In FortiOS, ensure Security Fabric is enabled, and prepare the root FortiGate for communication with supported Security Fabric devices. See [Preparing FortiGate for supported Security Fabric devices on page 2818](#).
2. (Optional) Configure pre-authorization of the supported Security Fabric device. See [Configuring pre-authorization of supported Security Fabric devices on page 2819](#).
3. On the supported Security Fabric device, configure the device to join the Security Fabric. See:
 - [Configuring FortiDeceptor on page 2825](#)
 - [Configuring FortiMail on page 2827](#)

- [Configuring FortiMonitor on page 2827](#)
 - [Configuring FortiNAC on page 2829](#)
 - [Configuring FortiNDR on page 2830](#)
 - [Configuring FortiPolicy on page 2832](#)
 - [Configuring FortiTester on page 2835](#)
 - [Configuring FortiVoice on page 2836](#)
 - [Configuring FortiWeb on page 2837](#)
4. Wait for the supported Security Fabric device to establish a connection with the root FortiGate in the Security Fabric.
 5. In FortiOS, authorize the supported Security Fabric device. See [Authorizing supported connectors on page 2824](#).
If the supported device is pre-authorized, you can skip this step.
 6. In FortiOS, go to *Security Fabric > Physical Topology* or *Security Fabric > Logical Topology* to view information about the authorized device.

Preparing FortiGate for supported Security Fabric devices

Before adding supported Security Fabric devices to FortiGate, ensure the following:

- On FortiGate, ensure that Security Fabric is enabled.
- On the root FortiGate of the Security Fabric, ensure that *Allow other Security Fabric devices to join* is enabled.
- On the root FortiGate, ensure that the appropriate interface is enabled to listen for supported Fabric devices.
- (As needed) On the root FortiGate, ensure that *Allow downstream device REST API access* is enabled, if the device requires REST API access to the root FortiGate, and select an administrator profile.

The minimum permission required for the selected *Administrator profile* is *Read/Write for User & Device* (set authgrp read-write).

See [Configuring the root FortiGate and downstream FortiGates on page 2770](#) for details.

Although optional, you can configure pre-authorization of the supported Fabric device on the root FortiGate. Pre-authorized devices can join the Security Fabric at any time, and do not require manual authorization in FortiOS. See [Configuring pre-authorization of supported Security Fabric devices on page 2819](#).

The following table identifies commands used for adding supported devices to the Security Fabric.

Command	Description
<pre>config system interface edit <port name> set allowaccess {protocols} next end</pre>	Specify management access to the port for the supported Security Fabric device.
<pre>config system csf set status enable</pre>	Enable the Security Fabric on FortiGate.
<pre>config system csf set group-name <string></pre>	Specify a group name for the Security Fabric.
<pre>config system csf</pre>	On the root FortiGate of the Security Fabric, enable downstream access.

Command	Description
<pre>set downstream-access enable</pre>	
<pre>config system csf set downstream- accprofile <string></pre>	Specify the administration profile used for REST API access.
<pre>config system csf config trusted-list</pre>	Configure pre-authorization for a device.

In this example FortiNDR is added to the Security Fabric using the CLI.

To add FortiNDR to the Security Fabric in the CLI:

1. Configure the interface to allow other Security Fabric devices to join:

```
config system interface
edit "port1"
set allowaccess ping https ssh http fgfm fabric
next
end
```

2. Enable the Security Fabric:

```
config system csf
set status enable
set group-name "fabric-ai"
end
```

3. In FortiNDR, configure the device to join the Security Fabric:

```
config system csf
set status enable
set upstream-ip 10.6.30.14
set management-ip 10.6.30.251
end
```

4. Authorize the FortiNDR in FortiOS:

```
config system csf
config trusted-list
edit "FAIVMSTM21000000"
set authorization-type certificate
set certificate "*****"
next
end
end
```

Configuring pre-authorization of supported Security Fabric devices

When the serial number or certificate for a supported Security Fabric device is added to the trusted list on the root FortiGate, the device can join the Security Fabric as soon as it connects.

Pre-authorization is optional. When a supported Security Fabric device connects to the Security Fabric without pre-authorization configured, you can manually authorize the device in FortiOS. See [Authorizing supported connectors on page 2824](#).

Before you can configure pre-authorization with a certificate, you must download the certificate for the device to your management computer.

To configure pre-authorization in the GUI:

1. On the root FortiGate, go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
2. In the *Device authorization* field and click *Edit*. The *Device Authorization* pane opens.
3. Click *Create New* to add a new device for pre-authorization.
4. Enter the device name in the *Name* field.
5. Select the *Authorization type*, either *Serial Number* or *Certificate*.
6. If *Certificate* is selected, click *Browse* to upload the certificate from the management computer for the supported Security Fabric device.
7. Set the *Action* to *Accept*.
8. Click *OK* and add more devices as required.
9. Click *OK*.

To configure pre-authorization in the CLI:

This example shows how to configure pre-authorization of a FortiVoice with a certificate.

```
config system csf
  config trusted-list
    edit "<name>"
      set action accept
      set authorization-type certificate
      set certificate "-----BEGIN CERTIFICATE-----
...
<encrypted_certificate_data>
...
-----END CERTIFICATE-----"
    next
  end
end
```

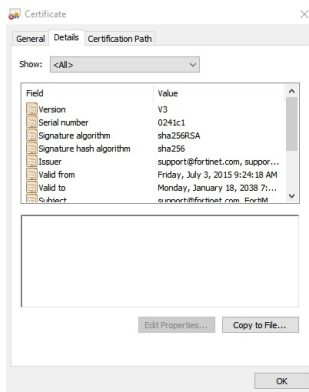

Pre-authorizing using the FortiMail certificate

In this example, FortiMail is configured for pre-authorization using a certificate.

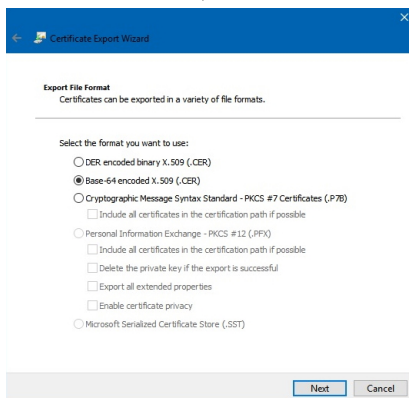

To pre-authorize FortiMail using a third-party or default certificate:

1. Log in to FortiMail.
2. Download the certificate. For example, in Chrome:
 - a. In the left side of the address bar, click the icon to view the site information.
 - b. Click *Certificate*.

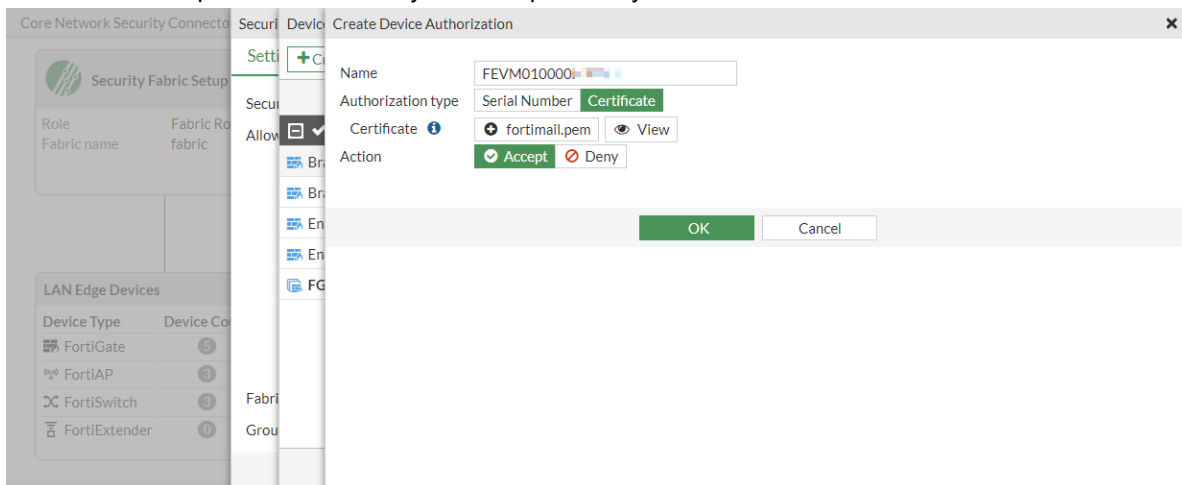

- c. Click the *Details* tab, then click *Copy to File*.

- d. The *Certificate Export Wizard* opens. Click *Next* to continue.
 e. For the file format, select *Base-64 encoded X.509 (.CER)*, then click *Next*.

- f. Browse to the folder location and enter a file name, then click *Next*.
 g. Click *Finish*, then click *OK* to close the dialog box.
 3. In FortiOS, go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
 4. Beside *Device authorization*, click *Edit > Create New* and configure the following:
- Enter the FortiMail serial number.
 - Set the *Authorization type* to *Certificate*.
 - Click *Browse* to upload the .CER file you saved previously.

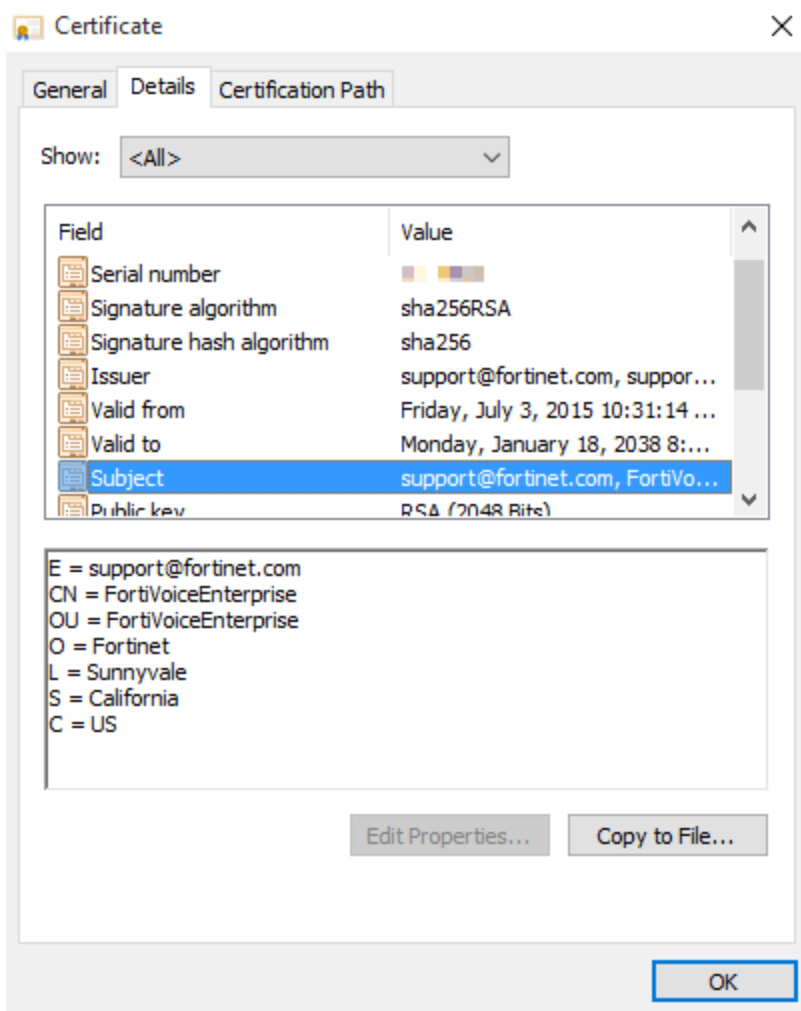

- d. Click *OK*.

Pre-authorizing using the FortiVoice certificate

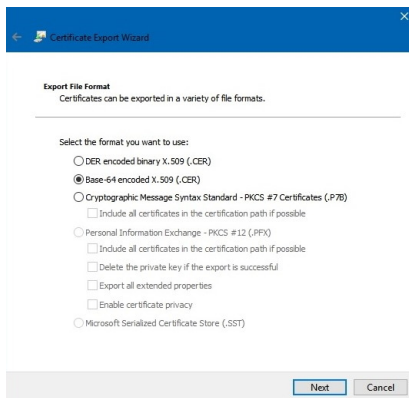

In this example, FortiVoice is configured for pre-authorization using a certificate.

To pre-authorize a FortiVoice using a third-party or default certificate in the GUI:

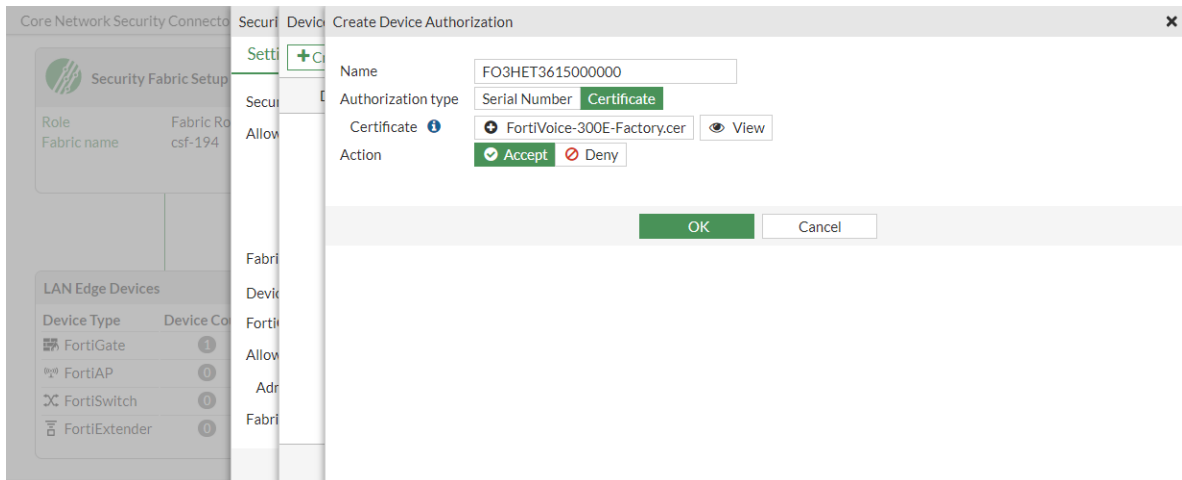

1. Log in to the FortiVoice.
2. Download the certificate. For example, in Chrome:
 - a. In the left side of the address bar, click the icon to view the site information.
 - b. Click *Certificate*.
 - c. In the *Certificate* window, click the *Details* tab, then click *Copy to File*.

- d. The *Certificate Export Wizard* opens. Click *Next*.
- e. Set the format to *Base-64 encoded X.509 (.CER)*, then click *Next*.

- f. Browse to the folder location, enter a file name, then click *Next*.
- g. Click *Finish*, then click *OK* to close the wizard.
3. In FortiOS, go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
4. Beside *Device authorization*, click *Edit*.
5. Click *Create New* and enter the following:
 - a. In the *Name* field, enter the FortiVoice serial number.
 - b. Set the *Authorization type* to *Certificate*.
 - c. Upload the .CER file.

- d. Click *OK*, then close the *Device authorization* pane.

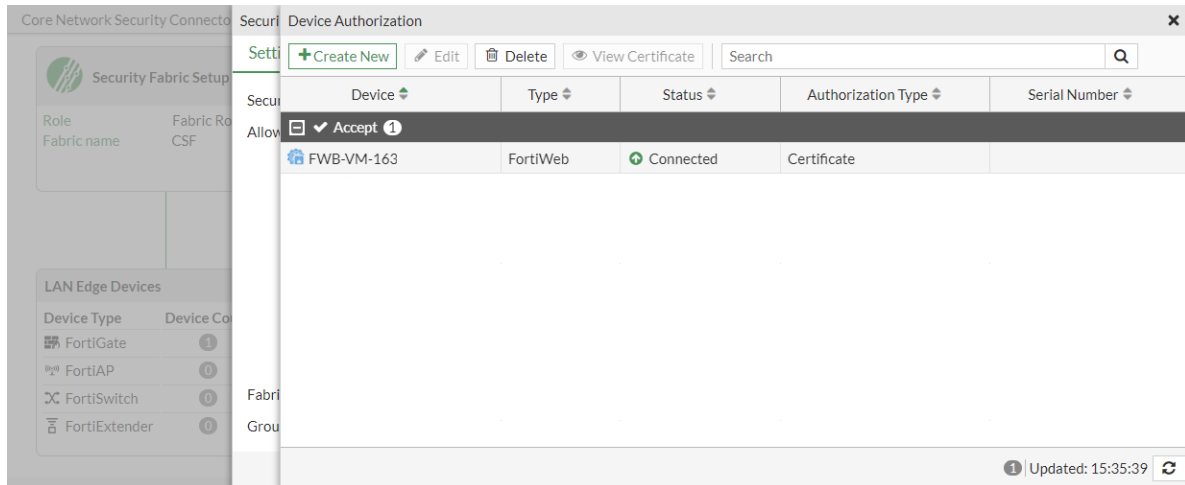

Pre-authorizing using the FortiWeb certificate

In this example, FortiWeb is configured for pre-authorization using a certificate.

To authorize a FortiWeb to join the Security Fabric in FortiOS:

1. Go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
2. Beside *Device authorization*, click *Edit*. The *Device authorization* pane opens.
3. Add the FortiWeb:
 - a. Click *Create New* and enter a device name.
 - b. For *Authorization type*, select *Certificate*.

- c. Click *Browse* to upload the certificate.
- d. For *Action*, select *Accept*.
- e. Click *OK*. The FortiWeb appears in the table.

Authorizing supported connectors

Supported connectors can be authorized from the *Security Fabric > Fabric Connectors* page.

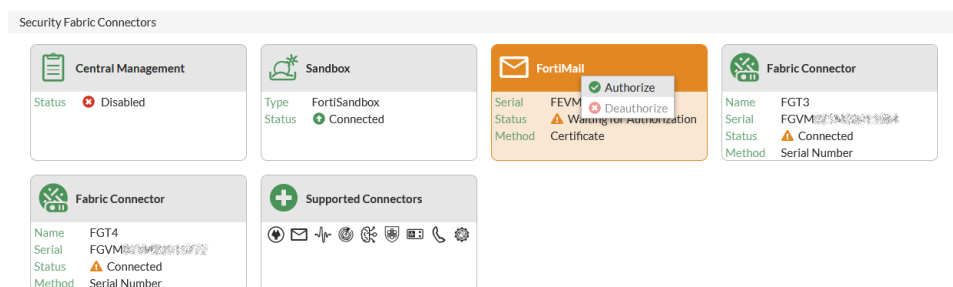

For information about authorizing other devices, see [Authorizing devices on page 2434](#).

To authorize a supported connector in the GUI:

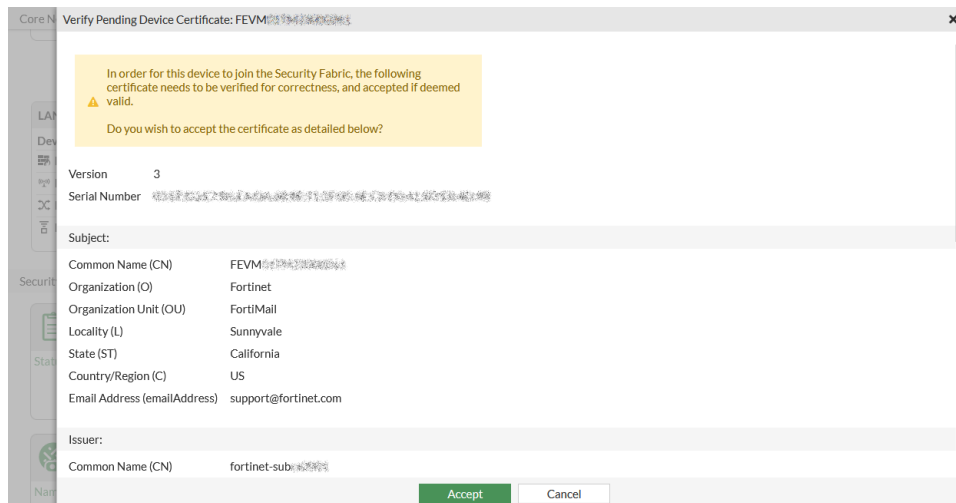

1. Go to *Security Fabric > Fabric Connectors*, either by selecting it in the tree menu, or clicking the link in the notification center dropdown.

2. In the *Security Fabric Connectors* section, click on the card of the unauthorized device, and select *Authorize*.

3. Verify the device certificate, then click *Accept*.

The device is authorized and should come online in a few moments. If the device does not come online in six to eight minutes, check its connection settings.

To authorize a supported connector in the CLI:

```
config system csf
  config trusted-list
    edit "<serial number>"
      set action accept
    next
  end
end
```

Configuring FortiDeceptor

FortiDeceptor can be added to the Security Fabric so it appears in the topology views and the dashboard widgets.

FortiDeceptor requires REST API access to FortiGate.

To add FortiDeceptor to the Security Fabric in the GUI:

1. In FortiOS, ensure that FortiGate is prepared to add FortiDeceptor to the Security Fabric. See [Preparing FortiGate for supported Security Fabric devices on page 2818](#).
2. (Optional) In FortiOS, configure pre-authorization of FortiDeceptor to enable the device to join the Security Fabric as soon as it connects. See [Configuring pre-authorization of supported Security Fabric devices on page 2819](#).
3. In FortiDeceptor, integrate the device:

FortiDeceptor instructions are included for convenience. For the latest FortiDeceptor instructions, see the [FortiDeceptor Administration Guide](#).
 - a. Go to *Fabric > Quarantine Integration*.
 - b. Click *Quarantine Integration With New Device*.
 - c. Click the toggle to enable the device.
 - d. For *Upstream IP Address*, enter the root FortiGate's management IP address.

Fabric Upstream

Enabled: ☐

Upstream IP Address: Port:

Authorization Status: The device is waiting to be authorized by upstream. [FGT81ETK18000000]

Apply **Cancel**

+ Quarantine Integration With New Device

Action	Enabled	Status	Name	Appliance	Integrate Meth...	Severi...	Detail
No records found.							

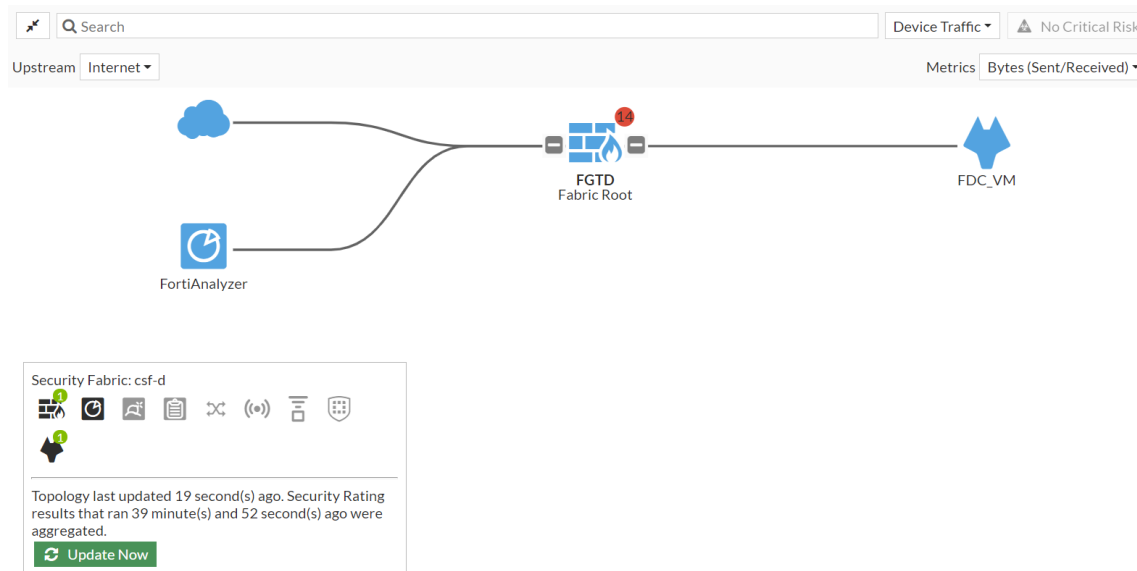

e. Click **Apply**.

4. In FortiOS, authorize the FortiDeceptor. See [Authorizing supported connectors on page 2824](#).

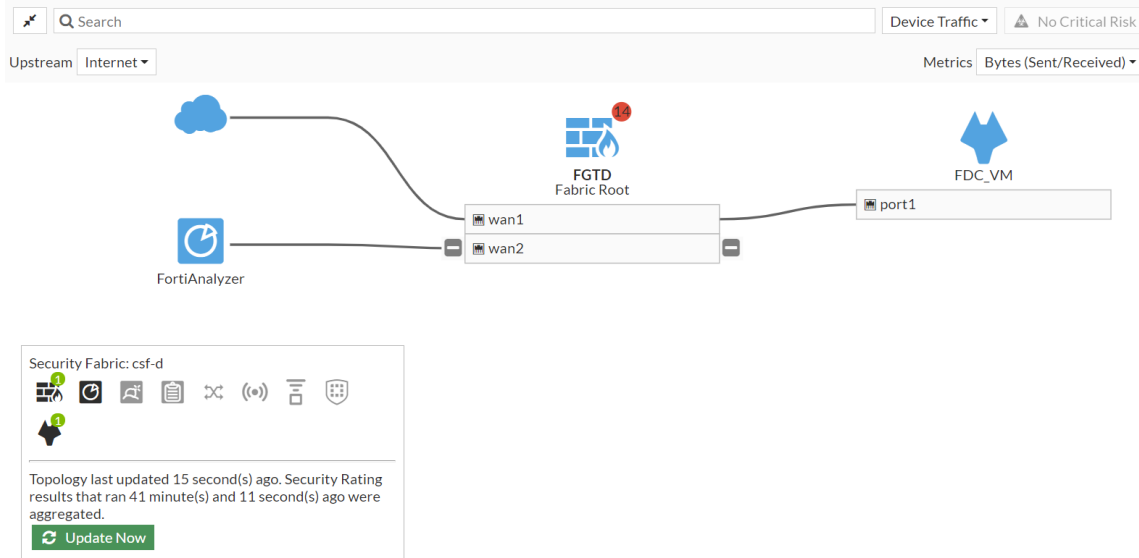

If FortiDeceptor is pre-authorized, you can skip this step.

5. Go to **Security Fabric > Physical Topology** or **Security Fabric > Logical Topology** to view more information.

Physical topology view:

Logical topology view:

Configuring FortiMail

FortiMail can be added to the Security Fabric so it appears in the topology views and the dashboard widgets.

To add FortiMail to the Security Fabric in the GUI:

1. In FortiOS, ensure that FortiGate is prepared to add FortiMail to the Security Fabric. See [Preparing FortiGate for supported Security Fabric devices on page 2818](#).
2. (Optional) In FortiOS, configure pre-authorization of FortiMail to enable the device to join the Security Fabric as soon as it connects. See [Configuring pre-authorization of supported Security Fabric devices on page 2819](#).
3. In FortiMail, integrate the device:
FortiMail instructions are included for convenience. For the latest FortiMail instructions, see the [FortiMail Administration Guide](#).
 - a. Go to *System > Customization* and click the *Corporate Security Fabric* tab (or the *Corporate Security Fabric* tab in FortiMail 6.4.2 and earlier).
 - b. Click the toggle to enable the Fabric.
 - c. Enter the *Upstream IP Address* (root FortiGate) and the *Management IP* of the FortiMail.
 - d. Click *Apply*.
4. In FortiOS, authorize the device. See [Authorizing supported connectors on page 2824](#).
If FortiMail is pre-authorized, you can skip this step.
5. On FortiOS, go to *Security Fabric > Physical Topology* or *Security Fabric > Logical Topology* to view more information.

Configuring FortiMonitor

FortiMonitor can be added to the Security Fabric so it appears in the topology views and the dashboard widgets.

FortiMonitor requires REST API access to FortiGate.

To add FortiMonitor to the Security Fabric:

1. In FortiOS, ensure that FortiGate is prepared to add FortiMonitor to the Security Fabric. See [Preparing FortiGate for supported Security Fabric devices on page 2818](#).
2. (Optional) In FortiOS, configure pre-authorization of FortiMonitor to enable the device to join the Security Fabric as soon as it connects. See [Configuring pre-authorization of supported Security Fabric devices on page 2819](#).
3. In FortiMonitor, start configuring the device to join the Security Fabric (see [Enable Security Fabric monitoring for detailed instructions](#)):
 - a. Complete the *Discovery Details* page.

Fortinet Fabric Device

Discovery Details | Discover & Select | Configure | Organize | Review & Finish

* Indicates a required field

Discovery Type * ☒ New ☐ Existing

FortiOS Version * ☒ 7.0 and above ☐ 6.x and below (coming soon)

Root Device IP/FQDN *

Fabric API Port *

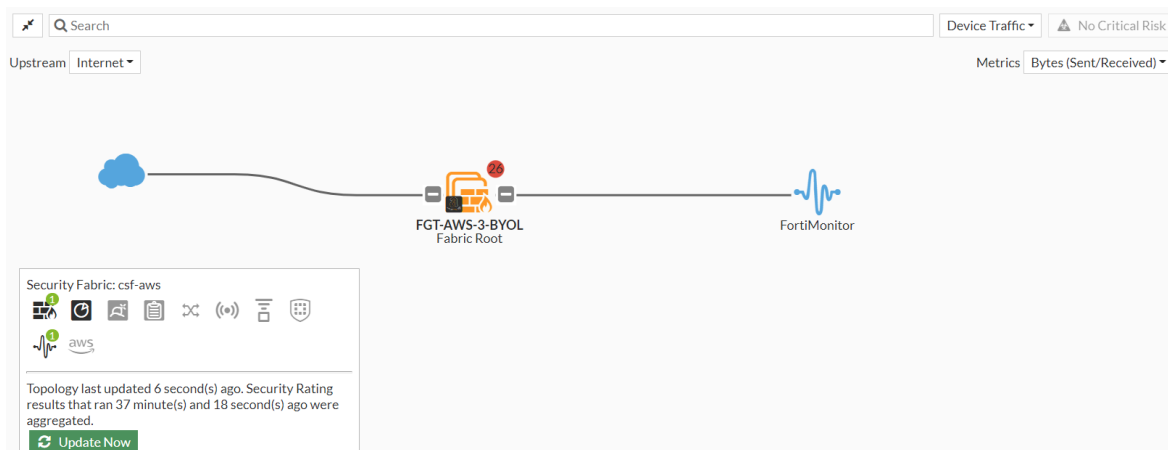

Serial Number *

Requirements: FortiOS 7.0 and above

- * IP/FQDN of your root device. The IP should be exposed to our cloud environment.
- * Serial Number of your root device.

Cancel Continue to Discover & Select >

4. In FortiOS, authorize the FortiMonitor. See [Authorizing supported connectors on page 2824](#).
If FortiMonitor is pre-authorized, you can skip this step.
 5. Go to *Security Fabric > Physical Topology* or *Security Fabric > Logical Topology* to view more information.
- Physical topology view:

Logical topology view:

6. In FortiMonitor, complete the device configuration. (See [Enable Security Fabric monitoring](#) for detailed instructions.)

Configuring FortiNAC

A FortiNAC device can be added to the Security Fabric on the root FortiGate. After the device has been added and authorized, you can log in to the FortiNAC from the FortiGate topology views.

Adding a FortiNAC to the Security Fabric requires a FortiNAC with a license issued in the year 2020 or later that includes an additional certificate. The device cannot be added if it has an older license. Use the `licensetool` in the FortiNAC CLI to determine if your license includes the additional certificate.

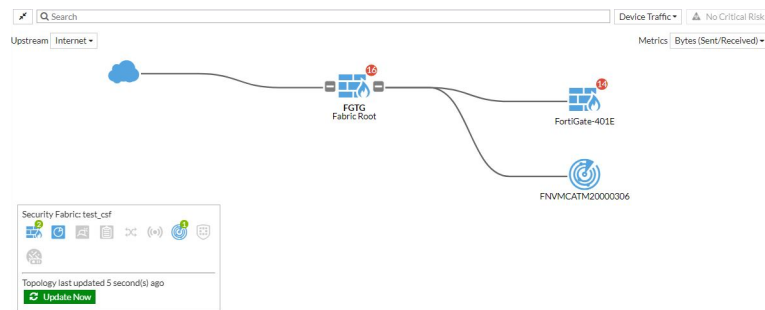

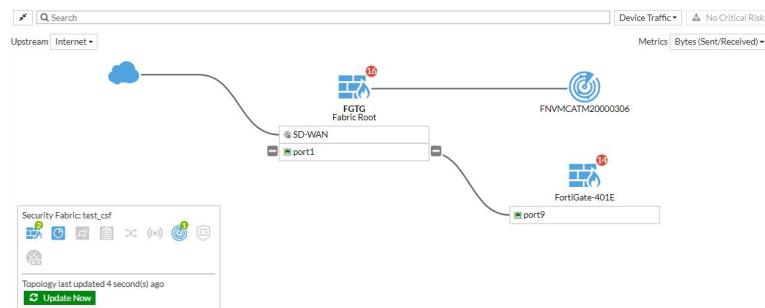

The FortiNAC tags connector under *Security Fabric > Fabric Connectors* has been deprecated. It was replaced with a REST API (in FortiNAC and FortiOS) that is used by FortiNAC to send user logon and logoff information to the FortiGate. The FortiNAC tag dynamic firewall address type is used to store the device IP, FortiNAC firewall tags, and FortiNAC group information sent from FortiNAC by the REST API when user logon and logoff events are registered (see [FortiNAC tag dynamic address on page 1329](#) for more information).

For upgrade support, the FSSO FortiNAC user type can still be configured in the CLI.

To add FortiNAC to the Security Fabric in the GUI:

1. In FortiOS, ensure that FortiGate is prepared to add FortiNAC to the Security Fabric. See [Preparing FortiGate for supported Security Fabric devices on page 2818](#).
2. (Optional) In FortiOS, configure pre-authorization of FortiNAC to enable the device to join the Security Fabric as soon as it connects. See [Configuring pre-authorization of supported Security Fabric devices on page 2819](#).
3. On FortiNAC, configure telemetry and input the IP address of the root FortiGate. See [Security Fabric Connection](#) in the *FortiNAC Administration Guide* for more information.
4. In FortiOS on the root FortiGate, authorize the FortiNAC. See [Authorizing supported connectors on page 2824](#). If FortiNAC is pre-authorized, you can skip this step.
5. Go to *Security Fabric > Physical Topology* or *Security Fabric > Logical Topology* to view more information.

Physical topology view:**Logical topology view:**

6. Run the following command in the CLI to view information about the FortiNAC device's status:

```
# diagnose sys csf downstream-devices fortinac
{
  "path": "FG5H1E5818900126:FNVMCATM20000306",
  "mgmt_ip_str": "10.1.100.197",
  "mgmt_port": 0,
  "admin_port": 8443,
  "serial": "FNVMCATM20000306",
  "host_name": "adnac",
  "device_type": "fortinac",
  "upstream_intf": "port2",
  "upstream_serial": "FG5H1E5818900126",
  "is_discovered": true,
  "ip_str": "10.1.100.197",
  "downstream_intf": "eth0",
  "authorizer": "FG5H1E5818900126",
  "idx": 1
}
```

Configuring FortiNDR

FortiNDR (formerly FortiAI) can be added to the Security Fabric so that it appears in the topology views and the dashboard widgets.

To add FortiNDR to the Security Fabric in the GUI:

1. In FortiOS, ensure that FortiGate is prepared to add FortiNDR to the Security Fabric. See [Preparing FortiGate for supported Security Fabric devices on page 2818](#).

2. (Optional) In FortiOS, configure pre-authorization of FortiNDR to enable the device to join the Security Fabric as soon as it connects. See [Configuring pre-authorization of supported Security Fabric devices on page 2819](#).
3. In FortiNDR, go to *System > FortiGuard* and verify that the pre-trained models (engines) are up to date. Refer to the [FortiGuard website](#) for the latest FortiNDR ANN versions.

The screenshot shows the 'FortiGuard Distribution Network' window. It contains a table of license information and a section for updates.

FortiGuard Updates

Manual Update:

Scheduled Updates: ☐

OK Cancel

4. In FortiNDR GUI, configure and authorize the FortiGate:

FortiNDR instructions are included for convenience. For the latest FortiNDR instructions, see the [FortiNDR Administration Guide](#).

 - a. Go to *Security Fabric > Fabric Connectors* and click the gear icon in the top right corner of the *Security Fabric* card.
 - b. Click the toggle to *Enable Security Fabric*.
 - c. Enter the IP addresses for the root FortiGate and the FortiNDR.

The screenshot shows the 'Status' section of the FortiNDR GUI. The 'Enable Security Fabric' toggle is turned on. Below it, the 'Fabric Device Settings' section contains the following fields:

FortiGate Root IP	10.6.30.14
TCP Port	8013
FortiNDR IP	10.6.30.251
TCP Port	443

OK Cancel

- d. Click OK. The FortiNDR is now authorized.
5. In FortiOS, authorize the FortiNDR. See [Authorizing supported connectors on page 2824](#).
If FortiNDR is pre-authorized, you can skip this step.

- On FortiOS, go to *Security Fabric > Physical Topology* or *Security Fabric > Logical Topology* to view more information.

Configuring FortiPolicy

FortiPolicy can be added to the Security Fabric. When FortiPolicy joins the Security Fabric and is authorized in the *Security Fabric* widget, it appears in the Fabric topology pages. A FortiGate can grant permission to FortiPolicy to perform firewall address and policy changes.

FortiPolicy requires REST API access to FortiGate.

To add FortiPolicy to the Security Fabric in the GUI:

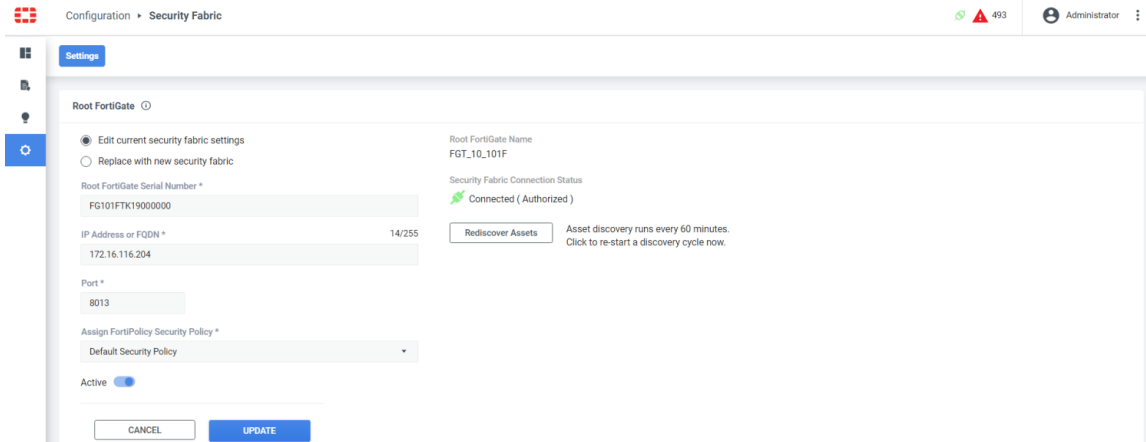

- In FortiOS, ensure that FortiGate is prepared to add FortiPolicy to the Security Fabric. See [Preparing FortiGate for supported Security Fabric devices on page 2818](#).
- (Optional) In FortiOS, configure pre-authorization of FortiPolicy to enable the device to join the Security Fabric as soon as it connects. See [Configuring pre-authorization of supported Security Fabric devices on page 2819](#).
- In FortiPolicy, edit the Security Fabric settings.

FortiPolicy instructions are included for convenience. For the latest FortiPolicy instructions, see the [FortiPolicy Administration Guide](#).

- Go to *Configuration > Security Fabric* and select *Edit current security fabric settings*.
- Enter the root FortiGate's IP address.
- Set the *Port* (the default is *8013*).
- Select a FortiPolicy security policy.

The screenshot displays the 'Security Fabric' configuration page in FortiOS. The 'Root FortiGate' section is active, showing fields for Name, Serial Number, IP Address, Port, and Assigned Security Policy. The 'Security Fabric Connection Status' is 'Not Connected (Authorization Pending)'. A 'Rediscover Assets' button is present. At the bottom, there are 'CANCEL' and 'UPDATE' buttons.

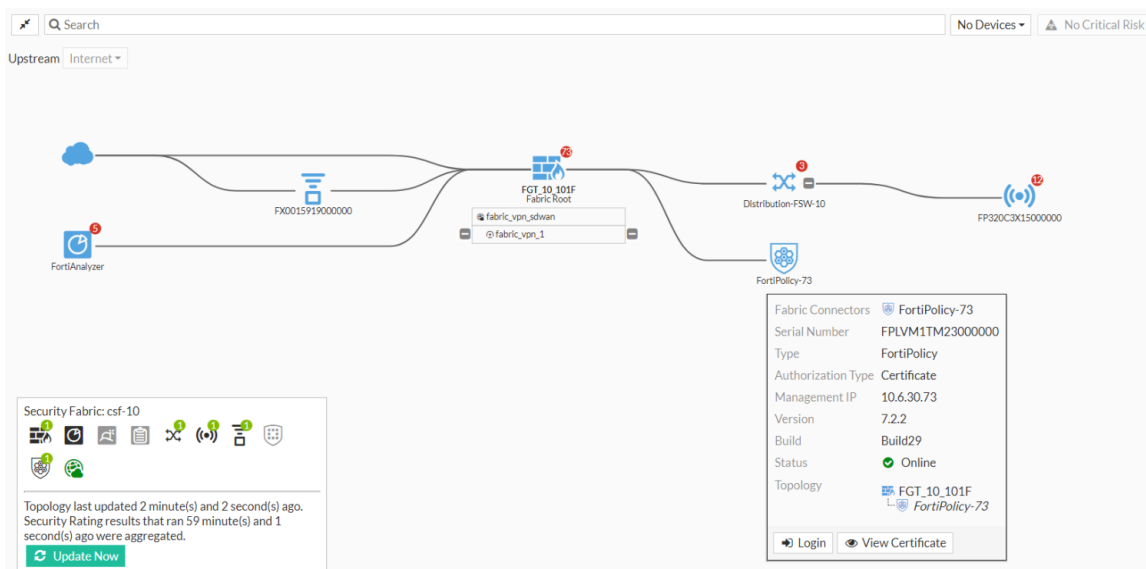

- Click **UPDATE**. The connection status is *Not Connected (Authorization Pending)*.
- In FortiOS, authorize the FortiPolicy. See [Authorizing supported connectors on page 2824](#).
If FortiPolicy is pre-authorized, you can skip this step.
 - In FortiPolicy, refresh the *Configuration > Security Fabric* page, and verify that the connection status is *Connected (Authorized)*.

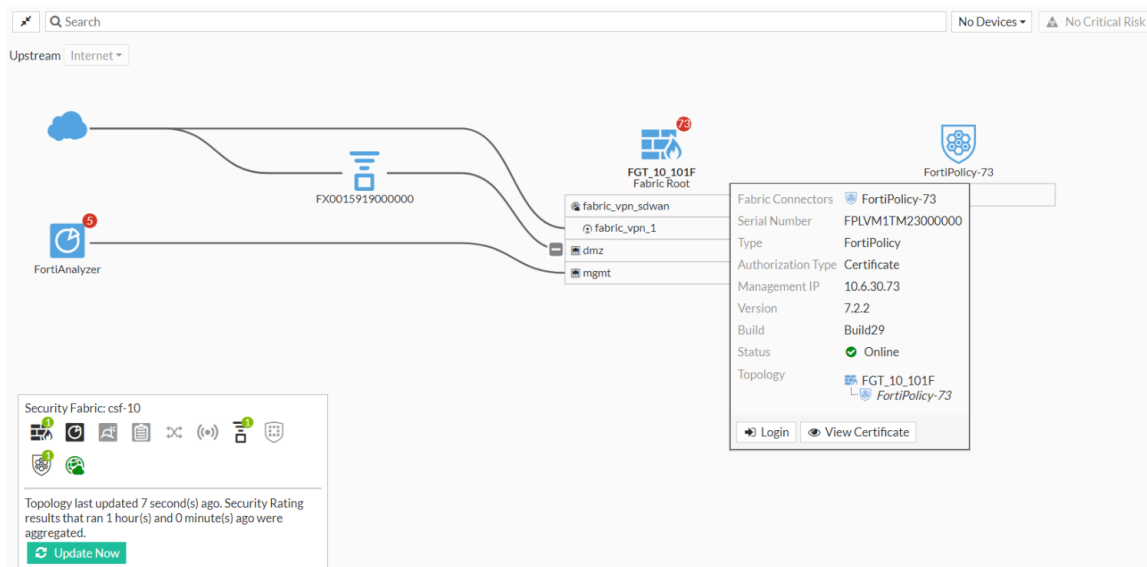

6. In FortiOS, grant FortiPolicy write access permission in the CLI:

```
config system csf
  config fabric-connector
    edit "FPLVM1TM23000000"
      set configuration-write-access enable
    next
  end
end
```

7. Go to *Security Fabric > Physical Topology* or *Security Fabric > Logical Topology* to view more information. Physical topology view:

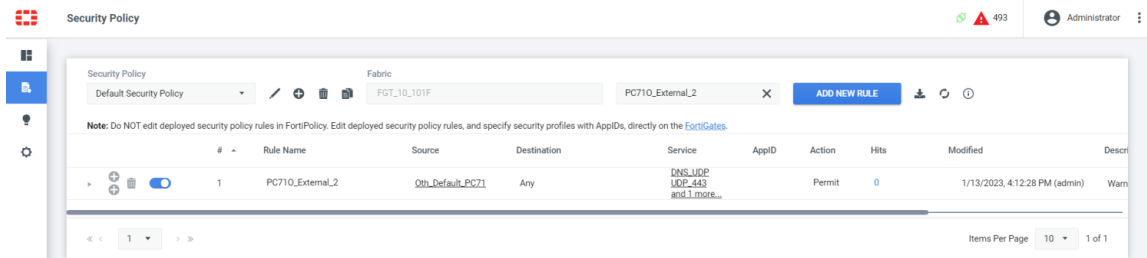

Logical topology view:

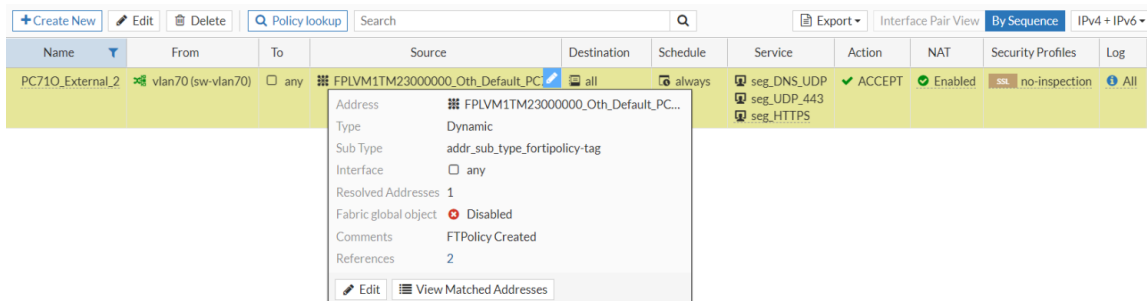

To deploy firewall policies from FortiPolicy to the root FortiGate:

1. Create a policy in FortiPolicy (see [Customizing policies](#) in the FortiPolicy Administration Guide).

In this example, a default security policy rule called *PC710_External_2* is created. Since the FortiPolicy is integrated in the Security Fabric, it will use the REST API to push the static policy, dynamic firewall objects, and service objects to the root FortiGate.

2. In FortiOS, go to *Policy & Objects > Firewall Policy* to view the policy named *PC710_External_2*.

3. Go to *Policy & Objects > Addresses* to view the dynamic firewall address associated with the policy (*FPLVM1TM23000000_Oth_Default_PC71*).

4. Go to *Policy & Objects > Services* to view the service objects associated with the policy (*seg_DNS_UDP*, *seg_UDP_443*, *seg_HTTPS*, and *seg_TCP_8013*).

Name	Details	IP/FQDN	Category	Protocol	Fabric Global Object	Ref.
seg_DNS_UDP	UDP/53	0.0.0.0	FTPolicy	TCP/UDP/SCTP	Disable	1
seg_UDP_443	UDP/443	0.0.0.0	FTPolicy	TCP/UDP/SCTP	Disable	1
seg_HTTPS	TCP/443	0.0.0.0	FTPolicy	TCP/UDP/SCTP	Disable	1
seg_TCP_8013	TCP/8013	0.0.0.0	FTPolicy	TCP/UDP/SCTP	Disable	1

Configuring FortiTester

FortiTester can be added to the Security Fabric and authorized from the Security Fabric topology views. Once added, the FortiTester will appear in the *Security Fabric* widget on the dashboard.

To add FortiTester to the Security Fabric in the GUI:

1. In FortiOS, ensure that FortiGate is prepared to add FortiTester to the Security Fabric. See [Preparing FortiGate for supported Security Fabric devices on page 2818](#).
2. (Optional) In FortiOS, configure pre-authorization of FortiTester to enable the device to join the Security Fabric as soon as it connects. See [Configuring pre-authorization of supported Security Fabric devices on page 2819](#).
3. In FortiTester, enable the Security Fabric:
See also the [FortiTester Administration Guide](#).
 - a. Go to *System Settings > Security Fabric > Settings*.
 - b. Click the toggle to enable the device (*Enable Security Fabric*).
 - c. Enter the *FortiGate Root IP Address*.

- d. Click *Apply*.
4. In FortiOS, authorize the FortiTester. See [Authorizing supported connectors on page 2824](#).
If FortiTester is pre-authorized, you can skip this step.
 5. Go to *Security Fabric > Physical Topology* or *Security Fabric > Logical Topology* to view more information.
Physical topology view:

Logical topology view:

Configuring FortiVoice

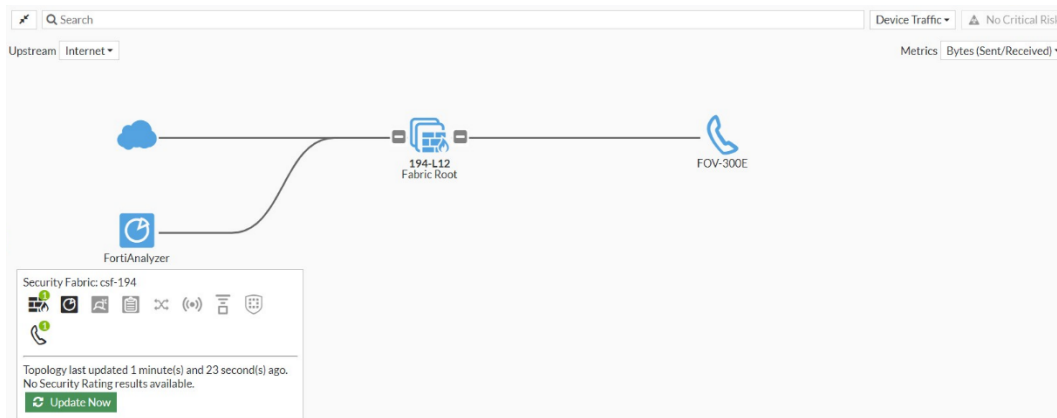

A FortiVoice can be added to the Security Fabric on the root FortiGate. Once the FortiVoice is added and authorized, you can log in to the device from the Security Fabric topology pages.

To add FortiVoice to the Security Fabric in the GUI:

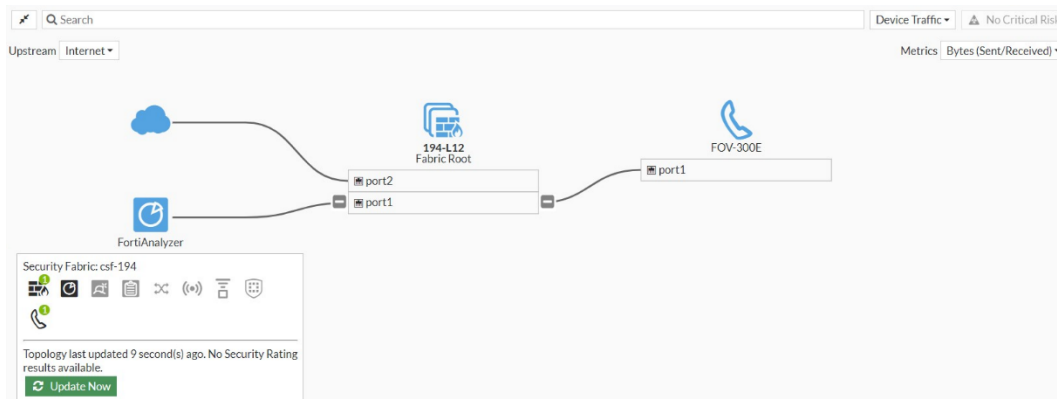

1. In FortiOS, ensure that FortiGate is prepared to add FortiVoice to the Security Fabric. See [Preparing FortiGate for supported Security Fabric devices on page 2818](#).

- (Optional) In FortiOS, configure pre-authorization of FortiVoice to enable the device to join the Security Fabric as soon as it connects. See [Configuring pre-authorization of supported Security Fabric devices on page 2819](#).
- On FortiVoice, enable the Security Fabric. See [Enabling Security Fabric](#) in the FortiVoice Phone System Administration Guide.
- In FortiOS, authorize the FortiVoice. See [Authorizing supported connectors on page 2824](#).
If FortiVoice is pre-authorized, you can skip this step.
- Go to *Security Fabric > Physical Topology* or *Security Fabric > Logical Topology* to view more information.

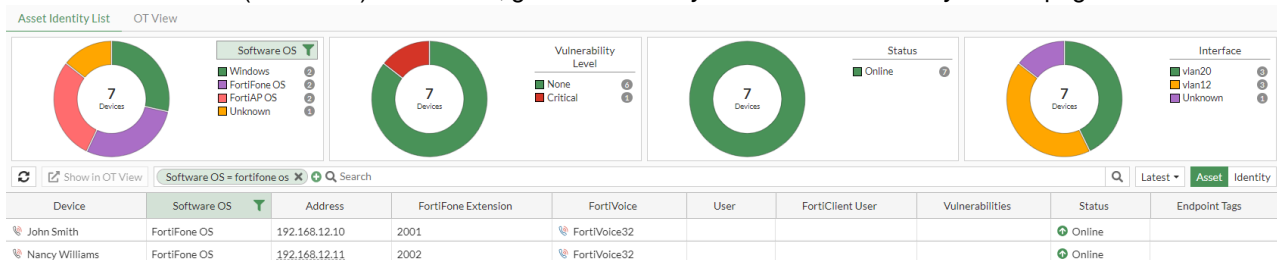

Physical topology view:

Logical topology view:

- For additional device (FortiFone) information, go to the *Security Fabric > Asset Identity Center* page.

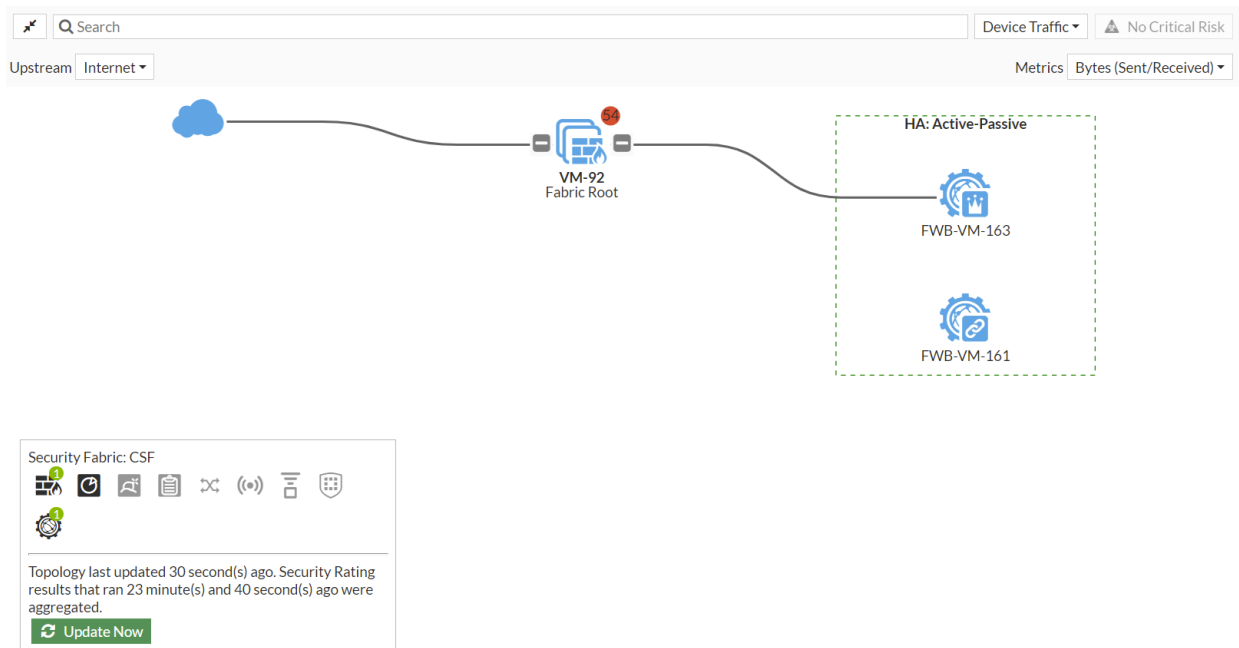

Configuring FortiWeb

A FortiWeb can be added to the Security Fabric on the root FortiGate.

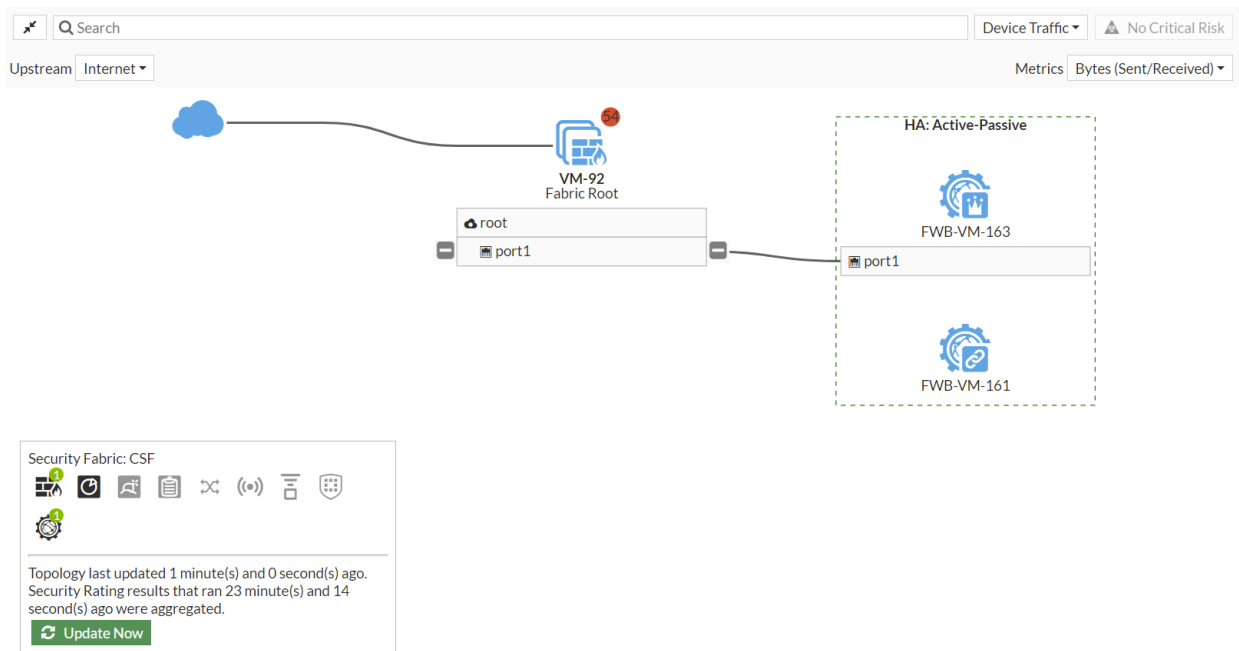

To add FortiWeb to the Security Fabric in the GUI:

1. In FortiOS, ensure that FortiGate is prepared to add FortiWeb to the Security Fabric. See [Preparing FortiGate for supported Security Fabric devices on page 2818](#).
2. (Optional) In FortiOS, configure pre-authorization of FortiWeb to enable the device to join the Security Fabric as soon as it connects. See [Configuring pre-authorization of supported Security Fabric devices on page 2819](#).
3. On FortiWeb, edit the FortiGate *Fabric Connector* settings. See [Fabric Connector: Single Sign On with FortiGate](#). The *Connection Status* is currently *Authorize pending*.
4. In FortiOS, authorize the FortiWeb. See [Authorizing supported connectors on page 2824](#).
If FortiWeb is pre-authorized, you can skip this step.
5. Go to *Security Fabric > Physical Topology* or *Security Fabric > Logical Topology* to view more information.

Physical topology view:

Logical topology view:

Using the Security Fabric

The following topics provide information about using and deploying the Security Fabric:

- [Dashboard widgets on page 2839](#)
- [Topology on page 2841](#)
- [Asset Identity Center page on page 2847](#)
- [WebSocket for Security Fabric events on page 2858](#)
- [Deploying the Security Fabric on page 2860](#)
- [Deploying the Security Fabric in a multi-VDOM environment on page 2867](#)
- [Other Security Fabric topics on page 2872](#)

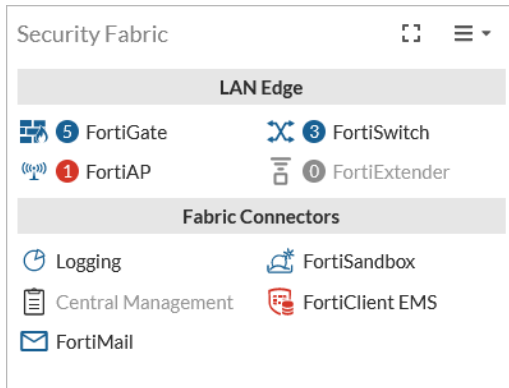

Dashboard widgets

Security Fabric widgets can be added to FortiGate dashboards, including:

- [Security Fabric status on page 2839](#)
- [FortiGate Cloud on page 2840](#)

Security Fabric status

The Security Fabric status widget shows a summary of the devices in the Security Fabric.

Hover the cursor over the top icons to view pop-ups showing the statuses of the devices in the fabric.

The device tree shows devices that are connected, or could be connected, to your Security Fabric, according to the following color scheme:

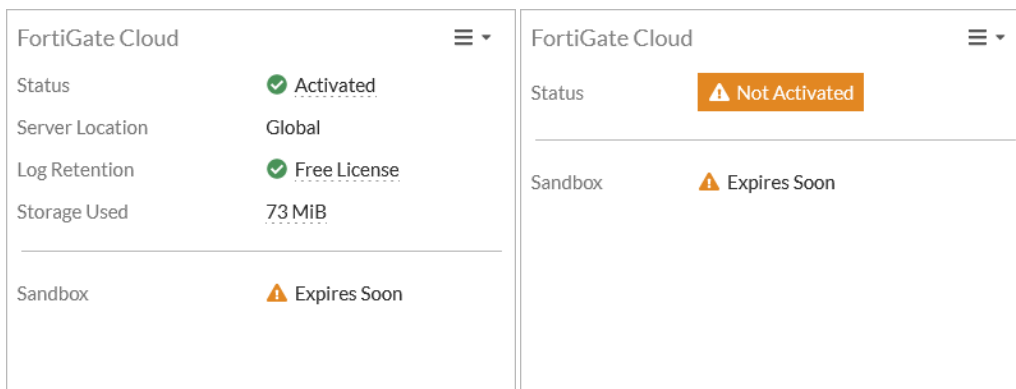

- Blue: connected to the network
- Gray: not configured or not detected
- Red: no longer connected or not authorized

Hover over a device in the tree to view details about the device, such as its serial number, operation mode, IP address, CPU and memory usage, and others, depending on the device type.

Unauthorized FortiAP and FortiSwitch devices are highlighted in the list, and can be authorized by clicking on the device name.

FortiGate Cloud

The FortiGate Cloud widget shows the FortiGate Cloud status and information. If your account is not activated, you can activate it from the widget.

To activate your FortiGate Cloud account:

1. Click on the *Not Activated* button and select *Activate*. The *Activate FortiGate Cloud* pane opens.
2. If you already have an account:
 - a. Fill in your email address, password, country or region, and reseller.
 - b. Click *OK*.

3. If you are creating an account:
 - a. In the *FortiCloud* field select *Create Account*.
 - b. Fill in all of the required information.
 - c. Click *OK*.

Topology

The full Security Fabric topology can be viewed on the root FortiGate. Downstream FortiGate devices' topology views do not include upstream devices.

The *Physical Topology* page shows the physical structure of your network, including all connected devices and the connections between them. The *Logical Topology* page shows information about the interfaces that connect devices to the Security Fabric.

In both topology pages, you can use filtering and sorting options to control the information that is shown. Hover the cursor over a device icon, port number, or endpoint to open a tooltip that shows information about that specific device, port, or endpoint. Right-click on a device to log into, configure, or deauthorize it. Right-click on an endpoint to perform various tasks, such as drilling down for more details in FortiView, quarantining the host, and banning the IP address.

The small number that might be shown in the top right corner of a device icon is the number of security ratings recommendations or warnings for that device. The circle color indicates the severity of the highest security rating check that failed. Clicking it opens the *Security Rating* page. See [Security rating on page 2905](#) for more information.

Views

From the dropdown list beside the search bar, select one of the following views:

- *Device Traffic*: organize devices by traffic.
- *Device Count*: organize devices by the number of devices connected to it.
- *Device Operating System*: organize devices by operating system.
- *Device Hardware Vendor*: organize devices by hardware vendor.
- *Risk*: only include devices that have endpoints with medium, high, or critical risk values of the specified type: *All*, *Compromised Host*, *Vulnerability*, or *Threat Score*.
- *No Devices*: do not show endpoints.

Endpoint groups

The *Device Traffic* and *Device Count* views display endpoint groups as donut charts, with the total number of endpoints in the group in the center of the chart. Each sector of the donut chart represents a different endpoint operating system.

To zoom in on a donut chart, click any chart sector. Each sector represents a different endpoint OS. Hovering over each sector allows you to see the OS that the sector represents and the number of endpoints that have that OS installed.

In this example, the endpoint group contains a total of nine endpoints, with the following OSes installed:

Donut sector color	OS	Number of endpoints
Orange	Linux	2
Green	FortiMail	1
Red	FortiManager	1
Blue	Other	5

To view the endpoint group in a bubble pack display, click the + button in the center of the donut chart. You can view each individual endpoint in the bubble pack view.

FortiAP and FortiSwitch devices

Newly discovered FortiAP and FortiSwitch devices are initially shown in the topologies with gray icons to indicate that they have not been authorized. To authorize a device, click on the device icon or name and select *Authorize*. Once authorized, the device icon will turn blue.

Right-click on an authorized FortiAP device to *Deauthorize* or *Restart* the device. Right-click on a FortiSwitch device to *Deauthorize*, *Restart*, or *Upgrade* the device, or to *Connect to the CLI*.

FortiAP and FortiSwitch links are enhanced to show link aggregation groups for the inter-switch link (ISL-LAG). To differentiate them from physical links, ISL-LAG links are shown with a thicker line. The endpoint circles can also be used as a reference to identify ISL-LAG groups that have more than two links.

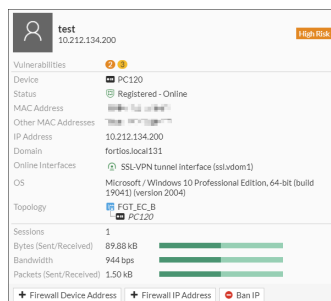

Managed clients connected over a VPN

When managed clients are connected over a VPN, EMS collects user information about these registered clients, such as the VPN connection information. The FortiGate can synchronize this user information from EMS and display it in the logical topology view to provide a detailed picture of clients and their associated VPN interfaces.

Client using an IPsec VPN interface:

Client using an SSL VPN interface:

Critical risks

Click the *Critical Risks* button to see a list of endpoints that are deemed critical risks, organized by threat severity. These are the red endpoints in the current topology view.

For each endpoint, the user's photo, name, IP address, email address, and phone number are shown. The number of vulnerabilities of each severity is shown, and if the IoC verdict is that the endpoint is compromised.

If applicable, the endpoint's host can be quarantined (click *Quarantine Host*) or their IP address can be banned (click *Ban IP*).

The dropdown menu also provides options to drill down to more information on compromised hosts or endpoint vulnerabilities.

Consolidated risk view

The consolidated *Risk* view mode displays different risks within the Security Fabric topology. You can use the *Risk* view mode to filter threats by *Compromised Hosts*, *Vulnerability*, and *Threat Score*.

To access the consolidated risk view mode:

1. On one of the topology pages, in the view option dropdown list beside the search bar, select *Risk*.

2. Select one of the following options from the *Risk Type* dropdown menu:
 - a. *All*
 - b. *Compromised Hosts*
 - c. *Vulnerability*
 - d. *Threat Score*
3. When devices fit into the risk metric, they will appear in the endpoint groups. Click the + in the endpoint group to

display the devices in a bubble chart.

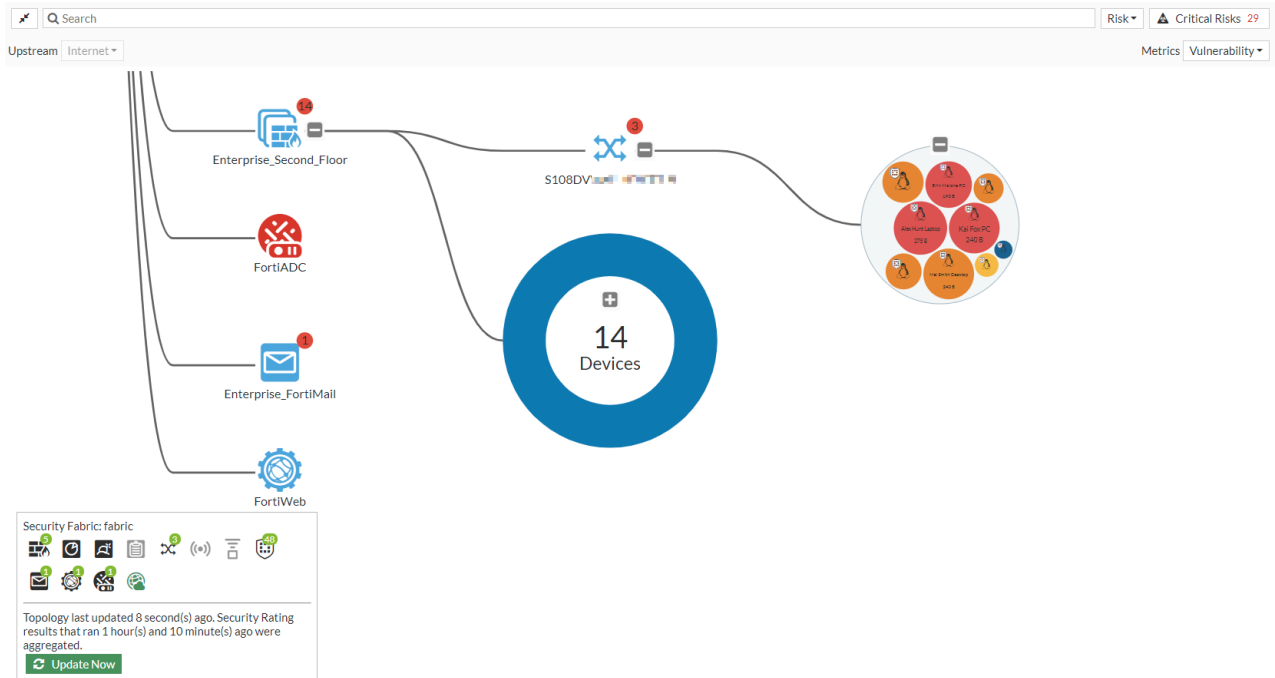

Viewing and controlling network risks in topology view

On the physical and logical topology pages, you can view and control compromised hosts. Compromised hosts behind a FortiSwitch or FortiAP can be quarantined.

To view a compromised endpoint host:

1. Test that FortiGate detects a compromised endpoint host by opening a browser on the endpoint host and entering a malicious website URL. The browser displays a *Web Page Blocked!* warning and does not allow access to the website.
2. On the root FortiGate, go to *Security Fabric > Physical Topology* or *Security Fabric > Logical Topology*. Expand the endpoint group connected to a FortiSwitch or FortiAP. The endpoint host connected to the switch is highlighted in red. Mouse over the endpoint host to view a tooltip that shows the IoC verdict. The endpoint host is compromised.

To quarantine a compromised endpoint host:

1. On the *Physical Topology* or *Logical Topology* page, right-click the endpoint host and select *Quarantine Host*. A dialog displays the FortiGate, host MAC address, and description of the host to be quarantined. Quarantine entries for each MAC address will be created on the FortiGate that the FortiSwitch or FortiAP is connected to.
2. Click *OK*.
3. Go to *Dashboard > User & Devices* and click the *Quarantine* widget to expand it.
4. In the top-right corner, use the dropdown to select the FortiGate in which this host was quarantined. In this example, it is the *Enterprise_Second_Floor* FortiGate.

5. On the endpoint host, open a browser and visit a website such as <https://www.fortinet.com/>. If the website cannot be accessed, this confirms that the endpoint host is quarantined.

To show the quarantined device from the CLI:

1. Log in to the downstream device where the host was quarantined (*Enterprise_Second_Floor*).
2. Enter the following show command:

```
Enterprise_Second_Floor # show user quarantine
config user quarantine
  set firewall-groups "QuarantinedDevices"
  config targets
    edit "Erin Malone PC"
      set description "Manually quarantined"
      config macs
        edit **:**:**:**:**:**
          set description "manual-qtn Hostname: Erin Malone PC"
        next
      end
    next
  end
end
end
```

Asset Identity Center page

The *Asset Identity Center* page unifies information from detected addresses, devices, and users into a single page, while building a data structure to store the user and device information in the backend. The *Asset* view groups information by *Device*, while the *Identity* view groups information by *User*. Hover over a device or a user in the GUI to perform different actions relevant to the object, such as adding a firewall device address, adding an IP address, banning the IP, quarantining the host, and more.

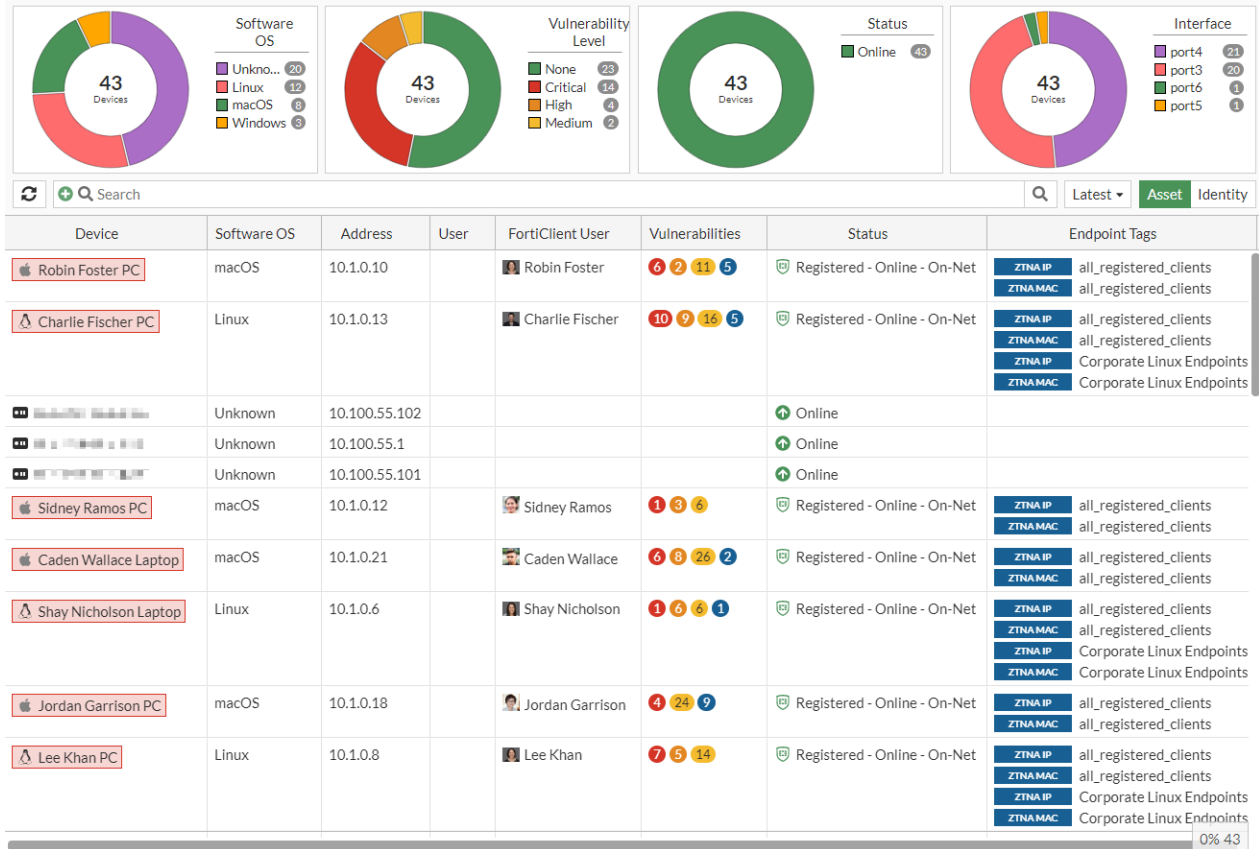

To view the Asset Identity Center page:

1. Go to *Security Fabric > Asset Identity Center*.
2. Click *Asset* to view information by device.

There are four donut charts with device related information: *Software OS*, *Vulnerability Level*, *Status*, and *Interface*.

The default table columns are *Device*, *Software OS*, *Address*, *User*, *FortiClient User*, *Vulnerabilities*, *Status*, and *Endpoint Tags*. The optional columns are *Device Family*, *Device Type*, *EMS Serial*, *EMS Tenant ID*, *Firewall Address*, *FortiSwitch*, *Hardware Vendor*, *Hardware Version*, *Hostname*, *Interface*, *IP Address*, *Last Seen*, *Port*, *Server*, *VLAN*, and *Vulnerability Level*.

Devices with vulnerabilities are highlighted in red.

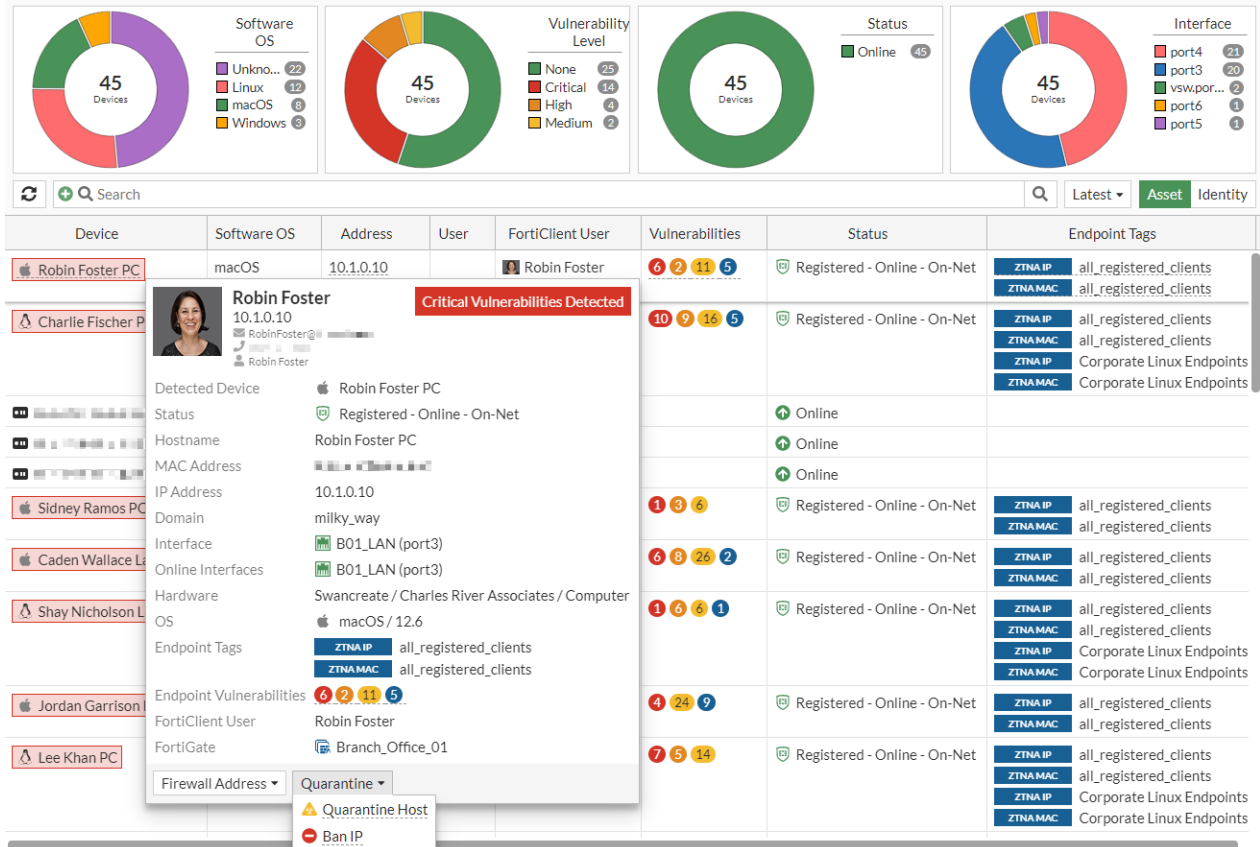

3. Click *Identity* to view information by user. The default table columns are *User*, *Device*, and *Properties*. The optional columns are *IP Address*, *Logoff Time*, and *Logon Time*.

User	Device	Properties	IP Address	Logoff Time	Logon Time
qa1	PC17	IP Address = 10.6.30.17 MAC address =	10.6.30.17		2021/09/20 16:12:21
test1	PC72 PC17	IP Address = 192.168.7.72 MAC address =	192.168.7.72		2021/09/20 16:14:24

Each view has a dropdown option to view the information within different time frames (*Latest*, *1 hour*, *24 hours*, and *7 days*). The page displays user and device relationships, such as which users are logged in to multiple devices or if multiple users are logged in to single devices.

4. Hover over a device in the list to view the tooltip and possible actions. The options under the *Firewall Address* dropdown are *Create Firewall Device Address* and *Create Firewall IP Address*. The options under the *Quarantine* dropdown are *Quarantine Host* and *Ban IP*.

Diagnostics

The following options are available for `diagnose user-device-store unified <option>`:

Option	Description
device-memory-query	Get device records and associated user records from memory.
device-query	Get device records and associated user records from memory and disk.
user-memory-query	Get user records and associated device records from memory.
user-query	Get user records and associated device records from memory and disk.
re-query	Retrieve query by <query-id> <iteration-start> <iteration-count> (takes 0-3 arguments).
list	List unified queries.
clear	Delete all unified queries.
dump	Dump unified query stats by <query-id> (takes 0-1 arguments).
delete	Delete unified query by <query-id> (takes 0-1 arguments).
stats	Get statistics for unified queries.
debug	Enable/disable debug logs for unified queries.

IoT vulnerabilities

Hovering over the data in the *Vulnerabilities* column displays a list of *FortiGuard IoT Detected Vulnerabilities* and *FortiClient Detected Vulnerabilities*. Clicking the *View IoT Vulnerabilities* button in the tooltip opens the *View IoT Vulnerabilities* table that includes the *Vulnerability ID*, *Type*, *Severity*, *Reference*, *Description*, and *Patch Signature ID*. Each entry in the *Reference* column includes the CVE number and a link to the CVE details.

The following settings are required to display IoT devices:

1. The FortiGate must have a valid IoT Detection Service license (see [Signature packages for IoT device detection and vulnerability protection](#)).
2. Device detection must be configured on a LAN interface used by IoT devices.

To configure device detection in the GUI:

- a. Go to *Network > Interfaces* and edit a LAN interface.
- b. Enable *Device detection*.
- c. Click OK.

To configure device detection in the CLI:

```
config system interface
  edit <name>
    set device-identification enable
  next
end
```

3. Configure a firewall policy with an application control sensor.

To view IoT asset vulnerabilities in the GUI:

1. Go to *Security Fabric > Asset Identity Center*. Ensure the *Asset* list view is selected.
2. Select a device with IoT vulnerabilities.
3. Hover over the *IoT Vulnerabilities* count to view the tooltip and click *View IoT Vulnerabilities*.

The screenshot shows the 'Asset Identity List' in the FortiGate GUI. The table has columns: Device, Software OS, Address, User, FortiClient User, Vulnerabilities, Status, and Endpoint Tags. A device with address 1.1.1.2 and OS Windows is highlighted. The 'Vulnerabilities' column shows counts: 2 Critical, 26 High, 26 Medium, and 3 Low. A tooltip is displayed over the counts, showing 'FortiGuard IoT Detected Vulnerabilities' and 'FortiClient Detected Vulnerabilities'. The tooltip also includes a 'View IoT Vulnerabilities' button.

Device	Software OS	Address	User	FortiClient User	Vulnerabilities	Status	Endpoint Tags
[Icon]	Windows	1.1.1.2			2 Critical, 26 High, 26 Medium, 3 Low	Online	

FortiGuard IoT Detected Vulnerabilities

Critical	2
High	26
Medium	26

```

OT asset visibility and network topology

When the *Operational Technology (OT)* feature is enabled, tabs are added in the *Asset Identity Center* page to view the OT asset list and OT network topology using Purdue Levels. This feature is available regardless of whether a Security Fabric is enabled.

To enable the OT features in the GUI:

1. Go to *System > Feature Visibility*.
2. In the *Additional Features* section, enable *Operational Technology (OT)*.
3. Click *Apply*.

To enable the OT features in the CLI:

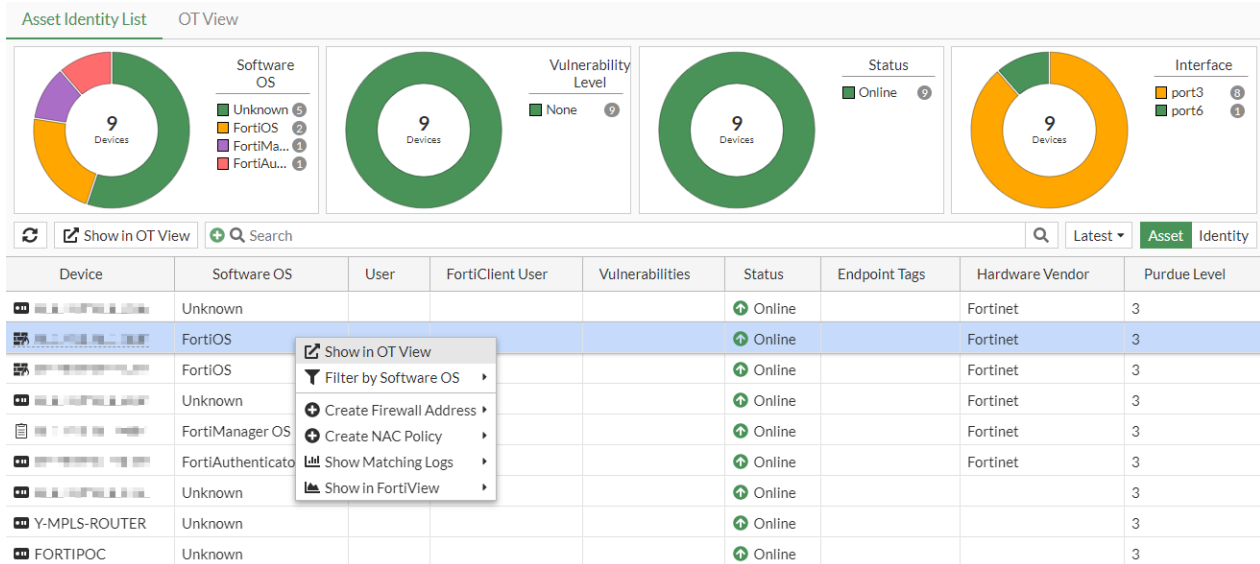

```

config system settings
    set gui-ot enable
end

```

Once enabled, the *Security Fabric > Asset Identity Center* page displays an *Asset Identity List* tab and an *OT View* tab.

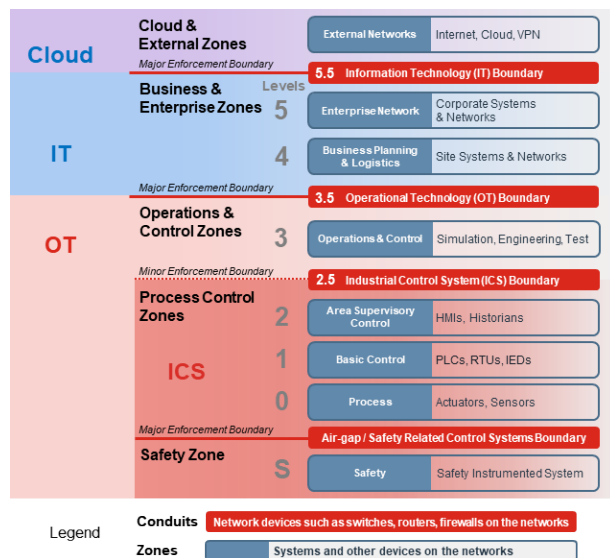

- The *Asset Identity List* tab includes a configurable *Purdue Level* column and a *Show in OT View* option for selected devices in the table.

- The **OT View** tab shows a topology of detected components and connections mapped to Purdue Levels. The default view is locked, but devices can be dragged and dropped to other Purdue Levels if the view is unlocked.

FortiGate and managed FortiSwitches are statically assigned Purdue Level 2 and cannot be changed. Other detected devices are assigned Purdue Level 3 by default and can be changed (except to level S, 0, or external).

The following diagram lists the Purdue Levels based on OT network topologies:

To change the Purdue Level in the Asset Identity List tab:

- Go to **Security Fabric > Asset Identity Center** and select the **Asset Identity List** tab.
- Add the **Purdue Level** column to the table:
 - Hover over the table header and click the gear icon (**Configure Table**).
 - Select **Purdue Level**.
 - Click **Apply**.
- Select a device and hover over the **Purdue Level** value.
- Click the pencil icon to edit the level.

5. Select a value from the dropdown.

	Unknown				🟢 Online			3
Y-MPLS-ROUTER	Unknown				🟢 Online			3
FORTIPOC	Unknown				🟢 Online			3

6. Click *Apply*.

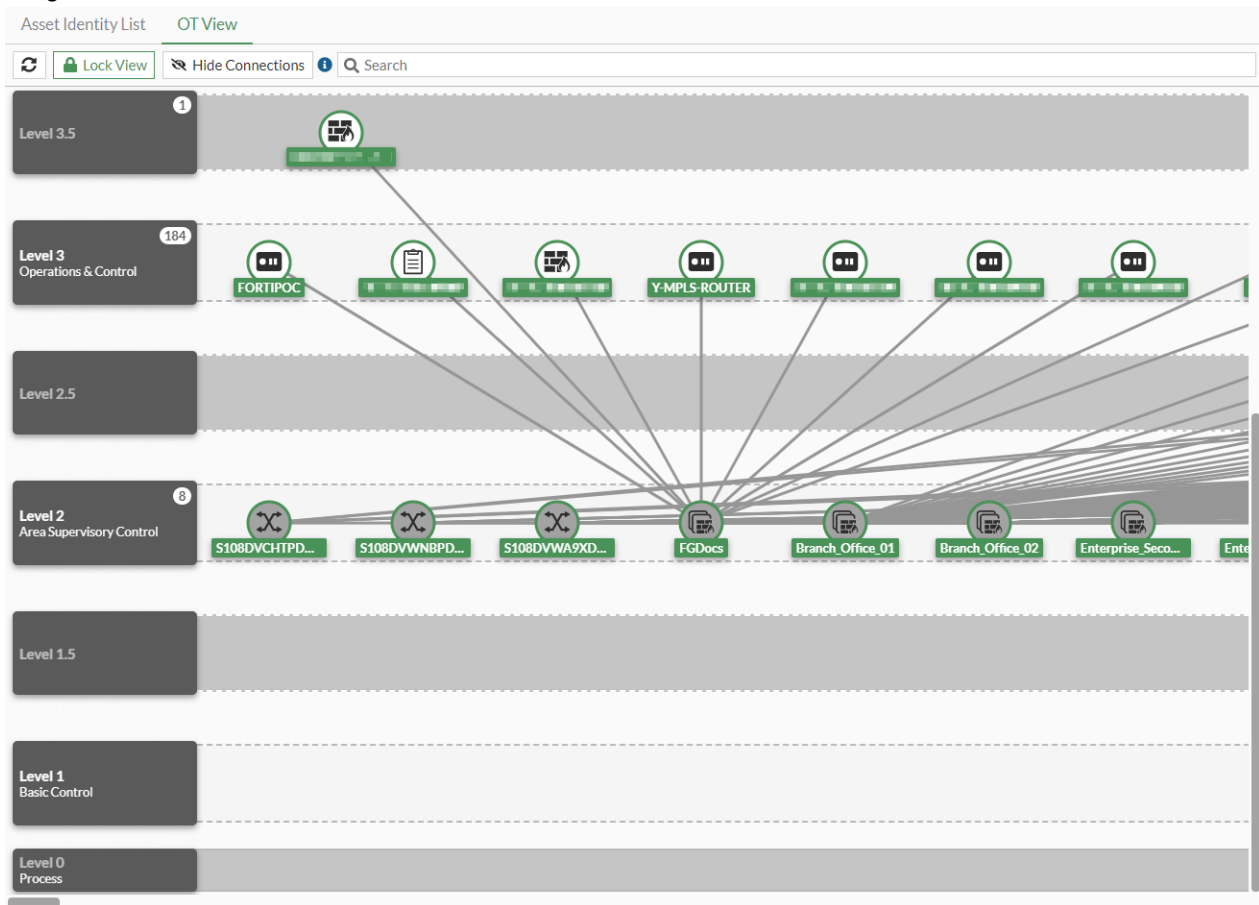

To change the Purdue Level in the OT View tab:

1. Go to *Security Fabric > Asset Identity Center* and select the *OT View* tab.
2. Click *Unlock View*.

3. Select a device.

4. Drag the device icon to another level row.

5. Optionally, click *Lock View* to revert to the locked view.**To change the Purdue Level in the CLI:**

```
# diagnose user-device-store device memory ot-purdue-set <mac> <ip> <level>
```

mac	Enter the MAC address of the device.
ip	Enter the IPv4 address of the device.
level	Enter the Purdue Level: 1, 1.5, 2, 2.5, 3, 3.5, 4, 5, 5.5.

Configuring the Purdue Level for discovered assets based on detected interface

The default Purdue Level can be set or unset in the CLI (`default-purdue-level`) within the system interface configuration. The default Purdue Level can be applied to discovered assets based on the interface with which they were detected. This feature requires a FortiGuard Industrial Security Service (ISS) license on the FortiGate so the Industrial Database (ISDB) can be used. Device identification must be enabled on interfaces connected to OT devices.

```
config system interface
  edit <name>
    set device-identification enable
    set default-purdue-level {1 | 1.5| 2 | 2.5| 3 | 3.5 | 4 | 5 | 5.5}
```

```

    next
end

```

By default, the `default-purdue-level` value is 3. If the asset's Purdue Level is manually overridden, then it takes precedence over this default value set in the interface.

For example, if the default Purdue Level on port1 is changed to 3.5, subsequently, the Purdue Level of a detected device on port1 is manually changed to 4 on the *Asset Identity Center* page. After the manual change on the device, the Purdue Level remains at 4.

To configure the default Purdue Level:

1. Configure the interface settings:

```

config system interface
    edit "port1"
        set device-identification enable
        set default-purdue-level 3.5
    next
end

```

2. Verify that the Purdue Level has been updated in the user device store list:

```
# diagnose user-device-store device memory list
```

Record #1:

```

device_info

    'os_name' = 'Windows'
    'os_version' = '10 / 2016'
    'last_seen' = '1680115135'
    'host_src' = 'mwbs'
    'unjoined_forticlient_endpoint' = 'false'
    'is_online' = 'true'
    'active_start_time' = '1680113976'
    'dhcp_lease_status' = 'leased'
    'dhcp_lease_expire' = '1680651757'
    'dhcp_lease_reserved' = 'false'
    'dhcp_server_id' = '2'
    'is_fortiguard_src' = 'true'
    'purdue_level' = '3.5'
    ...

```

3. Go to *Security Fabric > Asset Identity Center* and select the *Asset Identity List* tab. The device's *Purdue Level* is currently 3.5.

Asset Identity List OT View									
<div> Search </div> <div> <div>Latest ▾</div> <div>Asset Identity</div> </div>									
Device	Software OS	Hardware	FortiClient User	User	Status	Vulnerabilities	Vulnerability Level	Endpoint Tags	Purdue Level
	Windows	Dell / Computer			Online				3.5

4. Manually change the device's Purdue Level:

- Select the device and hover over the *Purdue Level* value.
- Click the pencil icon to edit the level.
- Select 4 and click *Apply*.

Asset Identity List OT View									
<div> Search </div> <div> <div>Latest ▾</div> <div>Asset Identity</div> </div>									
Device	Software OS	Hardware	FortiClient User	User	Status	Vulnerabilities	Vulnerability Level	Endpoint Tags	Purdue Level
	Windows	Dell / Computer			Online				<div>4 ▾</div> <div>Apply Cancel</div>

5. Verify that the Purdue Level has been updated in the user device store list:

```
# diagnose user-device-store device memory list
```

Record #1:

```

  'purdue_level' = '4'
  ...
```

WebSocket for Security Fabric events

With the WebSocket for Security Fabric events, subscribers to the WebSocket (such as the *Firmware & Registration* page) are updated upon new Fabric events and alert users to reload the page.

Example

To deauthorize a downstream FortiGate:

1. Go to *System > Firmware & Registration* and select a downstream FortiGate in the table.
2. Right-click on the device and select *Authorization > Deauthorize*.

Device Type: 11 Total (FortiGate: 5, FortiSwitch: 3, FortiAP: 3)

Upgrade Status: 8 Total (Up to date: 8)

Device	Status	Registration Status	Firmware Version	Upgrade Status
FGDocs	Online	Registered	v7.2.4 build1396 (Feature)	Up to date
Branch_Office_02	Online	Registered	v7.2.4 build1396 (Feature)	Up to date
Enterprise_Second_Floor	Online	Registered	v7.2.4 build1396 (Feature)	Up to date
Enterprise_First_Floor	Online	Registered	v7.2.4 build1396 (Feature)	Up to date
Branch_Office_01	Online	Registered	v7.2.4 build1396 (Feature)	Up to date

3. An alert appears in the bottom-right corner of the page. Click *Reload Now* to refresh the page.

Device Type: 11 Total (FortiGate: 5, FortiSwitch: 3, FortiAP: 3)

Upgrade Status: 8 Total (Up to date: 8)

Device	Status	Registration Status	Firmware Version	Upgrade Status
FGDocs	Online	Registered	v7.2.4 build1396 (Feature)	Up to date

Deploying the Security Fabric

This topic provides an example of deploying Security Fabric with three downstream FortiGate connecting to one root FortiGate. To deploy a Security Fabric, you need a FortiAnalyzer running firmware version 6.2 or later.

The following shows a sample network topology with three downstream FortiGates (Accounting, Marketing, and Sales) connected to the root FortiGate (Edge).

To configure the root FortiGate (Edge):

1. Configure the interfaces:
 - a. Go to *Network > Interfaces*.
 - b. Edit *port16*:
 - Set *Role* to *DMZ*.
 - For the interface connected to FortiAnalyzer, set the *IP/Network Mask* to *192.168.65.2/255.255.255.0*
 - c. Edit *port10*:
 - Set *Role* to *LAN*.
 - For the interface connected to the downstream FortiGate (Accounting), set the *IP/Network Mask* to *192.168.10.2/255.255.255.0*
 - d. Edit *port11*:
 - Set *Role* to *LAN*.
 - For the interface connected to the downstream FortiGate (Marketing), set the *IP/Network Mask* to *192.168.200.2/255.255.255.0*
2. Configure the Security Fabric settings:
 - a. Go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
 - b. Select the *Settings* tab, and set the *Security Fabric role* to *Serve as Fabric Root*.
 - c. Enter a *Fabric name*, such as *Office-Security-Fabric*.
 - d. Ensure *Allow other Security Fabric devices to join* is enabled and add *port10* and *port11*.
 - e. Click *OK*.
3. Configure the FortiAnalyzer logging settings:
 - a. Go to *Security Fabric > Fabric Connectors* and double-click the *Logging & Analytics* card.
 - b. Select the *Settings* tab, select the *FortiAnalyzer* tab, and set the *Status* to *Enabled*.
 - c. Enter the FortiAnalyzer IP in the *Server* field (*192.168.65.10*). The *Upload option* is automatically set to *Real Time*.
 - d. Click *Refresh*.

A warning message indicates that the FortiGate is not authorized on the FortiAnalyzer. The authorization is configured in a later step on the FortiAnalyzer.
 - e. Click *OK*. The FortiAnalyzer serial number is verified.
4. Create the address objects to use in the firewall policies:
 - a. Go to *Policy & Objects > Addresses*.
 - b. Click *Create New*.
 - Set *Name* to *FAZ-addr*.
 - Set *Type* to *Subnet*.
 - Set *Subnet/IP Range* to *192.168.65.10/32*.
 - Set *Interface* to *any*.
 - c. Click *OK*.
 - d. Click *Create New*.
 - Set *Name* to *Accounting*.
 - Set *Type* to *Subnet*.
 - Set *Subnet/IP Range* to *192.168.10.10/32*.

- Set *Interface* to *any*.
 - e. Click **OK**.
5. Create a policy to allow the downstream FortiGate (Accounting) to access the FortiAnalyzer:
- a. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
 - Set the *Name* to *Accounting-to-FAZ*.
 - Set *srcintf* to *port10*.
 - Set *dstintf* to *port16*.
 - Set *srcaddr* to *Accounting-addr*.
 - Set *dstaddr* to *FAZ-addr*.
 - Set *Action* to *Accept*.
 - Set *Schedule* to *Always*.
 - Set *Service* to *All*.
 - Enable *NAT*.
 - Set *IP Pool Configuration* to *Use Outgoing Interface Address*.
 - b. Click **OK**.
6. Create a policy to allow the two downstream FortiGates (Marketing and Sales) to access the FortiAnalyzer:
- a. In the root FortiGate (Edge), go to *Policy & Objects > Addresses* and click *Create New*.
 - Set *Name* to *Marketing-addr*.
 - Set *Type* to *Subnet*.
 - Set *Subnet/IP Range* to *192.168.200.10/32*.
 - Set *Interface* to *any*.
 - b. Click **OK**.
 - c. In the root FortiGate (Edge), go to *Policy & Objects > Firewall Policy* and click *Create New*.
 - Set *Name* to *Marketing-to-FAZ*.
 - Set *srcintf* to *port11*.
 - Set *dstintf* to *port16*.
 - Set *srcaddr* to *Marketing-addr*.
 - Set *dstaddr* to *FAZ-addr*.
 - Set *Action* to *Accept*.
 - Set *Schedule* to *Always*.
 - Set *Service* to *All*.
 - Enable *NAT*.
 - Set *IP Pool Configuration* to *Use Outgoing Interface Address*.
 - d. Click **OK**.

To configure the downstream FortiGate (Accounting):

1. Configure the interface:
 - a. Go to *Network > Interfaces*.
 - b. Edit interface *wan1*:
 - Set *Role* to *WAN*.
 - For the interface connected to root, set the *IP/Network Mask* to *192.168.10.10/255.255.255.0*
2. Configure the default static route to connect to the root FortiGate (Edge):

- a. Go to *Network > Static Routes* and click *Create New* or *Create New > IPv4 Static Route*.
 - Set *Destination* to *0.0.0.0/0.0.0.0*.
 - Set *Interface* to *wan1*.
 - Set *Gateway Address* to *192.168.10.2*.
- b. Click *OK*.
3. Configure the Security Fabric:
 - a. Go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
 - b. In the *Settings* tab, set the *Security Fabric role* to *Join Existing Fabric*.

FortiAnalyzer automatically enables logging. Settings for the FortiAnalyzer are retrieved from the root FortiGate (Edge) when FortiGate (Accounting) connects to the root FortiGate (Edge).
 - c. *Upstream FortiGate IP* is filled in automatically with the default static route *Gateway Address* of *192.168.10.2* set in the previous step.
 - d. Disable *Allow other Security Fabric devices to join*, because there is no downstream FortiGate connecting to it.
 - e. Click *OK*.

To configure the downstream FortiGate (Marketing):

1. Configure the interface:
 - a. Go to *Network > Interfaces*.
 - b. Edit *port12*:
 - Set *Role* to *LAN*.
 - For the interface connected to the downstream FortiGate (Sales), set the *IP/Network Mask* to *192.168.135.11/255.255.255.0*.
 - c. Edit *wan1*:
 - Set *Role* to *WAN*.
 - For the interface connected to the root FortiGate (Edge), set the *IP/Network Mask* to *192.168.200.10/255.255.255.0*.
2. Configure the default static route to connect to the root FortiGate (Edge):
 - a. Go to *Network > Static Routes* and click *Create New* or *Create New > IPv4 Static Route*.
 - Set *Destination* to *0.0.0.0/0.0.0.0*.
 - Set *Interface* to *wan1*.
 - Set *Gateway Address* to *192.168.200.2*.
 - b. Click *OK*.
3. Configure the Security Fabric:
 - a. Go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
 - b. In the *Settings* tab, set the *Security Fabric role* to *Join Existing Fabric*.

FortiAnalyzer automatically enables logging. Settings for the FortiAnalyzer are retrieved from the root FortiGate (Edge) when FortiGate (Marketing) connects to the root FortiGate (Edge).
 - c. *Upstream FortiGate IP* is filled in automatically with the default static route *Gateway Address* of *192.168.200.2* set in the previous step.
 - d. Enable *Allow other Security Fabric devices to join* and add *port12*.
 - e. Click *OK*.
4. Create the address objects to use in the firewall policies:

- a. Go to *Policy & Objects > Addresses* and click *Create New*.
 - Set *Name* to *FAZ-addr*.
 - Set *Type* to *Subnet*.
 - Set *Subnet/IP Range* to *192.168.65.10/32*.
 - Set *Interface* to *any*.
 - b. Click *OK*.
 - c. Click *Create New*.
 - Set *Name* to *Sales-addr*.
 - Set *Type* to *Subnet*.
 - Set *Subnet/IP Range* to *192.168.135.10/32*.
 - Set *Interface* to *any*.
 - d. Click *OK*.
5. Create a policy to allow another downstream FortiGate (Sales) going through FortiGate (Marketing) to access the FortiAnalyzer:
- a. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
 - Set *Name* to *Sales-to-FAZ*.
 - Set *srcintf* to *port12*.
 - Set *dstintf* to *wan1*.
 - Set *srcaddr* to *Sales-addr*.
 - Set *dstaddr* to *FAZ-addr*.
 - Set *Action* to *Accept*.
 - Set *Schedule* to *Always*.
 - Set *Service* to *All*.
 - Enable *NAT*.
 - Set *IP Pool Configuration* to *Use Outgoing Interface Address*.
 - b. Click *OK*.

To configure the downstream FortiGate (Accounting):

1. Configure the interface:
 - a. Go to *Network > Interfaces*.
 - b. Edit interface *wan1*:
 - Set *Role* to *WAN*.
 - For the interface connected to root, set the *IP/Network Mask* to *192.168.10.10/255.255.255.0*
2. Configure the default static route to connect to the root FortiGate (Edge):
 - a. Go to *Network > Static Routes* and click *Create New* or *Create New > IPv4 Static Route*.
 - Set *Destination* to *0.0.0.0/0.0.0.0*.
 - Set *Interface* to *wan1*.
 - Set *Gateway Address* to *192.168.10.2*.
 - b. Click *OK*.
3. Configure the Security Fabric:
 - a. Go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
 - b. In the *Settings* tab, set the *Security Fabric* role to *Join Existing Fabric*.

FortiAnalyzer automatically enables logging. Settings for the FortiAnalyzer are retrieved from the root FortiGate (Edge) when FortiGate (Accounting) connects to the root FortiGate (Edge).

- c. *Upstream FortiGate IP* is filled in automatically with the default static route *Gateway Address* of *192.168.10.2* set in the previous step.
- d. Disable *Allow other Security Fabric devices to join*, because there is no downstream FortiGate connecting to it.
- e. Click *OK*.

To configure the downstream FortiGate (Sales):

1. Configure the interface:
 - a. Go to *Network > Interfaces*.
 - b. Edit *wan2*:
 - Set *Role* to *WAN*.
 - For the interface connected to the upstream FortiGate (Marketing), set the *IP/Network Mask* to *192.168.135.10/255.255.255.0*.
2. Configure the default static route to connect to the upstream FortiGate (Marketing):
 - a. Go to *Network > Static Routes* and click *Create New* or *Create New > IPv4 Static Route*.
 - Set *Destination* to *0.0.0.0/0.0.0.0*.
 - Set *Interface* to *wan2*.
 - Set *Gateway Address* to *192.168.135.11*.
 - b. Click *OK*.
3. Configure the Security Fabric:
 - a. Go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
 - b. In the *Settings* tab, set the *Security Fabric role* to *Join Existing Fabric*.
FortiAnalyzer automatically enables logging. Settings for the FortiAnalyzer are retrieved from the root FortiGate (Edge) when FortiGate (Sales) connects to the root FortiGate (Edge).
 - c. *Upstream FortiGate IP* is filled in automatically with the default static route *Gateway Address* of *192.168.135.11* set in the previous step.
 - d. Disable *Allow other Security Fabric devices to join*, because there is no downstream FortiGate connecting to it.
 - e. Click *OK*.

To authorize downstream FortiGates (Accounting, Marketing, and Sales) on the root FortiGate (Edge):

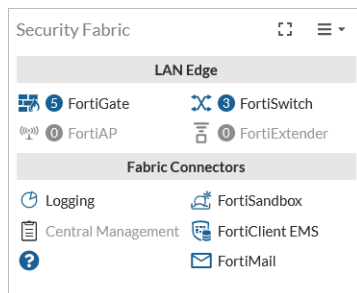

1. In the root FortiGate (Edge), go to *System > Firmware & Registration*.
The table highlights two connected FortiGates with their serial numbers that are unauthorized.
2. Select the unauthorized device and click *Authorization > Authorize*.
After they are authorized, the two downstream FortiGates (Accounting and Marketing) appear in the *Security Fabric* widget. This means that the two downstream FortiGates (Accounting and Marketing) have successfully joined the Security Fabric.
3. The table now highlights the Sales FortiGate with the serial number that is connected to the downstream Marketing FortiGate that is unauthorized.
4. Select the highlighted FortiGate and click *Authorization > Authorize*.
After it is authorized, the downstream FortiGate (Sales) appears in the *Topology* tree in the *Security Fabric* widget. This means that the downstream FortiGates (Sales) has successfully joined the Security Fabric.

To use FortiAnalyzer to authorize all the Security Fabric FortiGates:

1. Authorize all the Security Fabric FortiGates on the FortiAnalyzer side:
 - a. On the FortiAnalyzer, go to *System Settings > Network > All Interfaces*.
 - b. Edit *port1* and set *IP Address/Netmask* to *192.168.65.10/255.255.255.0*.
 - c. Go to *Device Manager > Unauthorized*. All of the FortiGates are listed as unauthorized.
 - i. Select all the FortiGates and select *Authorize*. The FortiGates are now listed as authorized.
After a moment, a warning icon appears beside the root FortiGate (Edge) because the FortiAnalyzer needs administrative access to the root FortiGate (Edge) in the Security Fabric.
 - ii. Click the warning icon and enter the admin username and password of the root FortiGate (Edge).
2. Check FortiAnalyzer status on all the Security Fabric FortiGates:
 - a. On each FortiGate, go to *Security Fabric > Fabric Connectors* and double-click the *FortiAnalyzer Logging* card.
 - b. Check that *Storage usage* information is shown.

To check Security Fabric deployment result:

1. On FortiGate (Edge), go to *Dashboard > Status* and check the *Security Fabric* widget.

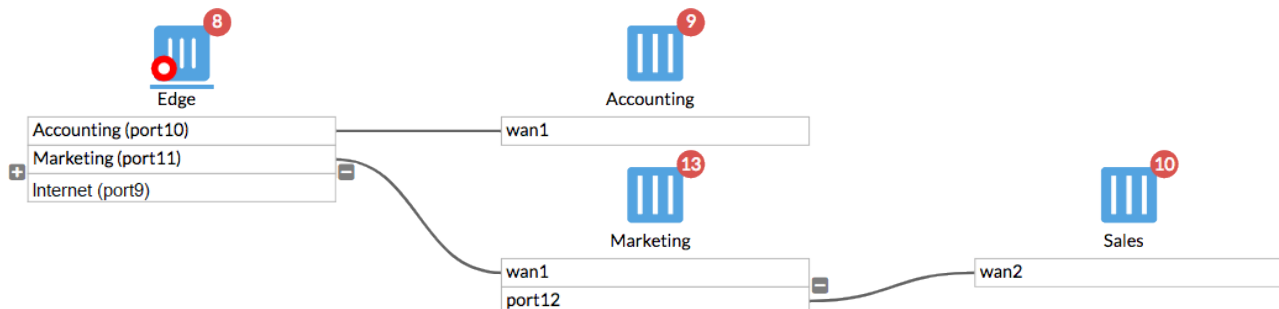

2. On FortiGate (Edge), go to *Security Fabric > Physical Topology*.

This page shows a visualization of access layer devices in the Security Fabric.

3. On FortiGate (Edge), go to *Security Fabric > Physical Topology*.

This dashboard shows information about the interfaces of each device in the Security Fabric.

To run diagnostics:

1. To view the downstream FortiGate pending authorization on the root FortiGate :

```
Edge # diagnose sys csf authorization pending-list
Serial                IP Address          HA-Members          Path
-----
FG201ETK18902514      0.0.0.0              FG3H1E5818900718:FG201ETK18902514
```

2. To view the downstream FortiGates after they join Security Fabric on the root or first level downstream FortiGate:

```
Edge # diagnose sys csf downstream
1:      FG201ETK18902514 (192.168.200.10) Management-IP: 0.0.0.0 Management-port:0
parent: FG3H1E5818900718
        path:FG3H1E5818900718:FG201ETK18902514
        data received: Y downstream intf:wan1 upstream intf:port11 admin-port:443
        authorizer:FG3H1E5818900718
2:      FGT81ETK18002246 (192.168.10.10) Management-IP: 0.0.0.0 Management-port:0 parent:
FG3H1E5818900718
        path:FG3H1E5818900718:FGT81ETK18002246
        data received: Y downstream intf:wan1 upstream intf:port10 admin-port:443
        authorizer:FG3H1E5818900718
3:      FG101ETK18002187 (192.168.135.10) Management-IP: 0.0.0.0 Management-port:0
parent: FG201ETK18902514
        path:FG3H1E5818900718:FG201ETK18902514:FG101ETK18002187
        data received: Y downstream intf:wan2 upstream intf:port12 admin-port:443
        authorizer:FG3H1E5818900718
```

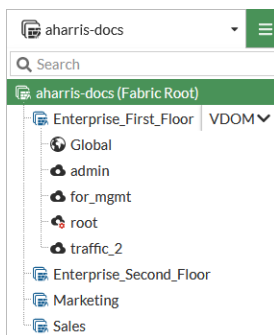

3. To view the upstream FortiGate after the downstream FortiGate joins Security Fabric:

```
Marketing # diagnose sys csf upstream
Upstream Information:
Serial Number:FG3H1E5818900718
IP:192.168.200.2
Connecting interface:wan1
Connection status:Authorized
```

Deploying the Security Fabric in a multi-VDOM environment

A Security Fabric can be enabled in multi-VDOM environments. This allows access to all of the Security Fabric features, including automation, security rating, and topologies, across the VDOM deployment.

- Users can navigate to downstream FortiGate devices and VDOMs directly from the root FortiGate using the Fabric selection menu.

- The logical topology shows all of the configured VDOMs.

- Security rating reports include results for all of the configured VDOMs as well the entire Fabric.

Downstream FortiGate devices must connect to the upstream FortiGate from its management VDOM.

Topology

In this topology, there is a root FortiGate with three FortiGates connected through two different VDOMs. The root FortiGate is able to manage all devices running in multi-VDOM mode.

This example assumes multi-VDOM mode is already configured on each FortiGate, and that FortiAnalyzer logging is configured on the root FortiGate (see [Configuring FortiAnalyzer on page 2779](#) and [Configuring the root FortiGate and downstream FortiGates on page 2770](#) for more details).

To enable multi-VDOM mode:

```
config system global
    set vdom-mode multi-vdom
end
```

Device configurations

Root FortiGate (Root-E)

The Security Fabric is enabled, and configured so that downstream interfaces from all VDOMs can allow other Security Fabric devices to join.

To configure Root-E in the GUI:

1. Go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
2. Set the *Security Fabric* role to *Serve as Fabric Root*.
3. Enable *Allow other Security Fabric devices to join* and click the + to add the interfaces (vlan50 and vlan90) from the vdom_nat1 and root VDOMs.

4. Configure the other settings as needed.
5. Click **OK**.

To configure Root-E in the CLI:

1. Enable the Security Fabric:

```
config system csf
    set status enable
    set group-name "CSF_E"
end
```

2. Configure the interfaces:

```
config system interface
    edit "vlan50"
        set vdom "vdom_nat1"
        ...
        set allowaccess ping https ssh http fgfm fabric
        ...
    next
    edit "vlan90"
```

```

set vdom "root"
...
set allowaccess ping https ssh http fgfm fabric
...
next
end

```

Downstream FortiGate 1 (Downstream-G)

To configure Downstream-G in the GUI:

1. Go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
2. In the *Settings* tab, set the *Security Fabric role* to *Join Existing Fabric*.
3. Enter the *Upstream FortiGate IP*, which is the IP of the root FortiGate vdom_nat1 interface (192.168.5.5). Downstream-G must use the interface from the management VDOM to connect to the upstream FortiGate IP.
4. Enable *Allow other Security Fabric devices to join* and click the + to add the downstream interface (sw-vlan71) from the FG-traffic VDOM.

5. Configure the other settings as needed.
6. Click **OK**.

To configure Downstream-G in the CLI:

1. Enable the Security Fabric:

```

config system csf
    set status enable
    set upstream-ip 192.168.5.5
end

```

2. Configure the interfaces:

```

config system interface
    edit "sw-vlan71"
        set vdom "FG-traffic"
    ...
end

```

```

        set allowaccess ping https ssh http fgfm fabric
    ...
next
end

```

Downstream FortiGate 2 (Level2-downstream-H)

To configure Level2-downstream-H in the GUI:

1. Go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
2. In the *Settings* tab, set the *Security Fabric role* to *Join Existing Fabric*.
3. Enter the *Upstream FortiGate IP*, which is the IP of the root VDOM on Downstream-G (192.168.71.7).

The screenshot shows the 'Security Fabric Settings' dialog box in the FortiGate GUI. The 'Settings' tab is selected. The 'Security Fabric role' is set to 'Join Existing Fabric'. The 'Upstream FortiGate IP/FQDN' is set to '192.168.71.7'. The 'Allow downstream device REST API access' is set to 'Auto'. The 'SAML Single Sign-On' is set to 'Manual'. The 'Mode' is set to 'Disabled'. The 'Management IP/FQDN' is set to '172.16.116.226'. The 'Management port' is set to 'Use Admin Port'. The 'OK' button is highlighted.

4. Configure the other settings as needed.
5. Click **OK**.

To configure Level2-downstream-H in the CLI:

```

config system csf
    set status enable
    set upstream-ip 192.168.71.7
end

```

Downstream FortiGate 3 (Level1-downstream-10)

To configure Level1-downstream-10 in the GUI:

1. Go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
2. In the *Settings* tab, set the *Security Fabric role* to *Join Existing Fabric*.

3. Enter the *Upstream FortiGate IP*, which is the IP of the root VDOM on Root-E (192.168.9.5).

4. Configure the other settings as needed.
5. Click **OK**.

To configure Level1-downstream-10 in the CLI:

```
config system csf
    set status enable
    set upstream-ip 192.168.9.5
end
```

Device authorization and verification

To authorize the downstream devices on the root FortiGate:

1. On Root-E, go to *System > Firmware & Registration*.
2. Select the unauthorized device and click *Authorization > Authorize* for each downstream FortiGate. Once all the devices are authorized, the physical topology page shows the root and downstream FortiGates. The logical topology page shows the root and downstream FortiGates connected to interfaces in their corresponding VDOMs.

Other Security Fabric topics

The following topics provide instructions on configuring other Security Fabric use cases:

- [Synchronizing objects across the Security Fabric on page 2873](#)
- [Group address objects synchronized from FortiManager on page 2879](#)
- [Security Fabric over IPsec VPN on page 2881](#)
- [Leveraging LLDP to simplify Security Fabric negotiation on page 2887](#)

Synchronizing objects across the Security Fabric

When the Security Fabric is enabled, various objects such as addresses, services, and schedules are synced from the upstream FortiGate to all downstream devices by default. FortiOS has the following settings for object synchronization across the Security Fabric:

- Set object synchronization (`fabric-object-unification`) to `default` or `local` on a downstream device.
- Set a per object option to toggle whether the specific Fabric object will be synchronized or not. After upgrading from 6.4.3, this option is disabled for supported Fabric objects. The synchronized Fabric objects are kept as locally created objects on downstream FortiGates.
- Define the number of task workers to handle synchronizations.

The firewall object synchronization wizard helps identify objects that are not synchronized and resolves any conflicts. A warning message appears in the topology tree if there is a conflict.

Summary of CLI commands

To configure object synchronization:

```
config system csf
    set fabric-object-unification {default | local}
    set configuration-sync {default | local}
    set fabric-workers <integer>
end
```

Parameter	Description
<code>fabric-object-unification</code>	<i>default:</i> Global CMDB objects will be synchronized in the Security Fabric. <i>local:</i> Global CMDB objects will not be synchronized to and from this device. This command is available on the root FortiGate. If set to <code>local</code> , the device does not synchronize objects from the root, but will send the synchronized objects downstream.
<code>configuration-sync</code>	<i>default:</i> Synchronize configuration for FortiAnalyzer, FortiSandbox, and Central Management to root node. <i>local:</i> Do not synchronize configuration with root node. If downstream FortiGates are set to <code>local</code> , the synchronized objects from the root to downstream are not applied locally. However, the downstream FortiGate will send the configuration to lower FortiGates.
<code>fabric-workers</code>	Define how many task worker process are created to handle synchronizations (1-4, default = 2). The worker processes dies if there is no task to perform after 60 seconds.

The per object setting can be configured on the root FortiGate as follows:

```
config firewall <object>
    edit <name>
        set fabric-object {enable | disable}
    next
end
```

Where:

- `<object>` is one of the following: `address`, `address6`, `addrgrp`, `addrgrp6`, `service`, `category`, `service custom`, `service group`, `schedule group`, `schedule onetime`, or `schedule recurring`.
- Enabling `fabric-object` sets the object as a Security Fabric-wide global object that is synchronized to downstream FortiGates.
- Disabling `fabric-object` sets the object as local to this Security Fabric member.
- If a device in the Fabric is in multi-VDOM mode, the GUI will not display the Fabric synchronization option. Even if this is enabled in the CLI, the object will not be synchronized to any downstream devices.

Sample topology

In this Security Fabric, the root FortiGate (FGTA-1) has `fabric-object-unification` set to default so the Fabric objects can be synchronized to the downstream FortiGate. The level 1 downstream FortiGate (FGTB-1) has `configuration-sync` set to local, so it will not apply the synchronized objects locally. The level 2 downstream FortiGate (FGTC) has `configuration-sync` set to default, so it will apply the synchronized objects locally.

In this example, firewall addresses and address groups are used. Other supported Fabric objects have the same behaviors. The following use cases illustrate common synchronization scenarios:

- If no conflicts exist, firewall addresses and address groups can be synchronized to downstream FortiGates ([see example below](#)).
- If a conflict exists between the root and downstream FortiGates, it can be resolved with the conflict resolution wizard. After the conflict is resolved, the firewall addresses and address groups can be synchronized to downstream FortiGates ([see example below](#)).
- If set `fabric-object` (*Fabric synchronization* option in the GUI) is disabled for firewall addresses and address groups on the root FortiGate, they will not be synchronized to downstream FortiGates ([see example below](#)).

To configure the FortiGates used in this example:

```

FGTA-1 # config system csf
    set status enable
    set group-name "fabric"
    set fabric-object-unification default
    ...
end

FGTB-1 # config system csf
    set status enable
    set upstream-ip 10.2.200.1
    set configuration-sync local
    ...
end

FGTC # config system csf
    set status enable
    set upstream-ip 192.168.7.2
    set configuration-sync default
  
```

```
...
end
```

To synchronize a firewall address and address group in the Security Fabric:**1. Configure the firewall address on the root FortiGate:**

```
FGTA-1 # config firewall address
edit "add_subnet_1"
set fabric-object enable
set subnet 22.22.22.0 255.255.255.0
next
end
```

2. Configure the address group on the root FortiGate:

```
FGTA-1 # config firewall addrgrp
edit "group_subnet_1"
set member "add_subnet_1"
set fabric-object enable
next
end
```

3. Check the firewall address and address group on the downstream FortiGates:

```
FGTB-1 # show firewall address add_subnet_1
entry is not found in table

FGTB-1 # show firewall addrgrp group_subnet_1
entry is not found in table
```

The synchronized objects are not applied locally on this FortiGate because `configuration-sync` is set to `local`.

```
FGTC # show firewall address add_subnet_1
config firewall address
edit "add_subnet_1"
set uuid 378a8094-34cb-51eb-ce40-097f298fcfdc
set fabric-object enable
set subnet 22.22.22.0 255.255.255.0
next
end

FGTC # show firewall addrgrp group_subnet_1
config firewall addrgrp
edit "group_subnet_1"
set uuid 4d7a8a52-34cb-51eb-fce7-d93f76915319
set member "add_subnet_1"
set color 19
set fabric-object enable
next
end
```

The objects are synchronized on this FortiGate because `configuration-sync` is set to `default`.

To resolve a firewall address and address group conflict in the Security Fabric:

1. On FGTC, create a firewall address:

- a. Go to *Policy & Objects > Addresses* and click *Create New > Address*.
- b. Configure the following:

Name	sync_add_1
IP/Netmask	33.33.33.0 255.255.255.0

- c. Click *OK*.

2. On FGTA-1 (Fabric root), create the firewall address with same name but a different subnet:

- a. Go to *Policy & Objects > Addresses* and click *Create New > Address*.
- b. Configure the following:

Name	sync_add_1
IP/Netmask	11.11.11.0 255.255.255.0
Fabric synchronization	Enable

- c. Click *OK*.

3. Add the address to a different address group than what is configured on FGTC:

- a. Go to *Policy & Objects > Addresses* and click *Create New > Address Group*.
- b. Configure the following:

Name	sync_group4
Members	sync_add_1
Fabric synchronization	Enable

- c. Click *OK*.

4. Open the notification center drop dropdown. There is a message that *1 Firewall object is conflict with other FortiGates in the fabric*.

 1 Firewall object is in conflict with other FortiGates in the fabric.

5. Resolve the conflict:

- a. Click the message in the notification center drop dropdown. The *Firewall Object Synchronization* pane opens.
- b. Click *Rename All Objects*. The conflicted object will be renamed on the downstream FortiGate.

Core Network Security Connectors

Security Fabric Setup

Role: Fabric name, Fabric Root: fabric

Logging & Analy: FortiAnalyzer Cloud Logging

LAN Edge Devices

Device Type	Device Count	Status
FortiGate	3	All authorized & registered

Refresh

To disable Fabric synchronization on the root FortiGate in the GUI:

1. On FGTA-1, create a firewall address:
 - a. Go to *Policy & Objects > Addresses* and click *Create New > Address*.
 - b. Configure the following:
- c. Click *OK*.
2. Create the firewall address group and add the address:
 - a. Go to *Policy & Objects > Addresses* and click *Create New > Address Group*.
 - b. Configure the following:

Name	add_subnet_3
IP/Netmask	33.33.33.0 255.255.255.0
Fabric synchronization	Disable

c. Click *OK*.

Name	group_subnet_3
Members	add_subnet_3
Fabric synchronization	Disable

c. Click *OK*.

3. On FGTC-1, go to *Policy & Objects > Addresses* and search for *subnet_3*. No results are found because Fabric synchronization is disabled on the root FortiGate (FGTA-1).

4. On FGTC, go to *Policy & Objects > Addresses* and search for *subnet_3*. No results are found because Fabric synchronization is disabled on the root FortiGate (FGTA-1).

To disable Fabric synchronization on the root FortiGate in the CLI:

1. Configure the firewall address on the root FortiGate:

```
FGTA-1 # config firewall address
      edit "add_subnet_3"
        set subnet 33.33.33.0 255.255.255.0
        set fabric-object disable
      next
end
```

2. Configure the address group on the root FortiGate:

```
FGTA-1 # config firewall addrgrp
      edit "group_subnet_3"
        set member "add_subnet_3"
        set fabric-object disable
      next
end
```

3. Check the firewall address and address group on the downstream FortiGates:

```
FGTB-1 # show firewall address add_subnet_3
entry is not found in table

FGTB-1 # show firewall addrgrp group_subnet_3
entry is not found in table

FGTC # show firewall address add_subnet_3
entry is not found in table

FGTC # show firewall addrgrp group_subnet_3
entry is not found in table
```

The objects are not synchronized from the root FortiGate (FGTA-1) because the `fabric-object` setting is disabled.

Group address objects synchronized from FortiManager

Address objects from external connectors that are learned by FortiManager are synchronized to FortiGate. These objects can be grouped together with the FortiGate CLI to simplify selecting connector objects in the FortiGate GUI.

Multiple groups can be created.

This option is only available for objects that are synchronized from FortiManager.

To add an object to a connector group:

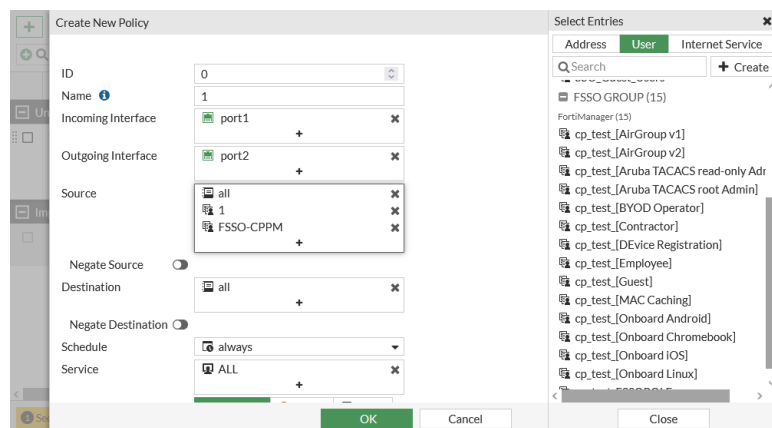

```
config user adgrp
  edit <object_name>
    set server-name "FortiManager"
    set connector-source <group_name>
  next
end
```

Example

In this example, objects learned by the FortiManager from an Aruba ClearPass device are synchronized to the FortiGate. Some of the objects are then added to a group called *ClearPass* to make them easier to find in the object list when creating a firewall policy.

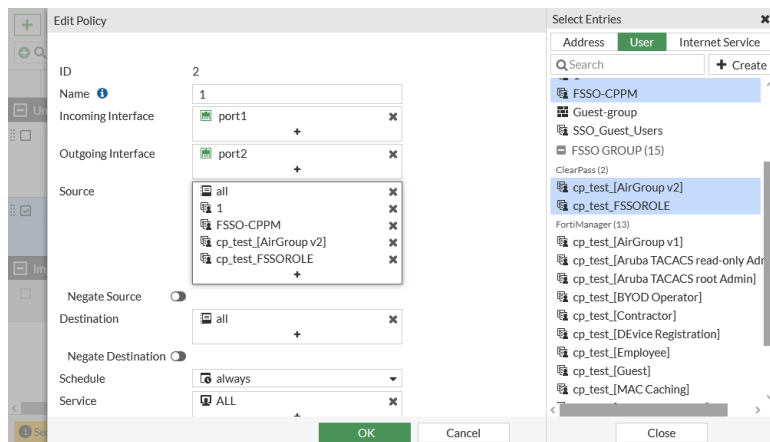

Prior to being grouped, the synchronized objects are listed under the FortiManager heading in the object lists.

To add some of the objects to a group:

```
config user adgrp
  edit "cp_test_FSSOROLE"
    set server-name "FortiManager"
    set connector-source "ClearPass"
  next
  edit "cp_test_[AirGroup v2]"
    set server-name "FortiManager"
    set connector-source "ClearPass"
  next
end
```

The objects are now listed under the *ClearPass* heading.

Security Fabric over IPsec VPN

This is an example of configuring Security Fabric over IPsec VPN.

Sample topology

This sample topology shows a downstream FortiGate (HQ2) connected to the root FortiGate (HQ1) over IPsec VPN to join Security Fabric.

Sample configuration

To configure the root FortiGate (HQ1):

1. Configure the interface:
 - a. Go to *Network > Interfaces*.
 - b. Edit *port2*:
 - Set *Role* to *WAN*.
 - For the interface connected to the internet, set the *IP/Network Mask* to *10.2.200.1/255.255.255.0*
 - c. Edit *port6*:
 - Set *Role* to *DMZ*.
 - For the interface connected to FortiAnalyzer, set the *IP/Network Mask* to *192.168.8.250/255.255.255.0*
2. Configure the static route to connect to the internet:
 - a. Go to *Network > Static Routes* and click *Create New* or *Create New > IPv4 Static Route*.
 - Set *Destination* to *0.0.0.0/0.0.0.0*.
 - Set *Interface* to *port2*.

- Set *Gateway Address* to *10.2.200.2*.
- b. Click *OK*.
- 3. Configure the IPsec VPN:
 - a. Go to *VPN > IPsec Wizard*.
 - Set *Name* to *To-HQ2*.
 - Set *Template Type* to *Custom*.
 - Click *Next*.
 - Set *Authentication* to *Method*.
 - Set *Pre-shared Key* to *123456*.
 - b. Leave all other fields in their default values and click *OK*.
- 4. Configure the IPsec VPN interface IP address which will be used to form Security Fabric:
 - a. Go to *Network > Interfaces*.
 - b. Edit *To-HQ2*:
 - Set *Role* to *LAN*.
 - Set the *IP/Network Mask* to *10.10.10.1/255.255.255.255*.
 - Set *Remote IP/Network Mask* to *10.10.10.3/255.255.255.0*.
- 5. Configure the IPsec VPN local and remote subnets:
 - a. Go to *Policy & Objects > Addresses*.
 - b. Click *Create New*
 - Set *Name* to *To-HQ2_remote_subnet_2*.
 - Set *Type* to *Subnet*.
 - Set *IP/Network Mask* to *10.10.10.3/32*.
 - c. Click *OK*.
 - d. Click *Create New*
 - Set *Name* to *To-HQ2_local_subnet_1*.
 - Set *Type* to *Subnet*.
 - Set *IP/Network Mask* to *192.168.8.0/24*.
 - e. Click *OK*.
 - f. Click *Create New*
 - Set *Name* to *To-HQ2_remote_subnet_1*.
 - Set *Type* to *Subnet*.
 - Set *IP/Network Mask* to *10.1.100.0/24*.
 - g. Click *OK*.
- 6. Configure the IPsec VPN static routes:
 - a. Go to *Network > Static Routes*.
 - b. Click *Create New* or *Create New > IPv4 Static Route*.
 - For *Named Address*, select *Type* and select *To-HQ2_remote_subnet_1*.
 - Set *Interface* to *To-HQ2*.Click *OK*.
 - c. Click *Create New* or *Create New > IPv4 Static Route*.
 - For *Named Address*, select *Type* and select *To-HQ2_remote_subnet_1*.
 - Set *Interface* to *Blackhole*.

- Set *Administrative Distance* to 254.
 - d. Click *OK*.
7. Configure the IPsec VPN policies:
- a. Go to *Policy & Objects > Firewall Policy*
 - b. Click *Create New*.
 - Set *Name* to *vpn_To-HQ2_local*.
 - Set *Incoming Interface* to *port6*.
 - Set *Outgoing Interface* to *To-HQ2*.
 - Set *Source* to *To-HQ2_local_subnet_1*.
 - Set *Destination* to *To-HQ2_remote_subnet_1*.
 - Set *Schedule* to *Always*.
 - Set *Service* to *All*.
 - Disable *NAT*.
 - c. Click *OK*.
 - d. Click *Create New*.
 - Set *Name* to *vpn_To-HQ2_remote*.
 - Set *Incoming Interface* to *To-HQ2*.
 - Set *Outgoing Interface* to *port6*.
 - Set *Source* to *To-HQ2_remote_subnet_1, To-HQ2_remote_subnet_2*.
 - Set *Destination* to *To-HQ2_local_subnet_1*.
 - Set *Schedule* to *Always*.
 - Set *Service* to *All*.
 - Enable *NAT*.
 - Set *IP Pool Configuration* to *Use Outgoing Interface Address*.
 - e. Click *OK*.
8. Configure the Security Fabric:
- a. Go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
 - b. Select the *Settings* tab, and set the *Security Fabric role* to *Serve as Fabric Root*.
 - c. Enter a *Fabric name*, such as *Office-Security-Fabric*.
 - d. Ensure *Allow other Security Fabric devices to join* is enabled and add VPN interface *To-HQ2*.
 - e. Click *OK*.
9. Configure the FortiAnalyzer logging settings:
- a. Go to *Security Fabric > Fabric Connectors* and double-click the *Logging & Analytics* card.
 - b. Select the *Settings* tab, select the *FortiAnalyzer* tab, and set the *Status* to *Enabled*.
 - c. Enter the FortiAnalyzer IP in the *Server* field (192.168.8.250). The *Upload option* is automatically set to *Real Time*.
 - d. Click *Refresh*. The FortiAnalyzer serial number is verified.
 - e. Click *OK*.

To configure the downstream FortiGate (HQ2):

1. Configure the interface:
 - a. Go to *Network > Interfaces*.
 - b. Edit interface *wan1*:
 - Set *Role* to *WAN*.
 - For the interface connected to the internet, set the *IP/Network Mask* to *192.168.7.3/255.255.255.0*.
 - c. Edit interface *vlan20*:
 - Set *Role* to *LAN*.
 - For the interface connected to local endpoint clients, set the *IP/Network Mask* to *10.1.100.3/255.255.255.0*.
2. Configure the static route to connect to the internet:
 - a. Go to *Network > Static Routes* and click *Create New* or *Create New > IPv4 Static Route*.
 - Set *Destination* to *0.0.0.0/0.0.0.0*.
 - Set *Interface* to *wan1*.
 - Set *Gateway Address* to *192.168.7.2*.
 - b. Click *OK*.
3. Configure the IPsec VPN:
 - a. Go to *VPN > IPsec Wizard*.
 - Set *VPN Name* to *To-HQ1*.
 - Set *Template Type* to *Custom*.
 - Click *Next*.
 - In the *Network IP Address*, enter *10.2.200.1*.
 - Set *Interface* to *wan1*.
 - Set *Authentication* to *Method*.
 - Set *Pre-shared Key* to *123456*.
 - b. Leave all other fields in their default values and click *OK*.
4. Configure the IPsec VPN interface IP address which will be used to form Security Fabric:
 - a. Go to *Network > Interfaces*.
 - b. Edit *To-HQ1*:
 - Set *Role* to *WAN*.
 - Set the *IP/Network Mask* to *10.10.10.3/255.255.255.255*.
 - Set *Remote IP/Network Mask* to *10.10.10.1/255.255.255.0.0*.
5. Configure the IPsec VPN local and remote subnets:
 - a. Go to *Policy & Objects > Addresses*.
 - b. Click *Create New*
 - Set *Name* to *To-HQ1_local_subnet_1*.
 - Set *Type* to *Subnet*.
 - Set *IP/Network Mask* to *10.1.100.0/24*.
 - c. Click *OK*.
 - d. Click *Create New*
 - Set *Name* to *To-HQ1_remote_subnet_1*.
 - Set *Type* to *Subnet*.

- Set *IP/Network Mask* to *192.168.8.0/24*.
 - e. Click *OK*.
6. Configure the IPsec VPN static routes:
- a. Go to *Network > Static Routes* and click *Create New* or *Create New > IPv4 Static Route*.
 - For *Named Address*, select *Type* and select *To-HQ1_remote_subnet_1*.
 - Set *Interface* to *To-HQ1*.
 - b. Click *OK*.
 - c. Click *Create New* or *Create New > IPv4 Static Route*.
 - For *Named Address*, select *Type* and select *To-HQ1_remote_subnet_1*.
 - Set *Interface* to *Blackhole*.
 - Set *Administrative Distance* to *254*.
 - d. Click *OK*.
7. Configure the IPsec VPN policies:
- a. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
 - Set *Name* to *vpn_To-HQ1_local*.
 - Set *Incoming Interface* to *vlan20*.
 - Set *Outgoing Interface* to *To-HQ1*.
 - Set *Source* to *To-HQ1_local_subnet_1*.
 - Set *Destination* to *To-HQ1_remote_subnet_1*.
 - Set *Schedule* to *Always*.
 - Set *Service* to *All*.
 - Disable *NAT*.
 - b. Click *OK*.
 - c. Click *Create New*.
 - Set *Name* to *vpn_To-HQ1_remote*.
 - Set *Incoming Interface* to *To-HQ1*.
 - Set *Outgoing Interface* to *vlan20*.
 - Set *Source* to *To-HQ1_remote_subnet_1*.
 - Set *Destination* to *-HQ1_local_subnet_1*.
 - Set *Schedule* to *Always*.
 - Set *Service* to *All*.
 - Disable *NAT*.
 - d. Click *OK*.
8. Configure the Security Fabric:
- a. Go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
 - b. In the *Settings* tab, set the *Security Fabric role* to *Join Existing Fabric*.

FortiAnalyzer automatically enables logging. FortiAnalyzer settings will be retrieved when the downstream FortiGate connects to the root FortiGate.
 - c. Set the *Upstream FortiGate IP* to *10.10.10.1*.
 - d. Click *OK*.

To authorize the downstream FortiGate (HQ2) on the root FortiGate (HQ1):

1. In the root FortiGate (HQ1), go to *System > Firmware & Registration*.
The table highlights the connected FortiGate with its serial numbers that is unauthorized.
2. Select the unauthorized device and click *Authorization > Authorize*.
After authorization, the downstream FortiGate (HQ2) appears in the *Security Fabric* widget. This means the downstream FortiGate (HQ2) has successfully joined the Security Fabric.

To check the Security Fabric over IPsec VPN:

1. On the root FortiGate (HQ1), go to *Security Fabric > Physical Topology*.
The root FortiGate (HQ1) is connected by the downstream FortiGate (HQ2) with VPN icon in the middle.

2. On the root FortiGate (HQ1), go to *Security Fabric > Logical Topology*.
The root FortiGate (HQ1) VPN interface *To-HQ2* is connected by downstream FortiGate (HQ2) VPN interface *To-HQ1* with VPN icon in the middle.

**To run diagnostics:**

1. To view the downstream FortiGate pending authorization on root FortiGate (HQ1):

```
HQ1 # diagnose sys csf authorization pending-list
Serial          IP Address      HA-Members
Path
-----
FG101ETK18002187      0.0.0.0
FG3H1E5818900718:FG101ETK18002187
```

2. To view the downstream FortiGate (HQ2) after it joins the Security Fabric:

```
HQ1 # diagnose sys csf downstream
1:      FG101ETK18002187 (10.10.10.3) Management-IP: 0.0.0.0 Management-port:0 parent:
FG3H1E5818900718
      path:FG3H1E5818900718:FG101ETK18002187
      data received: Y downstream intf:To-HQ1 upstream intf:To-HQ2 admin-port:443
      authorizer:FG3H1E5818900718
```

3. To view the root FortiGate (HQ1) on the downstream FortiGate (HQ2) after joining the Security Fabric:

```
HQ2 # diagnose sys csf upstream
Upstream Information:
Serial Number:FG3H1E5818900718
IP:10.10.10.1
```

```
Connecting interface:To-HQ1
Connection status:Authorized
```

Leveraging LLDP to simplify Security Fabric negotiation

LLDP reception is enabled on WAN interfaces, which prompts FortiGates that are joining the Security Fabric if the upstream FortiGate asks.

- If the interface role is undefined, LLDP reception and transmission inherit settings from the VDOM.
- If the interface role is WAN, LLDP reception is enabled.
- If the interface role is LAN, LLDP transmission is enabled.

When a FortiGate B's WAN interface detects that FortiGate A's LAN interface is immediately upstream (through the default gateway), and FortiGate A has Security Fabric enabled, FortiGate B will show a notification on the GUI asking to join the Security Fabric.

To configure LLDP reception and join a Security Fabric in the GUI:

1. On FortiGate A, go to *Network > Interfaces*.
2. Configure an interface:
 - If the interface's role is undefined, under *Administrative Access*, set *Receive LLDP* and *Transmit LLDP* to *Use VDOM Setting*.

The screenshot shows the 'Edit Interface' configuration window in the FortiGate GUI. The 'Role' is set to 'Undefined'. Under the 'Administrative Access' section, the 'Receive LLDP' and 'Transmit LLDP' options are both set to 'Use VDOM Setting'. Other options like 'HTTP', 'SSH', 'PING', and 'SNMP' are also visible.

- If the interface's role is WAN, under *Administrative Access*, set *Receive LLDP* to *Enable* and *Transmit LLDP* to *Use VDOM Setting*.

Edit Interface

Role: WAN

3. Click OK. A notification is shown on FortiGate B, *You can connect to a Security Fabric via an upstream FortiGate at 10.10.10.1*.
4. Click the notification. The *Security Fabric Settings* page opens. All the required settings automatically configured.
5. Click OK to apply the settings.

To configure LLDP reception and join a Security Fabric in the CLI:

1. Configure the interface on FortiGate A:

- Undefined role

```
config system interface
    edit "port3"
        set lldp-reception vdom
        set lldp-transmission vdom
        set role undefined
        ...
    next
end
```

- WAN role

```
config system interface
  edit "wan1"
    set lldp-reception enable
    set lldp-transmission vdom
    set role wan
    ...
  next
end
```

- LAN role

```
config system interface
  edit "port2"
    set lldp-reception vdom
    set lldp-transmission enable
    set role lan
    ...
  next
end
```

2. Edit the Security Fabric settings on FortiGate B:

```
config system csf
  set status enable
  set upstream-ip 10.2.200.1
end
```

Configuring the Security Fabric with SAML

Security Assertion Markup Language (SAML) is an open standard for exchanging authentication and authorization data between one Identity Provider (IdP) and one or more Service Providers (SP). Both parties exchange messages using the XML protocol as transport. FortiGate firewall devices can be configured as IdPs or SPs.

When the Security Fabric is enabled, you can configure the root FortiGate as the IdP. You can also configure downstream FortiGates to be automatically configured as SPs, with all links required for SAML communication, when added to the Security Fabric. Administrators must still be authorized on each device. Credentials are verified by the root FortiGate, and login credentials are shared between devices. Once authorized, an administrator can move between Fabric devices without logging in again.

Optionally, the downstream FortiGate can also be manually configured as an SP, and then linked to the root FortiGate.

The authentication service is provided by the root FortiGate using local system admin accounts for authentication. Any of the administrator account types can be used for SAML log in. After successful authentication, the administrator logs in to the first downstream FortiGate SP, and can then connect to other downstream FortiGates that have the SSO account properly configured, without needing to provide credentials again, as long as admins use the same browser session. In summary, the root FortiGate IdP performs SAML SSO authentication, and individual device administrators define authorization on FortiGate SPs by using security profiles.

Configuring single-sign-on in the Security Fabric

SAML SSO enables a single FortiGate device to act as the identify provider (IdP), while other FortiGate devices act as service providers (SP) and redirect logins to the IdP.

Only the root FortiGate can be the identity provider (IdP). The downstream FortiGates can be configured as service providers (SP).

The process is as follows:

1. [Configuring the root FortiGate as the IdP on page 2890](#)
2. [Configuring a downstream FortiGate as an SP on page 2891](#)
3. [Configuring certificates for SAML SSO on page 2893](#)
4. [Verifying the single-sign-on configuration on page 2894](#)

You can also use the CLI. See [CLI commands for SAML SSO on page 2895](#).

Configuring the root FortiGate as the IdP

To configure the root FortiGate as the IdP:

1. Log in to the root FortiGate.
2. Go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
3. Enable *SAML Single Sign-On*. The *Mode* field is automatically populated as *Identity Provider (IdP)*.
4. Enter an IP address in the *Management IP/FQDN* field.
5. Enter a management port in the *Management port* field.
The *Management IP/FQDN* will be used by the SPs to redirect the login request. The *Management IP/FQDN* and *Management port* must be reachable from the user's device.

6. Select the *IdP certificate*.

7. Click OK.

Configuring a downstream FortiGate as an SP

There are two ways to configure the downstream FortiGate:

- From the root FortiGate
- From within the downstream device

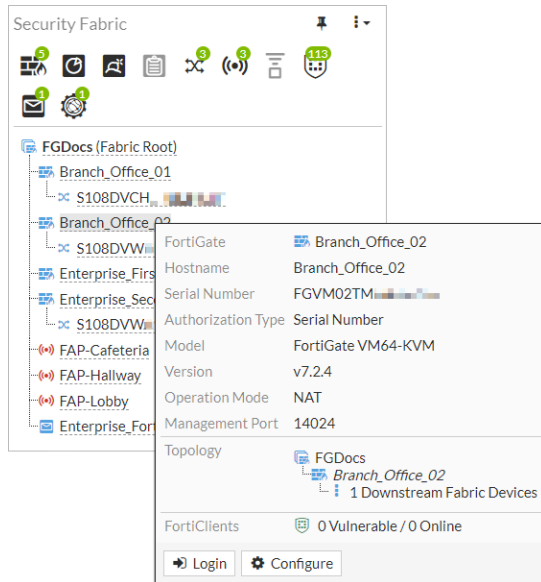

An SP must be a member of the Security Fabric before you configure it.

To configure the downstream FortiGate from the root FortiGate:

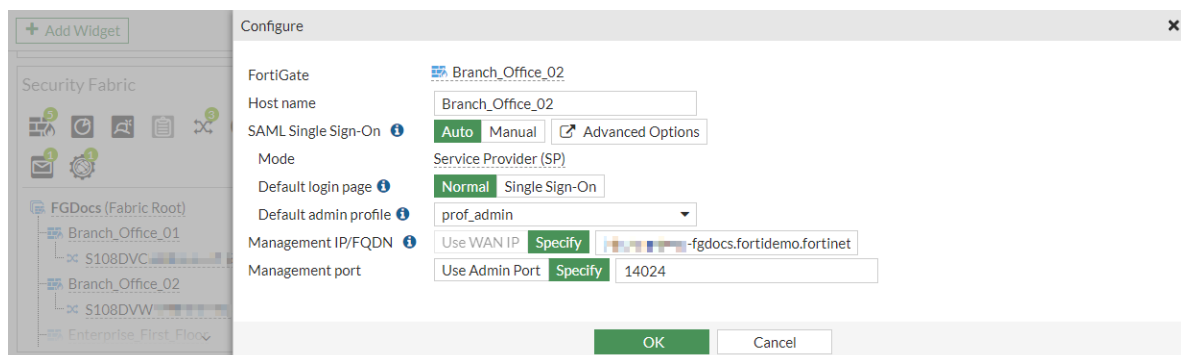

1. Log in to the root FortiGate.
2. Go to *Dashboard > Status* and locate the *Security Fabric* widget.

3. In the topology tree, hover over a FortiGate and click *Configure*.

The *Configure* pane opens.

4. Select a *SAML Single Sign-On* option. *Auto* sets the device to SP mode. *Manual* allows you to configure the SSO settings by clicking *Advanced Options*.
5. Select a *Default login page* option.
6. Select one of the following *Default admin profile* types: *prof_admin*, *super_admin*, or *super_admin_readonly*.
7. Enter an IP address in the *Management IP/FQDN* field.
8. Enter a management port in the *Management port* field.
The *Management IP/FQDN* will be used by the IdP and so other SPs can redirect to each other. The *Management port* must be reachable from the user's device.
9. Click *OK*.

To configure the downstream FortiGate within the device:

1. Log in to the downstream FortiGate.
2. Go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
3. In the *Settings* tab, select a *SAML Single Sign-On* option. *Auto* sets the device to SP mode. *Manual* allows you to configure the SSO settings by clicking *Advanced Options*.
4. Select a *Default login page* option.
5. Select one of the following *Default admin profile* types: *prof_admin*, *admin_no_access*, *super_admin*, or *super_admin_readonly*.

6. Enter an IP address in the *Management IP/FQDN* field.
7. Enter a management port in the *Management port* field.
The *Management IP/FQDN* will be used by the IdP and so other SPs can redirect to each other. The *Management port* must be reachable from the user's device.
8. Click **OK**.

Configuring certificates for SAML SSO

Because communication between the root FortiGate IdP and FortiGate SPs is secured, you must select a local server certificate in the *IdP certificate* option on the root FortiGate. When downstream SPs join the IdP (root FortiGate), the SP automatically obtains the certificate.

In the following SP example, the *IdP certificate* displays *REMOTE_Cert_2*, which is the root server certificate for the IdP: It is possible to manually import a certificate from an SP to the IdP so it can be used for authentication.

To manually import an SP certificate to an IdP:

1. Add the certificate:
 - a. On the SP, go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
 - b. Click *Advanced Options*. The *SAML SSO* pane opens.
 - c. Enable *SP certificate* and select a certificate from the dropdown box.
 - d. Click *Download*. The certificate is downloaded on the local file system.
 - e. Click **OK** to close the *SAML SSO* pane.
 - f. Click **OK** to close the *Security Fabric Setup* card.

2. Import the certificate:
 - a. On the IdP, go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
 - b. Click *Advanced Options*. The *SAML SSO* pane opens.
 - c. In the *Service Providers* table, select the SP from step 1 and click *Edit*.

- d. Enable *SP certificate* and in the dropdown box, click *Import*.

The *Upload Remote Certificate* window opens.

- e. Click *Upload* and select the certificate downloaded in step 1.
- f. Select *REMOTE_Cert_2*.
- g. Click *OK*. The certificate is imported.
- h. In the *IdP certificate* list, select the certificate that you imported.
- i. Click *OK* to close the *SAML SSO* pane.
- j. Click *OK* to close the *Security Fabric Setup* card.

Verifying the single-sign-on configuration

After you have logged in to a Security Fabric member using SSO, you can navigate between any Security Fabric member with SSO configured.

To navigate between Security Fabric members:

1. Log in to a Security Fabric member that is using SSO.
2. In the top banner, click the name of the device you are logged in to. A list of Security Fabric members displays.

3. Click a Security Fabric member. The login page appears. Click *Sign in with Security Fabric*.

4. A prompt appears that an SSO administrator account has been created. Click *Continue*.

You are now logged in to the Security Fabric member with SSO. The letters "SSO" also display beside the user name in the top banner.

5. Go to *System > Administrators > Single-Sign-On Administrator* to view the list of SSO admins created.

<div> <div>+ Create New</div> <div>Edit</div> <div>Delete</div> <div>Search</div> </div>

CLI commands for SAML SSO

To enter a question mark (?) or a tab, Ctrl + V must be entered first. Question marks and tabs cannot be typed or copied into the CLI Console or some SSH clients.

To configure the IdP:

```
config system saml
  set status enable
  set role identity-provider
  set cert "Fortinet_Factory"
  set server-address "172.16.106.74"
  config service-providers
    edit "csf_172.16.106.74:12443"
      set prefix "csf_ngczjwqxujfsbhgr9ivhehwu37fml20"
      set sp-entity-id "http://172.16.106.74/metadata/"
      set sp-single-sign-on-url "https://172.16.106.74/saml/?acs"
      set sp-single-logout-url "https://172.16.106.74/saml/?sls"
      set sp-portal-url "https://172.16.106.74/saml/login/"
      config assertion-attributes
        edit "username"
        next
        edit "tdoc@fortinet.com"
        set type email
        next
      end
    next
  end
end
```

To configure an SP:

```

config system saml
    set status enable
    set cert "Fortinet_Factory"
    set idp-entity-id "http://172.16.106.74/saml-idp/csf_
ngczjwqxujfsbhgr9ivhehwu37fml20/metadata/"
    set idp-single-sign-on-url "https://172.16.106.74/csf_
ngczjwqxujfsbhgr9ivhehwu37fml20/login/"
    set idp-single-logout-url "https://172.16.106.74/saml-idp/csf_
ngczjwqxujfsbhgr9ivhehwu37fml20/logout/"
    set idp-cert "REMOTE_Cert_1"
    set server-address "172.16.106.74:12443"
end

```

To configure an SSO administrator:

```

config system sso-admin
    edit "SSO-admin-name"
        set accprofile <SSO admin user access profile>
        set vdom <Virtual domain(s) that the administrator can access>
    next
end

```

SAML SSO with pre-authorized FortiGates

You can set up SAML SSO authentication in a Security Fabric environment by starting with a root FortiGate that has one or more pre-authorized FortiGates.

After the initial configuration, you can add more downstream FortiGates to the Security Fabric, and they are automatically configured with default values for a service provider.

To set up basic SAML SSO for the Security Fabric:

1. Log in to the root FortiGate of the Security Fabric.
2. Go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
3. Join two pre-authorized FortiGates to the root FortiGate (see [Configuring the root FortiGate and downstream FortiGates on page 2770](#)).
4. Configure the IdP (see [Configuring the root FortiGate as the IdP on page 2890](#)).
5. Configure the SPs (see [Configuring a downstream FortiGate as an SP on page 2891](#)).

Navigating between Security Fabric members with SSO

After you have logged in to a Security Fabric member by using SSO, you can navigate between any Security Fabric member with SSO configured. This can be done using the Security Fabric members dropdown menu or by logging in to a FortiGate SP from the root FortiGate IdP.

Security Fabric members dropdown

The Security Fabric members dropdown menu allows you to easily switch between all FortiGate devices that are connected to the Security Fabric. You can also use this menu to customize a FortiGate in the Security Fabric.

To navigate between Security Fabric members:

1. Log in to a Security Fabric member by using SSO.
2. In the top banner, click the name of the device you are logged into with SSO.
A list of Security Fabric members is displayed.

3. Click the Security Fabric member.
You are logged in to the Security Fabric member without further authentication.

To customize a FortiGate in the Security Fabric:

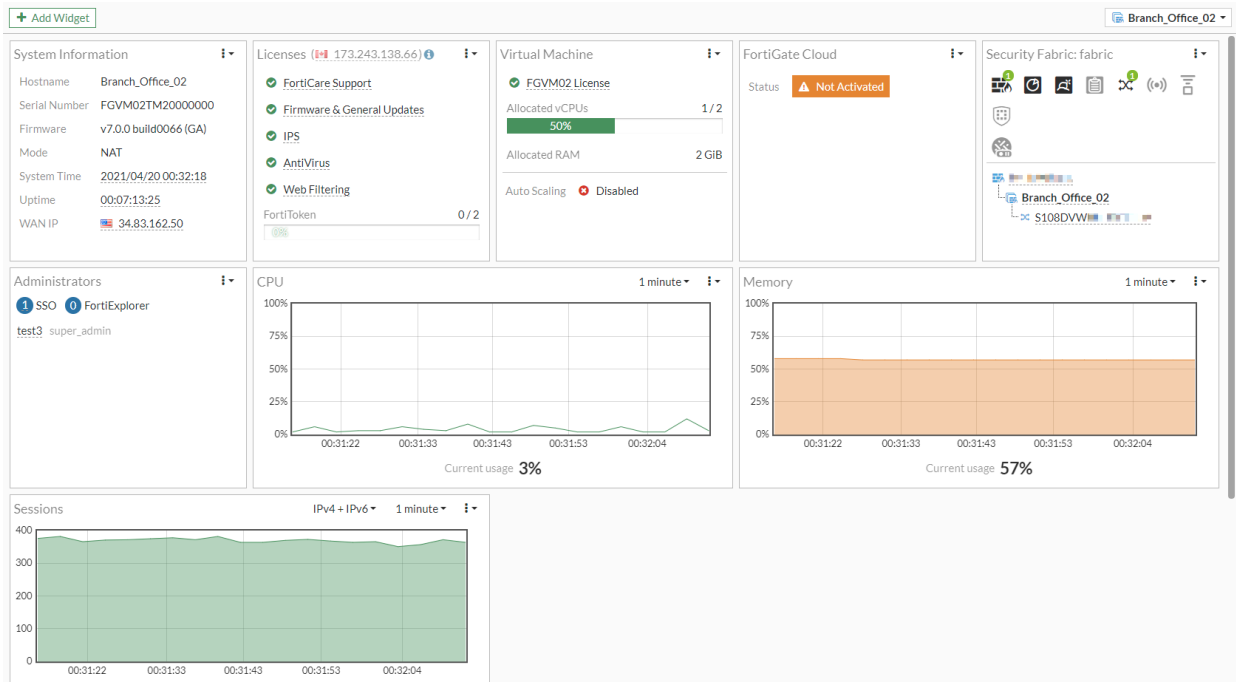

1. In the Security Fabric members dropdown menu, hover the cursor over a FortiGate so the tooltip is shown.
2. Click *Configure*. The *Configure* pane opens.
3. Edit the settings as required.
4. Click *OK*.

Logging in to an SP from the root IdP

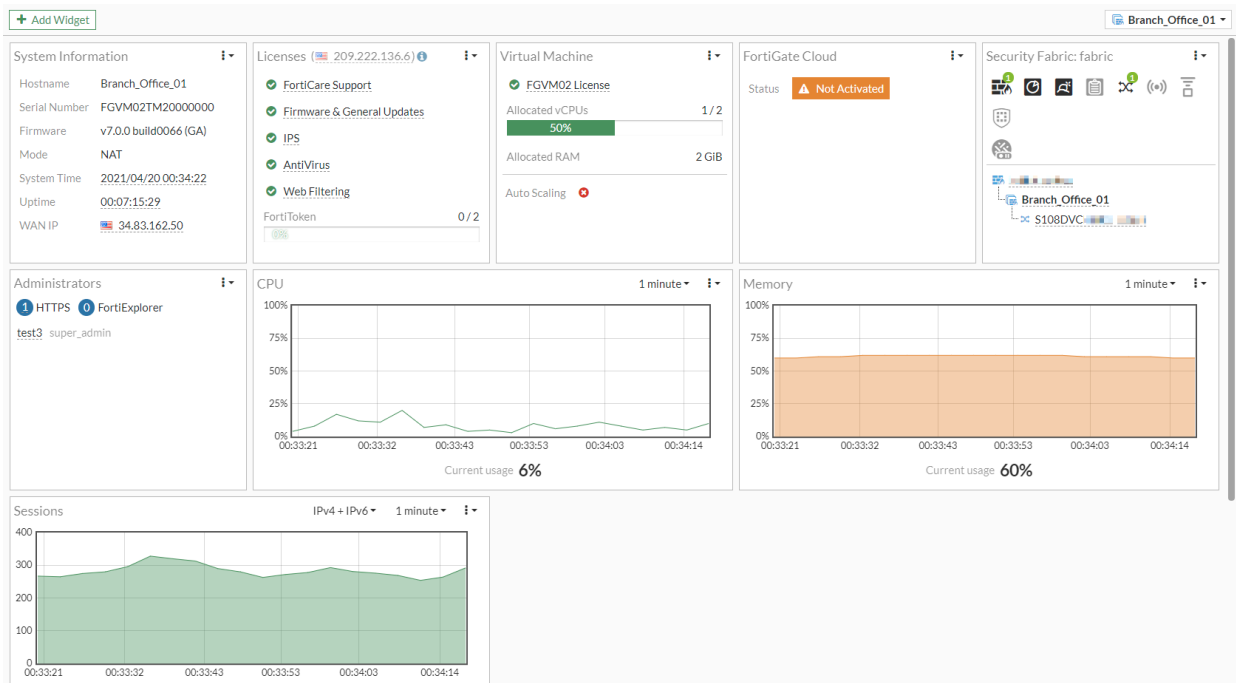

The following example describes how to log in to a root FortiGate IdP, and navigate to other FortiGate SPs in the Security Fabric without further authentication. The local administrator account is named *test3*. The local administrator account must also be available as an SSO administrator account on all downstream FortiGate SPs. Different tabs of the same browser are used to log in to the various FortiGates.

To log in to a FortiGate SP from a root FortiGate IdP:

1. Log in to the root FortiGate IdP by using the local administrator account.
In this example, the local administrator account is named *test3*.
2. Go to *Dashboard > Status* and locate the *Security Fabric* widget.
3. In the topology tree, click one of the downstream FortiGate SPs, and select *Login to <name of FortiGate>*. The login screen is displayed.
4. In the login screen, select *Single Sign-On*.
By using cookies in your local browser for the already-authenticated SSO administrator, FortiGate logs you in to the downstream FortiGate SP as the SSO administrator. In this example, the SSO administrator name is *test3*.

- While still logged into the root FortiGate IdP in your browser, go to the browser tab for the root FortiGate IdP, and log in to another FortiGate SP that is displayed on the *Security Fabric* widget in the GUI.

SAML SSO login uses *SAML_IDP* session cookies of already authenticated admin users in your local browser cache to send to the root FortiGate IdP for authentication. If your browser cache is manually cleared, or you close your browser, you must authenticate again.

It is possible to log in to one downstream FortiGate SP in a Security Fabric, and then open another tab in your browser to connect to another FortiGate SP that is not a member of the Security Fabric.

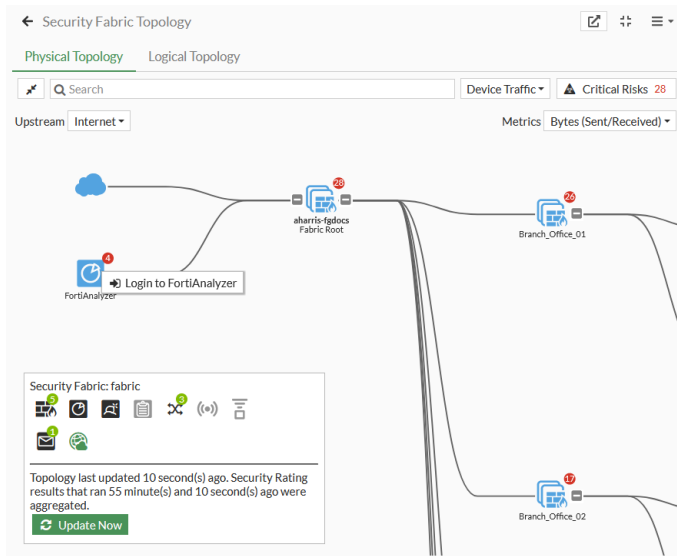

This is useful in cases where the SSO administrator and the local system administrator on the FortiGate SP both have the same login name, but are two different entities.

Integrating FortiAnalyzer management using SAML SSO

When a FortiGate acting as a Security Fabric root is configured as a SAML SSO identity provider (IdP), the FortiAnalyzer of the Security Fabric can register itself as a service provider (SP). This simplifies the configuration by enabling the setting in FortiAnalyzer to facilitate Fabric SSO access to the FortiAnalyzer once authenticated to the root FortiGate. When signed in using SSO, the FortiAnalyzer includes a Security Fabric navigation dropdown, which allows easy navigation to FortiGates in the Fabric.

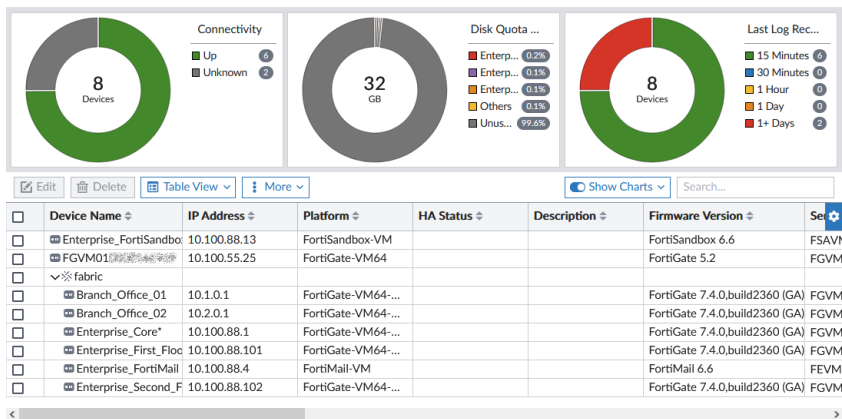

To enable FortiAnalyzer as a Fabric SP in the GUI:

1. On the root FortiGate, go to *Security Fabric > Physical Topology* or *Logical Topology*.
2. In the topology, click the *FortiAnalyzer* icon and select *Login to FortiAnalyzer*.

3. Enter the credentials to log in. A Security Fabric must be configured with the Fabric devices listed under the Fabric name.

- a. Go to *Device Manager* to verify the Fabric setup. There is an asterisk beside the root FortiGate.

4. Edit the FortiAnalyzer SAML SSO settings:

- a. Go to *System Settings > SAML SSO*.
- b. For *Single Sign-On Mode*, select *Fabric SP* and enter the address to access the FortiAnalyzer in *Server Address*.

The screenshot shows the 'Single Sign-On Settings' page in FortiGate. The 'Server Address' field is populated with 'https://10.100.88.1:443/fortianalyzer/saml/acs'. The 'Allow admins to login with FortiCloud' checkbox is checked. The 'Single Sign-On Mode' is set to 'Fabric SP'. A blue information box states: 'In Fabric SP mode, an SSO administrator is created for each Security Fabric. When a user logs in via Fabric SSO, the Fabric IdP provides the user's profile name. If this system has a profile with the matching name, the profile is assigned to the user. Otherwise, the profile of the SSO administrator is assigned to the user by default.' The 'Default Admin Profile' is set to 'Super_User'. Below this is a table for 'Fabric IdPs' with columns: Root Device, ADOM Name, Status, IDP Settings, and Certificate. The table lists three entries for FGVM01, FGVM02, and FGVM03, all with 'Enabled' status. An 'Apply' button is at the bottom.

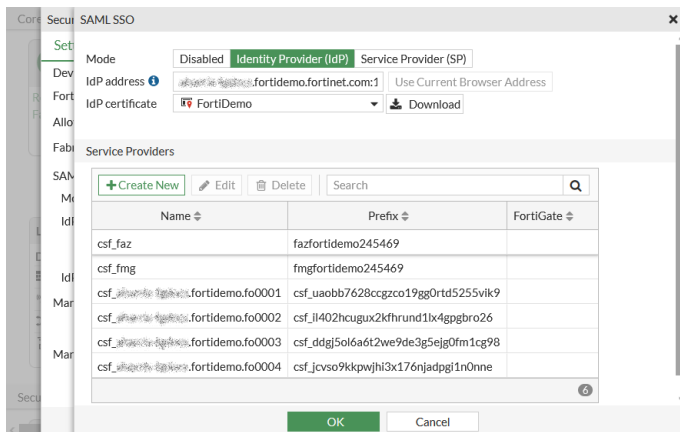

Root Device	ADOM Name	Status	IDP Settings	Certificate
FGVM01		Enabled	Entity ID: http://10.100.88.1:443/fortianalyzer/saml/acs Login URL: https://10.100.88.1:443/fortianalyzer/saml/acs Logout URL: https://10.100.88.1:443/fortianalyzer/saml/acs	csf-FGVM01
FGVM02		Enabled	Entity ID: http://10.100.88.2:443/fortianalyzer/saml/acs Login URL: https://10.100.88.2:443/fortianalyzer/saml/acs Logout URL: https://10.100.88.2:443/fortianalyzer/saml/acs	csf-FGVM02
FGVM03		Enabled	Entity ID: http://10.100.88.3:443/fortianalyzer/saml/acs Login URL: https://10.100.88.3:443/fortianalyzer/saml/acs Logout URL: https://10.100.88.3:443/fortianalyzer/saml/acs	csf-FGVM03

- c. Click *Apply* and log out of the FortiAnalyzer. The FortiAnalyzer will automatically register itself on the FortiGate and is a visible appliance in the list of SPs.

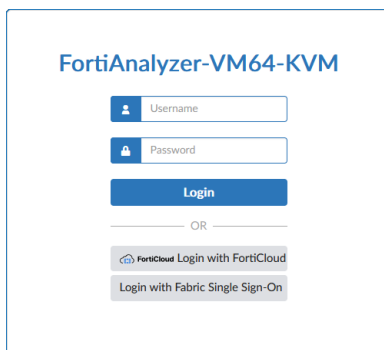

5. Verify that the FortiAnalyzer registration was successful:

- a. In FortiOS, go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
- b. In the *SAML Single Sign-On* section click *Advanced Options*. There should be an entry for the FortiAnalyzer in

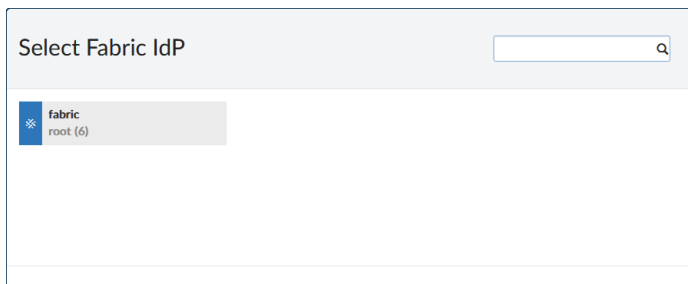

the *Service Providers* table.

6. Log in to the FortiAnalyzer. There is a new option to *Login with Fabric Single Sign-On*.

7. Click *Login with Fabric Single Sign-On*. A dialog appears to select a Fabric IdP.

8. Select a FortiGate. The ADOM containing that FortiGate opens.

To enable FortiAnalyzer as a Fabric SP in the CLI:

1. In FortiAnalyzer, enable the device as a Fabric SP:

```
config system saml
  set status enable
  set role FAB-SP
  set server-address "192.168.1.99"
end
```

FortiAnalyzer will register itself on the FortiGate as an appliance.

2. Verify the configuration in FortiOS:

```

show system saml
config system saml
    set status enable
    set role identity-provider
    set cert "fortigate.domain.tld"
    set server-address "192.168.1.99"
    config service-providers
        edit "appliance_192.168.1.103"
            set prefix "csf_76sh0bm4e7hf1ty54w42yrrv88tk8uj"
            set sp-entity-id "http://192.168.1.103/metadata/"
            set sp-single-sign-on-url "https://192.168.1.103/saml/?acs"
            set sp-single-logout-url "https://192.168.1.103/saml/?sls"
            set sp-portal-url "https://192.168.1.103/saml/login/"
            config assertion-attributes
                edit "username"
                next
                edit "profilename"
                set type profile-name
                next
            end
        next
    end
end

```

To navigate between devices using SAML SSO in FortiOS:

1. Log in to the root FortiGate.
2. Go to *Security Fabric > Physical Topology* or *Logical Topology*.
3. In the topology, click the *FortiAnalyzer* icon and select *Login to FortiAnalyzer*.

To navigate between devices using SAML SSO in FortiAnalyzer:

1. Log in to the FortiAnalyzer using SSO.
2. Navigate to the ADOM that contains the root FortiGate of the Security Fabric.
3. In the toolbar, click the Security Fabric name to display a dropdown a list of the Fabric FortiGates.

Integrating FortiManager management using SAML SSO

When a FortiGate is configured as the SAML SSO IdP, FortiManager can be added as an SP.

To configure FortiManager as a Fabric SP:

1. On the root FortiGate, go to *Security Fabric > Fabric Connectors*, and edit the *Security Fabric Setup* connector.
2. In the *SAML Single Sign-On* section, click *Advanced Options*.
3. In the *Service Providers* section, click *Create New*.
4. Enter a name and a prefix for the SP. FortiOS generates a unique prefix, but you can enter your own.
5. In *SP address*, enter the FortiManager address including the port number.

- To verify that the configuration works, log out of FortiManager and log in using the *Login via Single-Sign-On* link.

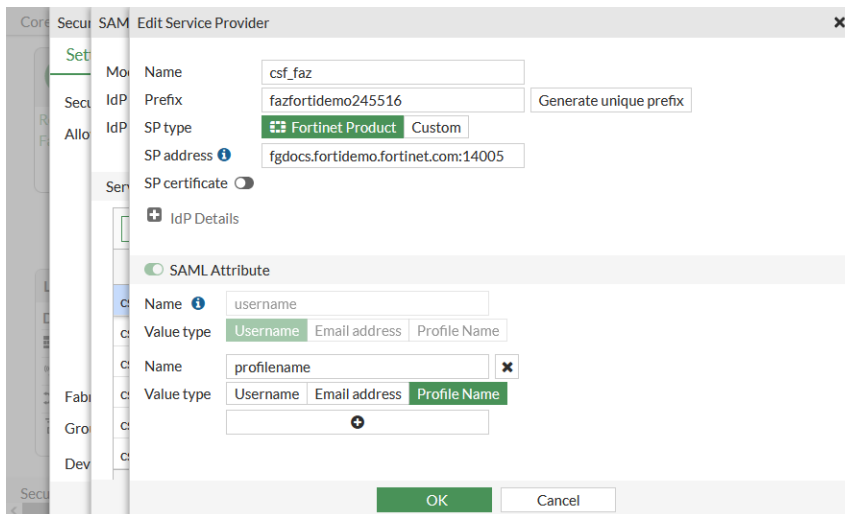

The image shows the login interface for FortiManager-VM64-KVM. It features a blue header with the text "FortiManager-VM64-KVM". Below the header, there are two input fields: "Username" and "Password", each with a corresponding icon (a person for username and a lock for password). A blue "Login" button is positioned below the password field. Below the "Login" button, there is a horizontal line with the text "OR" in the center. At the bottom, there is a grey button labeled "Login with Single Sign-On".

Advanced option - FortiGate SP changes

From a root FortiGate IdP, you can edit each of the FortiGate SPs. For example, you can edit a FortiGate SP to generate a new prefix, or you can add or modify SAML attributes. When you generate a new prefix value, it is propagated to the respective downstream FortiGates.

To edit an SP from the root FortiGate (IdP):

- Go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
- Click *Advanced Options*. The *SAML SSO* pane opens.
- In the *Service Providers* table, select a device and click *Edit*. The *Edit Service Provider* pane opens.

The image shows the "Edit Service Provider" configuration window. The window has a sidebar on the left with a tree view containing "Core", "Security Fabric", "SAML", "IdP", "Service Providers", "Groups", and "Users". The main area is titled "Edit Service Provider" and contains the following fields and sections:

- Name:** csf_faz
- Prefix:** fazfortidemo245516. There is a "Generate unique prefix" button to the right.
- SP type:** Fortinet Product (selected), Custom
- SP address:** fgdocs.fortidemo.fortinet.com:14005
- SP certificate:** (toggle switch is off)
- IdP Details:** (toggle switch is on)
- SAML Attribute:** (toggle switch is on)
 - Name:** username

- Click **OK**.

Security rating

The security rating uses real-time monitoring to analyze your Security Fabric deployment, identify potential vulnerabilities, highlight best practices that can be used to improve the security and performance of your network, and calculate Security Fabric scores.

To view the security rating, go to *Security Fabric > Security Rating* on the root FortiGate.

The *Security Rating* page is separated into three major scorecards: *Security Posture*, *Fabric Coverage*, and *Optimization*, which provide an executive summary of the three largest areas of security focus in the Security Fabric.

The scorecards show an overall letter grade and breakdown of the performance in sub-categories. The letter grade is calculated based on the percent of tests in a category that passed:

- A = 90% and above
- B = 77% to <90%
- C = 60% to <77%
- D = 50% to <60%
- F = Less than 50%

For example, if eight out of ten tests in a category passed, then 80% of the tests passed, and the category would be given a B grade.

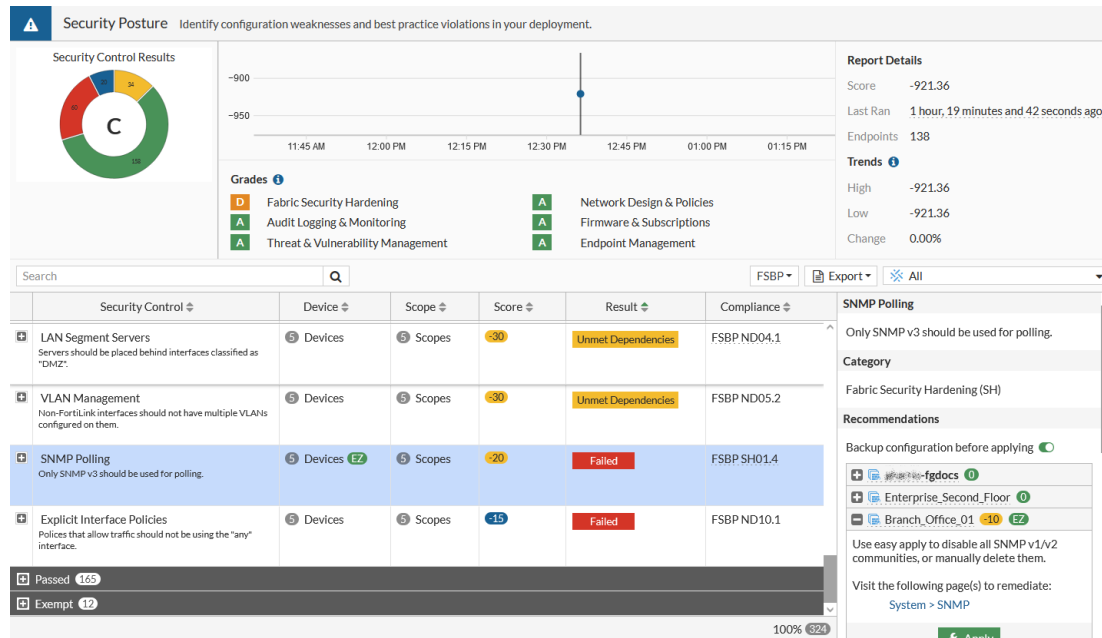

Clicking a scorecard drills down to a detailed report of itemized results and compliance recommendations. The point score represents the net score for all passed and failed items in that area. In the drill down report, hover the cursor over a score to view the calculation breakdown.

The report includes the security controls that were tested against, linking to specific FSBP, PCI, or CIS compliance policies. In the dropdown, select *FSBP*, *PCI*, or *CIS* to reference the corresponding standard.

The FortiGate must have a valid Attack Surface Security Rating license to view security ratings grouped by CIS.

Users can search or filter the report results. If there is a failed check on the scorecard, there is a link in the *Recommendations* section that takes you to the page to resolve the problem.

Certain remediations marked with an *EZ* symbol represent configuration recommendations that support *Easy Apply*. In the panel on the right, in the *Recommendations* section, click *Apply* to apply the changes to resolve the failed security control.

Recommendations

Backup configuration before applying

Enterprise_Security_Fabric -90 EZ

Enterprise_Second_Floor 0

Branch_Office_01 -60 EZ

Enterprise_First_Floor -90 EZ

Scope: root

Define a role for the following interfaces:

Management (port4) Choose

Internet_B (port5) Choose

MPLS-to-HQ (port6) Choose

Visit the following page(s) to remediate:

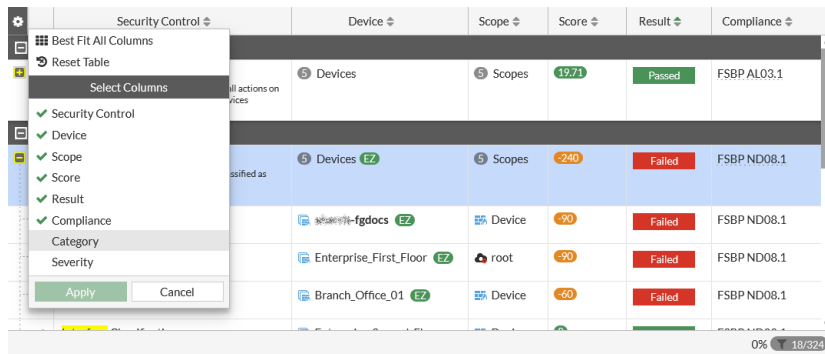

Network > Interfaces

Apply

Branch_Office_02 0

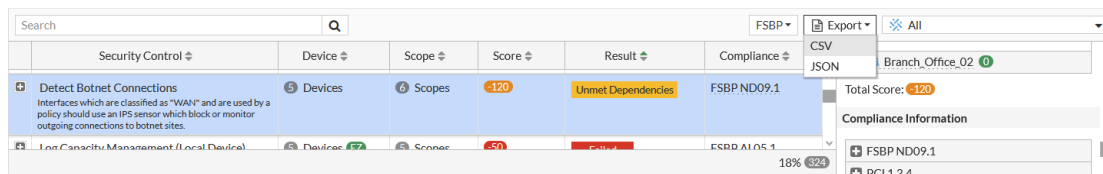

Total Score: -240

The report table can be customized by adding more columns, such as *Category*, to view, filter, or sort the results based on scorecard categories. Click the gear icon to customize the table.

Security Control	Device	Scope	Score	Result	Compliance
	Devices	Scopes	19.71	Passed	FSBP AL03.1
	Devices	Scopes	240	Failed	FSBP ND08.1
	Devices	Scopes	90	Failed	FSBP ND08.1
	Devices	Scopes	90	Failed	FSBP ND08.1
	Devices	Scopes	60	Failed	FSBP ND08.1

Users can also export the reports as CSV or JSON files by clicking the *Export* dropdown.

Security Control	Device	Scope	Score	Result	Compliance
Detect Botnet Connections	Devices	Scopes	-120	Unmet Dependencies	FSBP ND09.1
Log Connectivity Management (Local Device)	Devices	Scopes	90	Failed	FSBP AL03.1

To exit the current view, click the icon beside the scorecard title to return to the summary view.

For more information about security ratings, and details about each of the checks that are performed, go to [Security Best Practices & Security Rating Feature](#).

The following licensing options are available for security rating checks:

- A base set of free checks
- A licensed set that requires a FortiGuard Security Rating Service subscription

The base set can be run locally on any FortiGate and on all other devices in the Security Fabric. On licensed FortiGates, ratings scores can be submitted to and received from FortiGuard for ranking networks by percentile.

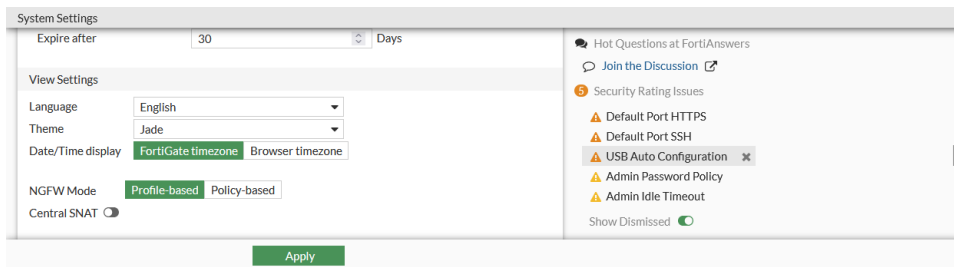

For a list of base and licensed security rating checks, see [FortiGuard Security Rating Service](#).

Security rating notifications

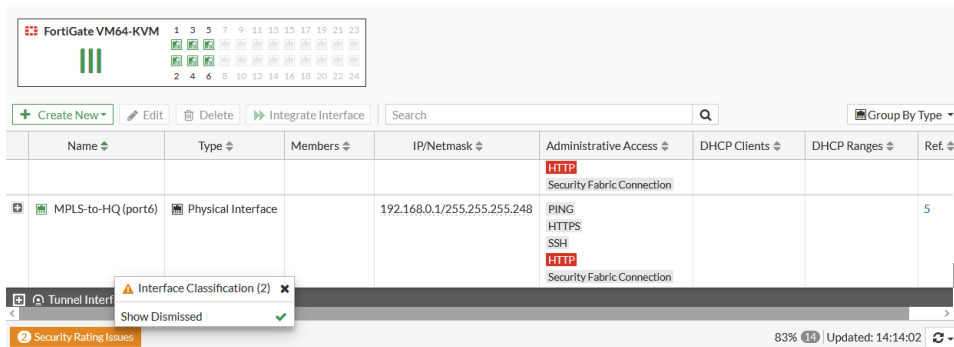

Security rating notifications are shown on settings pages, which list configuration issues determined by the security rating report. You can open the recommendations to see which items need to be fixed. Notifications can be dismissed in the GUI. Dismissed issues are unique for each administrator. Hashes for dismissed notifications are saved in local storage. If a user clears the local storage, all issues will show up again as not dismissed.

Notification locations

On the *System > Settings* page, there is a *Security Rating Issues* section in the right-side gutter. To dismiss a notification, hover over the issue and click the X beside it. To view dismissed notifications, enable *Show Dismissed*.

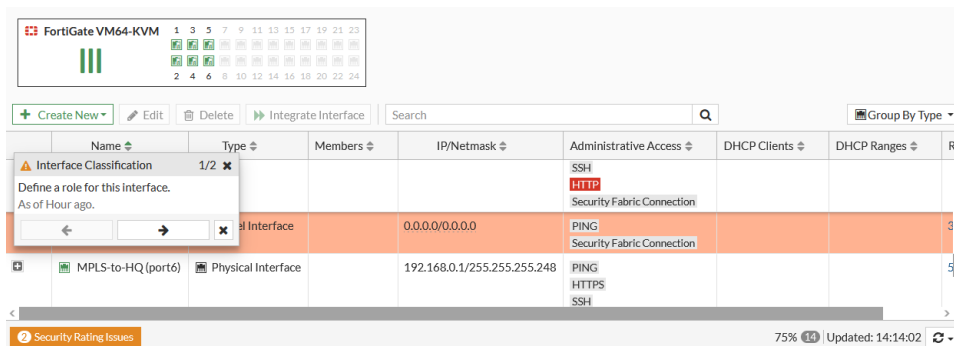

On the **Network > Interfaces** page, there is a **Security Rating Issues** section in the table footer. Click **Security Rating Issues** to view the list of issues. To dismiss a notification, click the X beside it. To view dismissed notifications, click **Show Dismissed**.

Notification pop-ups

When you click a security rating notification, a pop-up appears and the related setting is highlighted in the GUI. The pop-up contains a description of the problem and a timestamp of when the issue was found.

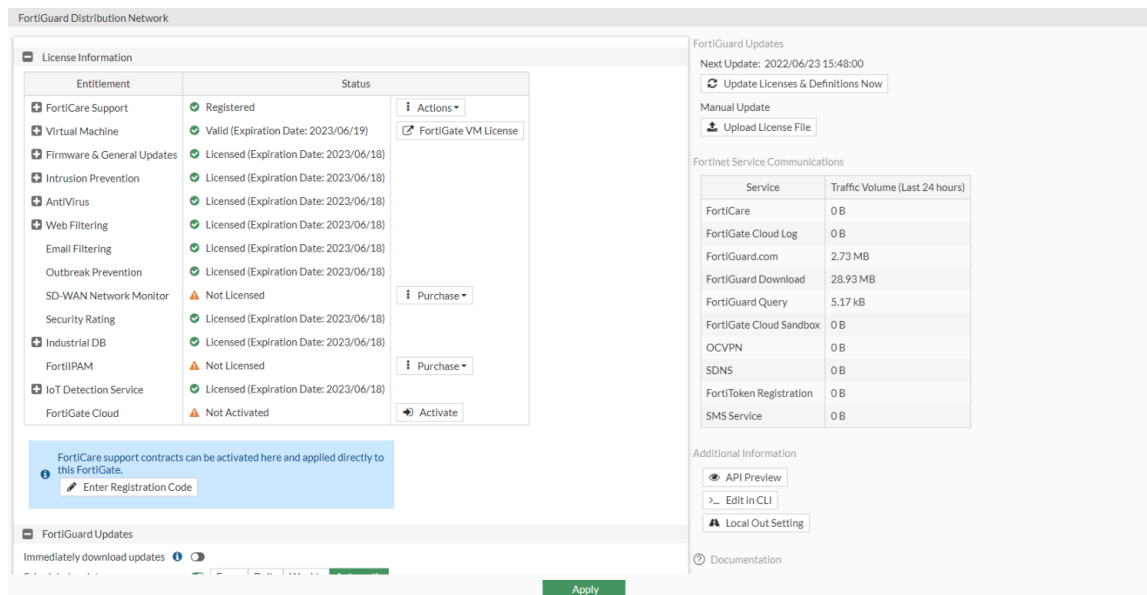

Once an issue is resolved, the notification disappears after the next security rating report runs.

PSIRT-related notifications

On a FortiGate with a valid Security Rating license, the separate Security Rating package downloaded from FortiGuard supports PSIRT vulnerabilities, which are highlighted in security rating results.

To verify the FortiGuard license entitlement in the GUI:

1. Go to *System > FortiGuard* and expand the *License Information* table.
2. Check that *Security Rating* appears in the list and the license is valid.

To verify the FortiGuard license entitlement in the CLI:

```
# diagnose autoupdate versions
...
Security Rating Data Package
-----
Version: 5.00017
Contract Expiry Date: Sun Jun 2 2023
Last Updated using scheduled update on Thu Jul 13 15:48:13 2022
Last Update Attempt: Thu Jul 13 15:48:13 2022
Result: Updates Installed

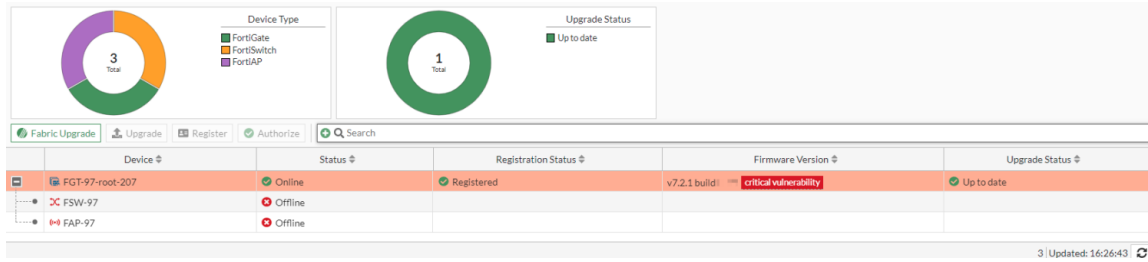

FDS Address
-----
173.243.138.66:443
```

The following notifications are visible in the GUI.

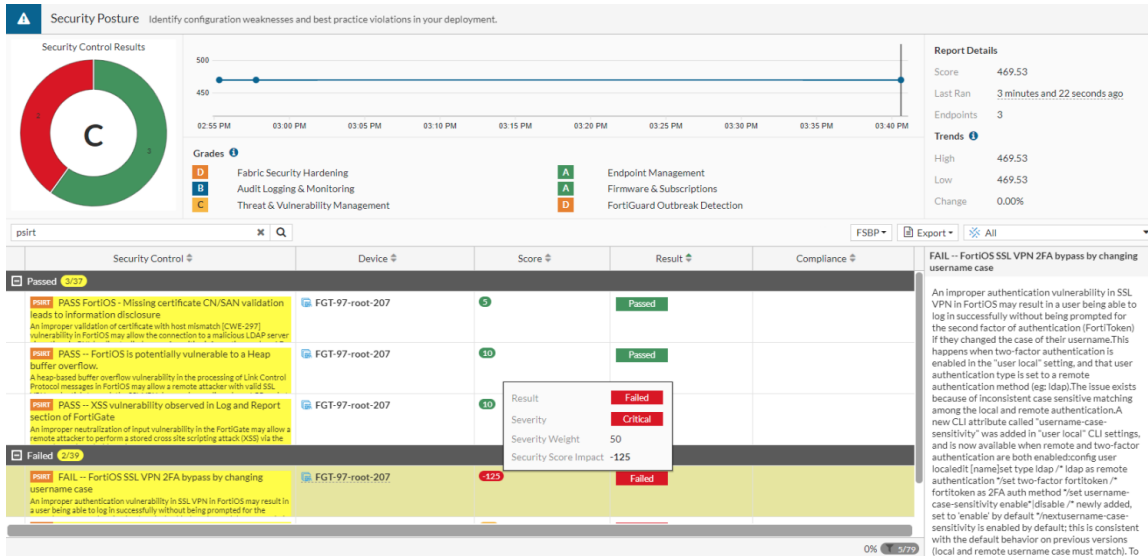

- Warning message: if the security rating result indicates a vulnerability with a critical severity, then the FortiOS GUI displays a warning message in the header and a new notification under the bell icon. The *View Vulnerability* link appears in the header for global administrators.

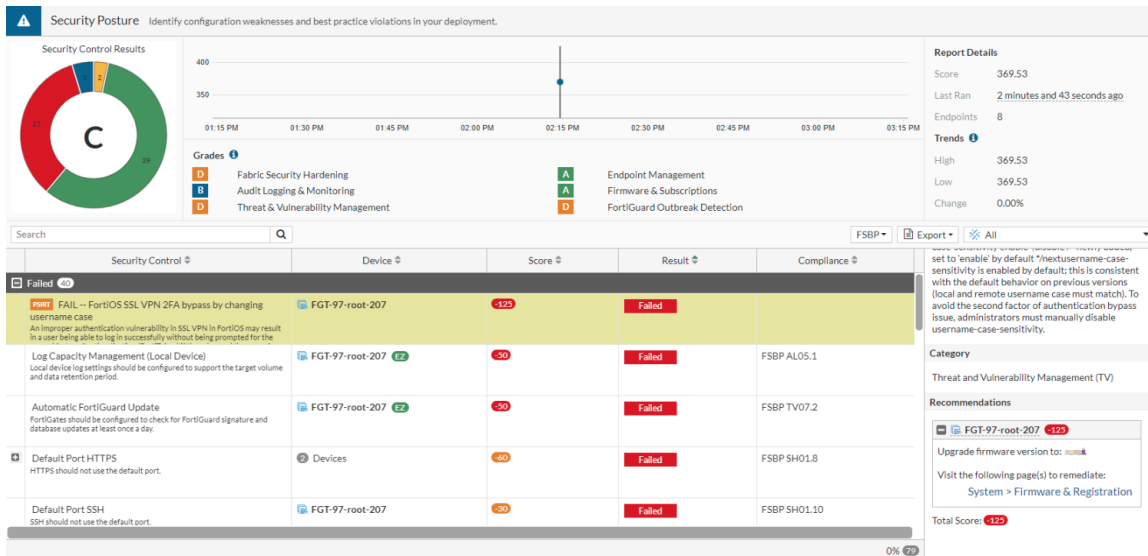

Clicking the warning message redirects to the *System > Firmware & Registration* page, where users are encouraged to update any affected Fortinet Fabric devices to the latest firmware releases to resolve the critical vulnerabilities.

- **Security Rating** page: when a failed result is selected, the security panel provides a description of the PSIRT vulnerability for failed results.

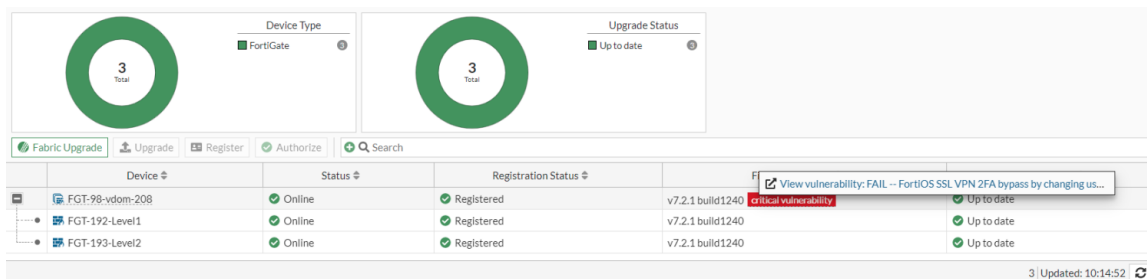

The **Recommendations** section includes a link to the **System > Firmware & Registration** page to update the firmware.

In the search bar, use PSIRT keywords to filter for PSIRT vulnerabilities.

- **Tooltip**: a tooltip for the **critical vulnerability** label on the **System > Firmware & Registration** page lists the vulnerability, and it links to the **Security Fabric > Security Rating** page where more details about the vulnerability are

displayed.

To view vulnerability results after performing security rating scan:

```
# diagnose report-runner vuln-read
Index: 0
Name: FG-IR-23-001: FortiOS / FortiManager / FortiAnalyzer / FortiWeb / FortiProxy /
FortiSwitchManager - Heap buffer underflow in administrative interface
FortiGate Serial: FGVM02TM23000000
```

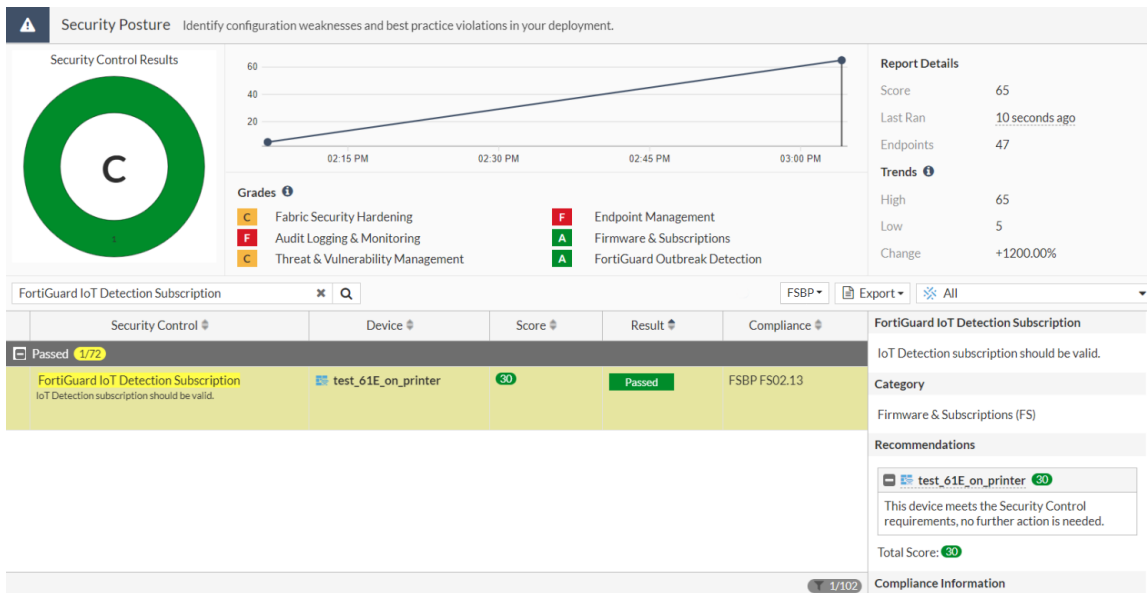

To clear the vulnerability result:

```
# diagnose report-runner vuln-clean
Deleted temporary critical vulnerability file
```

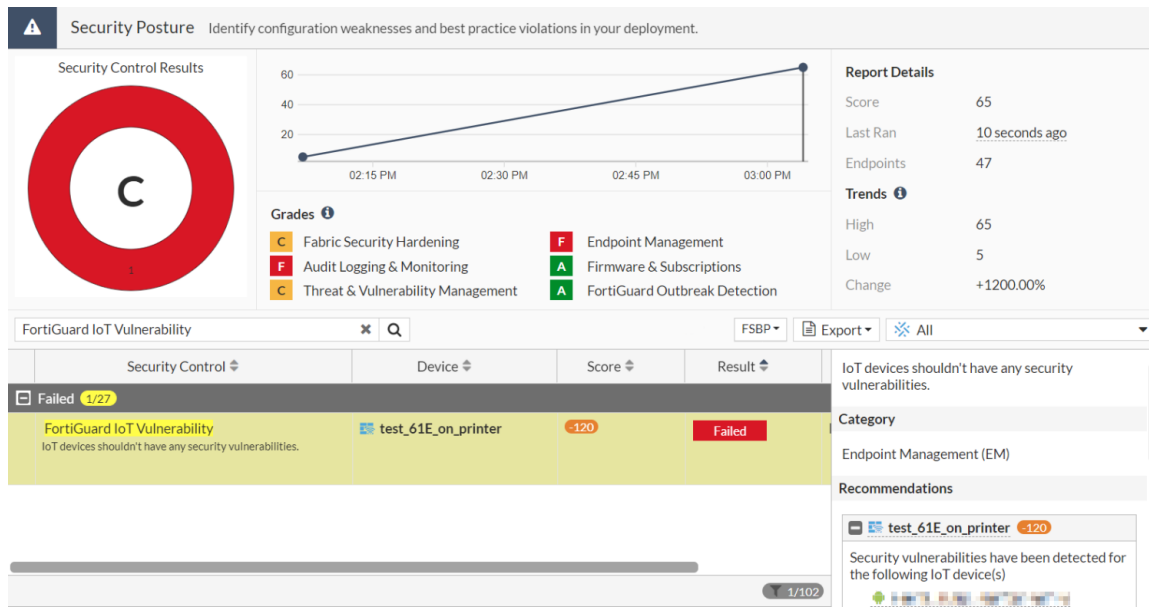

FortiGuard IoT vulnerability-related checks

There are two rating checks in the *Security Posture* report related to IoT vulnerabilities:

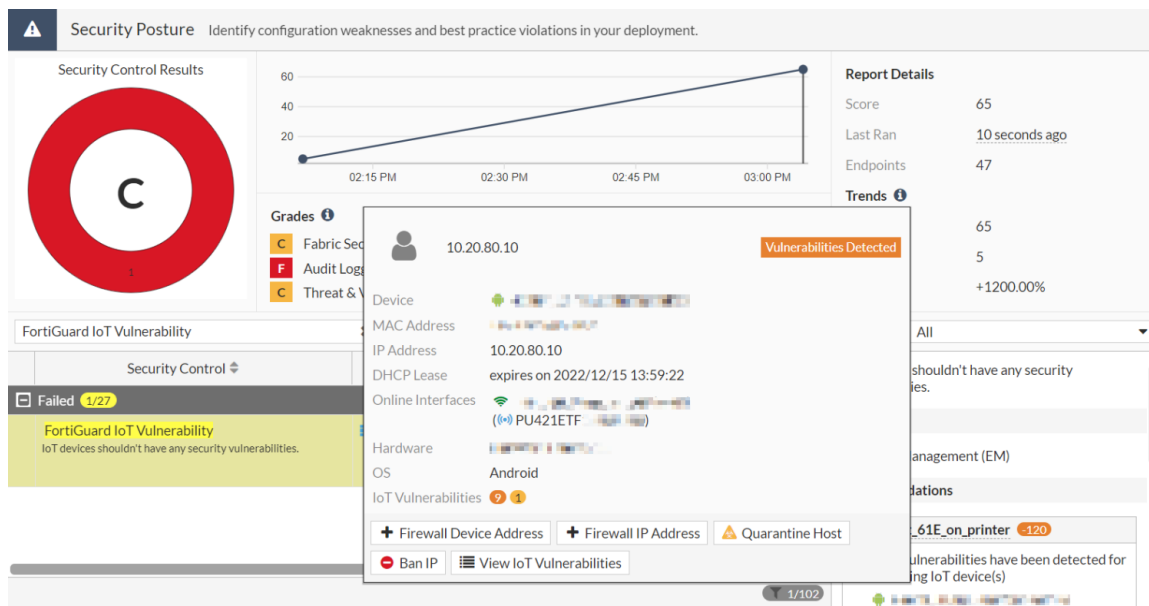

- The *FortiGuard IoT Detection Subscription* rating check will pass if the *System > FortiGuard* page shows that the *IoT Detection Service* is licensed. In this example, the result is marked as *Passed* because the license is valid.

- The *FortiGuard IoT Vulnerability* rating check will fail if any IoT vulnerabilities are found. In this example, the result is marked as *Failed* because there is a device with IoT vulnerabilities.

In the *Recommendations* section, hover over the device name to display the tooltip, which includes an option to *View IoT Vulnerabilities*.

To detect IoT vulnerabilities, the FortiGate must have a valid IoT Detection Service license, device detection must be configured on a LAN interface used by IoT devices, and a firewall policy with an application control sensor must be configured.

Security rating check scheduling

Security rating checks by default are scheduled to run automatically every four hours.

To disable automatic security checks using the CLI:

```
config system global
    security-rating-run-on-schedule disable
end
```

To manually run a report using the CLI:

```
# diagnose report-runner trigger
```

Opt out of ranking

Security rating scores can be submitted to FortiGuard for comparison with other organizations' scores, allowing a percentile score to be calculated. If you opt out of submitting your score, only an absolute score will be available.

To opt out of submitting the score using the CLI:

```
config system global
    set security-rating-result-submission {enable | disable}
end
```

Logging the security rating

The results of past security checks are available on the *Log & Report > System Events* page. Click the *Security Rating Events* card to see the detailed log.

Add Filter						Security Rating Events	Details

21 hours ago	■ ■ ■ ■ ■	Security Rating summary	0 1 0 1 6	+20	Optimization		

An event filter subtype can be created for the Security Fabric rating so event logs are created on the root FortiGate that summarize the results and show detailed information for the individual tests.

To configure security rating logging using the CLI:

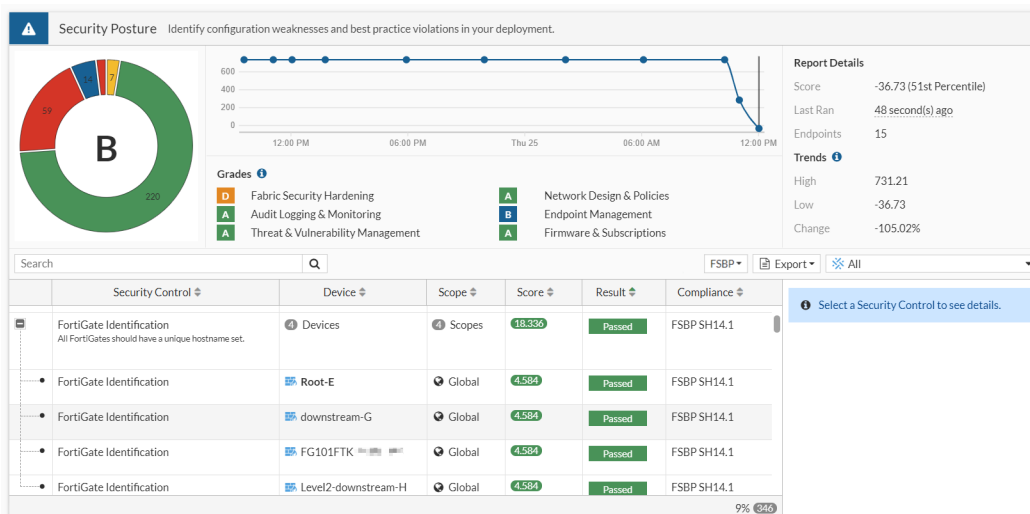

```
config log eventfilter
    set security-rating enable
end
```

Multi VDOM mode

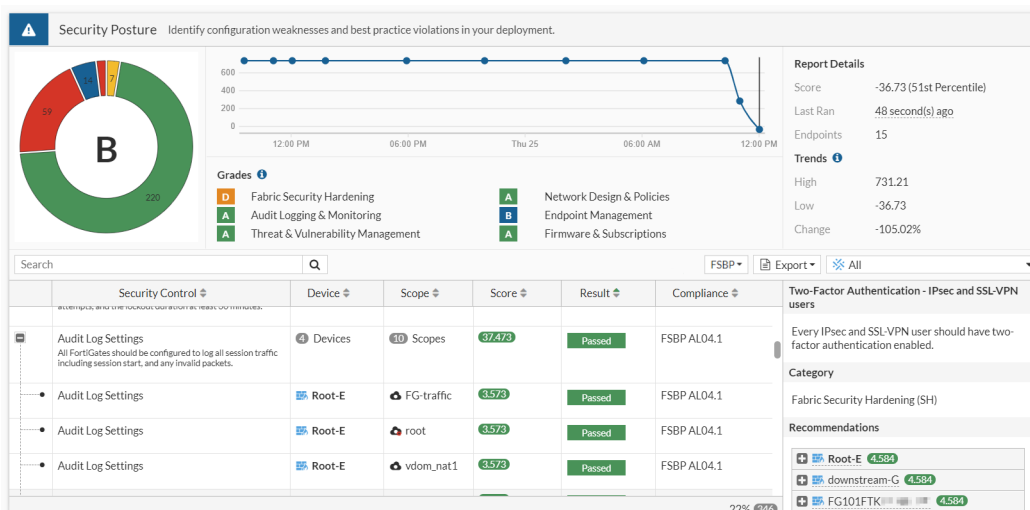

In multi VDOM mode, security rating reports can be generated in the Global VDOM for all of the VDOMs on the device. Administrators with read/write access can run the security rating report in the Global VDOM. Administrators with read-only access can only view the report.

On the report scorecards, the *Scope* column shows the VDOMs that the check was run on. On checks that support *Easy Apply*, the remediation can be run on all of the associated VDOMs.

Global scope:

VDOM scope:

The security rating event log is available on the root VDOM.

Security Fabric score

The Security Fabric score is calculated when a security rating check is run, based on the severity level of the checks that are passed or failed. A higher score represents a more secure network. Points are added for passed checks and removed for failed checks.

Severity level	Weight (points)
Critical	50
High	25
Medium	10
Low	5

To calculate the number of points awarded to a device for a passed check, the following equation is used:

$$\text{score} = \frac{\text{<severity level weight>}}{\text{<\# of FortiGates>}} \times \text{<secure FortiGate multiplier>}$$

The secure FortiGate multiplier is determined using logarithms and the number of FortiGate devices in the Security Fabric.

For example, if there are four FortiGate devices in the Security Fabric that all pass the compatible firmware check, the score for each FortiGate device is calculated with the following equation:

$$\frac{50}{4} \times 1.292 = 16.15 \text{ points}$$

All of the FortiGate devices in the Security Fabric must pass the check in order to receive the points. If any one of the FortiGate devices fails a check, the devices that passed are not awarded any points. For the device that failed the check, the following equation is used to calculate the number of points that are lost:

$$\text{score} = \text{<severity level weight>} \times \text{<secure FortiGate multiplier>}$$

For example, if the check finds two critical FortiClient vulnerabilities, the score is calculated with the following equation:

$$-50 \times 2 = -100 \text{ points}$$

Scores are not affected by checks that do not apply to your network. For example, if there are no FortiAP devices in the Security Fabric, no points will be added or subtracted for the FortiAP firmware version check.

Automation stitches

Automation stitches automate the activities between the different components in the Security Fabric, which decreases the response times to security events. Events from any source in the Security Fabric can be monitored, and action responses can be set up to any destination.

The automation settings can be synchronized within the Security Fabric, or can only apply to an individual FortiGate in the Security Fabric. Automation stitches can only be created on the root FortiGate in a Security Fabric.

To configure automation setting synchronization in a Security Fabric:

```
config automation setting
    set fabric-sync {enable | disable}
end
```

Automation stitches can also be used on FortiGates that are not part of a Security Fabric.

An automation stitch consists of two parts: the trigger and the actions. The trigger is the condition or event on the FortiGate that activates the action, for example, a specific log, or a failed log in attempt. The action is what the FortiGate does in response to the trigger.

Automation stitches that use cloud-based actions (AWS Lambda, Azure Function, Google Cloud Function, and AliCloud Function) have the option to delay an action after the previous action is completed.

Diagnose commands are available in the CLI to test, log, and display the stitch history and settings.

Creating automation stitches

To create an automation stitch, a trigger event and a response action or actions are selected. Automation stitches can be tested after they are created.

In the GUI, go to *Security Fabric > Automation* and click *Create New*. Automation stitches, actions, and triggers are configured in separate dialogs.

The stitch *Action execution* can be set to either *Sequential* or *Parallel*. In sequential execution, actions will execute one after another with a delay (if specified). If one action fails, then the action chain stops. This is the default setting. In parallel execution, all actions will execute immediately when the stitch is triggered.

When creating a stitch, clicking *Add Trigger* and *Add Action* displays a list of available triggers and actions, and the option to create a new one.

See More

Triggers and actions can be configured separately, and then added to an automation stitch.

The maximum number of automation stitches that are allowed to run concurrently can be configured in the CLI (32 - 256, default = 128).

To configure the maximum number of concurrent automation stitches:

```
config automation setting
    set max-concurrent-stitches <integer>
end
```

Tabs on the Automation page

On the *Security Fabric > Automation* page, there are tabs for *Stitch*, *Trigger*, and *Action*. The *Stitch* tab is the default view that lists the trigger and actions used in each stitch. Individual triggers and actions can be created or edited in the corresponding tabs.

Sample configuration

The following example shows how to configure an automation stitch with an Any Security Rating Notification trigger with AWS Lambda and Email actions. There is a 60-second delay before the Email action.

To configure the automation stitch in the GUI:

- Go to *Security Fabric > Automation* and click *Create New*.
- Enter the stitch name and description.
- Configure the trigger:
 - Click *Add Trigger*.
 - Select *Any Security Rating Notification*.
 - Click *Apply*.
- Configure the AWS Lambda function action:
 - Click *Add Action*.
 - Click *Create* and select *AWS Lambda*.
 - Enter the following:

Name	<i>aws_no_delay</i>
URL	Enter the request API URI
API key	Enter the API key
HTTP header	<i>header2 : header2_value</i>

Create New Automation Action

AWS Lambda Query an AWS Lambda function. [CHANGE TYPE](#)

[Automation for debug commands?](#)
1 Answers 0 Votes 258 Views

[See More](#)

OK **Cancel**

- d. Click **OK**.
 - e. Select the action in the list and click **Apply**.
6. Click the **Add delay** located between both actions. Enter **60** and click **OK**.
7. Click **OK**.

To configure the automation stitch in the CLI:**1. Configure the trigger:**

```
config system automation-trigger
    edit "Any Security Rating Notification"
        set event-type security-rating-summary
        set report-type any
    next
end
```

2. Configure the actions:

```
config system automation-action
    edit "aws_no_delay"
        set action-type aws-lambda
        set aws-api-key xxxxxxxxxxxx
        set uri "xxxxxxxxxx.execute-api.us-east-1.amazonaws.com/xxxxxxxxxx"
        config http-headers
            edit 1
                set key "header2"
                set value "header2_value"
            next
        end
    next
    edit "email_action"
        set action-type email
        set email-to "test@fortinet.com"
        set email-subject "email action for test"
        set replacement-message enable
    next
end
```

3. Configure the stitch:

```
config system automation-stitch
    edit "aws_no_delay"
        set description "aws action test"
        set trigger "Any Security Rating Notification"
        config actions
            edit 1
                set action "aws_no_delay"
                set required enable
            next
            edit 2
                set action "email_action"
                set delay 60
                set required enable
            next
        end
    next
end
```

Testing automation stitches

In the GUI, go to *Security Fabric > Automation*, right-click on the automation stitch and select *Test Automation Stitch*.

In the CLI, enter `diagnose automation test <automation-stitch name>`.

Default automation stitches

The following default automation stitches are included in FortiOS:

- Compromised Host Quarantine
- Firmware upgrade notification
- FortiAnalyzer Connection Down
- Network Down
- HA Failover
- [Incoming Webhook Quarantine](#)
- License Expired Notification
- Reboot
- Security Rating Notification

To view and edit the automation stitches in the GUI, go to *Security Fabric > Automation*.

            next
        end
    next
end

```

Incoming Webhook Quarantine stitch

The Incoming Webhook Quarantine stitch for API calls to the FortiGate accepts multiple parameters (MAC address and FortiClient UUID) from an Incoming Webhook trigger, which enacts either the Access Layer Quarantine action (MAC address) or the FortiClient Quarantine action (FortiClient UUID). This is a default automation stitch included in FortiOS.

To trigger the Incoming Webhook Quarantine stitch in the GUI:

1. Create a new API user:
 - a. Go to *System > Administrators*.
 - b. Click *Create New > REST API Admin*.
 - c. Configure the *New REST API Admin* settings, and copy the API key to the clipboard.

2. Enable the stitch:
 - a. Go to *Security Fabric > Automation*.
 - b. Under *Incoming Webhook*, right-click *Incoming Webhook Quarantine*, and select *Select Status > Enable*.
3. Get the sample cURL request:
 - a. Click the *Trigger* trigger tab.
 - b. Under *Incoming Webhook*, right-click *Incoming Webhook Call*, and select *Edit*.

- c. In the *API admin key* field, enter the API key you recorded previously. The *Sample cURL request* field updates.

The screenshot shows the 'Edit Automation Trigger' window for an 'Incoming Webhook'. The window has a title bar 'Edit Automation Trigger' and a subtitle 'Incoming Webhook An incoming webhook has been triggered.' Below the subtitle, there are fields for 'Name' (Incoming Webhook Call) and 'Description' (0/255). The 'Incoming Webhook' section contains a 'URL' field with the value 'https://172.16.116.226/api/v2/monitor/system/automation-stitch/webhook/Incoming Webhook Call' and an 'API admin key' field. The 'Sample cURL request' field contains a cURL command: `curl -k -X POST -H 'Authorization: Bearer [API Key]' --data '{"srcip": "1.1.1.1", "mac": "11:11:11:11:11:11", "fctuid": "0000BB0B0ABD0D00B0D0A0B0E0F0B00B"}' https://172.16.116.226/api/v2/monitor/system/automation-stitch/webhook/Incoming Webhook Call`. On the right side, there is an 'Additional Information' panel with links for 'API Preview', 'References', 'Edit in CLI', 'Guides', 'FortiAnalyzer Event Handler', 'Documentation', 'Online Help', and 'Video Tutorials'. At the bottom, there are 'OK' and 'Cancel' buttons.

- d. Copy the *Sample cURL request* to the clipboard.

- e. Click OK.

4. Execute the request:

- a. Edit the sample cURL request you just copied.

- b. Add parameters to the data field ("mac" and "fctuid"), and then execute the request.

```
root@pc:~# curl -k -X POST -H 'Authorization: Bearer
cfgtctlmmx3fQxr4kxb994p7swdfmk' --data '{ "mac": "0c:0a:00:0c:ce:b0", "fctuid":
"0000BB0B0ABD0D00B0D0A0B0E0F0B00B" }'
https://172.16.116.226/api/v2/monitor/system/automation-
stitch/webhook/Incoming%20Webhook%20Quarantine
{
  "http_method": "POST",
  "status": "success",
  "http_status": 200,
  "serial": "FGT00E0Q00000000",
  "version": "v6.4.0",
  "build": 1545
}
```

Encode spaces in the automation stitch name with %20. For example,
Incoming%20Webhook%20Quarantine

Once the automation stitch is triggered, the MAC address is quarantined by the FortiGate, and an event log is created. The FortiClient UUID is quarantined on the EMS server side.

To trigger the Incoming Webhook Quarantine stitch in the CLI:

1. Create a new API user and note the API key:

```
config system api-user
```

2. Enable the automation stitch:

```

config system api-user
  edit "api"
    set api-key *****
    set accprofile "api_profile"
    set vdom "root"
    config trusthost
      edit 1
        set ipv4-trusthost 10.6.30.0 200.200.200.0
      next
    end
  next
end

```

3. Edit the cURL request to include parameters in the data field ("mac" and "fctuid"), then execute the request:

```

root@pc56:~# curl -k -X POST -H 'Authorization: Bearer
cftgtclmmx0fQxr4kxb000p70wdfmk' --data '{ "mac": "0c:0a:00:0c:ce:b0", "fctuid":
"3000BB0B0ABD0D00B0D0A0B0E0F0B00B"}'
https://100.10.100.200/api/v2/monitor/system/automation-
stitch/webhook/Incoming%20Webhook%20Quarantine
{
  "http_method": "POST",
  "status": "success",
  "http_status": 200,
  "serial": "FGT80E0Q00000000",
  "version": "v6.4.0",
  "build": 1545
}

```

Encode spaces in the automation stitch name with %20. For example, Incoming%20Webhook%20Quarantine.

Once the automation stitch is triggered, the MAC address is quarantined by the FortiGate, and an event log is created. The FortiClient UUID is quarantined on the EMS server side.

Sample log

```

date=2020-02-14 time=15:37:48 logid="0100046600" type="event" subtype="system"
level="notice" vd="root" eventtime=1581723468644200712 tz="-0800" logdesc="Automation
stitch triggered" stitch="Incoming Webhook Quarantine" trigger="Incoming Webhook
Quarantine" stitchaction="Compromised Host Quarantine_quarantine,Compromised Host
Quarantine_quarantine-forticlient" from="log" msg="stitch:Incoming Webhook Quarantine is
triggered."

```

Triggers

There are two types of automation triggers that can be configured in automation stitches: static and dynamic.

Static automation triggers are included in FortiOS by default. They require only a name, description, and one setting. Static automation triggers can be edited, but they cannot be deleted.

Dynamic automation triggers require multiple settings to be configured. Dynamic automation triggers can be created by clicking the *Create New* button on the *Trigger* tab, or clicking *Create* within the *Create Automation Stitch* page.

The following table outlines the available static triggers.

Trigger	Description
Anomaly Logs	An anomalous event has occurred. See Event log category triggers on page 2945 for an example.
Any Security Rating Notification	A summary is available for a recently run Security Rating report. The default report type is Any. Other available options include: <ul style="list-style-type: none"> • Security Posture • Fabric Coverage • Optimization
AV & IPS DB Update	The antivirus and IPS database is updating.
Compromised Host	An indicator of compromise (IoC) is detected on a host endpoint. Additional actions are available only for <i>Compromised Host</i> triggers: <ul style="list-style-type: none"> • Access Layer Quarantine • FortiClient Quarantine • VMware NSX Security Tag • IP Ban
Configuration Change	A FortiGate configuration change has occurred.
Conserve Mode	A FortiGate entered conserve mode due to low memory. See Execute a CLI script based on memory and CPU thresholds on page 2990 for an example.
FortiGate Cloud-Based IOC	IOC detection from the FortiGate Cloud IOC service. This option requires an IOC license, a web filter license, and FortiCloud logging must be enabled.
HA Failover	An HA failover is occurring.
High CPU	A FortiGate has high CPU usage. See Execute a CLI script based on memory and CPU thresholds on page 2990 for an example.
IPS Logs	An IPS event has occurred.
License Expiry	A FortiGuard license is expiring. The default license type is Any. Other available options include: The license type must be selected. Options include: <ul style="list-style-type: none"> • FortiCare Support • FortiGuard Web Filter • FortiGuard AntiSpam • FortiGuard AntiVirus • FortiGuard IPS • FortiGuard Management Service • FortiGate Cloud
Local Certificate Expiry	A local certificate is about to expire. See Certificate expiration trigger on page 2948 for an example.

Trigger	Description
Reboot	A FortiGate is rebooting.
SSH Logs	An SSH event has occurred.
Traffic Violation	A traffic policy has been violated.
Virus Logs	A virus event has occurred.
Web Filter Violation	A web filter policy has been violated.

The following table outlines the available dynamic triggers.

Category	Trigger	Description
Security Fabric		
	Fabric Connector Event	An event has occurred on a specific Fabric connector. See Fabric connector event trigger on page 2937 for details.
	FortiAnalyzer Event Handler	The specified FortiAnalyzer event handler has occurred. See FortiAnalyzer event handler trigger on page 2932 for details.
	FortiGate Cloud Event Handler	The specified FortiGate Cloud event handler has occurred. This option requires a FortiGate Cloud log retention license.
Miscellaneous		
	FortiOS Event Log	The specified FortiOS log has occurred. Multiple event log IDs can be selected, and log field filters can be applied. See FortiOS event log trigger on page 2942 for an example.
	Incoming Webhook	An incoming webhook is triggered.
	Schedule	A scheduled monthly, weekly, daily, hourly, or one-time trigger. Set to occur on a specific minute of an specific hour on a specific day. When using the one-time trigger, set to occur on specific date and time in the future. See Schedule trigger on page 2951 for an example.

FortiAnalyzer event handler trigger

You can trigger automation stitches based on FortiAnalyzer event handlers. This allows you to define rules based on complex correlations across devices, log types, frequencies, and other criteria.

To set up a FortiAnalyzer event handler trigger:

1. [Configure a FortiGate event handler on the FortiAnalyzer](#)
2. [Configure FortiAnalyzer logging on the FortiGate on page 2933](#)
3. [Configure an automation stitch that is triggered by a FortiAnalyzer event handler on page 2934](#)

Configure a FortiGate event handler on the FortiAnalyzer

On the FortiAnalyzer, configure an event handler for the automation stitch. In this example, the event handler is triggered when an administrator logs in to the FortiGate. See [Creating a custom event handler](#) in the FortiAnalyzer Administration

Guide for more information.

To configure an event handler on the FortiAnalyzer:

1. Go to *FortiSoC > Handlers > FortiGate Event Handlers*, and click *Create New*.
2. Configure an event handler with two conditions for the automation stitch:

Log Type	Event Log
Log Subtype	System
Group By	Device ID
Logs match	Any of the following conditions
Log Field	Level
Match Criteria	Equal To
Value	Information
Log Field	Action
Match Criteria	Equal To
Value	login

3. Configure the other settings as needed.

Create New Handler

Status: ☒ ON

Name: system-log-handler2

Description:

Devices: ☒ All Devices ☐ Specify

Subnets: ☒ All Subnets ☐ Specify

Filters: +

Filter 1 ☒ ON

Log Device Type: FortiGate

Log Type: Event Log (event)

Log Subtype: System (system)

Group By: Device ID (device) +

Logs match: ☐ All ☒ Any of the following conditions

Log Field	Match Criteria	Value
Level (pri)	Equal To	Information
Action (action)	Equal To	login

Generic Text Filter: 0/1023

Generate Alert When: At least 1 Exact matches occurred over a period of 30 minutes

Event Message:

OK Cancel

4. Click **OK**.

Configure FortiAnalyzer logging on the FortiGate

See [Configuring FortiAnalyzer on page 2779](#) for more information.

To configure FortiAnalyzer logging in the GUI:

1. Go to *Security Fabric > Fabric Connectors* and double-click the *FortiAnalyzer Logging* card.
2. In the *Settings > FortiAnalyzer* tab, ensure the *Status* is *Enabled*, and configure the settings as needed.

3. Click *OK*.

To configure FortiAnalyzer logging in the CLI:

```
config log fortianalyzer setting
  set status enable
  set server "10.6.30.250"
  set serial "FL-4HET0000000000"
  set upload-option realtime
  set reliable enable
end
```

Configure an automation stitch that is triggered by a FortiAnalyzer event handler

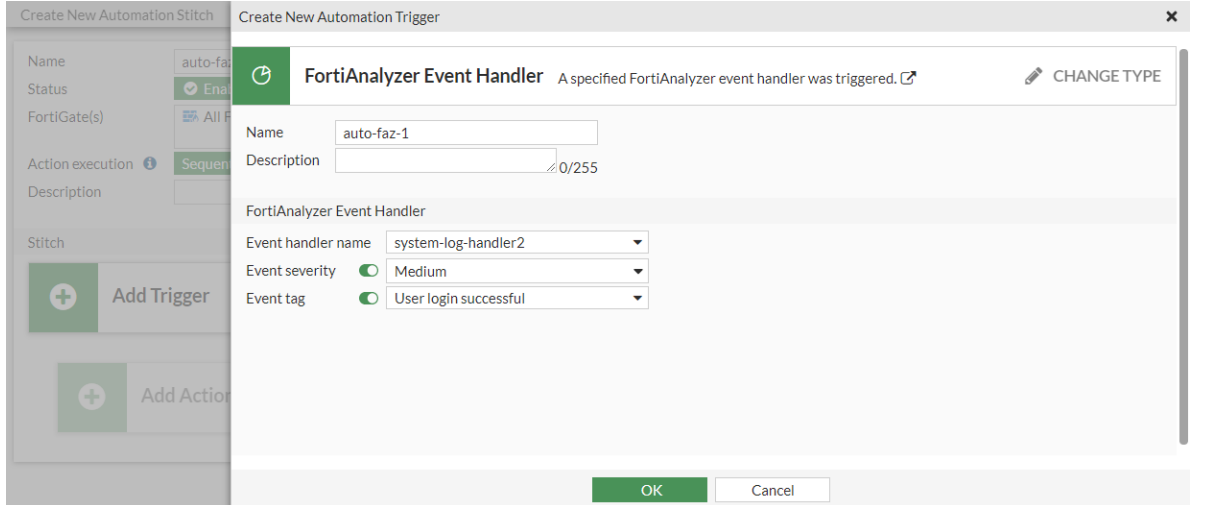

When a FortiAnalyzer event handler is triggered, it sends a notification to the FortiGate automation framework, which generates a log and triggers the automation stitch.

To configure an automation stitch that is triggered by a FortiAnalyzer event handler in the GUI:

1. Go to *Security Fabric > Automation* and click *Create New*.
2. Enter the stitch name, *auto-faz-1*.

3. Configure the trigger:
 - a. Click *Add Trigger*.
 - b. Click *Create* and select *FortiAnalyzer Event Handler*.
 - c. Enter the following:

Name	auto-faz-1
Event handler name	system-log-handler2
Event severity	Medium
Event tag	User login successful

- d. Click *OK*.
 - e. Select the trigger in the list and click *Apply*.
4. Configure the Email notification action:
 - a. Click *Add Action*.
 - b. Click *Create* and select *Email*.
 - c. Enter the following:

Name	auto-faz-1_email
To	Enter an email address
Subject	CSF stitch alert
Body	User login FortiGate successfully.

Create New Automation Action

Email Send a custom email to the specified recipient(s). CHANGE TYPE

Name: auto-faz-1_email

Minimum interval: 0 second(s)

Description: 0/255

Email

From:

Send to FortiCare email: ☐

To: admin@fortinet.com

Subject: CSF stitch alert

Body: User login FortiGate successfully. %

Replacement message: ☐

OK Cancel

- d. Click **OK**.
 - e. Select the action in the list and click **Apply**.
5. Click **OK**.

To configure an automation stitch that is triggered by a FortiAnalyzer event handler in the CLI:

1. Create an automation trigger:

```
config system automation-trigger
  edit "auto-faz-1"
    set event-type faz-event
    set faz-event-name "system-log-handler2"
    set faz-event-severity "medium"
    set faz-event-tags "User log in successful"
  next
end
```

2. Create an automation action:

```
config system automation-action
  edit "auto-faz-1_email"
    set action-type email
    set email-to "admin@fortinet.com"
    set email-subject "CSF stitch alert"
    set message "User login FortiGate successfully."
  next
end
```

3. Create the automation stitch:

```
config system automation-stitch
  edit "auto-faz-1"
    set trigger "auto-faz-1"
    config actions
      edit 1
        set action "auto-faz-1_email"
        set required enable
      next
    end
end
```

```
next
end
```

View the trigger event log

To view the trigger event log in the GUI:

1. Log in to the FortiGate.
The FortiAnalyzer sends a notification to the FortiGate automation framework, generates an event log on the FortiGate, and triggers the automation stitch.
2. Go to *Log & Report > System Events* and select *General System Events*. From the log location dropdown, select *FortiAnalyzer*.

To view the trigger event log in the CLI:

```
# execute log display
...
date=2019-02-05 time=14:16:17 logid="0100046600" type="event" subtype="system"
level="notice" vd="root" eventtime=1549404977 logdesc="Automation stitch triggered"
stitch="auto-faz-1" trigger="auto-faz-1" from="log" msg="stitch:auto-faz-1 is triggered."
...
```

Sample email

The email sent by the action will look similar to the following:

Fabric connector event trigger

With the *Fabric Connector Event* trigger, any supported Fabric connector is able to trigger an automation stitch on the FortiGate based on a specific event defined on the Fabric connector. Currently, only FortiDeceptor 4.1 and later supports this trigger for the *Insider Threat*, *Notify Ban*, and *Notify Unban* events.

In the following example, an authorized FortiDeceptor in the Security Fabric deploys a decoy called ubuntu16 configured with SSH, SAMBA, HTTP, and HTTPS services.

This example assumes the Security Fabric is already configured. Refer to [Configuring the root FortiGate and downstream FortiGates](#) and [FortiDeceptor](#) for detailed configuration steps. On the root FortiGate, the *Allow downstream device REST API access* option must be enabled (`set downstream-access enable`). The minimum permission required for the selected *Administrator profile* is *Read/Write for User & Device* (`set authgrp read-write`).

Three stitches are configured, one for each FortiDeceptor trigger type:

Stitch name	Fabric connector event trigger	Actions
fortideceptor_threat	Insider threat	Email and IP ban
fortideceptor_ban	Notify ban	Email and IP ban
fortideceptor_unban	Notify unban	Email and CLI script

To configure stitches with the Fabric connector event trigger in the GUI:**1. Configure the triggers:**

- a. Go to *Security Fabric > Automation*, select the *Trigger* tab, and click *Create New*.
- b. In the *Security Fabric* section, click *Fabric Connector Event* and enter the following:

Name	<i>fdc_Insider_Threat</i>
Description	<i>Insider_Threat</i>
Connector	Select the FortiDeceptor connector
Event Name	<i>Insider Threat</i>

- c. Click *OK*.
- d. Repeat these steps to create two more triggers with the following settings:

Name	<i>fdc_Notify_Ban</i>
Description	<i>Notify_Ban</i>
Connector	Select the FortiDeceptor connector
Event Name	<i>Notify Ban</i>

Name	<i>fdc_Notify_Unban</i>
Description	<i>Notify_Unban</i>
Connector	Select the FortiDeceptor connector
Event Name	<i>Notify Unban</i>

2. Configure the actions (the default *IP Ban* action will be added later to the stitch):

- a. Go to *Security Fabric > Automation*, select the *Action* tab, and click *Create New*.
- b. In the *Notifications* section, click *Email* and enter the following:

Name	<i>email_log</i>
To	Enter an email address
Subject	<i>CSF stitch alert</i>

- c. Click *OK*.
- d. Repeat these steps to create a *CLI Script* (in the *General* section) action with the following settings:

Name	<i>fdc_unban</i>
Script	<i>diagnose user quarantine delete src4 %%log.srcip%%</i>
Administrator profile	<i>super_admin</i>

3. Configure the *fortideceptor_threat* stitch:

- a. Go to *Security Fabric > Automation*, select the *Stitch* tab, and click *Create New*.
- b. Enter the name, *fortideceptor_threat*.
- c. Click *Add Trigger*. Select *fdc_Insider_Threat* and click *Apply*.

- d. Click *Add Action*. Select *email_log* and click *Apply*.
 - e. Click *Add Action*. Select *IP Ban* and click *Apply*.
 - f. Click the *Add delay* located between both actions. Enter 5 and click OK.
 - g. Click OK.
4. Configure the *fortideceptor_ban* stitch:
 - a. Go to *Security Fabric > Automation*, select the *Stitch* tab, and click *Create New*.
 - b. Enter the name, *fortideceptor_ban*.
 - c. Click *Add Trigger*. Select *fdc_Notify_Ban* and click *Apply*.
 - d. Click *Add Action*. Select *email_log* and click *Apply*.
 - e. Click *Add Action*. Select *IP Ban* and click *Apply*.
 - f. Click the *Add delay* located between both actions. Enter 5 and click OK.
 - g. Click OK.
 5. Configure the *fortideceptor_unban* stitch:
 - a. Go to *Security Fabric > Automation*, select the *Stitch* tab, and click *Create New*.
 - b. Enter the name, *fortideceptor_unban*.
 - c. Click *Add Trigger*. Select *fdc_Notify_Unban* and click *Apply*.
 - d. Click *Add Action*. Select *email_log* and click *Apply*.
 - e. Click *Add Action*. Select *fdc_unban* and click *Apply*.
 - f. Click the *Add delay* located between both actions. Enter 5 and click OK.
 - g. Click OK.

To configure stitches with the Fabric connector event trigger in the CLI:

1. Configure the triggers:

```
config system automation-trigger
  edit "fdc_Insider_Threat"
    set description "Insider_Threat"
    set event-type fabric-event
    set serial "FDC-VMTM210000**"
    set fabric-event-name "insider_threat"
  next
  edit "fdc_Notify_Ban"
    set description "Notify_Ban"
    set event-type fabric-event
    set serial "FDC-VMTM210000**"
    set fabric-event-name "notify_ban"
  next
  edit "fdc_Notify_Unban"
    set description "Notify_Unban"
    set event-type fabric-event
    set serial "FDC-VMTM210000**"
    set fabric-event-name "notify_unban"
  next
end
```

2. Configure the actions:

```
config system automation-action
  edit "IP Ban"
    set action-type ban-ip
```

```
next
edit "fdc_unban"
    set action-type cli-script
    set script "diagnose user quarantine delete src4 %%log.srcip%"
    set output-size 10
    set timeout 0
    set accprofile "super_admin"
next
edit "email_log"
    set action-type email
    set email-to "*****@fortinet.com"
    set email-subject "CSF stitch alert"
next
end
```

3. Configure the stitches:

```
config system automation-stitch
    edit "fortideceptor_threat"
        set trigger "fdc_Insider_Threat"
        config actions
            edit 1
                set action "email_log"
                set required enable
            next
            edit 2
                set action "IP Ban"
                set delay 5
                set required enable
            next
        end
    next
    edit "fortideceptor_ban"
        set trigger "fdc_Notify_Ban"
        config actions
            edit 1
                set action "email_log"
                set required enable
            next
            edit 2
                set action "IP Ban"
                set delay 5
                set required enable
            next
        end
    next
    edit "fortideceptor_unban"
        set trigger "fdc_Notify_Unban"
        config actions
            edit 1
                set action "email_log"
                set required enable
            next
            edit 2
                set action "fdc_unban"
                set delay 5
                set required enable
```

```

        next
    end
    next
end

```

Verification

A device with IP 172.16.200.33 uses SSH to access the decoy (ubuntu16) deployed in the FortiDeceptor. The FortiDeceptor will detect the attacker IP 172.16.200.33, automatically quarantine it, and send the insider threat notification to the FortiGate. This notification will trigger the *fortideceptor_threat* stitch due to the insider threat event trigger, so an email alert is sent and the attacker IP (172.16.200.33) is banned.

In FortiDeceptor, if the attacker IP (172.16.200.33) is manually blocked or unblocked, the FortiDeceptor will send out the internal block or unblock notification to FortiGate (see [Quarantine Status](#) for more details). This notification will trigger the *fortideceptor_ban* or *fortideceptor_unban* stitch due the notify ban or unban event trigger. An email alert is sent, and based on the event, the IP is banned or the CLI script runs to unban the IP.

To view the quarantine details in FortiDeceptor:

1. Go to *Fabric > Quarantine Status*.

a. Automatic quarantine:

Refresh

Block

Unblock

<input type="checkbox"/>	Attacker IP	Start	End	Type	Integrated Device	Time Remaining	Status	Message

To confirm that the stitch was triggered in the FortiOS GUI:

1. Go to *Security Fabric > Automation* and select the *Stitch* tab.

a. Triggered insider threat:

Stitch	Trigger	Action				
+ Create New	✎ Edit	🗑 Delete				
📄 Clone	<input type="text" value="Search"/>	🔍				
Name	Status	Trigger	Actions	FortiGate(s)	Trigger Count	Last Triggered
🔌 Fabric Connector Event 1/3						
🔌 fortideceptor_threat	🟢 Enabled	🔌 fdc_Insider_Threat	📧 email_log 🚫 IP Ban	🏢 All FortiGates	3 <div></div>	Hour ago

b. Triggered notify ban or unban:

Stitch

Trigger

Action

+ Create New

View

Clone

Search

Q

Name	Status	Trigger	Actions	FortiGate(s)	Trigger Count	Last Triggered
Fabric Connector Event 2/3						
fortideceptor_ban	Enabled	fdc_Notify_Ban	email_log IP Ban	All FortiGates	1	Hour ago
fortideceptor_unban	Enabled	fdc_Notify_Unban	email_log >... fdc_unban	All FortiGates	2	Hour ago

To view the quarantined IP details in the FortiOS CLI:

```
# diagnose user banned-ip list
src-ip-addr      created                expires                cause
172.16.200.33    Wed Jan  5 15:57:41 2022 indefinite           Administrative
```

If the IP is unbanned by the stitch, the list will be empty:

```
# diagnose user quarantine list
src-ip-addr      created                expires                cause
```

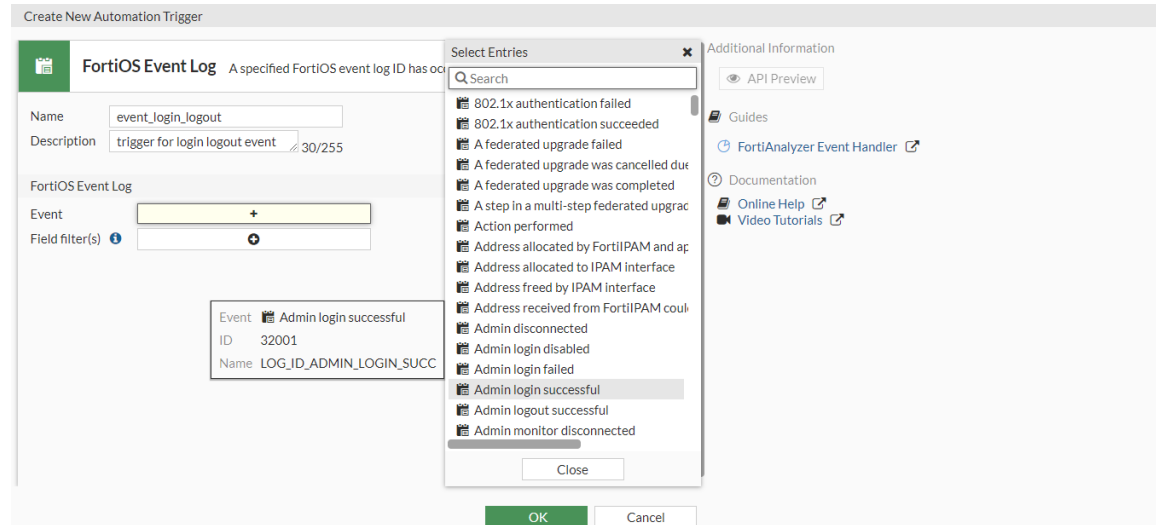

FortiOS event log trigger

You can configure a FortiOS event log trigger for when a specific event log ID occurs. You can select multiple event log IDs, and apply log field filters. FortiOS event log triggers can be configured from the *Security Fabric > Automation > Trigger* page, or by using the shortcut on the *Log & Report > System Events > Logs* page.

To configure a FortiOS event log trigger in the GUI:

1. Go to *Security Fabric > Automation*, select the *Trigger* tab, and click *Create New*.
2. In the *Miscellaneous* section, click *FortiOS Event Log*.
3. Enter a name and description.
4. In the *Event* field, click the + to select multiple event log IDs.

The *Event* options correspond to the *Message Meaning* listed in the FortiOS Log Message Reference. Hover over an entry to view the tooltip that includes the event ID and log name. In this example, the *Admin login successful* event in the GUI corresponds to log ID 32001, which is *LOG_ID_ADMIN_LOGIN_SUCC*.

5. In the *Field filter(s)* field, click the + to add multiple field filters. The configured filters must match in order for the stitch to be triggered.
 - a. To view the list of available fields for a log, refer to the FortiOS Log Message Reference by appending the log ID to the document URL (https://docs.fortinet.com/document/fortigate/7.4.1/fortios-log-message-reference/<log_ID>).

Create New Automation Trigger

OK **Cancel**

6. Click **OK**.

To configure a FortiOS event log trigger in the CLI:

```
config system automation-trigger
  edit "event_login_logout"
    set description "trigger for login logout event"
    set event-type event-log
    set logid 32001 32003
    config fields
      edit 1
        set name "user"
        set value "csf"
      next
      edit 2
        set name "srcip"
        set value "10.6.30.254"
      next
    end
  next
end
```

System Events page shortcut

A FortiOS Event Log trigger can be created using the shortcut on the *System Events > Logs* page. In this example, a trigger is created for a FortiGate update succeeded event log.

To configure a FortiOS Event Log trigger from the System Events page:

1. Go to *Log & Report > System Events* and select the *Logs* tab.
2. Select a log for a successful FortiGate update, then right-click and select *Create Automation Trigger*.

Summary

Logs

The *Create New Automation Trigger* pane opens to configure the FortiOS Event Log settings.

3. Enter a name (such as *trigger-update*). The *Event* field is already populated with *FortiGate update succeeded*.

Create New Automation Trigger

Event log category triggers

There are six default automation triggers based on event log categories:

- Anomaly logs
- IPS logs
- SSH logs
- Traffic violations
- Virus logs
- Web filter violations

When multi VDOM mode is enabled, individual VDOMs can be specified so that the trigger is only applied to those VDOMs.

```
config system automation-trigger
  edit "Anomaly Logs"
    set trigger-type event-based
    set event-type anomaly-logs
    set vdom <name>
  next
  edit "IPS Logs"
    set trigger-type event-based
    set event-type ips-logs
    set vdom <name>
  next
  edit "SSH Logs"
    set trigger-type event-based
    set event-type ssh-logs
    set vdom <name>
  next
  edit "Traffic Violation"
    set trigger-type event-based
    set event-type traffic-violation
    set vdom <name>
  next
  edit "Virus Logs"
    set trigger-type event-based
    set event-type virus-logs
    set vdom <name>
  next
  edit "Webfilter Violation"
    set trigger-type event-based
```

```

        set event-type webfilter-violation
        set vdom <name>
    next
end

```

Example

In this example, an automation stitch is created that uses the anomaly logs trigger and an email notification action. The trigger specifies which VDOMs should be used. There is a three-second delay between the trigger and action.

To configure an automation stitch with the anomaly logs trigger in the GUI:

1. Configure the trigger:
 - a. Go to *Security Fabric > Automation*, select the *Trigger* tab.
 - b. Edit the *Anomaly Logs* trigger.
 - c. Add the required VDOMs (*root*, *vdom-nat*, *vdom-tp*).

- d. Click *OK*.
2. Configure the action:
 - a. Go to *Security Fabric > Automation*, select the *Action* tab, and click *Create New*.
 - b. In the *Notifications* section, click *Email* and enter the following:

Name	<i>email_default_rep_message</i>
To	Enter an email address
Subject	<i>CSF stitch alert</i>
Replacement message	Enable

- c. Click *OK*.
3. Configure the stitch:
 - a. Go to *Security Fabric > Automation*, select the *Stitch* tab, and click *Create New*.
 - b. Enter the name, *anomaly-logs-stitch*.
 - c. Click *Add Trigger*. Select *Anomaly Logs* and click *Apply*.
 - d. Click *Add Action*. Select *email_default_rep_message* and click *Apply*.
 - e. Click *Add delay* (between the trigger and action). Enter 3 and click *OK*.
 - f. Click *OK*.

To configure an automation stitch with the anomaly logs trigger in the CLI:**1. Configure the trigger:**

```
config system automation-trigger
  edit "Anomaly Logs"
    set event-type anomaly-logs
    set vdom "root" "vdom-nat" "vdom-tp"
  next
end
```

2. Configure the action:

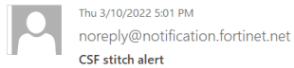

```
config system automation-action
  edit "email_default_rep_message"
    set action-type email
    set email-to "admin@fortinet.com"
    set email-subject "CSF stitch alert"
    set replacement-message enable
  next
end
```

3. Configure the stitch:

```
config system automation-stitch
  edit "anomaly-logs-stitch"
    set description "anomaly-logs"
    set trigger "Anomaly Logs"
    config actions
      edit 1
        set action "email_default_rep_message"
        set delay 3
        set required enable
      next
    end
  next
end
```

Verification

Once the anomaly log is generated, the automation stitch is triggered and the email notification is sent.

To confirm that the stitch was triggered in the GUI:

1. Go to *Security Fabric > Automation* and select the *Stitch* tab.
2. Verify the *Last Triggered* column.

To confirm that the stitch was triggered in the CLI:

```
# diagnose test application autod 2
...
stitch: anomaly-logs-stitch
  destinations: all
  trigger: Anomaly Logs
    type: anomaly logs

  field ids:
    (id:6) vd=root, vdom=nat, vdom=tp

local hit: 1 relayed to: 0 relayed from: 0
actions:
  email_default_rep_message type:email interval:0
  delay:3 required:yes
  subject: CSF stitch alert
  body: %%log%%
  sender:
  mailto:admin@fortinet.com;
```

Certificate expiration trigger

The local certificate expiry trigger (`local-certificate-near-expiry`) can be used in an automation stitch if a user-supplied local certificate used for SSL VPN, deep inspection, or other purpose is about to expire. This trigger relies on a VPN certificate setting in the CLI configuration setting for the certificate log expiring warning threshold:

```
config vpn certificate setting
  set cert-expire-warning <integer>
end
```

<code>cert-expire-warning</code> <integer>	Set the certificate log expiring warning threshold, in days (0 - 100, default = 14).
---	--

Example

In this example, the default local certificate expiry trigger is used with an email notification action to remind an administrator to re-sign or load a new local certificate to avoid any service interruptions. The local certificate, fw-cert-30-days, will expire in 30 days. The certificate log expiring warning threshold is set to 31 days.

To configure the certificate log expiring warning threshold:

```
config vpn certificate setting
    set cert-expire-warning 31
end
```

To configure an automation stitch with the local certificate expiry trigger in the GUI:

1. Configure the action:
 - a. Go to *Security Fabric > Automation*, select the *Action* tab, and click *Create New*.
 - b. In the *Notifications* section, click *Email*, and enter the following:

Name	<i>email_no_rep_message</i>
To	Enter an email address.
Subject	<i>CSF stitch alert</i>

- c. Click *OK*.
2. Configure the stitch:
 - a. Go to *Security Fabric > Automation*, select the *Stitch* tab, and click *Create New*.
 - b. Enter the name, *cert-expiry*.
 - c. Click *Add Trigger*. Select *Local Certificate Expiry* and click *Apply*.
 - d. Click *Add Action*. Select *email_no_rep_message* and click *Apply*.
 - e. Click *OK*.

To configure an automation stitch with the local certificate expiry trigger in the CLI:

1. Configure the trigger:

```
config system automation-trigger
    edit "Local Certificate Expiry"
        set description "A local certificate is near expiration."
        set event-type local-cert-near-expiry
    next
end
```

2. Configure the action:

```
config system automation-action
    edit "email_no_rep_message"
        set action-type email
        set email-to "*****@fortinet.com"
        set email-subject "CSF stitch alert"
```

```

    next
end

```

3. Configure the stitch:

```

config system automation-stitch
    edit "cert-expiry"
        set trigger "Local Certificate Expiry"
        config actions
            edit 1
                set action "email_no_rep_message"
                set required enable
            next
        end
    next
end

```

Verification

Once the event log is generated for the local certificate expiry, the automation stitch is triggered and the email notification is sent.

To confirm that the stitch was triggered in the GUI:

1. Go to *Security Fabric > Automation* and select the *Stitch* tab.
2. Verify the *Last Triggered* column.

Stitch Trigger Action						
+ Create New Edit Delete Clone <input type="text"/> <input type="button" value="Q"/>

      cert-expiry

```

Schedule trigger

The schedule automation trigger can be used for monthly, weekly, daily, hourly, or one-time triggers, including a one-time configuration backup to a disk, a reboot, or a shutdown.

```

config system automation-trigger
  edit <name>
    set trigger-type scheduled
    set trigger-frequency {hourly | daily | weekly | monthly | once}
    set trigger-hour <integer>
    set trigger-minute <integer>
    set trigger-weekday {sunday | monday | tuesday | wednesday | thursday | friday |
saturday}
    set trigger-day <integer>
    set trigger-datetime <YYYY-MM-DD HH:MM:SS>
  next
end

```

trigger-frequency {hourly daily weekly monthly once}	Set the scheduled trigger frequency (default = daily).
trigger-hour <integer>	Set the hour of the day on which to trigger (0 - 23, default = 1), available for daily, weekly, and monthly schedule.
trigger-minute <integer>	Set the minute of the hour on which to trigger (0 - 59, default = 0), available for hourly, daily, weekly, and monthly schedule.
trigger-weekday {sunday monday tuesday wednesday thursday friday saturday}	Set the day of the week to trigger, available for weekly schedule.
trigger-day <integer>	Set the day within a month to trigger, available for monthly schedule.
trigger-datetime <YYYY-MM-DD HH:MM:SS>	Set the trigger time in YYYY-MM-DD HH:MM:SS format for one-time triggers.

Example

In this example, an automation stitch is created to trigger a one-time configuration backup to a disk. The backup will occur August 5, 2022 at 4:00 AM.

To schedule a one-time automation stitch in the GUI:

1. Configure the trigger:
 - a. Go to *Security Fabric > Automation*, select the *Trigger* tab, and click *Create New*.
 - b. In the *Miscellaneous* section, click *Schedule*.
 - c. Enter a name (*schedule-once*) in the *Name* field.
 - d. In the *Frequency* dropdown list, select *Once*.

- e. Select when the trigger will occur in the *Date/Time* fields.

- f. Click OK.

2. Configure the stitch:

- a. Go to *Security Fabric > Automation*, select the *Stitch* tab, and click *Create New*.
- b. Enter the name, *backup-once*.
- c. Click *Add Trigger*. Select *schedule-once* and click *Apply*.
- d. Click *Add Action*. Select *Backup Config Disk* and click *Apply*.

- e. Click OK. The backup configuration will occur once at the date and time you set.

To schedule a one-time automation stitch in the CLI:

1. Configure the trigger:

```
config system automation-trigger
  edit "schedule-once"
    set trigger-type scheduled
    set trigger-frequency once
    set trigger-datetime 2022-08-05 04:00:00
  next
end
```

2. Configure the action:

```
config system automation-action
  edit "Backup Config Disk"
    set description "Backup the configuration on disk."
```

```

        set action-type system-actions
        set system-action backup-config
    next
end

```

3. Configure the stitch:

```

config system automation-stitch
    edit "backup-once"
        set trigger "schedule-once"
        config actions
            edit 1
                set action "Backup Config Disk"
                set required enable
            next
        end
    next
end

```

4. To view automation stitch information:

```

# diagnose test application autod 3
stitch: backup-once (scheduled)

    local hit: 0 relayed to: 0 relayed from: 0
    last trigger:    last relay:
    next scheduled trigger: Fri Aug  5 05:00:00 2022
    actions:
        Backup Config Dis:
            done: 0 relayed to: 0 relayed from: 0
            last trigger:                last relay:

logid to stitch mapping:
id:0 (scheduled stitches) local hit: 0 relayed hits: 0
    backup-once

```

Actions

There are two types of automation actions that can be configured in automation stitches: static and dynamic.

Static automation actions are included in FortiOS by default. They require only a name, description, and one setting. Static automation actions can be edited, but they cannot be deleted.

Dynamic automation actions require multiple settings to be configured. Dynamic automation actions can be created by clicking the *Create New* button on the *Action* tab, or clicking *Create* within the *Create Automation Stitch* page.

Multiple actions can be added to an automation stitch. Actions can be reorganized in the *Edit Automation Stitch* page by dragging and dropping the actions in the diagram.

The following table outlines the available static actions.

Action	Description
Access Layer Quarantine	This option is only available for Compromised Host triggers. Quarantine the MAC address on access layer devices (FortiSwitch and FortiAP).

Action	Description
FortiClient Quarantine	<p>This option is only available for Compromised Host triggers.</p> <p>Use FortiClient EMS to block all traffic from the source addresses that are flagged as compromised hosts.</p> <p>Quarantined devices are flagged on the Security Fabric topology views. Go to the <i>Dashboard > Assets & Identities > Quarantine</i> widget to view and manage quarantined IP addresses.</p>
FortiNAC Quarantine	<p>This option is only available for Compromised Host and Incoming Webhook triggers.</p> <p>Use FortiNAC to quarantine a client PC and disable its MAC address. See FortiNAC Quarantine action on page 2956 for details.</p>
IP Ban	<p>This option is only available for Compromised Host triggers.</p> <p>Block all traffic from the source addresses flagged by the IoC.</p> <p>Go to the <i>Dashboard > Assets & Identities > Quarantine</i> widget to view and manage quarantined IP addresses.</p>
System Action > Backup Config Disk	<p>Back up the FortiGate's configuration. The default minimum interval is 0 seconds. See System actions on page 3012 for an example.</p>
System Action > Reboot FortiGate	<p>Reboot the FortiGate. The default minimum interval is 5 minutes (300 seconds in the CLI). See System actions on page 3012 for an example.</p>
System Action > Shutdown FortiGate	<p>Shut down the FortiGate. The default minimum interval is 0 seconds.</p>

The following table outlines the available dynamic actions.

Category	Action	Description
Security Response		
	VMware NSX Security Tag	<p>This option is only available for Compromised Host triggers.</p> <p>If an endpoint instance in a VMware NSX environment is compromised, the configured security tag is assigned to the compromised endpoint. See VMware NSX security tag action on page 2959 and VMware NSX-T security tag action on page 2963 for details.</p>
Notifications		
	Email	<p>Send a custom email message to the selected recipients. At least one recipient and an email subject must be specified.</p> <p>Enable <i>Send to FortiCare email</i> to send the message to the email address associated with the FortiCare Support entitlement. This is the FortiCloud email address visible on the <i>System > FortiGuard</i> page under the <i>FortiCare Support</i> license information.</p>

Category	Action	Description
		<p>The email body can use parameters from logs or previous action results. Wrapping the parameter with %% will replace the expression with the JSON value for the parameter, for example: %%results.source%% is the source property from the previous action.</p> <p>Replacement messages can be enabled in the email body to create branded email alerts. See Replacement messages for email alerts on page 2967 for details.</p>
	FortiExplorer Notification	<p>Send push notifications to FortiExplorer.</p> <p>The FortiGate must be registered to FortiCare on the mobile app that will receive the notification.</p>
	Slack Notification	Send a notification to a Slack channel. See Slack Notification action on page 2971 for details.
	Microsoft Teams Notification	Send a notification to channels in Microsoft Teams. See Microsoft Teams Notification action on page 2975 for details.
Cloud Compute		
	AWS Lambda	Send log data to an integrated AWS service. See AWS Lambda action on page 2980 for details.
	Azure Function	Send log data to an Azure function. See Azure Function action on page 2982 for details.
	Google Cloud Function	Send log data to a Google Cloud function. See Google Cloud Function action on page 2983 for details.
	AliCloud Function	Send log data to an AliCloud function. See AliCloud Function action on page 2985 for details.
General		
	CLI Script	Run one or more CLI scripts. See CLI script action on page 2987 for details. See Execute a CLI script based on memory and CPU thresholds on page 2990 for an example.
	Webhook	Send an HTTP request using a REST callback. See Webhook action on page 2994 for details, and Slack integration webhook on page 3008 and Microsoft Teams integration webhook on page 3010 for examples.
	Alert	<p>Generate a FortiOS dashboard alert.</p> <p>This option is only available in the CLI.</p>
	Disable SSID	<p>Disable the SSID interface.</p> <p>This option is only available in the CLI.</p>

FortiNAC Quarantine action

Users can configure an automation stitch with the FortiNAC Quarantine action with a Compromised Host or Incoming Webhook trigger. When the automation is triggered, the client PC will be quarantined and its MAC address is disabled in the configured FortiNAC.

In this example, the FortiNAC has been configured to join an enabled Security Fabric. See [Configuring FortiNAC on page 2829](#) for more information.

The FortiNAC must also be configured to isolate disabled hosts:

- Endpoints connecting to FortiWiFi or wired ports on FortiGate:
 - See the requisite *Configure FortiNAC* section in the [FortiGate Endpoint Management Integration Guide](#).
- Endpoints connecting to FortiAP:
 - Set the *Dead End* VLAN. See [Model configuration](#).
- Endpoints connecting to FortiSwitch:
 - Set the *Dead End* VLAN. See [Model configuration](#).
 - Add the switch to the physical address filtering group. See [Systems groups](#) and [Modify a group](#).

To configure an automation stitch with a FortiNAC quarantine action in the GUI:

1. Create a new API user and generate the API key:
 - a. Go to *System > Administrators* and click *Create New > REST API Admin*.
 - b. Configure the settings as needed.
 - c. Click *OK*. The *New API key* window opens.
 - d. Copy the key to the clipboard and click *Close*.

- e. Click *OK*.
2. Configure the automation stitch trigger:
 - a. Go to *Security Fabric > Automation* and click *Create New*.
 - b. Enter the stitch name (*auto_webhook*).
 - c. Click *Add Trigger*.
 - d. Click *Create* and select *Incoming Webhook*.
 - e. Enter a name (*auto_webhook*).
 - f. Click *OK*.

- g. Paste the key in the *API admin key* field.

The screenshot shows two overlapping dialog boxes in the FortiNAC configuration interface. The background dialog is 'Create New Automation Trigger', which has fields for Name (auto_webhook), Description, URL (https://172.17.48.225:4431/api/v2/monitor/system/automation-stitch/webhook/auto_webhook), API admin key, and Sample cURL request. The foreground dialog is 'Incoming Webhook URL', which contains a blue information box stating: 'To trigger an automation stitch using this trigger, make an application/json POST request to this URL with the data you want to pass on to the automation action(s)'. It also shows the same URL and a sample cURL request: `curl -k -X POST -H 'Authorization: Bearer cxx7d9xdzxx14Nztd1Ncr701dpwwy9' -data '{"srcip": "1.1.1.1", "mac": "00:0C:29:0B:A6:16", "fctuid": "A8BA0B12DA694E47BA4ADF24F8358E2F"}' https://172.17.48.225:4431/api/v2/monitor/system/automation-stitch/webhook/auto_webhook`. Both dialogs have 'OK' buttons at the bottom.

- h. Click **OK**.
i. Select the trigger in the list and click **Apply**.

3. Configure the automation stitch action:

- a. Click **Add Action**.
- b. Select *FortiNAC Quarantine*.
- c. Click **Apply**.
- d. Click **OK**.

4. On a Linux PC accessible by the FortiGate, create a cURL request to trigger the automation stitch:

```
root@pc56:~# curl -k -X POST -H 'Authorization: Bearer cxx7d9xdzxx14Nztd1Ncr701dpwwy9' -
-data '{"srcip": "1.1.1.1", "mac": "00:0C:29:0B:A6:16", "fctuid":
"A8BA0B12DA694E47BA4ADF24F8358E2F"}'
https://172.17.48.225:4431/api/v2/monitor/system/automation-stitch/webhook/auto_webhook
```

5. In FortiOS, verify the automation stitch is triggered and the action is executed:

- a. Go to *Log & Report > System Events* to confirm that the stitch was activated.
 - b. Go to *Security Fabric > Automation* to see the last time that the stitch was triggered.
- In FortiNAC, the *Host View* shows the status of the client PC. It is quarantined and its MAC address is disabled.

Hosts - Displayed: 1 Total: 7

Disable

To configure an automation stitch with a FortiNAC quarantine action in the CLI:**1. Create a new API user and generate the API key:**

```
config system api-user
  edit "g-api-rw-user"
    set api-key *****
    set accprofile "super_admin"
    set vdom "root"
    config trusthost
      edit 1
        set ipv4-trusthost 10.6.30.0 255.255.255.0
      next
    end
  next
end
```

2. Configure the automation trigger:

```
config system automation-trigger
  edit "auto_webhook"
    set event-type incoming-webhook
  next
end
```

3. Configure the automation action:

```
config system automation-action
  edit "FortiNAC Quarantine"
    set action-type quarantine-fortinac
  next
end
```

4. Configure the automation stitch:

```
config system automation-stitch
  edit "auto_webhook"
    set trigger "auto_webhook"
    config actions
      edit 1
        set action "FortiNAC Quarantine"
        set required enable
      next
    end
  next
end
```

5. On a Linux PC accessible by the FortiGate, create a cURL request to trigger the automation stitch:

```
root@pc56:~# curl -k -X POST -H 'Authorization: Bearer ckx7d9xdzzx14Nztd1Ncr701dpwwy9' -
-data '{ "srcip": "1.1.1.1", "mac": "00:0C:29:0B:A6:16", "fctuid":
"A8BA0B12DA694E47BA4ADF24F8358E2F"}'
https://172.17.48.225:4431/api/v2/monitor/system/automation-stitch/webhook/auto_webhook
```

6. In FortiOS, verify that the automation stitch is triggered and the action is executed:

```
# diagnose test application autod 2
csf: enabled    root:yes
version:1592949233 sync time:Tue Jun 23 15:03:15 2020
```

```

```

VMware NSX security tag action

If an endpoint instance in a VMware NSX environment is compromised, this action will assign the configured security tag to the compromised endpoint.

This action is only available when the automation trigger is set to compromised host.

To set up the NSX quarantine action, you need to:

1. [Configure a VMware NSX SDN connector](#)
2. [Configure an NSX security tag automation stitch](#)
3. [Configure FortiAnalyzer logging on the FortiGate](#)

Configure a VMware NSX SDN connector

The FortiGate retrieves security tags from the VMware NSX server through the connector.

To configure a VMware NSX SDN connector in the GUI:

1. Go to *Security Fabric > External Connectors*.
2. Click *Create New*.
3. Select *VMware NSX*.

4. Configure the settings as needed.

5. Click OK.

To configure a VMware NSX SDN connector in the CLI:

```
config system sdn-connector
  edit "nsx"
    set type nsx
    set server "172.18.64.32"
    set username "admin"
    set password xxxxxxxxxxxx
  next
end
```

Configure an NSX security tag automation stitch

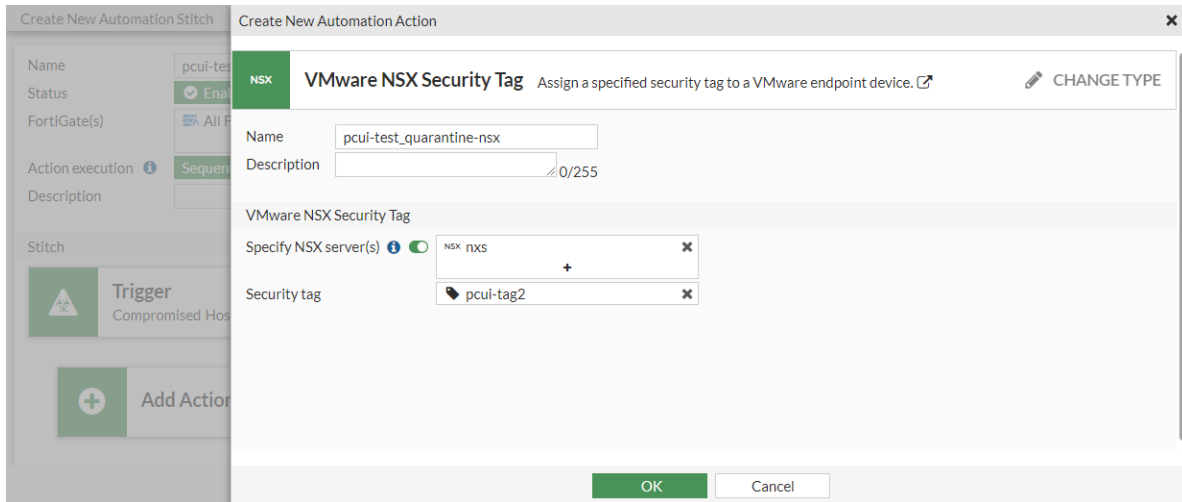

Security tags are retrieved from the VMware NSX server through the NSX SDN connector.

To configure an automation stitch with an NSX security tag in the GUI:

1. Go to *Security Fabric > Automation* and click *Create New*.
2. Enter the stitch name (*pcui-test*).
3. Configure the trigger:
 - a. Click *Add Trigger*.
 - b. Select *Compromised Host*.
 - c. Click *Apply*.
4. Configure the VMware NSX Security Tag action:
 - a. Click *Add Action*.
 - b. Click *Create* and select *VMware NSX Security Tag*.

- c. Enter the following:

Name	pcui-test_quarantine-nsx
Specify NSX server(s)	Enable and select the SDN connector
Security tag	Select an existing tag, or create a new one

- d. Click **OK**.
 e. Select the action in the list and click *Apply*.

5. Click **OK**.

To configure an automation stitch with an NSX security tag in the CLI:

1. Create the automation trigger:

```
config system automation-trigger
  edit "Compromised Host"
  next
end
```

2. Create the automation action:

```
config system automation-action
  edit "pcui-test_quarantine-nsx"
  set action-type quarantine-nsx
  set security-tag "pcui-tag2"
  set sdn-connector "nsx"
  next
end
```

3. Create the automation stitch:

```
config system automation-stitch
  edit "pcui-test"
  set trigger "Compromised Host"
  config actions
    edit 1
      set action "pcui-test_quarantine-nsx"
      set required enable
    next
  end
```

```

        next
    end
    next
end

```

Configure FortiAnalyzer logging on the FortiGate

The FortiAnalyzer is used to send endpoint compromise notification to the FortiGate.

See [Configuring FortiAnalyzer on page 2779](#) for more information.

To configure FortiAnalyzer logging in the GUI:

1. Go to **Security Fabric > Fabric Connectors** and double-click the **Logging & Analytics** card.
2. In the **FortiAnalyzer** tab, ensure the **Status** is **Enabled**, and configure the settings as needed.

The screenshot displays the 'Logging Settings' window in the FortiGate GUI. The 'FortiAnalyzer' tab is active, showing the following configuration:

- Status:** Enabled (with a green checkmark icon and a red 'X' icon for Disabled).
- Server:** 10.6.30.250
- Connection status:** Connected (with a green plus icon and a 'Refresh' button).
- Upload option:** Real Time (selected), Every Minute, Every 5 Minutes.
- Allow access to FortiGate REST API:** Enabled (with a green toggle switch).
- Verify FortiAnalyzer certificate:** Enabled (with a green toggle switch and a certificate icon).
- FortiAnalyzer Status:**
 - Log queued: 0
 - Failed logs: 0
- Logging Usage:**
 - Logging ADOM: root
 - Remote Logs Sent Daily:
 - Traffic log (green)
 - Event log (orange)
 - Web filter log (purple)
 - Bar chart showing logging usage from Dec-24 to Dec-30. Usage is zero until Dec-27, then shows significant spikes on Dec-28 and Dec-29, reaching over 200 MB.

At the bottom of the window are 'OK' and 'Cancel' buttons.

3. Click **OK**.

To configure FortiAnalyzer logging in the CLI:

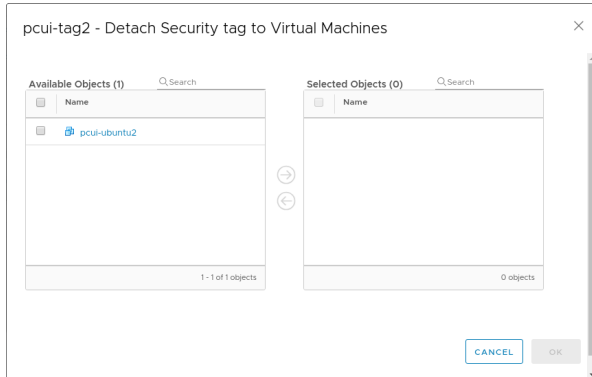

```

config log fortianalyzer setting
    set status enable
    set server "172.18.64.234"
    set serial "FL-8HFT000000000"
    set upload-option realtime
    set reliable enable
end

```

When an endpoint instance is compromised

When an endpoint instance, such as *pcui-ubuntu2*, in the VMware NSX environment is compromised, the automation stitch is triggered. The FortiGate then assigns the configured security tag, *pcui-tag2* in this example, to the compromised NSX endpoint instance.

VMware NSX-T security tag action

VMware NSX SDN connectors' vCenter server and credentials can be configured so the FortiGate resolves NSX-T VMs. The FortiGate uses the VMware NSX Security Tag automation action to assign a tag to the VM through an automation stitch.

The FortiGate is notified of a compromised host on the NSX-T network by an incoming webhook or other means, such as FortiGuard IOC. An automation stitch can be configured to process this trigger and action it by assigning a VMware NSX security tag on the VM instance.

To configure an automation stitch to assign a security tag to NSX-T VMs in the GUI:

1. Configure the NSX SDN connector:
 - a. Go to *Security Fabric > External Connectors* and click *Create New*.
 - b. Select *VMware NSX*.
 - c. Configure the connector settings.
 - d. Enable *vCenter Settings* and configure as needed.

New External Connector

- Video Tutorials

- e. Click **OK**.
2. Configure the automation stitch trigger:
 - a. Go to *Security Fabric > Automation* and click *Create New*.
 - b. Enter the stitch name (*auto_webhook*).
 - c. Click *Add Trigger*.
 - d. Click *Create* and select *Incoming Webhook*.
 - e. Enter a name (*auto_webhook*).
 - f. Click **OK** to close the *Incoming Webhook URL* prompt.
 - g. Select the trigger in the list and click *Apply*.
3. Configure the automation stitch action:
 - a. Click *Add Action*.
 - b. Click *Create* and select *VMware NSX Security Tag*.
 - c. Enter the following:

Name	auto_webhook_quarantine-nsx
Specify NSX server(s)	Enable and select the SDN connector
Security tag	Select an existing tag, or create a new one

d. Click **OK**.

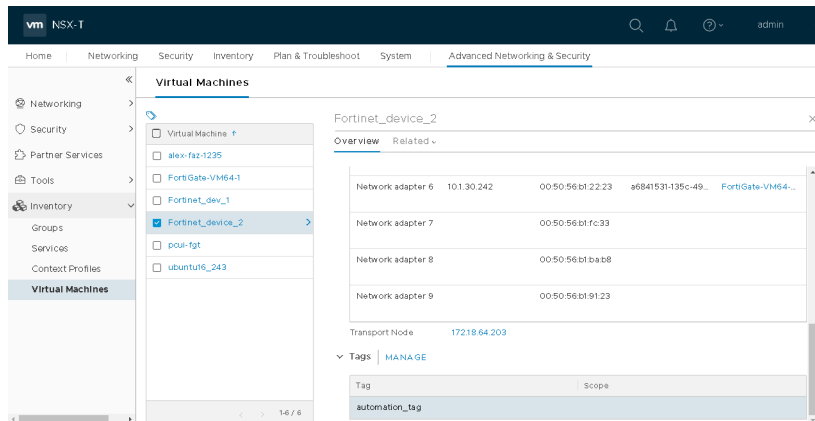

e. Select the action in the list and click **Apply**.

4. Click **OK**.

5. In NSX-T, create a cURL request to trigger the automation stitch on the FortiGate:

```
root@pc56:/home# curl -k -X POST -H 'Authorization: Bearer
3fdxNG08mgNg0fh4NQ51g1NQ1QHcx' --data '{"srcip": "10.1.30.242"}'
https://172.16.116.230/api/v2/monitor/system/automation-stitch/webhook/auto_webhook
{
  "http_method": "POST",
  "status": "success",
  "http_status": 200,
  "serial": "FGVM08TM20000000",
  "version": "v6.4.0",
  "build": 1608
}
```

The automation stitch is triggered and the configured tag is added to the NSX-T VM.

In FortiOS, the *Security Fabric > Automation* page shows the last trigger time.

+ Create New		Edit	Delete	Clone	Search	Q	Manage Components	
Name	Status	Trigger	Actions		FortiGate(s)	Trigger Count	Last Triggered	
Incoming Webhook 2								
Incoming Webhook Quarantine	Enabled	Incoming Webhook Call	Compromised Host Quarantine_quarantine Compromised Host Quarantine_quarantine-forticlient		All FortiGates	0		
auto_webhook	Enabled	auto_webhook	NSX auto_webhook_quarantine-nsx		All FortiGates	1	6 minutes ago	
100% 2 Updated: 15:38:21								

To configure an automation stitch to assign a security tag to NSX-T VMs in the CLI:

1. Configure the NSX SDN connector:

```
config system sdn-connector
  edit "nsx_t25"
    set type nsx
    set server "172.18.64.205"
    set username "admin"
    set password xxxxxxxxxxxx
    set vcenter-server "172.18.64.201"
    set vcenter-username "administrator@vsphere.local"
    set vcenter-password xxxxxxxxxxxx
  next
end
```

2. Configure the automation stitch:

```
config system automation-trigger
  edit "auto_webhook"
    set trigger-type event-based
    set event-type incoming-webhook
  next
end

config system automation-action
  edit "auto_webhook_quarantine-nsx"
    set action-type quarantine-nsx
    set security-tag "automation_tag"
    set sdn-connector "nsx_t25"
  next
end

config system automation-stitch
  edit "auto_webhook"
    set trigger "auto_webhook"
    config actions
      edit 1
        set action "auto_webhook_quarantine-nsx"
        set required enable
      next
    end
  next
end
```

3. In NSX-T, create a cURL request to trigger the automation stitch on the FortiGate:

```
root@pc56:/home# curl -k -X POST -H 'Authorization: Bearer
3fdxNG08mgNg0fh4NQ51g1NQ1QHcxx' --data '{ "srcip": "10.1.30.242"}'
https://172.16.116.230/api/v2/monitor/system/automation-stitch/webhook/auto_webhook
```

```
{
  "http_method": "POST",
  "status": "success",
  "http_status": 200,
  "serial": "FGVM08TM20000000",
  "version": "v6.4.0",
  "build": 1608
}
```

To verify the automation stitch is triggered and the action is executed:

```
# diagnose test application autod 2

csf: enabled root:yes
version:1586883541 sync time:Tue Apr 14 11:04:05 2020

total stitches activated: 1

stitch: auto_webhook
destinations: all
trigger: auto_webhook

(id:15)service=auto_webhook

local hit: 1 relayed to: 0 relayed from: 0
actions:
auto_webhook_quarantine-nsx type:quarantine-nsx interval:0
security tag:automation_tag
sdn connector:
nsx_t25;
```

Replacement messages for email alerts

Automation stitches with an Email action can leverage the formatting options provided by replacement messages to create branded email alerts.

You can enable a replacement message and edit the message body or select a customized replacement message group when you configure the automation action. When the automation stitch is triggered, the FortiGate will send the email with the defined replacement message.

In this example, a Security Rating report triggers an Email notification action. The email uses a customized replacement message group.

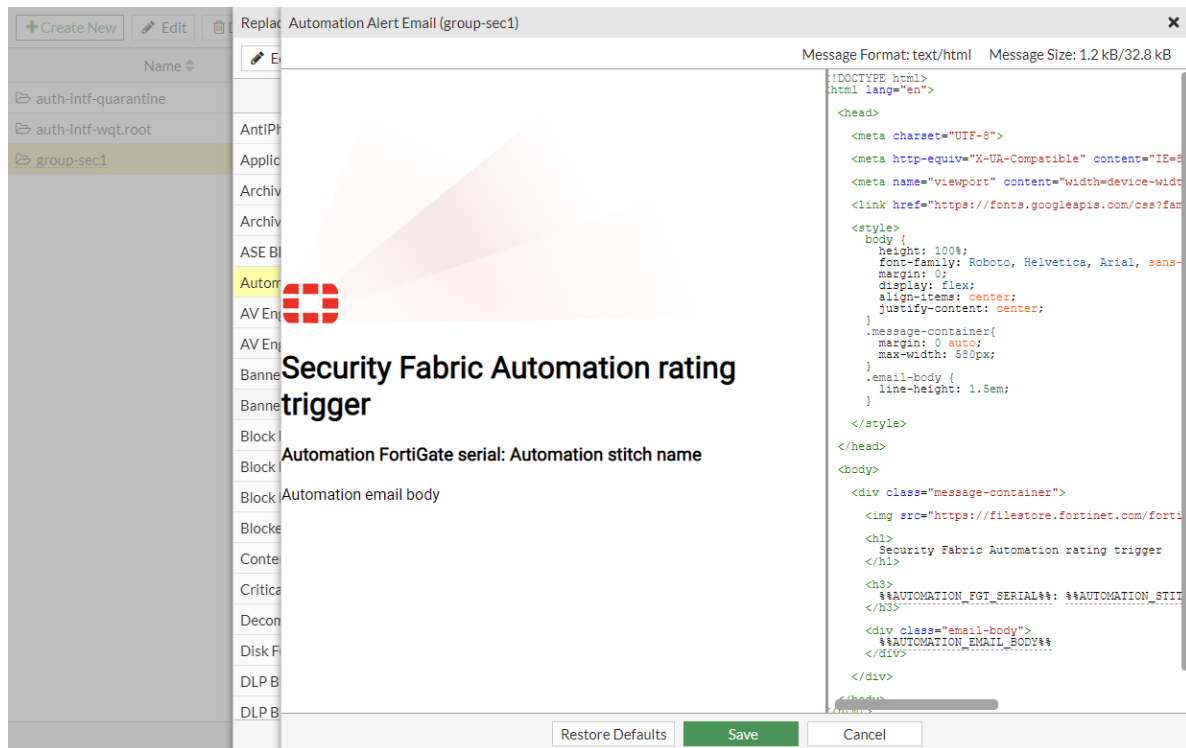

To configure the replacement message group in the GUI:

1. Go to *System > Replacement Message Groups* and click *Create New*.
2. Enter the following:

Name	group-sec1
Group Type	Security

3. Click *OK*.
4. Select the group in the list and click *Edit*.

5. Select *Automation Alert Email* and click *Edit*.

6. Edit the HTML code as needed, then click *Save*.

To configure the email action in the GUI:

1. Go to *Security Fabric > Automation* and click *Create New*.
2. Enter the stitch name.
3. Configure the trigger:
 - a. Click *Add Trigger*.
 - b. Select *Any Security Rating Notification*.
 - c. Click *Apply*.
4. Configure the Email notification action:
 - a. Click *Add Action*.
 - b. Click *Create* and select *Email*.
 - c. Enter the following:

Name	email-group1
To	Enter an email address
Subject	CSF stitch alert group1
Replacement message	Enable
Customize messages	Enable and select group-sec1 from the dropdown

- d. Click **OK**.
 - e. Select the action in the list and click **Apply**.
 5. Click **OK**.
 6. Right-click the automation stitch, and click **Test Automation Stitch**.
- After the Security Rating report is finished, the automation is triggered, and the email is delivered with the customized replacement message in the email body.

To configure the replacement message group in the CLI:

```
config system replacemsg-group
  edit "group-sec1"
    set comment ""
    set group-type utm
  config automation
    edit "automation-email"
      set buffer "...<h1> Security Fabric Automation rating trigger </h1>..."
      ...
    next
  end
```

```
    next
end
```

To configure the email action in the CLI:

1. Configure the automation trigger:

```
config system automation-trigger
    edit "Any Security Rating Notification"
        set event-type security-rating-summary
        set report-type any
    next
end
```

2. Configure the automation action:

```
config system automation-action
    edit "email-group1"
        set action-type email
        set email-to "admin@fortinet.com"
        set email-subject "CSF stitch alert group1"
        set replacement-message enable
        set replacemsg-group "group-secl"
    next
end
```

3. Configure the automation stitch:

```
config system automation-stitch
    edit "auto_rating"
        set trigger "Any Security Rating Notification"
        config actions
            edit 1
                set action "email-group1"
                set required enable
            next
        end
    next
end
```

4. To view the automation stitch information after it is triggered:

```
# diagnose test application autod 3
stitch: auto_rating
    local hit: 1 relayed to: 0 relayed from: 0
    last trigger: Tue Mar 16 15:11:29 2021
    last relay:
    actions:
        email-group1:
            done: 1 relayed to: 0 relayed from: 0
            last trigger: Tue Mar 16 15:11:29 2021
            last relay:

logid2stitch mapping:
id:52000  local hit: 1 relayed hits: 0
    auto_rating
```

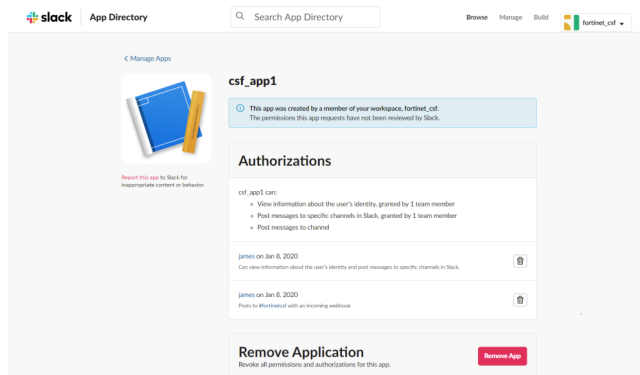

Slack Notification action

To configure an automation stitch with a Slack Notification action, you first need to configure an incoming webhook in Slack. Then you can enter the webhook URL when you configure the Slack Notification action.

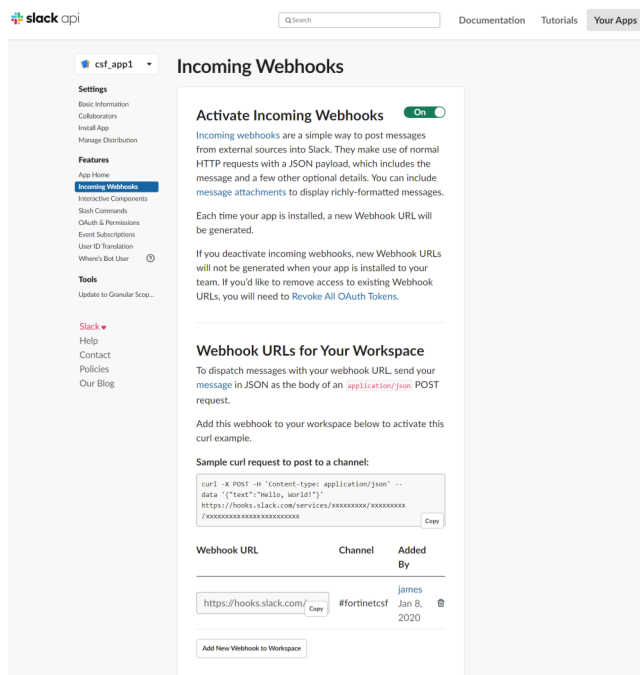

This example uses the default Any Security Rating Notification trigger in the automation stitch with two Slack Notification actions with different notification messages. One message is a custom message, and the other is for the Security Rating Summary log with a 90 second delay.

To create an Incoming Webhook in Slack:

1. Go to the Slack website, and create a workspace.
2. Create a Slack application for the workspace.

3. Add an Incoming Webhook to a channel in the workspace (see [Sending messages using Incoming Webhooks](#) for more details).
4. Activate the Incoming Webhook, and copy the *Webhook URL* to the clipboard.

To configure an automation stitch with Slack Notification actions in the GUI:

1. Go to *Security Fabric > Automation* and click *Create New*.
2. Enter the stitch name.
3. Configure the trigger:
 - a. Click *Add Trigger*.
 - b. Select *Any Security Rating Notification*.
 - c. Click *Apply*.
4. Configure the first Slack Notification action:
 - a. Click *Add Action*.
 - b. Click *Create* and select *Slack Notification*.
 - c. Enter the following:

Name	slack1
URL	Paste the webhook URL from the clipboard
Message	Text
Message text	This is test for slack notification.

The screenshot shows the 'Create New Automation Action' dialog box. The title bar says 'Create New Automation Action'. The dialog has a sidebar on the left with 'Slack Notification' selected. The main area contains the following fields:

- Name:** slack1
- Minimum interval:** 0 second(s)
- Description:** (empty field)
- Slack Notification:**
 - URL:** https://hooks.slack.com/services/xxxxxxx/xxxxxxx/xxxxxxxxxxxxxxxxxxxxxxxx
 - Message:** Text (selected), JSON
 - Message content:** This is test for slack notification.

At the bottom, there are 'OK' and 'Cancel' buttons.

- d. Click *OK*.
- e. Select the action in the list and click *Apply*.
5. Configure the second Slack Notification action:
 - a. Click *Add Action*.
 - b. Click *Create* and select *Slack Notification*.
 - c. Enter the following:

Name	slack2
-------------	--------

URL	Paste the webhook URL from the clipboard
Message	Text
Message text	%%log%%

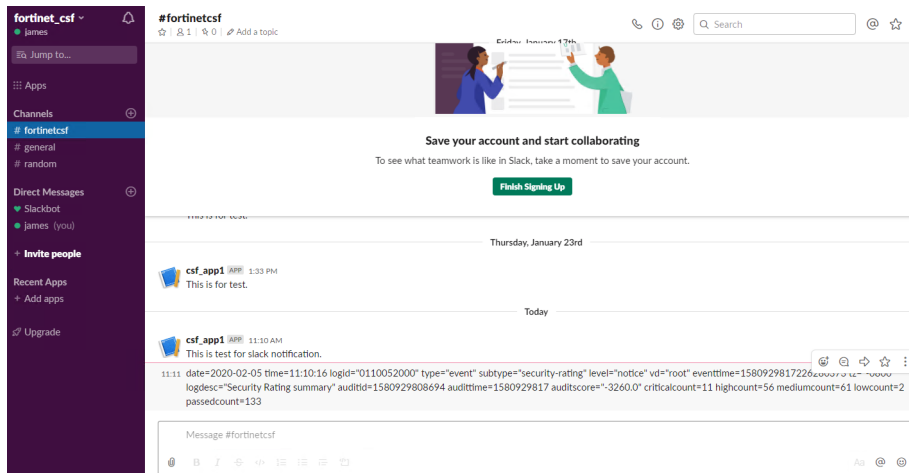

- d. Click **OK**.
- e. Select the action in the list and click **Apply**.
- f. Click the **Add delay** located between both actions. Enter **90** and click **OK**.

6. Click **OK**.

7. Trigger the automation stitch:

a. Right-click the automation stitch and select *Test Automation Stitch*.

After the Security Rating report is finished, the automation is triggered and an event log is created by the FortiGate. The two notifications are sent to the Slack channel.

To configure an automation stitch with Slack Notification actions in the CLI:

1. Configure the automation trigger:

```
config system automation-trigger
  edit "Any Security Rating Notification"
    set event-type security-rating-summary
    set report-type any
  next
end
```

2. Configure the automation actions:

```
config system automation-action
  edit "slack1"
    set action-type slack-notification
    set message "This is test for slack notification."
    set uri "hooks.slack.com/services/xxxxxxxx/xxxxxxxx/xxxxxxxxxxxxxxxxxxxxxxxx"
  next
  edit "slack2"
    set action-type slack-notification
    set uri "hooks.slack.com/services/xxxxxxxx/xxxxxxxx/xxxxxxxxxxxxxxxxxxxxxxxx"
  next
end
```

3. Configure the automation stitch:

```
config system automation-stitch
  edit "auto_rating"
    set trigger "Any Security Rating Notification"
    config actions
      edit 1
        set action "slack1"
        set required enable
      next
      edit 2
```

```
        set action "slack2"
        set delay 90
        set required enable
    next
end
next
end
```

4. Verify that the automation action was triggered:

```
# diagnose test application autod 3
stitch: auto-rating
  local hit: 1 relayed to: 0 relayed from: 0
  last trigger:Wed Feb 05 11:10:23 2020
  last relay:
  actions:
    slack1:
      done: 1 relayed to: 0 relayed from: 0
      last trigger:Wed Feb 11:10:23 2020
      last relay:
    slack2:
      done: 1 relayed to: 0 relayed from: 0
      last trigger:Wed Feb 05 11:10:23 2020
      last relay:
```

Microsoft Teams Notification action

Microsoft Teams Notification actions can be configured to send notifications to channels in Microsoft Teams. To trigger the notifications, you need to add an Incoming Webhook connector to a channel in Microsoft Teams, then you can configure the automation stitch with the webhook URL.

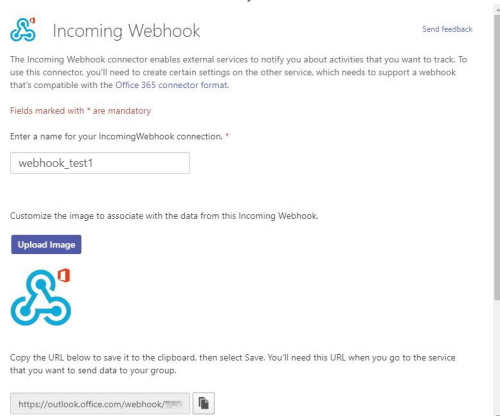

In the following example, you will configure an automation stitch with the default Any Security Rating Notification trigger and two Microsoft Teams Notification actions with different notification messages. One message is for the Security Rating Summary log, and the other is a custom message with a ten second delay.

To add the Incoming Webhook connector in a Microsoft Teams channel:

1. In Microsoft Teams, click the ... (*More options*) beside the channel name, and select *Connectors*.
2. Search for *Incoming Webhook* and click *Configure*.
3. Enter a name for the webhook, upload an image for the webhook, and click *Create*.

4. Copy the webhook to the clipboard and save it.

Connectors for "General" channel in "Alert-myself" team

Send feedback

The Incoming Webhook connector enables external services to notify you about activities that you want to track. To use this connector, you'll need to create certain settings on the other service, which needs to support a webhook that's compatible with the Office 365 connector format.

Fields marked with * are mandatory

Enter a name for your IncomingWebhook connection.*

webhook_test1

Customize the image to associate with the data from this Incoming Webhook.

Upload Image

Copy the URL below to save it to the clipboard, then select Save. You'll need this URL when you go to the service that you want to send data to your group.

<https://outlook.office.com/webhook/7881...>

5. Click *Done*.

To configure an automation stitch with Microsoft Teams Notification actions in the GUI:

1. Go to *Security Fabric > Automation* and click *Create New*.
2. Enter the stitch name.
3. Configure the trigger:
 - a. Click *Add Trigger*.
 - b. Select *Any Security Rating Notification*.
 - c. Click *Apply*.
4. Configure the first Microsoft Teams Notification action:
 - a. Click *Add Action*.
 - b. Click *Create* and select *Microsoft Teams Notification*.
 - c. Enter the following:

Name	teams_1
URL	Paste the webhook URI from the clipboard
Message	Text
Message text	%%log%%

The screenshot shows the 'Create New Automation Action' window for a 'Microsoft Teams Notification' action. The window has a sidebar on the left with options like 'Name', 'Status', 'FortiGate(s)', 'Action execution', 'Description', 'Stitch', 'Trigger', and 'Add Action'. The main area contains the following fields:

- Name:** teams_1
- Minimum interval:** 0 second(s)
- Description:** (empty)
- Microsoft Teams Notification:**
 - URL:** https://outlook.office.com/webhook/xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx@xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx/IncomingWebhook/xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx/xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx (186/1023)
 - Message:** Text JSON (7/4095)

At the bottom, there are 'OK' and 'Cancel' buttons.

d. Click **OK**.

e. Select the action in the list and click **Apply**.

5. Configure the second Microsoft Teams Notification action:

a. Click **Add Action**.

b. Click **Create** and select **Microsoft Teams Notification**.

c. Enter the following:

Name	teams_2
URL	Paste the webhook URI from the clipboard
Message	Text
Message text	This is for test.

6. Click **OK**.
7. Trigger the automation stitch:
 - a. Right-click the automation stitch and select *Test Automation Stitch*.

After the Security Rating report is finished, the automation is triggered and an event log is created by the FortiGate. The two notifications are sent to the Microsoft Teams channel.

To configure an automation stitch with Microsoft Teams Notification actions in the CLI:

1. Configure the automation trigger:

```
config system automation-trigger
  edit "Any Security Rating Notification"
    set event-type security-rating-summary
    set report-type any
  next
end
```

2. Configure the automation actions:

```
config system automation-action
  edit "teams_1"
    set action-type microsoft-teams-notification
    set uri "outlook.office.com/webhook/xxxxxxxx-xxxx-xxxx-xxxx-
xxxxxxxxxxxxx@xxxxxxxx-xxxx-xxxx-xxxx-
xxxxxxxxxxxxx/IncomingWebhook/xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx/xxxxxxxx-xxxx-xxxx-xxxx-
xxxxxxxxxxxxx"
  next
  edit "teams_2"
    set action-type microsoft-teams-notification
    set message "This is for test."
    set uri "outlook.office.com/webhook/xxxxxxxx-xxxx-xxxx-xxxx-
xxxxxxxxxxxxx@xxxxxxxx-xxxx-xxxx-xxxx-
xxxxxxxxxxxxx/IncomingWebhook/xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx/xxxxxxxx-xxxx-xxxx-xxxx-
xxxxxxxxxxxxx"
  next
end
```

3. Configure the automation stitch:

```
config system automation-stitch
  edit "Teams_action"
```

```

        set trigger "Any Security Rating Notification"
    config actions
        edit 1
            set action "teams_1"
            set required enable
        next
        edit 2
            set action "teams_2"
            set delay 10
            set required enable
        next
    end
next
end

```

4. Verify that the automation action was triggered:

```

# diagnose test application autod 3
stitch: Teams_action
  local hit: 2 relayed to: 0 relayed from: 0
  last trigger: Mon Nov 16 10:28:08 2020

```

AWS Lambda action

AWS Lambda functions can be called when an automation stitch is triggered. This example uses the default Any Security Rating Notification trigger in the automation stitch.

To configure an AWS Lambda function automation stitch in the GUI:

1. Go to *Security Fabric > Automation* and click *Create New*.
2. Enter the stitch name.
3. Configure the trigger:
 - a. Click *Add Trigger*.
 - b. Select *Any Security Rating Notification*.
 - c. Click *Apply*.
4. Configure the AWS Lambda function action:
 - a. Click *Add Action*.
 - b. Click *Create* and select *AWS Lambda*.
 - c. Enter the following:

Name	aws-action-1
URL	Enter the request API URI
API key	Enter the API key
HTTP header	header2 : header2_value

d. Click *OK*.

e. Select the action in the list and click *Apply*.

5. Click *OK*.

To configure an AWS Lambda function automation stitch in the CLI:

1. Create the automation trigger:

```
config system automation-trigger
  edit "Any Security Rating Notification"
    set event-type security-rating-summary
    set report-type any
  next
end
```

2. Create the automation action:

```
config system automation-action
  edit "aws-action-1"
    set action-type aws-lambda
    set aws-api-key *****
    set uri "0100000000.execute-api.us-east-2.amazonaws.com/default/xxxxx-
autobatoon-XXX-lambdaXXX"
    config http-headers
      edit 1
        set key "header2"
        set value "header2_value"
      next
    end
  next
end
```

3. Create the automation stitch:

```
config system automation-stitch
  edit "auto-aws"
    set trigger "Any Security Rating Notification"
    config actions
      edit 1
        set action "aws-action-1"
        set required enable
      next
    end
  next
end
```

When the automation stitch is triggered, the *Security Fabric > Automation* page shows the stitch trigger time. In AWS, the log shows that the function was called, executed, and finished.

Azure Function action

Azure functions can be called when an automation stitch is triggered. This example uses the default Any Security Rating Notification trigger in the automation stitch.

To configure an Azure function automation stitch in the GUI:

1. Go to *Security Fabric > Automation* and click *Create New*.
2. Enter the stitch name.
3. Configure the trigger:
 - a. Click *Add Trigger*.
 - b. Select *Any Security Rating Notification*.
 - c. Click *Apply*.
4. Configure the Azure Function action:
 - a. Click *Add Action*.
 - b. Click *Create* and select *Azure Function*.
 - c. Enter the following:

Name	azure_function
URL	Enter the request API URI
Authorization	Function
API key	Enter the API key
HTTP header	header1 : value1

- d. Click *OK*.
 - e. Select the action in the list and click *Apply*.
5. Click *OK*.

To configure an Azure function automation stitch in the CLI:

1. Create an automation trigger:

```
config system automation-trigger
  edit "Any Security Rating Notification"
    set event-type security-rating-summary
    set report-type any
  next
end
```

2. Create an automation action:

```
config system automation-action
  edit "azure_function"
    set action-type azure-function
    set azure-function-authorization function
    set azure-api-key *****
    set uri "xxxxx00-no-delete-xxxx.azurewebsites.net/api/headersResponse"
    config http-headers
      edit 1
        set key "header1"
```

```

        set value "value1"
    next
end
next
end

```

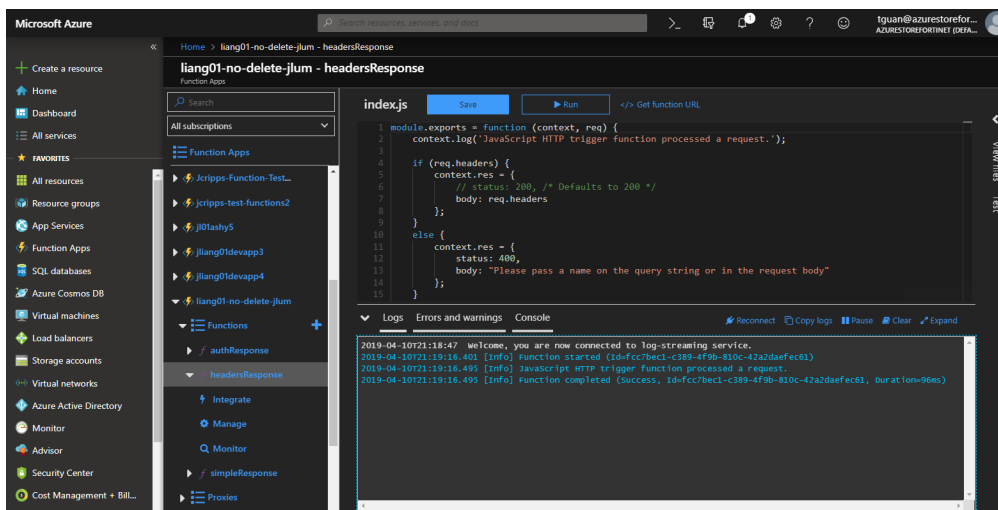

3. Create the automation stitch:

```

config system automation-stitch
    edit "auto-azure"
        set trigger "Any Security Rating Notification"
        config actions
            edit 1
                set action "azure_function"
                set required enable
            next
        end
    next
end

```

When the automation stitch is triggered, the *Security Fabric > Automation* page shows the stitch trigger time. In Azure, the function log shows that the function was called, executed, and finished:

Google Cloud Function action

Google Cloud functions can be called when an automation stitch is triggered. This example uses the default Any Security Rating Notification trigger in the automation stitch.

To configure a Google Cloud function automation stitch in the GUI:

1. Go to *Security Fabric > Automation* and click *Create New*.
2. Enter the stitch name.
3. Configure the trigger:
 - a. Click *Add Trigger*.
 - b. Select *Any Security Rating Notification*.
 - c. Click *Apply*.

4. Configure the Google Cloud Function action:

- a. Click *Add Action*.
- b. Click *Create* and select *Google Cloud Function*.
- c. Enter the following:

Name	google-echo
URL	Enter the request API URI
HTTP header	echo-header : echo-value

- d. Click *OK*.
- e. Select the action in the list and click *Apply*.

5. Click *OK*.**To configure a Google Cloud function automation stitch in the CLI:****1. Create an automation trigger:**

```
config system automation-trigger
  edit "Any Security Rating Notification"
    set event-type security-rating-summary
    set report-type any
  next
end
```

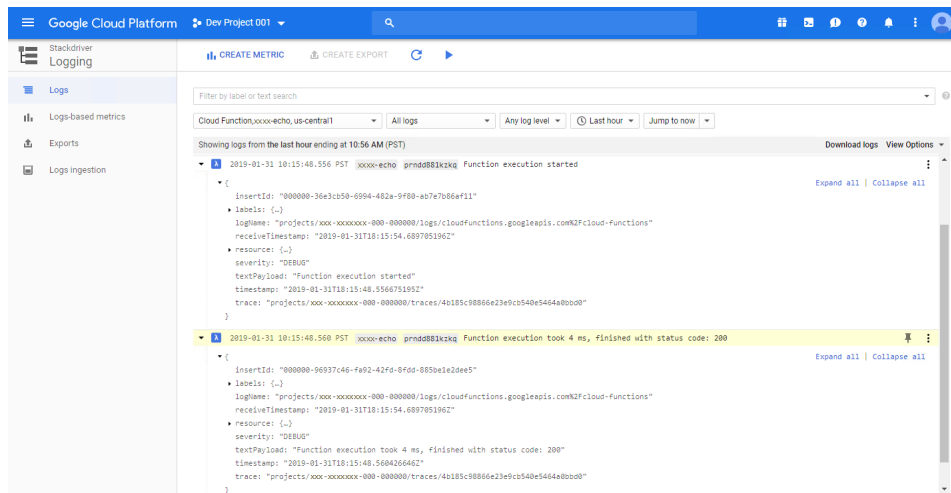

2. Create an automation action:

```
config system automation-action
  edit "google-echo"
    set action-type google-cloud-function
    set uri "us-centrall-xxx-xxxxxxx-000-000000.cloudfunctions.net/xxxx-echo"
    config http-headers
      edit 1
        set key "echo-header"
        set value "echo-value"
      next
    end
  next
end
```

3. Create the automation stitch:

```
config system automation-stitch
  edit "auto-google1"
    set trigger "Any Security Rating Notification"
    config actions
      edit 1
        set action "google-echo"
        set required enable
      next
    end
  next
end
```

When the automation stitch is triggered, the *Security Fabric > Automation* page shows the stitch trigger time. In Google Cloud, go to *Logs* to see the function log showing that the configured function was called, executed, and finished:

AliCloud Function action

AliCloud functions can be called when an automation stitch is triggered. This example uses the default Any Security Rating Notification trigger in the automation stitch.

To configure an AliCloud function automation stitch in the GUI:

1. Go to *Security Fabric > Automation* and click *Create New*.
2. Enter the stitch name.
3. Configure the trigger:
 - a. Click *Add Trigger*.
 - b. Select *Any Security Rating Notification*.
 - c. Click *Apply*.
4. Configure the AliCloud Function action:
 - a. Click *Add Action*.
 - b. Click *Create* and select *AliCloud Function*.
 - c. Enter the following:

Name	Ali-Action-1
URL	Enter the request API URI
Authorization	Function
AccessKey ID	Enter the access key ID
AccessKey Secret	Enter the access key secret

- d. Click *OK*.
 - e. Select the action in the list and click *Apply*.
5. Click *OK*.

To configure an AliCloud function automation stitch in the CLI:

1. Create an automation trigger:

```
config system automation-trigger
    edit "Any Security Rating Notification"
        set event-type security-rating-summary
        set report-type any
    next
end
```

2. Create an automation action:

```
config system automation-action
    edit "Ali-Action-1"
        set action-type alicloud-function
        set alicloud-function-authorization function
        set alicloud-access-key-id "XXXXXXXXXXXXXXXXXXXX"
        set alicloud-access-key-secret xxxxxx
        set uri "0000000000000000.us-east-1.fc.aliyuncs.com/2099-99-99/proxy/test-function/echoBodyAuth/"
    next
end
```

3. Create the automation stitch:

```
config system automation-stitch
    edit "auto-ali"
        set trigger "Any Security Rating Notification"
        config actions
            edit 1
                set action "Ali-Action-1"
                set required enable
            next
        end
    next
end
```

When the automation stitch is triggered, the *Security Fabric > Automation* page shows the stitch trigger time. In AliCloud, the function log shows that the function was called, executed, and finished:

The screenshot displays the Fortinet Security Fabric interface, specifically the logstore for the 'echoBodyAuth' function. The interface shows a list of log entries with columns for ID, Time, and Log. The log entries are as follows:

ID	Time	Log
7	03-19 09:58:01	versionid: __source__ __tag__ __receive_time__ 1553014685 __topic__ test-function functionName: echoBodyAuth message: 2019-03-19T16:58:01.220Z 2d36bde-3773-c108-7c56-2644a780f80 [verbose] [{"data": {"stitch": "auto-ali", "actions": [{"name": "Ali-Action-1", "type": "alicloud-function"}], "triggerType": "event", "eventType": "security rating summary", "sn": "FG3H1E5000000000", "time": 1553014677, "tagid": "2019-03-19", "time": "09:58:01", "type": "event", "subtype": "security-rating", "level": "notice", "vd": "root", "eventtime": "1550000000", "logdesc": "Security Rating summary", "auditid": "1550000000", "auditime": "1553014677", "auditscore": "615 0", "criticalcount": "6", "highcount": "6", "mediumcount": "13", "lowcount": "1", "passedcount": "29"}] }] qualifier: LATEST serviceName: test-function versionid: __source__

CLI script action

CLI scripts can run when an automation stitch is triggered. The scripts can be entered manually, uploaded as a file, or recorded in the CLI console. The output of the script can be sent as an email action.

The maximum length of the CLI script action output is 16 thousand characters. The CLI script can be configured in the GUI and CLI; however, the output size and timeout settings can only be configured in the CLI.

```
config system automation-action
  edit <name>
    set action-type cli-script
    set output-size <integer>
    set timeout <integer>
  next
end
```

output-size <integer>	Set the size to limit the script output, in megabytes (1 - 1024, default = 10).
timeout <integer>	Set the maximum running time for this script, in seconds (0 - 300, 0 = no timeout).

Example

In this example, the script sets the idle timeout value to 479 minutes, and sends an email with the script output.

To configure a stitch with a CLI script action in the GUI:

1. Go to *Security Fabric > Automation* and click *Create New*.
2. Enter the stitch name (*auto-cli-1*).
3. Configure the trigger:
 - a. Click *Add Trigger*.
 - b. Select *Any Security Rating Notification*.
 - c. Click *Apply*.
4. Configure the CLI Script action:
 - a. Click *Add Action*.
 - b. Click *Create* and select *CLI Script*.
 - c. Enter the following:

Name	admintimeout
Script	<pre>config system global set admintimeout 479 end</pre> <p>Alternatively, click <i>Upload</i> to upload a file, or click <i>>_Record in CLI console</i> and enter the CLI commands.</p>

6. Click **OK**.

To configure a stitch with a CLI script action in the CLI:

1. Create the automation trigger:

```
config system automation-trigger
  edit "Any Security Rating Notification"
    set event-type security-rating-summary
    set report-type any
  next
end
```

2. Create the automation actions:

```
config system automation-action
  edit "admintimeout"
    set action-type cli-script
    set script "config system global
    set admintimeout 479
    end"
    set output-size 10
    set timeout 0
    set accprofile "super_admin"
  next
  edit "auto-cli-1_email"
    set action-type email
    set email-to "admin@fortinet.com"
    set email-subject "CSF stitch alert"
    set message "%%results%%"
  next
end
```

3. Create the automation stitch:

```

config system automation-stitch
  edit "auto-cli-1"
    set trigger "Any Security Rating Notification"
    config actions
      edit 1
        set action "admintimeout"
        set required enable
      next
      edit 2
        set action "auto-cli-1_email"
        set required enable
      next
    end
  next
end

```

Sample email

The email sent by the action will look similar to the following:

**Execute a CLI script based on memory and CPU thresholds**

Automation stitches can be created to run a CLI script and send an email message when memory or CPU usage exceeds specified thresholds.

The maximum size of the CLI script action output is 192K characters.

To define memory and CPU usage thresholds:

```

config system global
  set cpu-use-threshold <percent>
  set memory-use-threshold-extreme <percent>
  set memory-use-threshold-green <percent>
  set memory-use-threshold-red <percent>
end

```

Where:

cpu-use-threshold	Threshold at which CPU usage is reported, in percent of total possible CPU utilization (default = 90).
memory-use-threshold-extreme	Threshold at which memory usage is considered extreme, and new sessions are dropped, in percent of total RAM (default = 95).

memory-use-threshold-green	Threshold at which memory usage forces the FortiGate to exit conserve mode, in percent of total RAM (default = 82).
memory-use-threshold-red	Threshold at which memory usage forces the FortiGate to enter conserve mode, in percent of total RAM (default = 88).

Configuring a high memory usage stitch

In this example, an automation stitch is created that runs a CLI script to collect debug information, and then email the results of the script to a specified email address when the memory usage causes the FortiGate to enter conserve mode.

To create an automation stitch for high memory usage in the GUI:

1. Go to *Security Fabric > Automation* and click *Create New*.
2. Enter the stitch name (*auto_high_memory*).
3. Configure the trigger:
 - a. Click *Add Trigger*.
 - b. Select *Conserve Mode*.
 - c. Click *Apply*.
4. Configure the CLI Script action:
 - a. Click *Add Action*.
 - b. Click *Create* and select *CLI Script*.
 - c. Enter the following:

Name	high_memory_debug
Script	<pre>diagnose sys top 5 20 3 diagnose sys session full-stat get system performance status diagnose sys session full-stat diagnose hardware sysinfo shm diagnose hardware sysinfo memory</pre>
Administrator profile	Select a profile

Create New Automation Action

Hot Questions at FortiAnswers

[Automation for debug commands?](#)

1 Answers 0 Votes 319 Views

[See More](#)

- d. Click **OK**.
 - e. Select the action in the list and click **Apply**.
5. Configure the Email notification action:
- a. Click **Add Action**.
 - b. Click **Create** and select **Email**.
 - c. Enter the following:

Name	auto_high_memory_email
To	Enter an email address
Subject	CSF stitch alert: high_memory
Body	%%results%%

- d. Click **OK**.
 - e. Select the action in the list and click **Apply**.
6. Click **OK**.

To create an automation stitch for high memory usage in the CLI:

1. Create the automation trigger:

```
config system automation-trigger
  edit "Conserve Mode"
    set event-type low-memory
  next
end
```

2. Create the automation actions:

```
config system automation-action
  edit "high_memory_debug"
    set action-type cli-script
    set script "diagnose sys top 5 20 3
diagnose sys session full-stat
```

```

get system performance status
diagnose sys session full-stat
diagnose hardware sysinfo shm
diagnose hardware sysinfo memory"
    set output-size 10
    set timeout 0
    set accprofile "super_admin"
next
edit "auto_high_memory_email"
    set action-type email
    set email-to "person@fortinet.com"
    set email-subject "CSF stitch alert: high_memory"
    set message "%results%"
next
end

```

3. Create the automation stitch:

```

config system automation-stitch
    edit "auto_high_memory"
        set trigger "Conserve Mode"
        config actions
            edit 1
                set action "high_memory_debug"
                set required enable
            next
            edit 2
                set action "auto_high_memory_email"
                set required enable
            next
        end
    end
end

```

Results

When the FortiGate enters conserve mode due to the `memory-use-threshold-red` being exceeded, the GUI displays a notice, and the `auto_high_memory` automation stitch is triggered. This causes the CLI script to run and the script results are emailed to the specified address.

The screenshot shows the FortiGate GUI with a green header bar. A red notification banner at the top states: "Conserve mode activated due to high memory usage". Below the header, there are tabs for "Stitch", "Trigger", and "Action". The "Stitch" tab is active, displaying a table of automation stitches. The table has columns: Name, Status, Trigger, Actions, FortiGate(s), Trigger Count, and Last Triggered. The "auto_high_memory" stitch is highlighted in blue, showing it is "Enabled", triggered by "Conserve Mode", and has actions "high_memory_debug" and "auto_high_memory_email".

Name	Status	Trigger	Actions	FortiGate(s)	Trigger Count	Last Triggered
Compromised Host						
Conserve Mode

Configuring a high CPU usage stitch

Similar to the previous example, an automation stitch can be created that runs a CLI script to collect debug information, and then email the results of the script to a specified email address when CPU usage threshold is exceeded (High CPU trigger).

The following commands are recommended for collecting debug information, but they are not the only options. Other commands can be used.

```

diagnose sys cmdb info
diagnose sys vd list | grep fib
diagnose sys top 5 20 2
diagnose sys session full-stat
diagnose sys session list | grep "<dirty>" -c
get system performance status
diagnose sys session full-stat
diagnose hardware sysinfo memory
diagnose sys cmdb info
diagnose sys vd list | grep fib

```

Webhook action

The webhook automation stitch action makes HTTP and HTTPS requests to a specified server, with custom headers, bodies, ports, and methods. It can be used to leverage the ubiquity of HTML requests and APIs to integrate with other tools.

The URI and HTTP body can use parameters from logs or previous action results. Wrapping the parameter with %% will replace the expression with the JSON value for the parameter, for example: `%%results.source%%` is the source property from the previous action.

In this example, a specific log message (failed administrator log in attempt) triggers the FortiGate to send the contents of the log to a server. The server responds with a generic reply. This example assumes that the server is already configured and able to communicate with the FortiGate.

To configure the webhook automation stitch in the GUI:

1. Go to *Security Fabric > Automation* and click *Create New*.
2. Enter the stitch name (*badLogin*).
3. Configure the trigger:
 - a. Click *Add Trigger*.
 - b. Click *Create* and select *FortiOS Event Log*.
 - c. Enter the following:

Name	badLogin
Event	Admin login failed

- d. Click *OK*.
 - e. Select the trigger in the list and click *Apply*.
4. Configure the automation stitch action:
 - a. Click *Add Action*.
 - b. Click *Create* and select *Webhook*.
 - c. Enter the following:

Name	Send Log To Server
Protocol	HTTP
URL	172.16.200.44
Custom port	Enable and enter 80
Method	POST
HTTP body	%%log%%
HTTP header	Header : 1st Action

Create New Automation Action

Webhook Send an HTTP request using a REST callback. [?](#) CHANGE TYPE

Name:

Minimum interval: second(s)

Description:

Webhook

Protocol: HTTP HTTPS

URL: 13/1023

Custom port: ☒

Method: POST PUT GET PATCH DELETE

HTTP body: 7/4095 %

HTTP header: :

OK Cancel

- d. Click **OK**.
 - e. Select the action in the list and click **Apply**.
5. Click **OK**.

To configure the webhook automation stitch in the CLI:

1. Create an automation trigger:

```
config system automation-trigger
  edit "badLogin"
    set event-type event-log
    set logid 32002
  next
end
```

2. Create the automation action:

```
config system automation-action
  edit "Send Log To Server"
    set action-type webhook
    set uri "172.16.200.44"
    set http-body "%log%"
    set port 80
    config http-headers
      edit 1
        set key "Header"
        set value "1st Action"
      next
    end
  next
end
```

3. Create the automation stitch:

```
config system automation-stitch
  edit "badLogin"
    set trigger "badLogin"
    config actions
```

```

edit 1
    set action "Send Log To Server"
    set required enable
next
end
next
end

```

To test the automation stitch:

1. Attempt to log in to the FortiGate with an incorrect username or password.
2. On the server, check the log to see that its contents were sent by the FortiGate.

```

```

Webhook action with Twilio for SMS text messages

The FortiGate automation stitch framework can be used to interact with third-party services with webhooks to perform various tasks. A webhook action to Twilio can be used to automate tasks that send alerts and information to administrators by SMS text messages.

This topic includes two examples where the FortiGate uses webhooks to trigger Twilio to send SMS text messages to an administrator.

- [Example 1: using an SD-WAN health check to trigger a Twilio webhook action](#)
- [Example 2: using an incoming webhook to trigger a Twilio webhook action](#)

Prerequisites

- An active Twilio account with a virtual phone number that is able to send SMS text messages to the receiver in the desired region
- A valid Twilio Account SID and Auth token for sending SMS text messages

These examples assume that the Twilio account is already configured. For more information, see [Creating or Updating Resources with the POST Method](#) in the Twilio documentation.

Example 1: using an SD-WAN health check to trigger a Twilio webhook action

In this example, an administrator wants to monitor the FortiGate's SD-WAN health, particularly when a dead health check is reported. An automation stitch will trigger the alert based on an SD-WAN log event (log ID 0113022931, SD-WAN SLA information warning) and perform a webhook action to inform Twilio to send an SMS message.

Sample SD-WAN log event

```
date=2023-01-13 time=10:39:26 eventtime=1673635167489361827 tz="-0800" logid="0113022931"
type="event" subtype="sdwan" level="warning" vd="root" logdesc="SDWAN SLA information
warning" eventtype="Health Check" healthcheck="Google" interface="VLAN1101"
probepproto="ping" oldvalue="alive" newvalue="dead" msg="SD-WAN health-check member changed
state."
```

To configure the automation stitch in the GUI:

1. Go to *Security Fabric > Automation* and click *Create New*.
2. Enter the stitch name (*SD-WAN-HC-Down-SMS*).
3. Configure the FortiOS event log trigger:
 - a. Click *Add Trigger*.
 - b. Click *Create* and select *FortiOS Event Log*.
 - c. Enter the following:

Name	<i>SD-WAN-HC-Down</i>
Event	<i>SDWAN SLA information warning</i>
Field filter(s)	<i>Set Field name to newvalue. Set Value to dead.</i>

- d. Click *OK*.
- e. Select the trigger in the list and click *Apply*.

4. Configure the webhook action:

- a. Click *Add Action*.
- b. Click *Create* and select *Webhook*.
- c. Enter the following:

Name	<i>Twilio-SMS-HC</i>
Protocol	<i>HTTPS</i>
URL	Enter the URL provided by Twilio for sending SMS messages using the POST method. The URL can be found in the cURL code sample in the following format: <i>https://api.twilio.com/2010-04-01/Accounts/<Twilio_Account_SID>/Messages.json</i> .
Method	<i>POST</i>
HTTP body	<i>Body=%%log%%&From=%2B1360x*****&To=%2B1604*****</i> This string for the body text includes the SD-WAN log message, and the Twilio from and to phone numbers.
HTTP header	<i>Content-Type : application/x-www-form-urlencoded</i> <i>Authorization : Basic <Base64_encoded_authentication_code></i>

Create New Automation Action

Webhook Send an HTTP request using a REST callback. [CHANGE TYPE](#)

Hot Questions at FortiAnswers

Automation for debug commands?

1 Answers 0 Votes 168 Views

[See More](#)

- d. Click **OK**.
- e. Select the action in the list and click **Apply**.

5. Click **OK** to save the stitch.

To configure the automation stitch in the CLI:

1. Configure the automation trigger:

```
config system automation-trigger
  edit "SD-WAN-HC-Down"
    set event-type event-log
    set logid 22931
    config fields
      edit 1
        set name "newvalue"
        set value "dead"
      next
    end
  next
end
```

2. Configure the automation action:

```
config system automation-action
  edit "Twilio-SMS-HC"
    set action-type webhook
    set protocol https
    set uri "api.twilio.com/2010-04-01/Accounts/*****/Messages.json"
    set http-body "Body=%%log%%&From=%2B1360*****&To=%2B1604*****"
    set port 443
```

```

config http-headers
  edit 1
    set key "Content-Type"
    set value "application/x-www-form-urlencoded"
  next
  edit 2
    set key "Authorization"
    set value "Basic *****"
  next
end
next
end

```

3. Configure the automation stitch:

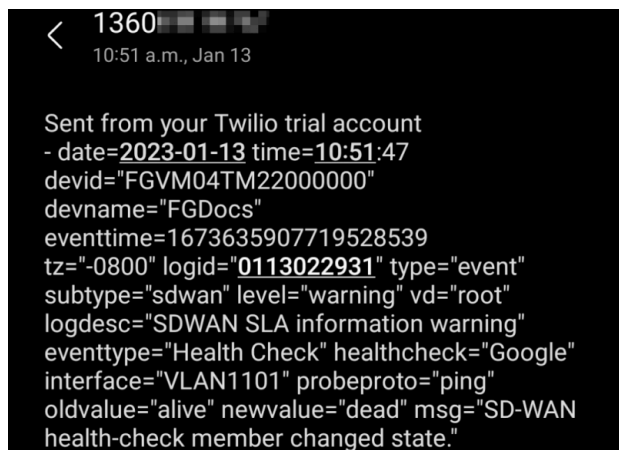

```

config system automation-stitch
  edit "SD-WAN-HC-Down-SMS"
    set trigger "SD-WAN-HC-Down"
    config actions
      edit 1
        set action "Twilio-SMS-HC"
        set required enable
      next
    end
  next
end

```

Verification:

1. Simulate an SD-WAN health check failure to trigger the automation stitch.
2. Twilio sends an SMS message to the administrator.

3. Go to *Security Fabric > Automation* and locate the *SD-WAN-HC-Down-SMS* stitch. The *Trigger Count* value has increased by one.

System log after the stitch was triggered:

```

date=2023-01-13 time=10:51:47 eventtime=1673635907720476287 tz="-0800" logid="0100046600"
type="event" subtype="system" level="notice" vd="root" logdesc="Automation stitch triggered"
stitch="SD-WAN-HC-Down-SMS" trigger="SD-WAN-HC-Down" stitchaction="Twilio-SMS-HC" from="log"
msg="stitch:SD-WAN-HC-Down-SMS is triggered."

```

Example 2: using an incoming webhook to trigger a Twilio webhook action

In this example, an administrator wants to trigger an automation stitch remotely to retrieve the device uptime with an SMS text message. An incoming webhook will be used to send an HTTP POST request to trigger the event to occur. Subsequently, the FortiGate performs a CLI action followed by a webhook action to inform Twilio to send an SMS text message.

A REST API administrator with write privileges must be configured to apply an API key to this incoming webhook. See [REST API administrator on page 2399](#) for more information.

To configure the automation stitch in the GUI:

1. Go to *Security Fabric > Automation* and click *Create New*.
2. Enter the stitch name (*Check-Uptime*).
3. Configure the incoming webhook trigger:
 - a. Click *Add Trigger*.
 - b. Click *Create* and select *Incoming Webhook*.
 - c. Enter the trigger name (*Check-Uptime-Webhook*).
 - d. Click *OK*.
 - e. Select the trigger in the list and click *Apply*.
4. Configure the CLI script action:
 - a. Click *Add Action*.
 - b. Click *Create* and select *CLI Script*.
 - c. Enter the following:

Name	Uptime
Script	<code>get system performance status grep Uptime</code>
Administrator profile	Select a profile with REST API write privileges (<i>prof_admin</i>)

- d. Click *OK*.
 - e. Select the action in the list and click *Apply*.
5. Configure the webhook action:
 - a. Click *Add Action*.
 - b. Click *Create* and select *Webhook*.
 - c. Enter the following:

Name	<i>Twilio-SMS-Uptime</i>
Protocol	<i>HTTPS</i>
URL	Enter the URL provided by Twilio for sending SMS messages using the POST method. The URL can be found in the cURL code sample in the following format: <i>https://api.twilio.com/2010-04-01/Accounts/<Twilio_Account_SID>/Messages.json</i> .
Method	<i>POST</i>
HTTP body	<i>Body=%%results%%&From=%2B1360*****&To=%2B1604*****</i> This string for the body text includes the results from the preceding CLI script action.
HTTP header	<i>Content-Type : application/x-www-form-urlencoded</i> <i>Authorization : Basic <Base64_encoded_authentication_code></i>

d. Click **OK**.

e. Select the action in the list and click *Apply*.

6. Click **OK** to save the stitch.

To configure the automation stitch in the CLI:

1. Configure the automation trigger:

```
config system automation-trigger
  edit "Check-Uptime-Webhook"
    set event-type incoming-webhook
  next
end
```

2. Configure the automation actions:

```
config system automation-action
  edit "Uptime"
    set action-type cli-script
    set script "get system performance status | grep Uptime"
    set accprofile "prof_admin"
  next
  edit "Twilio-SMS-Uptime"
    set action-type webhook
    set protocol https
    set uri "api.twilio.com/2010-04-01/Accounts/*****/Messages.json"
    set http-body "Body=%%results%%&From=%2B1360*****&To=%2B1604*****"
    set port 443
    config http-headers
      edit 1
        set key "Content-Type"
        set value "application/x-www-form-urlencoded"
      next
      edit 2
        set key "Authorization"
        set value "Basic *****"
      next
    next
  next
end
```

```

        end
    next
end

```

3. Configure the automation stitch:

```

config system automation-stitch
    edit "Check-Uptime"
        set trigger "Check-Uptime-Webhook"
        config actions
            edit 1
                set action "Uptime"
                set required enable
            next
            edit 2
                set action "Twilio-SMS-Uptime"
                set required enable
            next
        end
    next
end

```

Verification:

1. From a command prompt, issue the sample cURL command as recommended by the Check-Uptime-Webhook incoming webhook:

```

>curl -k -X POST -H "Authorization: Bearer <API_token>" --data "{ 'srcip': '1.1.1.1',
'mac':'11:11:11:11:11:11', 'fctuid': '*****'}"
https://x.x.x.x/api/v2/monitor/system/automation-stitch/webhook/Check-Uptime-Webhook

```

Response:

```

{
    "http_method": "POST",
    "status": "success",
    "http_status": 200,
    "serial": "FGVM04TM20000000",
    "version": "v7.2.4",
    "build": 1368
}

```

2. This triggers the automation stitch on the FortiGate to send a HTTP POST request to Twilio. In response, Twilio sends an SMS text message to the recipient.

3. From the Twilio dashboard, go to *Messaging > Overview* and verify the *Recent Messages* section to confirm that the SMS text message was delivered.

To view automation stitch diagnostics:

```
# diagnose debug enable
# diagnose debug application autod -1

2023-01-13 11:23:19 __action_cli_script_open()-180: cli script action:Uptime is called. svc
ctx:0x10b4d5c0

CURL request for action (Twilio-SMS-Uptime).
2023-01-13 11:23:20 auto_generate_generic_curl_request()-462: Formatting HTTP body with
action parameters.
2023-01-13 11:23:20 auto_generate_generic_curl_request()-495: Generic automation CURL
request POST data for action (Twilio-SMS-Uptime):
Body=##### script name: autod.569 #####

===== #1, 2023-01-13 11:23:19 =====
FGDocs $ get system performance status | grep Uptime
Uptime: 49 days, 2 hours, 14 minutes
&From=%2B1360*****&To=%2B1604*****

2023-01-13 11:23:20 auto_generate_generic_curl_request()-550: Generic automation CURL
request Host header: api.twilio.com
2023-01-13 11:23:20 auto_generate_generic_curl_request()-553: Adding 2 user defined headers
2023-01-13 11:23:23 auto_curl_perform()-114: Failed to send curl request. http status code:
201

```

Although the final line in this debug output shows Failed to send curl request. http status code: 201, the HTTP status code 201 indicates that the request was successful and a response code was created.

Slack integration webhook

A webhook can be created to post messages and notifications to Slack.

In this example, a configuration change triggers the FortiGate to post a message to Slack.

To create a webhook automation stitch for Slack integration in the GUI:

1. Create an incoming webhook in Slack. See [Sending messages using Incoming Webhooks](#) for more information.
2. Go to *Security Fabric > Automation* and click *Create New*.
3. Enter the stitch name.
4. Configure the trigger:
 - a. Click *Add Trigger*.
 - b. Select *Configuration Change*.
 - c. Click *Apply*.
5. Configure the action:
 - a. Click *Add Action*.
 - b. Click *Create* and select *Webhook*.

c. Enter the following:

Name	send to Slack
Protocol	HTTPS
URL	Enter the incoming webhook URL created in Slack
Custom port	Enable and enter 443
Method	POST
HTTP body	{\"channel\": \"#delivery\", \"username\": \"tleela\", \"text\": \"Configuration changed\", \"icon_emoji\": \":worried:\"}
HTTP header	Content-type : application/json

The screenshot shows the 'Create New Automation Action' dialog for a 'Webhook' action. The dialog is titled 'Webhook' and has a subtitle 'Send an HTTP request using a REST callback.' The 'Name' field is set to 'send to Slack'. The 'Minimum interval' is set to '0' seconds. The 'Description' field is empty. The 'Webhook' section shows the 'Protocol' set to 'HTTPS', the 'URL' set to 'https://hooks.slack.com/services/XXXXXXXX', the 'Custom port' checked and set to '443', the 'Method' set to 'POST', the 'HTTP body' set to '{\"channel\": \"#delivery\", \"username\": \"tleela\", \"text\": \"Configuration changed\", \"icon_emoji\": \":worried:\"}', and the 'HTTP header' set to 'Content-type : application/json'. The 'Security' section shows 'TLS certificate' and 'Verify remote host' both checked. The 'OK' and 'Cancel' buttons are at the bottom.

d. Click **OK**.

e. Select the action in the list and click *Apply*.

6. Click **OK**.

To create a webhook automation stitch for Slack integration in the CLI:

1. Create an incoming webhook in Slack. See [Sending messages using Incoming Webhooks](#) for more information.
2. Create the automation trigger:

```
config system automation-trigger
  edit "Configuration Change"
    set event-type config-change
  next
end
```

3. Create the automation action:

```

config system automation-action
  edit "send to Slack"
    set action-type webhook
    set protocol https
    set uri "hooks.slack.com/services/XXXXXXX"
    set http-body "{\"channel\": \"#delivery\", \"username\": \"tleela\", \"text\": \"Configuration changed\", \"icon_emoji\": \":worried:\"}"
    set port 443
    config http-headers
      edit 1
        set key "Content-type"
        set value "application/json"
      next
    end
  next
end

```

4. Create the automation stitch:

```

config system automation-stitch
  edit "Slack"
    set trigger "Configuration Change"
    config actions
      edit 1
        set action "send to Slack"
        set required enable
      next
    end
  next
end

```

Microsoft Teams integration webhook

A webhook can be created to post messages and notifications to Microsoft Teams.

In this example, a configuration change triggers the FortiGate to post a message to Teams.

To create a webhook automation stitch for Teams integration in the GUI:

1. Create an incoming webhook in Teams. See [Create an incoming webhook](#) for information.
2. Go to *Security Fabric > Automation* and click *Create New*.
3. Enter the stitch name.
4. Configure the trigger:
 - a. Click *Add Trigger*.
 - b. Select *Configuration Change*.
 - c. Click *Apply*.
5. Configure the action:
 - a. Click *Add Action*.
 - b. Click *Create* and select *Webhook*.

c. Enter the following:

Name	send to Teams
Protocol	HTTPS
URL	Enter the incoming webhook URL created in Teams
Custom port	Enable and enter 443
Method	POST
HTTP body	{ \"text\": \"<message to send>\" }
HTTP header	Content-type : application/json

The screenshot shows the 'Create New Automation Action' window for a 'Webhook' action. The 'Name' field is 'send to Teams'. The 'Minimum interval' is '0' seconds. The 'Description' field is empty. Under the 'Webhook' section, the 'Protocol' is 'HTTPS', the 'URL' is 'https://outlook.office.com/webhook/XXXXXXXXXXXX/IncomingWebhook/XXXXXXXXXXXX/XXXXXXXXXXXX', the 'Custom port' is '443', the 'Method' is 'POST', the 'HTTP body' is '{ \"text\": \"<message to send>\" }', and the 'HTTP header' is 'Content-type : application/json'. The 'Security' section shows 'TLS certificate' as disabled and 'Verify remote host' as enabled. The 'OK' and 'Cancel' buttons are at the bottom.

d. Click **OK**.

e. Select the action in the list and click *Apply*.

6. Click **OK**.

To create a webhook automation stitch for Teams integration in the CLI:

1. Create an incoming webhook in Teams. See [Create an incoming webhook](#) for information.
2. Create the automation trigger:

```
config system automation-trigger
  edit "Configuration Change"
    set event-type config-change
  next
end
```

3. Create the automation action:

```
config system automation-action
  edit "send to Teams"
    set action-type webhook
```

```

        set protocol https
        set uri
        "outlook.office.com/webhook/XXXXXXXXXXXX/IncomingWebhook/XXXXXXXXXXXX/XXXXXXXXXXXX"
        set http-body "{ \"text\": \"<message to send>\" }"
        set port 443
        config http-headers
            edit 1
                set key "Content-type"
                set value "application/json"
            next
        end
    next
end

```

4. Create the automation stitch:

```

config system automation-stitch
    edit "Teams"
        set trigger "Configuration Change"
        config actions
            edit 1
                set action "send to Teams"
                set required enable
            next
        end
    next
end

```

For information about more advanced messages that can be configured and sent to the Teams incoming webhook, see [Sending messages to connectors and webhooks](#).

System actions

The system actions can be used to back up the configuration of the FortiGate, reboot the FortiGate, or shut down the FortiGate.

These actions can occur even if the FortiGate is in conserve mode, and allows the automation stitch to bypass the CLI user confirmation prompts, which the CLI script action does not support.

```

config system automation-action
    edit "Backup Config Disk"
        set action-type system-actions
        set system-action backup-config
    next
    edit "Reboot FortiGate"
        set action-type system-actions
        set system-action reboot
    next
    edit "Shutdown FortiGate"
        set action-type system-actions
        set system-action shutdown
    next
end

```

Example

In this example, an automation stitch is created that uses the Conserve Mode trigger, a Backup Config Disk action to back up the configuration to the FortiGate's disk (see [Configuration backups on page 72](#) for more details), and then a Reboot FortiGate action. There is a 120-second delay between the two actions.

To configure an automation stitch with system actions in the GUI:

1. Go to *Security Fabric > Automation*, select the *Stitch* tab, and click *Create New*.
2. Enter the name, *system-action-stitch*.
3. Click *Add Trigger*. Select *Conserve Mode* and click *Apply*.
4. Click *Add Action*. Select *Backup Config Disk* and click *Apply*.
5. Click *Add Action*. Select *Reboot FortiGate* and click *Apply*.
6. Click *Add delay* (between the actions). Enter *120* and click *OK*.

The screenshot shows the 'Create New Automation Stitch' window in the Fortinet GUI. The 'Name' field is set to 'system-action-stitch'. The 'Status' is 'Enable'. The 'FortiGate(s)' field is set to 'All FortiGates'. The 'Action execution' is set to 'Sequential'. The 'Description' field is empty. The 'Stitch' section shows a flowchart: a 'Trigger' (Conserve Mode) followed by an 'Add delay' (120 Seconds) and then two 'Action' steps: 'Backup Config Disk' and 'Reboot FortiGate'. The 'Additional Information' section on the right includes links for 'API Preview', 'Guides', 'Online Guides', 'Relevant Documentation', 'Video Tutorials', and 'Hot Questions at FortiAnswers'.

7. Click *OK*.

To configure an automation stitch with system actions in the CLI:

1. Configure the trigger:

```
config system automation-trigger
  edit "Conserve Mode"
    set event-type low-memory
  next
end
```

2. Configure the back up and reboot actions:

```
config system automation-action
  edit "Backup Config Disk"
    set description "Backup the configuration on disk."
    set action-type system-actions
    set system-action backup-config
  next
  edit "Reboot FortiGate"
    set description "Reboot this FortiGate unit."
    set action-type system-actions
    set system-action reboot
    set minimum-interval 300
  next
end
```

3. Configure the stitch:

```
config system automation-stitch
  edit "system-action-stitch"
    set trigger "Conserve Mode"
    config actions
      edit 1
        set action "Backup Config Disk"
        set required enable
      next
      edit 2
        set action "Reboot FortiGate"
        set delay 120
        set required enable
      next
    end
  next
end
```

Verification

When the FortiGate enters conserve mode due to low memory, the automation stitch will be triggered and it will back up the configuration to the FortiGate disk, then reboot the FortiGate.

To confirm that the stitch was triggered in the GUI:

1. Go to *Security Fabric > Automation* and select the *Stitch* tab.
2. Verify the *Last Triggered* column.

To confirm that the stitch was triggered in the CLI:

```
# diagnose test application autod 3
alert mail log count: 0

stitch: system-action-stitch

local hit: 1 relayed to: 0 relayed from: 0
last trigger: Thu Jun 23 11:31:25 2022
last relay:
actions:
  Backup Config Disk:
    done: 1 relayed to: 0 relayed from: 0
```

```

last trigger:Thu Jun 23 11:31:25 2022
last relay:
Reboot FortiGate:
done: 0 relayed to: 0 relayed from: 0
last trigger:Thu Jun 23 11:31:25 2022
last relay:

logid to stitch mapping:
id:22011 local hit: 1 relayed hits: 0
system-action-stitch

log category to stitch mapping:

```

To locate the backed up configuration in the GUI:

1. Click on the user name in the upper right-hand corner of the screen and select *Configuration > Revisions*.
2. Click the + in the table to expand and view more details.

To locate the backed up configuration in the CLI:

```

# execute revision list config
Last Firmware Version: V0.0.0-build000-REL0
1  2022-04-01 09:27:26 daemon_admin V7.2.0-build1157-REL0 Automatic backup
(upgrade)
2  2022-06-20 13:41:02 daemon_admin V7.2.1-build1254-REL0 Automatic backup
(upgrade)
3  2022-06-23 11:31:25 daemon_admin V7.2.1-build1254-REL0 Autod backup config
by stitch: system-action-stitch

```

Public and private SDN connectors

Cloud SDN connectors provide integration and orchestration of Fortinet products with public and private cloud solutions. In a typical cloud environment, resources are dynamic and often provisioned and scaled on-demand. By using an SDN connector, you can ensure that changes to cloud environment attributes are automatically updated in the Security Fabric.

To protect the East-West or North-South traffic in these environments, the FortiGate uses the SDN connector to sync the dynamic addresses that these volatile environments use. You can then configure the dynamic address objects as sources or destinations for firewall policies. When you make changes to cloud environment resources, such as moving them to a new location or assigning different IP addresses to them, you do not need to modify the policy in FortiOS, as the SDN connector syncs changes to the cloud address objects.

These configurations consist of three primary steps:

1. Configure the cloud SDN connector to connect your FortiGate and public or private cloud account.
2. Create dynamic address objects to use the SDN connector. Use filters to sync only cloud address objects that you require.
3. Apply the dynamic address objects to your firewall policy to protect your traffic.

This chapter explores the steps in detail and describes how to connect to each currently supported cloud platform. This chapter does not discuss cloud account role-based or permission requirements. The respective cloud documents contain this information.

The following external connectors are available in the Security Fabric:

Category	Connector	Example configuration
Public SDN		
	Amazon Web Services (AWS)	AWS SDN connector using access keys on page 3023
	Microsoft Azure	Azure SDN connector using service principal on page 3028
	Google Cloud Platform (GCP)	GCP SDN connector using service account on page 3036
	Oracle Cloud Infrastructure (OCI)	OCI SDN connector using certificates on page 3062
	IBM Cloud	IBM Cloud SDN connector using API keys on page 3038
	AliCloud	AliCloud SDN connector using access key on page 3021
Private SDN		
	Kubernetes	Kubernetes (K8s) SDN connectors on page 3042
	VMware ESXi	VMware ESXi SDN connector using server credentials on page 3071
	VMware NSX	VMware NSX-T Manager SDN connector using NSX-T Manager credentials on page 3073
	OpenStack (Horizon)	OpenStack SDN connector using node credentials on page 3064
	Application Centric Infrastructure (ACI)	Cisco ACI SDN connector using a standalone connector on page 3029
	Nuage Virtualized Services Platform	Nuage SDN connector using server credentials on page 3058
	Nutanix	Nutanix SDN connector using server credentials on page 3060
	SAP	SAP SDN connector on page 3068
Endpoint/Identity		
	FSSO Agent on Windows AD	Fortinet single sign-on agent on page 3084
	Symantec Endpoint Protection	Symantec endpoint connector on page 3086
	Poll Active Directory Server	Poll Active Directory server on page 3085
	RADIUS Single Sign-On Agent	RADIUS single sign-on agent on page 3092
	Exchange Server	Exchange Server connector on page 3095
Threat Feeds		

Category	Connector	Example configuration
	FortiGuard Category	Threat feeds on page 3099
	IP Address	IP address threat feed on page 3112
	Domain Name	Domain name threat feed on page 3115
	Malware Hash	Malware hash threat feed on page 3119

If VDOMs are enabled, SDN and Threat Feeds connectors are in the global settings, and Endpoint/Identity connectors are per VDOM.

Getting started with public and private SDN connectors

You can use SDN connectors to connect your FortiGate to public and private cloud solutions. By using an SDN connector, you can ensure that changes to cloud environment attributes are automatically updated in the Security Fabric. You can use SDN connector address objects to create policies that provide dynamic access control based on cloud environment attribute changes. There is no need to manually reconfigure addresses and policies whenever changes to the cloud environment occur.

There are four steps to creating and using an SDN connector:

1. Gather the required information. The required information depends on which public or private cloud solution SDN connector you are configuring.
2. [Creating the SDN connector on page 3017](#)
3. [Creating an SDN connector address on page 3018](#)
4. [Adding the address to a firewall policy on page 3020](#)

The following provides general instructions for creating an SDN connector and using the dynamic address object in a firewall policy. For instructions for specific public and private cloud solutions, see the relevant topic in this guide. For advanced scenarios regarding SDN connectors, see the appropriate [FortiOS 7.4 cloud platform guide](#).

Creating the SDN connector

To create an SDN connector in the GUI:

1. Go to *Security Fabric > External Connectors*.
2. Click *Create New*.
3. Click the desired public or private cloud.
4. Enter the *Name*, *Status*, and *Update Interval* for the connector.
5. Enter previously collected information for the connector as needed.
6. Click *OK*.

To create an SDN connector in the CLI:

```
config system sdn-connector
    edit <name>
        set status {enable | disable}
```

```

set type {connector type}
...
set update-interval <integer>
next
end

```

The available CLI commands vary depending on the selected SDN connector type.

Creating an SDN connector address

You can use an SDN connector address in the following ways:

- As the source or destination address for firewall policies.
- To automatically update changes to addresses in the public or private cloud environment, based on specified filters.
- To automatically apply changes to firewall policies that use the address, based on specified filters.

To create an SDN connector address in the GUI:

1. Go to *Policy & Objects > Addresses*.
2. Click *Create New > Address*.
3. Configure the address:
 - a. Set the *Type* to *Dynamic*.
 - b. From the *Sub Type* dropdown list, select *Fabric Connector Address*.
 - c. From the *SDN Connector* dropdown list, select the desired SDN connector.
 - d. From the *Filter* dropdown list, configure the desired filter. The filters available depend on the selected SDN connector type. The SDN connector automatically populates and updates IP addresses only for instances that satisfy the filter requirements. In this example, the address will automatically populate and update IP addresses only for AliCloud instances that belong to the specified security group:

The screenshot shows the 'Edit Address' window in the Fortinet GUI. The configuration is as follows:

- Name:** all-address-security
- Color:** [Color selection icon] Change
- Type:** Fabric Connector Address
- SDN Connector:** ali1
- Filter:** A dropdown menu is open showing a list of filters. The selected filter is 'SecurityGroupId=sg-rj9bp5ax5kv'. Other visible filters include 'InstanceId=i-rj9hbxeno029l0b0iy', 'SecurityGroupId=sg-rj92w1juq9p', 'SecurityGroupId=sg-rj952xgnquj', and 'SecurityGroupId=sg-rj9g57ev1r5'.
- Interface:** [Empty field]
- Show in Address List:** ☒
- Comments:** [Empty field]
- Tags:** [Add Tag C button]

At the bottom right of the window are 'OK' and 'Cancel' buttons.

You can set filtering conditions using multiple entries with AND ("&") or OR ("|"). When both AND and OR are specified, AND is interpreted first, then OR.

- e. Configure other settings as desired.
- f. Click OK.
4. Ensure that the SDN connector resolves dynamic firewall IP addresses as configured:
 - a. Go to *Policy & Objects > Addresses*.
 - b. Hover over the address that you created to see a list of IP addresses for instances that satisfy the filter that you configured. In this case, the IP addresses of instances that belong to the specified security group display:

+ Create New Edit Clone Delete Search	
Name	Type
Address (31)	
FIREWALL_AUTH	all-address-security resolves to:
SSLVPN_TUNNEL	<ul style="list-style-type: none"> 10.0.0.16 10.0.0.17 10.0.0.20
all-address-OR	connector Address (ACS)
all-address-security	Fabric Connector Address (ACS)

To create an SDN connector address in the CLI:

1. Create the address:

```
config firewall address
  edit <name>
    set type dynamic
    set sdn <sdn_connector>
    set visibility enable
    set associated-interface <interface_name>
    set color <integer>
    ...
    set comment <comment>
  config tagging
    edit <name>
      set category <string>
      set tags <strings>
    next
  end
next
end
```

2. Ensure that the SDN connector resolves dynamic firewall IP addresses as configured by running `show`. The following shows example output:

```
config firewall address
  edit "ali-address-security"
    set type dynamic
    config list
      edit "10.0.0.16"
      next
      edit "10.0.0.17"
      next
      edit "10.0.20.20"
      next
    end
    ...
  next
end
```

The available CLI commands vary depending on the selected SDN connector type.

Adding the address to a firewall policy

You can use an SDN connector address as the source or destination address in a policy.

To add the address to a firewall policy in the GUI:

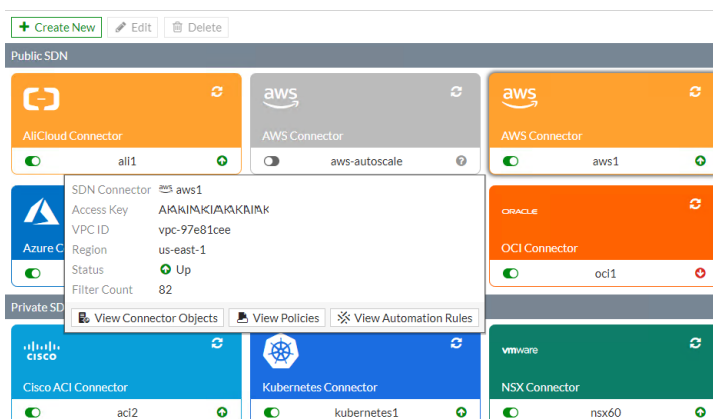

1. Go to *Policy & Objects > Firewall Policy*.
2. Click *Create New*.
3. Use the SDN connector address as the source or destination address.
4. Configure the remaining settings as needed.
5. Click *OK*.

To add the address to a firewall policy in the CLI:

```
config firewall policy
  edit 0
    set name <name>
    set srcintf <port_name>
    set dstintf <port_name>
    set srcaddr <firewall_address>
    set dstaddr <firewall_address>
    set action accept
    set schedule <schedule>
    set service <service>
  next
end
```

Connector tooltips

In *Security Fabric > External Connectors*, hover over an SDN connector to view a tooltip that shows basic configuration information.

Three buttons provide additional information:

Button	Information
View Connector Objects	Connector's dynamic objects, such as filters and instances.
View Policies	List of policies that use the dynamic addresses from the connector.
View Automation Rules	List of automation actions that use the connector.

AliCloud SDN connector using access key

FortiOS automatically updates dynamic addresses for AliCloud using an AliCloud SDN connector, including mapping the following attributes from AliCloud instances to dynamic address groups in FortiOS:

- ImageId
- InstanceId
- SecurityGroupId
- VpcId
- VSwitchId
- TagKey
- TagValue

To configure AliCloud SDN connector using the GUI:

1. Configure the AliCloud SDN connector:
 - a. Go to *Security Fabric > External Connectors*.
 - b. Click *Create New*, and select *AliCloud*.
 - c. Configure as shown, substituting the access key, secret, and region ID for your deployment. The update interval is in seconds.

Edit External Connector

Public SDN

Alibaba Cloud

Connector Settings

Name: ali1

AccessKey ID: LTAIKmERWEuEOChg

AccessKey Secret: Change

Region ID: us-west-1

Update Interval: Use Default Specify 30

Status: ☒

2. Create a dynamic firewall address for the configured AliCloud SDN connector:
 - a. Go to *Policy & Objects > Addresses*.
 - b. Click *Create New*, then select *Address*.
 - c. Configure the address as shown, selecting the desired filter in the *Filter* dropdown list. In this example, the address will automatically populate and update IP addresses only for AliCloud instances that belong to the

specified security group:

3. Ensure that the AliCloud SDN connector resolves dynamic firewall IP addresses:

- Go to **Policy & Objects > Addresses**.
- Hover over the address created in step 2 to see a list of IP addresses for instances that belong to the security group configured in step 2:

+ Create New ▾ Edit Clone Delete Search	
Name	Type
Address 31	
FIREWALL_AUTH	all-address-security resolves to:
SSLVPN_TUNNEL	• 10.0.0.16
ali-address-OR	• 10.0.0.17
ali-address-security	• 10.0.0.20
	connector Address (ACS)
	Fabric Connector Address (ACS)

To configure AliCloud SDN connector using CLI commands:

1. Configure the AliCloud SDN connector:

```
config system sdn-connector
  edit "ali1"
    set type acs
    set access-key "LTAIKmERWEuEOChg"
    set secret-key xxxxx
    set region "us-west-1"
    set update-interval 30
  next
end
```

2. Create a dynamic firewall address for the configured AliCloud SDN connector with the supported AliCloud filter. In this example, the AliCloud SDN Connector will automatically populate and update IP addresses only for instances that belong to the specified security group:

```
config firewall address
  edit "ali-address-security"
    set type dynamic
    set sdn "ali1"
    set filter "SecurityGroupId=sg-rj9bp5ax5kwy3gqdzqb"
  next
end
```

3. Confirm that the AliCloud SDN connector resolves dynamic firewall IP addresses using the configured filter:

```
config firewall address
  edit "ali-address-security"
    set type dynamic
    set sdn "alil"
    set filter "SecurityGroupId=sg-rj9bp5ax5kwy3gqdizqb"
  config list
    edit "10.0.0.16"
    next
    edit "10.0.0.17"
    next
    edit "10.0.0.20"
    next
  end
next
end
```

AWS SDN connector using access keys

FortiOS automatically updates dynamic addresses for AWS using an AWS SDN connector, including mapping attributes from AWS instances to dynamic address groups in FortiOS.

Configuring the SDN connector using the GUI, then checking the configuration using the CLI is recommended.

To configure an AWS SDN connector using the GUI:

1. Configure the AWS SDN connector:
 - a. Go to *Security Fabric > External Connectors*.
 - b. Click *Create New*, and select *Amazon Web Services (AWS)*.
 - c. In the *Access key ID* field, enter the key created in the AWS management portal.
 - d. In the *Secret access key* field, enter the secret access key accompanying the above access key.
 - e. In the *Region name* field, enter the region name. Refer to [AWS service endpoints](#) for the desired region name.
 - f. If desired, enable *VPC ID*. In the *VPC ID* field, enter the VPC ID within the specified region you desire to cover with the SDN connector.
 - g. Click *OK*.

2. Check the configuration using the CLI:

```
config system sdn-connector
  edit "<connector-name>"
  show
```

The output resembles the following:

```
config system sdn-connector
  edit "<connector-name>"
    set access-key "<example-access-key>"
    set secret-key ENC <example-secret-key>
    set region "us-west-2"
    set vpc-id "vpc-e1e4b587"
    set update-interval 1
  next
end
```

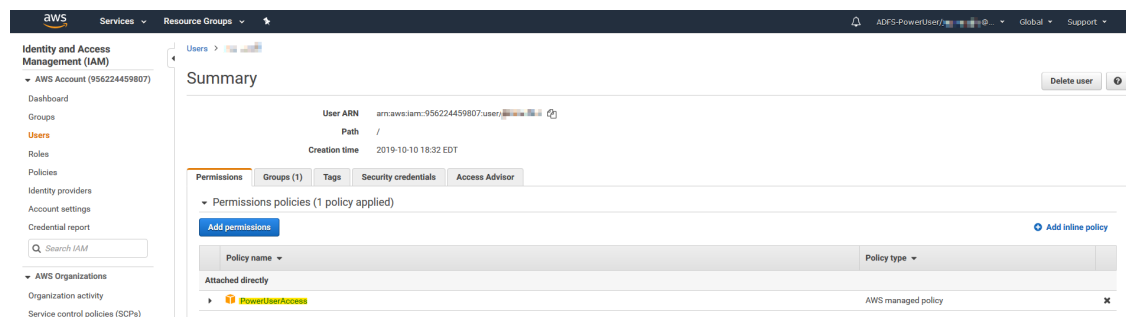

If you see that the SDN connector is disabled in *Security Fabric > External Connectors* in the GUI, run the following commands to enable the SDN connector:

```
diagnose debug application awsd -1
diagnose debug enable
```

The output may display an error like the following:

```
FGT # awsd sdn connector AWS_SDN prepare to update
awsd sdn connector AWS_SDN start updating
aws curl response err, 403
<?xml version="1.0" encoding="UTF-8"?>
<Response><Errors><Error><Code>UnauthorizedOperation</Code><Message>You are not
  authorized to perform this
  operation.</Message></Error></Errors><RequestID>8403cc11-b185-41da-ad6d-
  23bb4db7d00a</RequestID></Response>
awsd curl failed 403
awsd sdn connector AWS_SDN failed to get instance list
aws curl response err, 403
{"Message": "User: arn:aws:iam::956224459807:user/jcarcavallo is not authorized to
  perform: eks:ListClusters on resource: arn:aws:eks:us-east-
  1:956224459807:cluster/*"}
awsd sdn connector AWS_SDN get EKS cluster list failed
awsd sdn connector AWS_SDN list EKS cluster failed
awsd sdn connector AWS_SDN start updating IP addresses
awsd sdn connector AWS_SDN finish updating IP addresses
awsd reap child pid: 569
```

In this case, you must configure power user access for the current administrator in the AWS management console:

After configuring power user access, run the following commands:

```
diagnose debug application awsd -1
diagnose debug enable
```

The output should display without error, as follows:

```
FGT # AWSd: update sdn connector AWS_SDN status to enabled
awsd sdn connector AWS_SDN prepare to update
awsd sdn connector AWS_SDN start updating
awsd get ec2 instance info successfully
awsd sdn connector AWS_SDN start updating IP addresses
awsd sdn connector AWS_SDN finish updating IP addresses
awsd reap child pid: 893
```

The AWS connector is now enabled.

3. Create a dynamic firewall address for the configured AWS SDN connector:
 - a. Go to *Policy & Objects > Addresses*.
 - b. Click *Create New*, then select *Address*.
 - c. From the *Type* dropdown list, select *Dynamic*.
 - d. From the *Sub Type* dropdown list, select *Fabric Connector Address*.
 - e. From the *SDN Connector* dropdown list, select the AWS connector that you created.
 - f. In the *Filter* field, add the desired filters. The following filters are supported:

Description	Key	Example value
Architecture	architecture	x86
Autoscaling group	AutoScaleGroup	10703c-4f731e90-fortigate-payg-auto-scaling-group
AZ	placement.availabilityzone	us-east-1a
Endpoint DNS name	EndpointDNSName	vpce-06795... This filter supports the following ENI IP address types: <ul style="list-style-type: none"> • API gateway private endpoint • VPC endpoint for data API for Aurora • AWS PrivateLink for S3 • VPC endpoints for Lambda
Group name	placement.groupname	
Image ID	imageId	ami-123456
Instance ID	instanceId	i-12345678
Instance type	instanceType	t2.micro
Key name	keyName	
Kubernetes (K8s) cluster	k8s_cluster	
K8s label and its name	k8s_label.Name	
K8s namespace	k8s_namespace	
K8s node name	k8s_nodename	
K8s pod name	k8s_podname	
K8s region	k8s_region	
K8s service name	k8s_servicename	
K8s zone	k8s_zone	
Private DNS name	privateDnsName	ip-172-31-10-211.us-west-2.compute.internal
Public DNS name	publicDnsName	ec2-54-202-168-254.us-west-2.compute.amazonaws.com
Security group ID	SecurityGroupId	
Subnet ID	subnetId	sub-123456
Tag and its name. This key supports a maximum of eight tags.	tag.Name	

Description	Key	Example value
Tenancy placement	placement.tenancy	
VPC ID	VpcId	

4. Ensure that the AWS SDN connector resolves dynamic firewall IP addresses:

- Go to *Policy & Objects > Addresses*.
- Hover over the address that you created to see a list of IP addresses for instances that belong to the configured security group. The following is an example for a public SDN address type:

Name	Type	Details	Interface	Visibility	Ref.
FABRIC_DEVICE	Subnet	0.0.0.0/0		Visible	0
FIREWALL	Subnet	0.0.0.0/0		Hidden	0
SSLVPN	IP Range	10.212.134.200 - 10.212.134.210	SSL-VPN tunnel interface (ssl.root)	Visible	2
all	Subnet	0.0.0.0/0		Visible	0
aws-ec2	Fabric Connector Address (AWS)			Visible	1

The following is an example for a private SDN address type:

Name	Type	Details	Interface	Visibility	Ref.
FABRIC_DEVICE	Subnet	0.0.0.0/0		Visible	0
FIREWALL	Subnet	0.0.0.0/0		Hidden	0
SSLVPN	IP Range	10.212.134.200 - 10.212.134.210	SSL-VPN tunnel interface (ssl.root)	Visible	2
all	Subnet	0.0.0.0/0		Visible	0
aws-ec2	Fabric Connector Address (AWS)			Visible	1
aws-eks1	Fabric Connector Address (AWS)			Visible	1

To configure AWS SDN connector using CLI commands:

1. Configure the AWS connector:

```
config system sdn-connector
edit "<connector-name>"
set access-key "<example-access-key>"
set secret-key ENC <example-secret-key>
set region "us-west-2"
set vpc-id "vpc-e1e4b587"
set update-interval 1
next
end
```

2. Create a dynamic firewall address for the configured AWS SDN connector with the supported filter:

```
config firewall address
edit "aws-ec2"
```

```

        set type dynamic
        set sdn "<connector-name>"
        set filter "SecurityGroupId=sg-05f4749cf84267548"
        set sdn-addr-type public
    next
    edit "aws-eks1"
        set type dynamic
        set sdn "<connector-name>"
        set filter "K8S_Region=us-west-2"
    next
end

```

3. Confirm that the AWS SDN connector resolves dynamic firewall IP addresses using the configured filter:

```

config firewall address
    edit "aws-ec2"
        set type dynamic
        set sdn "<connector-name>"
        set filter "SecurityGroupId=sg-05f4749cf84267548"
        set sdn-addr-type public
        config list
            edit "34.222.246.198"
            next
            edit "54.188.139.177"
            next
            edit "54.218.229.229"
            next
        end
    next
    edit "aws-eks1"
        set type dynamic
        set sdn "<connector-name>"
        set filter "K8S_Region=us-west-2"
        config list
            edit "192.168.114.197"
            next
            edit "192.168.167.20"
            next
            edit "192.168.180.72"
            next
            edit "192.168.181.186"
            next
            edit "192.168.210.107"
            next
        end
    next
end

```

To add an EC2 instance to test automatic address population:

1. Assume that you want to boot up another instance with an IP address of 34.222.246.178, which is currently stopped. This instance belongs to the security group that the aws-ec2 address is filtering for. In the AWS management portal, start the instance.
2. Verify that the instance is running.
3. At this point, running `show` again shows the SDN connector has automatically populated and added the 34.222.246.178 instance:

```
config firewall address
```

```

edit "aws-ec2"
  set type dynamic
  set sdn "<connector-name>"
  set filter "SecurityGroupId=sg-05f4749cf84267548"
  set sdn-addr-type public
  config list
    edit "34.222.246.198"
    next
    edit "54.188.139.177"
    next
    edit "54.218.229.229"
    next
    edit "34.222.246.178"
    next
  end
end
next
end

```

Therefore, administrators do not need to add this instance to the address manually. When you apply a firewall policy to this address, the policy automatically covers 34.222.246.178.

Azure SDN connector using service principal

FortiOS automatically updates dynamic addresses for Azure using Azure SDN connector, including mapping attributes from Azure instances to dynamic address groups in FortiOS.

To configure the Azure SDN connector using service principal:

1. Create an Azure SDN connector:
 - a. Go to *Security Fabric > External Connectors* and click *Create New*.
 - b. Select *Microsoft Azure*.
 - c. Configure the connector. See [Azure SDN connector service principal configuration requirements](#):

- d. Click *OK*.

2. Create a dynamic firewall address for the Azure connector.
 - a. Go to *Policy & Objects > Addresses* and click *Create New > Address*.
 - b. From the *Type* dropdown list, select *Dynamic*.
 - c. From the *Sub Type* dropdown list, select *Fabric Connector Address*.
 - d. From the *SDN Connector* dropdown list, select the Azure SDN connector.
 - e. In the *Filter* field, add filters as desired. The Azure SDN connector supports the following filters:
 - `vm=<VM name>`
 - `securitygroup=<nsg id>`
 - `vnet=<VNet id>`
 - `subnet=<subnet id>`
 - `vmss=<VM scale set>`
 - `tag.<key>=<value>`
 - `servicetag=<value>`
 - `tag.<key>=<value>`
 - f. Click OK.
 - g. Hover the cursor over the address name to see the dynamic IP addresses that the connector resolves.

Cisco ACI SDN connector using a standalone connector

Cisco ACI (Application Centric Infrastructure) SDN connectors can be used in dynamic firewall addresses.

The Fortinet SDN Connector for Cisco ACI and Nuage Networks is a standalone connector that connects to SDN controllers within Cisco ACI and Nuage Networks. You must configure a connection to the Fortinet SDN connector in FortiOS to query the dynamic addresses.

To configure a Cisco ACI connector in the GUI:

1. Create the Cisco ACI SDN connector:
 - a. Go to *Security Fabric > External Connectors* and click *Create New*.
 - b. In the *Private SDN* section, click *Application Centric Infrastructure (ACI)*.
 - c. In the *Cisco ACI Connector* section, for *Type*, select *Fortinet SDN Connector* and configure the remaining settings as needed.

d. Click OK.

- [Video Tutorials](#)

To verify the dynamic firewall IPs are resolved by the SDN connector in the GUI:

1. Go to *Policy & Objects > Addresses*.
2. In the address table, hover over the address to view which IPs it resolves to.

To configure a Cisco ACI connector in the CLI:**1. Create the SDN connector:**

```
config system sdn-connector
  edit "aci1"
    set type aci
    set server "172.18.64.31"
    set username "admin"
    set password xxxxxxxx
  next
end
```

2. Create the dynamic firewall address for the connector:

```
config firewall address
  edit "aci-address1"
    set type dynamic
    set sdn "aci1"
    set color 17
    set tenant "wqdai-ten"
    set epq-name "EPG-in"
    set sdn-tag "fffff"
  next
end
```

To verify the dynamic firewall IPs are resolved by the SDN connector in the CLI:

```
# diagnose firewall dynamic list
```

```
List all dynamic addresses:
```

```
aci1.aci.wqdai-ten.EPG-in.fffff: ID(171)
      ADDR(192.168.100.20)
```

Retrieve IPv6 dynamic addresses from Cisco ACI SDN connector

IPv6 dynamic addresses can be retrieved from Cisco ACI SDN connectors. IPv6 addresses imported from Cisco ACI to the Fortinet SDN Connector VM can be imported into the FortiGate as IPv6 dynamic addresses. The Fortinet SDN Connector VM must be running version 1.1.10 or later.

```
config firewall address6
  edit <name>
    set type dynamic
    set sdn <ACI_connector>
  next
end
```

The following example assumes the Fortinet SDN Connector VM has already connected to Cisco ACI and learned the IPv6 addresses. See [Configuring the SDN Connector](#) in the Cisco ACI Administration Guide for more information. The *Dynamic Address List* values for the DN with the filter *tn-Fortinet/ap-ApplicationProfile/epg-App1* is used in this example.

Fortinet SDN Connector 			
		UpgradeService	RestartService
		ChangePassword	Logout
Total DN with endpoints: 5000; Total number of endpoints: 50000			
Configuration	search		
Running Status

tn-Fortinet/ap-ApplicationProfile/epg-App10	[]	[{"ip":"196.140.217.136","mac":"75:68:f4:10:15:d3"}]	10

To configure the Cisco ACI connector and dynamic address:

1. Configure the Cisco ACI SDN connector:

```
config system sdn-connector
  edit "aci_64.115_115"
    set type aci
    set server-list "10.6.30.115"
    set server-port 5671
    set username "admin"
    set password xxxxxxxx
  next
end
```

2. Verify that the SDN connector status is up:

```
# diagnose sys sdn status "aci_64.115_115"
SDN Connector          Type          Status
-----
aci_64.115_115         aci           Up
```

3. Configure the IPv6 dynamic firewall address (filters for tenant and endpoint group are used in this example):

```
config firewall address6
  edit "aci-add6-App1"
    set type dynamic
    set sdn "aci_64.115_115"
    set color 17
    set tenant "Fortinet"
    set epg-name "App1"
  next
end
```

4. Verify the list of resolved IPv6 addresses:

```
# diagnose firewall dynamic6 list "aci-add6-App1"
aci_64.115_115.aci.Fortinet.App1.*: ID(220)
  ADDR(2001:cafe:654e:7d1:df4a:5f7c:3ab2:361a)
  ADDR(2001:cafe:da3:69c3:4136:eb69:90ea:9481)
```

```
ADDR(2001:cafe:b9a7:793a:abc4:9c29:385b:6e11)
ADDR(2001:cafe:1880:e8d5:21af:4837:854:603c)
ADDR(2001:cafe:f00f:8d5b:f4f9:ab2c:98fe:32c0)
```

ClearPass endpoint connector via FortiManager

ClearPass Policy Manager (CPPM) is a network access system that can send information about authenticated users to third party systems, such as a FortiGate or FortiManager.

In this example, communications are established between CPPM and FortiManager, and then the FortiManager forwards information to a managed FortiGate. On the FortiGate, the user information can be used in firewall policies and added to FSSO dynamic addresses.

Configure the FortiManager

Establish communications between FortiManager and CPPM so that FortiManager can synchronize CPPM user groups. See [Creating a ClearPass connector](#) in the FortiManager Administration Guide.

Edit ClearPass Connector

Name: test

Status: ☒ ON

Server: 10.1.100.139

Client: test

User: admin

Password: *****

Connector Users:

- Search...
- cp_test_FSSOROLE (0/2)
- cp_test_AirGroup v1 (0/0)
- cp_test_AirGroup v2 (0/0)
- cp_test_Aruba TACACS read-only Admin (0/0)
- cp_test_Aruba TACACS root Admin (0/0)
- cp_test_BYOD Operator (0/0)
- cp_test_Contractor (0/0)
- cp_test_Device Registration (0/0)

Buttons: Apply & Refresh, OK, Cancel

FortiManager forwards the group information to managed FortiGates.

Adding CPPM FSSO user groups to a local user group

To add CPPM user groups to a local user group in the GUI:

1. On the FortiGate, go to *User & Authentication > User Groups*.
2. Click *Create New*.
3. Enter a name for the group and set *Type* to *Fortinet Single Sign-On (FSSO)*.
4. Click the *Members* field, and add one or more FSSO groups.
FSSO groups can come from multiple sources; CPPM FSSO groups are prefixed with *cp_* and are listed under the *FortiManager* heading.

5. Click **OK**.

To add CPPM user groups to a local user group in the CLI:

```
config user group
  edit fssso-group
    set group-type fssso-service
    set member "cp_test_[Employee]" "cp_test_FSSOROLE"
  next
end
```

Using the local FSSO user group in a firewall policy

To add the local FSSO user group to a firewall policy in the GUI:

1. Go to *Policy & Objects > Firewall Policy*.
2. Create a new policy, or edit an existing one.

- Click in the *Source* field and add the *fsso-group* user group.

CPPM user groups can also be added directly to the policy.

- Click OK.

To add the local FSSO user group to a firewall policy in the CLI:

```
config firewall policy
  edit 1
    set name "pol1"
    set srcintf "port2"
    set dstintf "port3"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
    set logtraffic all
    set groups "fsso-group"
    set nat enable
  next
end
```

Verification

To verify that a user was added to the FSSO list on the FortiGate:

- Log on to the client and authenticate with CPPM.
After successful authentication, the user is added to the FSSO list on the FortiGate.
- On the FortiGate, go to *Dashboard > Assets & Identities* and look at the *Firewall Users* widget to verify that the user was added.

<div><div><div><div><div><div></div></div></div><div><div></div></div></div><div><div></div></div><div><div></div></div></div></div> <div><div>Refresh</div><div>Deauthenticate</div><div>Show all FSSO Logons</div><div>Search</div><div>Q</div><div>Enterprise_First_Floor</div></div>					
User Name	User Group	Duration	IP Address	Traffic Volume	Method
<div><div><div></div></div><div>fsso2</div></div>	<div><div><div></div></div><div>fsso-group</div><div>cp test FSSOROLE</div></div>	9 second(s)	10.1.100.188	0 B	<div><div><div></div></div><div>Fortinet Single Sign-On</div></div>

The user group *cp_test_FSSOROLE* is listed separately because the user is a member of that group on the CPPM.

To verify that traffic can pass the firewall:

1. Log on to the client and browse to an external website.
2. On the FortiGate, go to *Dashboard > FortiView Sources*.
3. Double-click on the user and select the *Destinations* tab to verify that traffic is being passed by the firewall.

To verify the user address groups:

```
show user adgrp
config user adgrp
    edit "cp_test_FSSOROLE"
        set server-name "FortiManager"
    next
    edit "cp_test_[AirGroup v1]"
        set server-name "FortiManager"
    next
    edit "cp_test_[AirGroup v2]"
        set server-name "FortiManager"
    next
    edit "cp_test_[Aruba TACACS read-only Admin]"
        set server-name "FortiManager"
    next
    edit "cp_test_[Aruba TACACS root Admin]"
        set server-name "FortiManager"
    next
    edit "cp_test_[BYOD Operator]"
        set server-name "FortiManager"
    next
    edit "cp_test_[Contractor]"
        set server-name "FortiManager"
    next
    edit "cp_test_[Device Registration]"
        set server-name "FortiManager"
    next
    ...
    edit "CN=group1,OU=Testing,DC=Fortinet-FSSO,DC=COM"
        set server-name "Local FSSO Agent"    <----- !!!
    next
end
```

GCP SDN connector using service account

FortiOS automatically updates dynamic addresses for GCP using a GCP SDN connector, including mapping attributes from GCP instances to dynamic address groups in FortiOS.

To configure GCP connector using the GUI:

1. In FortiOS, go to *Security Fabric > External Connectors*.
2. Click *Create New*, and select *Google Cloud Platform (GCP)*.

Note you can create only one SDN Connector per connector type. For example, you can create one entry for GCP.

3. Configure the connector as follows:

- a. **Project name:** Enter the name of the GCP project. The VMs whose IP addresses you want to populate should be running within this project.
- b. **Service account email:** Enter the email address associated with the service account that will call APIs to the GCP project specified above.
- c. **Private key:** Enter the private key statement as shown in the text box. For details, see [Creating a GCP service account](#).

Once the connector is successfully configured, a green indicator appears at the bottom right corner. If the indicator is red, the connector is not working. See [Troubleshooting GCP SDN Connector](#).

4. Create a dynamic firewall address for the configured GCP SDN connector:

- a. Go to *Policy & Objects > Addresses*. Click *Create New*, then select *Address*.
- b. Configure the address:
 - i. **Name:** Enter the desired name.
 - ii. **Type:** Select *Dynamic*.
 - iii. **Fabric Connector Type:** Select *Google Cloud Platform (GCP)*.
 - iv. **Filter:** The SDN connector automatically populates and updates only instances that match this filtering condition. Currently GCP supports the following filters:

- `id=<instance id>`: This matches an VM instance ID.
- `name=<instance name>`: This matches a VM instance name.
- `zone=<gcp zones>`: This matches a zone name.
- `network=<gcp network name>`: This matches a network name.
- `subnet=<gcp subnet name>`: This matches a subnet name.
- `tag=<gcp network tags>`: This matches a network tag.
- `label.<gcp label key>=<gcp label value>`: This matches a free form GCP label key and its value.

In the example, the filter is set as `'network=default & zone=us-central-1f'`. This configuration populates all IP addresses that belong to the default network in the zone us-central-1f.

You can set filtering conditions using multiple entries with AND ("&") or OR ("|"). When both AND and OR are specified, AND is interpreted first, then OR.

Note that wildcards (such as the asterisk) are not allowed in filter values.

v. Click OK.

The address has been created. Wait for a few minutes before the setting takes effect. You will know that the address is in effect when the exclamation mark disappears from the address entry. When you hover over the address, you can see the list of populated IP addresses.

Name	Type	Details
jkatogcp001	Fabric Connector Address (GCP)	

If the exclamation mark does not disappear, check the address settings.

IBM Cloud SDN connector using API keys

FortiOS can automatically update dynamic addresses for IBM Cloud using an SDN connector.

To configure IBM Cloud SDN connectors using the GUI:

1. Create SDN connectors for compute generation 1 and 2:
 - a. Go to *Security Fabric > External Connectors*.
 - b. Click *Create New*, then select *IBM Cloud*.

c. Configure the connector for computer generation 1:

d. Click **OK**.e. Click **Create New**, then select **IBM Cloud**.

f. Configure the connector for computer generation 2:

g. Click **OK**.

2. Create dynamic firewall addresses for the configured connectors:

- a. Go to *Policy & Objects > Addresses*.
- b. Click *Create New > Address*.
- c. From the *Type* dropdown list, select *Dynamic*.
- d. From the *Sub Type* dropdown list, select *Fabric Connector Address*.
- e. From the *SDN Connector* dropdown list, select the IBM SDN connector.
- f. In the *Filter* field, add the desired filters. The following filters are supported:
 - <Instanceld>
 - <InstanceName>
 - <ImageId>
 - <ImageName>
 - <Architecture>
 - <Profile>
 - <Vpc>
 - <Zone>
 - <Subnet>
 - <ResourceGroup>

- g. Click **OK**.
- h. Click **Create New > Address**.
- i. Repeat the process for computer generation 2:

- j. Click **OK**.
3. Ensure that the connectors resolve dynamic firewall IP addresses:
 - a. Go to **Policy & Objects > Addresses**.
 - b. Hover over the addresses created in step 2 to see a list of IP addresses that the connector has resolved:

Name	Type	Details	Interface
gmail.com	FQDN	gmail.com	
ibm_gen1_add1	Dynamic (IBM)	ibm_gen1_add1	
ibm_gen2_add1	Dynamic	ibm_gen2_add1	
login.microsoft.com	Fabric Connector Address	login.microsoft.com	
login.windows.net	Fabric Connector Address	login.windows.net	
onboarding.address	Fabric Connector Address	onboarding.address	
vlan_linux.address	Fabric Connector Address	vlan_linux.address	
wildcard.dropbox.com	FQDN	wildcard.dropbox.com	
wildcard.google.com	FQDN	wildcard.google.com	

To configure IBM Cloud SDN connectors using the CLI:

1. Create SDN connectors for compute generation 1 and 2:

```
config system sdn-connector
  edit "ibm_gen1"
    set status enable
    set type ibm
    set api-key xxxxxx
    set compute-generation 1
    set ibm-region us-south
    set update-interval 60
  next
  edit "ibm_gen2"
    set status enable
    set type ibm
```

```
        set api-key xxxxxx
        set compute-generation 2
        set ibm-region us-east
        set update-interval 60
    next
end
```

2. Create dynamic firewall addresses for the configured connectors:

```
config firewall address
    edit "ibm_gen1_add1"
        set type dynamic
        set sdn "ibm_gen1"
        set color 19
        set filter "Vpc=alex-vpc1"
    next
    edit "ibm_gen2_add1"
        set type dynamic
        set sdn "ibm_gen2"
        set color 19
        set filter "ResourceGroup=alex-grp2"
    next
end
```

3. Ensure that the connectors resolve dynamic firewall IP addresses:

```
# show firewall address ibm_gen1_add1
config firewall address
    edit "ibm_gen1_add1"
        set uuid 586841c4-7f46-51ea-dc66-dbf840af03d3
        set type dynamic
        set sdn "ibm_gen1"
        set color 19
        set filter "Vpc=alex-vpc1"
        config list
            edit "10.240.0.49"
            next
            edit "10.240.0.75"
            next
            edit "169.61.227.88"
            next
            edit "52.117.170.31"
            next
        end
    next
end

# show firewall address ibm_gen2_add1
config firewall address
    edit "ibm_gen2_add1"
        set uuid 5868c4f0-7f46-51ea-2b79-b5170fbfd4a8
        set type dynamic
        set sdn "ibm_gen2"
        set color 19
        set filter "ResourceGroup=alex-grp2"
        config list
            edit "10.241.128.4"
            next
        end
    end
```

```
        edit "10.241.128.5"  
        next  
        edit "10.241.129.4"  
        next  
        edit "52.117.126.69"  
        next  
    end  
next  
end
```

Kubernetes (K8s) SDN connectors

The following topics provide information about configuring Kubernetes SDN connectors:

- [AliCloud Kubernetes SDN connector using access key on page 3042](#)
- [EKS SDN connector using access key on page 3044](#)
- [Azure Kubernetes \(AKS\) SDN connector using client secret on page 3047](#)
- [GCP Kubernetes \(GKE\) SDN connector using service account on page 3049](#)
- [Oracle Kubernetes \(OKE\) SDN connector using certificates on page 3052](#)
- [Private cloud K8s SDN connector using secret token on page 3054](#)

AliCloud Kubernetes SDN connector using access key

When an AliCloud SDN connector is configured, dynamic address objects can support Kubernetes filters based on cluster, service, node, pod, and more.

The following address filters can be applied:

- K8S_Cluster
- K8S_Namespace
- K8S_ServiceName
- K8S_NodeName
- K8S_PodName
- K8S_Region
- K8S_Zone
- K8S_Label

To configure an AliCloud SDN connector with a Kubernetes filter in the GUI:

1. Configure the AliCloud SDN connector:
 - a. Go to *Security Fabric > External Connectors*.
 - b. Click *Create New*, and select *AliCloud*.

- c. Configure the settings as needed and click **OK**.

2. Create a dynamic firewall address with the supported Kubernetes filter:

- a. Go to *Policy & Objects > Addresses*.
- b. Click *Create New > Address* and enter a name.
- c. Configure the following settings:
 - i. For *Type*, select *Dynamic*.
 - ii. For *Sub Type*, select *Fabric Connector Address*.
 - iii. For *SDN Connector*, select the connector created in step 1.
 - iv. For *SDN address type*, select *Private*.
 - v. For *Filter*, select *K8S_Cluster=zhmcluster*.

- d. Click **OK**.

The corresponding IP addresses are dynamically updated and resolved after applying the Kubernetes filter.

3. Confirm that the AliCloud SDN connector resolves dynamic firewall IP addresses using the configured filter:

- a. Go to *Policy & Objects > Addresses*.
- b. In the address table, hover over the address created in step 2 to view which IPs it resolves to:

<div> <div>+ Create New</div> <div> <div>IP Range/Sub</div> <div>FABRIC_</div> <div>FIREWAL</div> <div>SSLVPN_</div> <div>all</div> <div>none</div> <div>FortiClient E</div> <div>FCTEMS</div> <div>2</div> <div>ali_add1</div> <div>aws_add1</div> <div>FQDN 6</div> <div>gmail.com</div> <div>login.mic</div> <div>login.mic</div> </div> <div>0 Security Ratin</div> </div>		<div> <div>Address</div> <div>ali_add1</div> <div>Type</div> <div>Dynamic</div> <div>Sub Type</div> <div>Fabric Connector Address</div> <div>SDN Connector</div> <div>ali1</div> <div>Filter</div> <div>K8S_Cluster=zhmcluster1</div> <div>Interface</div> <div>any</div> <div>Resolved To</div> <div>10.0.0.28 10.0.0.29 10.0.0.30</div> <div>10.0.1.129 10.0.104.237 10.0.104.238</div> <div>10.0.2.65 10.0.50.166 172.16.0.20</div> <div>172.16.1.10 172.16.1.30 172.16.1.50</div> <div>172.16.2.30 172.16.3.30 172.16.4.30</div> <div>172.16.5.30 172.16.6.30 172.16.7.30</div> <div>172.16.8.30 172.20.0.130 172.20.0.131</div> <div>172.20.0.132 172.20.0.133 172.20.0.2</div> <div>172.20.0.3 172.20.0.4 172.20.0.5</div> <div>172.20.0.66 172.20.0.67 172.20.0.68</div> <div>172.20.0.69 172.20.0.70 172.20.0.71</div> <div>172.20.0.72 172.20.0.73 172.20.0.74</div> <div>172.20.0.75 172.21.0.1 172.21.0.10</div> <div>172.21.1.159 172.21.11.21 172.21.12.245</div> <div>172.21.12.35 172.21.13.2 172.21.14.62</div> <div>172.21.2.138 172.21.2.254 172.21.3.135</div> <div>172.21.9.67 192.168.0.202 192.168.0.203</div> <div>192.168.0.204 192.168.0.94 192.168.0.95</div> </div>		<div> <div>Q</div> <div>Interface</div> <div>Type</div> <div>Ref.</div> <div>10</div> <div>SSL-VPN tunnel interface (ssl.root)</div> <div>Address</div> <div>0</div> <div>Address</div> <div>0</div> <div>Address</div> <div>2</div> <div>Address</div> <div>2</div> <div>Address</div> <div>0</div> <div>Address</div> <div>0</div> <div>Address</div> <div>0</div> <div>Address</div> <div>1</div> <div>Address</div> <div>1</div> <div>Address</div> <div>1</div> </div>		<div> <div>0% 16 Updated: 11:58:46</div> </div>	
--	--	--	--	---	--	---	--

To configure an AliCloud SDN connector with a Kubernetes filter in the CLI:**1. Configure the AliCloud SDN connector:**

```
config system sdn-connector
  edit "ali1"
    set type alicloud
    set access-key "*****"
    set secret-key xxxxxxxx
    set region "us-west-1"
  next
end
```

2. Create a dynamic firewall address with the supported Kubernetes filter:

```
config firewall address
  edit "ali_add1"
    set type dynamic
    set sdn "ali1"
    set color 10
    set filter "K8S_Cluster=zhmcluster1"
  next
end
```

3. Confirm that the AliCloud SDN connector resolves dynamic firewall IP addresses using the configured filter:

```
config firewall address
  edit "ali_add1"
    show
    config firewall address
      edit "ali_add1"
        set uuid c48e4f00-5435-51eb-0547-aced5cf80f1f
        set type dynamic
        set sdn "ali1"
        set color 10
        set filter "K8S_Cluster=zhmcluster1"
      config list
        edit "10.0.0.28"
        next
        edit "10.0.0.29"
        next
        edit "10.0.0.30"
        next
        ...
      end
    next
  end
end
next
end
```

EKS SDN connector using access key

AWS SDN connectors support dynamic address groups based on AWS Kubernetes (EKS) filters.

If there is an authorization issue with the dynamic address resolution of Kubernetes (K8s) IP addresses and/or the K8s dynamic addresses fail to display, confirm that you have set the correct Identity & Access Management permissions or role assignments. For more information, see [How do I provide access to other IAM users and roles after cluster creation in Amazon EKS?](#).

To enable an AWS SDN connector to fetch IP addresses from EKS:

1. Go to *Security Fabric > External Connectors*. Click *Create New*, then select *Amazon Web Services (AWS)*. Configure the SDN connector as desired. See [AWS SDN connector using access keys on page 3023](#).

2. Go to *Policies & Objects > Addresses*. Click *Create New > Address* to create a dynamic firewall address for the configured SDN connector using the supported K8s filter.
3. From the *Type* dropdown list, select *Dynamic*.
4. From the *Sub Type* dropdown list, select *Fabric Connector Address*.
5. From the *SDN Connector* dropdown list, select the desired SDN connector.
6. In the *Filter* field, add the desired filters. The following filters are supported:

Filter	Description
k8s_cluster	Name of K8s cluster.
k8s_namespace	Namespace of a K8s service or pod.
k8s_svcname	Name of a K8s service.
k8s_nodename	Name of a K8s node.
k8s_zone	Zone of a K8s node.
k8s_region	Region of a Kubernetes node.
k8s_podname	Name of a Kubernetes pod.
k8s_label.xxx	Name of label of a Kubernetes resource (cluster/service/node/pod).

7. Configure the rest of the settings, then click **OK**.
8. Ensure that the SDN connector resolves the dynamic firewall address IP addresses by going to *Policy & Objects > Addresses* and hovering over the newly created address.

<div> <div>+ Create New</div> <div>Edit</div> <div>Clone</div> <div>Delete</div> <div>Search</div> </div>	
Name	Type
aws-k8s-and	Fabric Connector Address (AWS)
aws-k8s-or	Fabric Connector Address (AWS)
aws-label	Fabric Connector Address (AWS)
aws-nam	Fabric Connector Address (AWS)
aws-nod	Fabric Connector Address (AWS)
aws-pod	Fabric Connector Address (AWS)

aws-pod resolves to:

- 192.168.114.197

To configure an EKS SDN connector through the CLI:

1. Configure the SDN connector:

```
config system sdn-connector
  edit "aws1"
    set type aws
    set access-key "AKIAIJNKE75ANVN5AEQA"
    set secret-key xxxxx
    set region "us-west-2"
    set update-interval 30
  next
end
```

2. Create a dynamic firewall address for the SDN connector with a supported Kubernetes filter:

```
config firewall address
  edit "aws-pod"
    set type dynamic
    set sdn "aws1"
    set filter "K8S_PodName=aws-node-g6zhx"
  next
end
```

The SDN connector resolves the dynamic firewall address IP address:

```
config firewall address
  edit "aws-pod"
    set type dynamic
    set sdn "aws1"
```

```

set filter "K8S_PodName=aws-node-g6zhx"
config list
  edit "192.168.114.197"
  next
end
next
end

```

Azure Kubernetes (AKS) SDN connector using client secret

Azure SDN connectors support dynamic address groups based on Azure Kubernetes (AKS) filters.

To enable an Azure SDN connector to fetch IP addresses from Azure Kubernetes:

1. Configure the Azure SDN connector:
 - a. Go to *Security Fabric > External Connectors*.
 - b. Click *Create New*, and select *Azure*.
 - c. Configure as shown substituting the region, tenant and client IDs, and client secret for your deployment. See [Azure SDN connector service principal configuration requirements](#).

2. Create a dynamic firewall address for the configured K8s SDN connector:
 - a. Go to *Policy & Objects > Addresses*.
 - b. Click *Create New*, then select *Address*.
 - c. From the *Type* dropdown list, select *Dynamic*.
 - d. From the *Sub Type* dropdown list, select *Fabric Connector Address*.
 - e. From the *SDN Connector* dropdown list, select the desired SDN connector.
 - f. In the *Filter* field, add the desired filter. The following filters are supported:

Filter	Description
k8s_cluster	Name of Kubernetes cluster.
k8s_namespace	Namespace of a Kubernetes service or pod.

Filter	Description
k8s_svcname	Name of a Kubernetes service.
k8s_nodename	Name of a Kubernetes node.
k8s_zone	Zone of a Kubernetes node.
k8s_region	Region of a Kubernetes node.
k8s_podname	Name of a Kubernetes pod.
k8s_label.xxx	Name of label of a Kubernetes resource (cluster/service/node/pod).

In this example, the address is configured to automatically populate and update IP addresses only for instances that belong to the zhmKC cluster:

3. Ensure that the K8s SDN connector resolves dynamic firewall IP addresses:

- Go to *Policy & Objects > Addresses*.
- Hover over the address created in step 2 to see a list of IP addresses for instances that belong to the zhmKC cluster as configured in step 2:

Name	Type
aws-zone	Fabric Connector Address (AWS)
az-k8s-cluster	Fabric Connector Address (AZURE)
az-k8s-label	Fabric Connector Address (AZURE)
az-k8s-pod	Fabric Connector Address (AZURE)
az-k8s-region	Fabric Connector Address (AZURE)
dmz	Interface Subnet
gmail.com	QDN
google-play	QDN
login.microsoft	QDN
login.microsoft	QDN
login.microsoft	QDN
login.windows	QDN
none	Subnet
swscan.apple	QDN
update.microsoft	QDN
Address Group	

To configure an Azure Kubernetes SDN connector through the CLI:**1. Configure the SDN connector:**

```
config system sdn-connector
  edit "azure1"
    set type azure
    set tenant-id "942b80cd-1b14-42a1-8dcf-4b21dece61ba"
    set client-id "14dbd5c5-307e-4ea4-8133-68738141feb1"
    set client-secret xxxxx
    set update-interval 30
  next
end
```

2. Create a dynamic firewall address for the SDN connector with a supported Kubernetes filter. In this example, the address will automatically populate and update IP addresses only for instances that belong to the zhmkC cluster:

```
config firewall address
  edit "az-k8s-cluster"
    set type dynamic
    set sdn "azure1"
    set filter "K8S_Cluster=zhmkC"
  next
end
```

3. Confirm that the Azure SDN connector resolves dynamic firewall IP addresses using the configured filter:

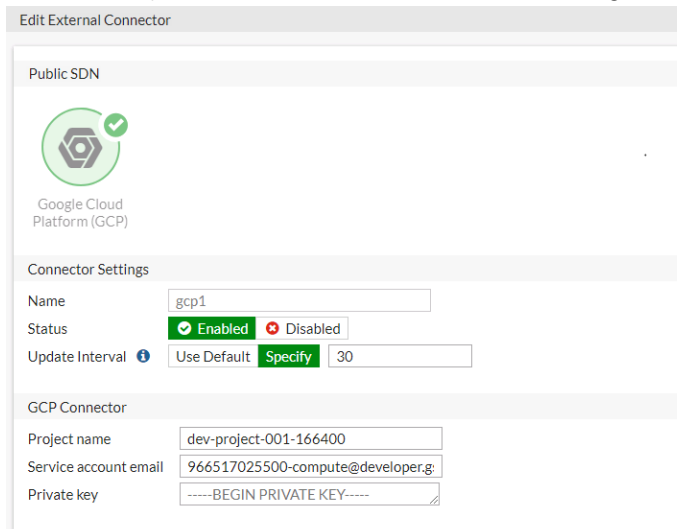

```
config firewall address
  edit "az-k8s-cluster"
    set type dynamic
    set sdn "azure1"
    set filter "K8S_Cluster=zhmkC"
  config list
    edit "10.240.0.4"
    next
    edit "10.240.0.5"
    next
    edit "10.244.0.10"
    next
  end
next
end
```

GCP Kubernetes (GKE) SDN connector using service account

Google Cloud Platform (GCP) SDN connectors support dynamic address groups based on GCP Kubernetes Engine (GKE) filters.

To enable a GCP SDN connector to fetch IP addresses from GKE:

1. Go to *Security Fabric > External Connectors*, and configure an SDN connector for GCP.

Edit External Connector

Public SDN

Google Cloud Platform (GCP)

Connector Settings

Name: gcp1

Status: Enabled Disabled

Update Interval: Use Default Specify 30

GCP Connector

Project name: dev-project-001-166400

Service account email: 966517025500-compute@developer.g

Private key: -----BEGIN PRIVATE KEY-----

2. Go to *Policies & Objects > Addresses* and create a dynamic firewall address for the configured SDN connector using the supported Kubernetes filter.
3. To filter out the Kubernetes IP addresses, select the address filter or filters. The following filters are supported:

Filter	Description
k8s_cluster	Name of Kubernetes cluster.
k8s_namespace	Namespace of a Kubernetes service or pod.
k8s_svcname	Name of a Kubernetes service.
k8s_nodename	Name of a Kubernetes node.
k8s_zone	Zone of a Kubernetes node.
k8s_region	Region of a Kubernetes node.
k8s_podname	Name of a Kubernetes pod.
k8s_label.xxx	Name of label of a Kubernetes resource (cluster/service/node/Pod).

In this example, the GCP SDN connector will automatically populate and update IP addresses only for instances that belong to the zhm-kc3 cluster:

4. Configure the rest of the settings, then click **OK**.
 The dynamic firewall address IP is resolved by the SDN connector.

<input type="button" value="+ Create New"/> <input type="button" value="Edit"/> <input type="button" value="Clone"/> <input type="button" value="Delete"/> <input type="text" value="Search"/>	
Name	Type
Address 13	
FIREWALL_AUTH_PORTAL_ADDRESS	Subnet
SSLVPN_TUNNEL_ADDR1	IP Range
all	Subnet
gcp-k8s-cluster	Fabric Connector Address (GCP)
gcp-k8s-label	gcp-k8s-cluster resolves to:
gcp-k8s-pod	10.0.2.4
gcp-k8s-pool	10.0.2.7
gmail.com	10.28.0.13
login.microsoft.com	10.28.0.14
login.microsoft.com	10.28.0.17
login.windows.net	10.28.0.18
none	10.28.0.19
vmware-network	10.28.0.20
Address Group	10.28.0.21
Wildcard FQDN	10.28.0.22
	10.28.1.11
	10.28.1.12
	10.28.1.13
	10.28.1.14
	10.28.1.15
	35.235.101.176
	35.236.43.119
	35.236.60.13
	50.13.123.45

To configure a GCP Kubernetes SDN connector through the CLI:

1. Configure an SDN connector for Kubernetes:

```
config system sdn-connector
  edit "gcp1"
    set type gcp
    set gcp-project "dev-project-001-166400"
    set service-account "966517025500-compute@developer.gserviceaccount.com"
    set update-interval 30
  next
end
```

2. Create a dynamic firewall address for the SDN connector with a supported Kubernetes filter:

```
config firewall address
  edit "gcp-k8s-cluster"
    set type dynamic
    set sdn "gcp1"
```

```

        set filter "K8S_Cluster=zhm-kc3"
    next
end

```

The dynamic firewall address IP is resolved by the SDN connector:

```

config firewall address
    edit "gcp-k8s-cluster"
        set type dynamic
        set sdn "gcp1"
        set filter "K8S_Cluster=zhm-kc3"
    config list
        edit "10.0.2.4"
        next
        edit "10.0.2.7"
        next
        edit "10.28.0.13"
        next
    end
next
end

```

Oracle Kubernetes (OKE) SDN connector using certificates

OCI SDN connectors support dynamic address groups based on Oracle Kubernetes (OKE) filters.

To enable an OCI SDN connector to fetch IP addresses from Oracle Kubernetes:

1. Configure the OCI SDN connector:
 - a. Go to *Security Fabric > External Connectors*.
 - b. Click *Create New*, and select *Oracle Cloud Infrastructure (OCI)*.
 - c. Configure as shown substituting the region, tenant and client IDs, and client secret for your deployment. The update interval is in seconds.

Edit External Connector

Public SDN

Oracle Cloud Infrastructure (OCI)

Connector Settings

Name: oci1

Status: Enabled Disabled

Update Interval: Use Default Specify: 30

OCI Connector

Server region: US Ashburn

User ID: ocid1.user.oc1.aaaaaaq2ifspco3uetz

Tenant ID: ocid1.tenancy.oc1.aaaaaaaambr3uztzo

OK **Cancel**

2. Create dynamic firewall addresses for the configured SDN connector with supported Kubernetes filter:
 - a. Go to *Policy & Objects > Addresses*.
 - b. Click *Create New*, then select *Address*.

- c. In the *Filter* field, select the desired filters. The following filters are supported:

Filter	Description
k8s_cluster	Name of Kubernetes cluster.
k8s_namespace	Namespace of a Kubernetes service or pod.
k8s_svcname	Name of a Kubernetes service.
k8s_nodename	Name of a Kubernetes node.
k8s_zone	Zone of a Kubernetes node.
k8s_region	Region of a Kubernetes node.
k8s_podname	Name of a Kubernetes pod.
k8s_label.xxx	Name of label of a Kubernetes resource (cluster/service/node/Pod).

3. Confirm that the SDN connector resolves dynamic firewall IP addresses:

- Go to *Policy & Objects > Addresses*.
- Hover over the address created in step 2 to see a list of IP addresses for instances:

Name	Type	Details	Interface	Visibility	Re
SSLVPN_TUNNEL_ADDR1	IP Range	10.212.134.200 - 10.212.134.210	SSL-VPN tunnel interface (ssl.root)	Visible	
ali-address-security	Fabric Connector Address (ALICLOUD)			Visible	
ali-address-vpc	Fabric Connector Address (ALICLOUD)			Visible	
all	Subnet	0.0.0.0/0		Visible	
gmail.com	FQDN	gmail.com		Visible	
k8s_and	Fabric Connector Address (OCI)			Visible	
k8s_cluster	Fabric Connector Address (OCI)			Visible	
k8s_compartm	Fabric Connector Address (OCI)			Visible	
k8s_label	Fabric Connector Address (OCI)			Visible	
k8s_namespace	Fabric Connector Address (OCI)			Visible	
k8s_nodename	Fabric Connector Address (OCI)			Visible	
k8s_or	Fabric Connector Address (OCI)			Visible	
k8s_podname	Fabric Connector Address (OCI)			Visible	
k8s_region	Fabric Connector Address (OCI)			Visible	
k8s_servicename	Fabric Connector Address (OCI)			Visible	
k8s_zone	Fabric Connector Address (OCI)			Visible	
login.microsoft.com	FQDN	login.microsoft.com		Visible	
login.microsoftonline.com	FQDN	login.microsoftonline.com		Visible	
login.windows.net	FQDN	login.windows.net		Visible	

To configure an SDN connector through the CLI:**1. Configure the OCI SDN connector:**

```

config system sdn-connector
  edit "oci1"
    set type oci
    set tenant-id
      "ocidl.tenancy.oc1..aaaaaaaambr3uzztoyhweohbzqqdo775h7d3t54zpmz4b2cf35vs55cxxx"
    set user-id
      "ocidl.user.oc1..aaaaaaaq2lfspeo3uetzbzpiv2pqvzzevozccnys347stwssvizqlatfxxx"
    set compartment-id
      "ocidl.compartment.oc1..aaaaaaaaelxxdjazqo7nzcpgypyiqcgkmytjry6nfg5345vw7eavpwnmxxx"
    set oci-region ashburn
    set oci-cert "cert-sha2"
    set update-interval 30
  next
end

```

2. Create dynamic firewall addresses for the configured SDN connector with supported Kubernetes filter:

```

config firewall address
  edit "k8s_nodename"
    set type dynamic
    set sdn "oci1"
    set filter "K8S_NodeName=129.213.120.172"
  next
end

```

3. Confirm that the SDN connector resolves dynamic firewall IP addresses:

```

config firewall address
  edit "k8s_nodename"
    set type dynamic
    set sdn "oci1"
    set filter "K8S_NodeName=129.213.120.172"
  config list
    edit "10.0.32.2"
    next
    edit "10.244.2.2"
    next
    edit "10.244.2.3"
    next
    edit "10.244.2.4"
    next
    edit "10.244.2.5"
    next
  end
next
end

```

Private cloud K8s SDN connector using secret token

FortiOS automatically updates dynamic and cluster IP addresses for Kubernetes (K8s) by using a K8s SDN connector, enabling FortiOS to manage K8s pods as global address objects, as with other connectors. This includes mapping the following attributes from K8s instances to dynamic address groups in FortiOS:

Filter	Description
Namespace	Filter service IP addresses in a given namespace.
ServiceName	Filter service IP addresses by the given service name.
NodeName	Filter node IP addresses by the given node name.
PodName	Filter IP addresses by the pod name.
Label.XXX	Filter service or node IP addresses with the given label XXX. For example: <code>K8S_Label.app=nginx</code> .

FortiOS 6.2.3 and later collect cluster IP addresses in addition to external IP addresses for exposed K8s services.

There is no maximum limit for the number of IP addresses populated with the filters.

To configure K8s SDN connector using the GUI:

1. Configure the K8s SDN connector:
 - a. Go to *Security Fabric > External Connectors > Create New Connector*.
 - b. Select *Kubernetes*.
 - c. In the *IP* field, enter the IP address that you obtained in [Obtaining the IP address, port, and secret token in Kubernetes](#).
 - d. In the *Port* field, select *Specify*, then enter the port that you obtained in [Obtaining the IP address, port, and secret token in Kubernetes](#).
 - e. In the *Secret token* field, enter the token that you obtained in [Obtaining the IP address, port, and secret token in Kubernetes](#).
 - f. Configure the other fields as desired.
2. Create a dynamic firewall address for the configured K8S SDN connector:
 - a. Go to *Policy & Objects > Addresses*.
 - b. Click *Create New*, then select *Address*.
 - c. Configure the address as shown, selecting the desired filter in the *Filter* dropdown list. In this example, the K8s SDN connector will automatically populate and update IP addresses only for node instances that match

the specified node name:

3. Ensure that the K8s SDN connector resolves dynamic firewall IP addresses:
 - a. Go to *Policy & Objects > Addresses*.
 - b. Hover over the address created in step 2 to see a list of IP addresses for node instances that match the node name configured in step 2:

<div> <div>+ Create New</div> <div>Edit</div> <div>Clone</div> <div>Delete</div> <div>Search</div> </div>	
Name	Type
aws-security	Fabric Connector Address (AWS)
aws-zone	Fabric Connector Address (AWS)
az-k8s-cluster	Fabric Connector Address (AZURE)
az-k8s-label	Fabric Connector Address (AZURE)
az-k8s-pod	Fabric Connector Address (AZURE)
az-k8s-region	Fabric Connector Address (AZURE)
dmz	Interface Subnet
gmail.com	FQDN
google-play	SDN
k8s_label	Fabric Connector Address (KUBERNETES)
k8s_nodename	Fabric Connector Address (KUBERNETES)

k8s_nodename resolves to:

- 172.16.65.227

To configure K8s SDN connector using CLI commands:

1. Configure the K8s SDN connector:

```

config system sdn-connector
edit "kubernetes1"
set type kubernetes
set server "<IP address obtained in Obtaining the IP address, port, and secret token in Kubernetes>"
set server-port <Port obtained in Obtaining the IP address, port, and secret token in Kubernetes>
set secret-token <Secret token obtained in Obtaining the IP address, port, and secret token in Kubernetes>
set update-interval 30
next
end
      
```
2. Create a dynamic firewall address for the configured K8s SDN connector with the supported K8s filter. In this example, the K8s SDN connector will automatically populate and update IP addresses only for node instances that match the specified node name:

```

config firewall address
  edit "k8s_nodename"
    set type dynamic
    set sdn "kubernetes1"
    set filter "K8S_NodeName=van-201669-pc1"
  next
end

```

3. Confirm that the K8s SDN connector resolves dynamic firewall IP addresses using the configured filter:

```

config firewall address
  edit "k8s_nodename"
    set type dynamic
    set sdn "kubernetes1"
    set filter "K8S_NodeName=van-201669-pc1"
  config list
    edit "172.16.65.227"
    next
  end
next
end

```

To troubleshoot the connection:

1. In FortiOS, run the following commands:
 diagnose deb application kubed -1
 diagnose debug enable
2. Reset the connection on the web UI to generate logs and troubleshoot the issue. The following shows the output in the case of a failure:

```

fortigate # diagnose deb application kubed -1
Debug messages will be on for 30 minutes.

fortigate # diagnose debug enable

fortigate # k8s: update sdn connector kubernetes1 status to enabled
k8s: update sdn connector kubernetes2 status to disabled
kubed sdn connector kubernetes1 prepare to update
getting token
kubed sdn connector kubernetes1 start updating
kube url: https://172.17.215.10:6443/api/v1/services
kube host: 172.17.215.10:6443:172.17.215.10
{"kind":"Status","apiVersion":"v1","metadata":{"status":"Failure","message":"services is forbidden: User \"system:serviceaccount:default:fortigateconnector\" cannot list resource \"services\" in API group \"\" at the cluster scope","reason":"Forbidden","details":{"kind":"services"},"code":403}}
kubed failed to list kubernetes services.
kubed failed to get IPs from kubedrnets services.
kubed failed to get ip addr list
kubed reap child pid: 1226

```

The following shows the output in the case of a success:

```

kube-system
k8s pod ip: 10.180.1.2, podname: metrics-server-v0.3.6-64655c969-djt8s, namespace: kube-system
e: kube-system
k8s pod ip: 10.138.0.6, podname: netd-4qvvn, namespace: kube-system
k8s pod ip: 10.138.0.5, podname: netd-756ch, namespace: kube-system
k8s pod ip: 10.138.0.4, podname: netd-hr75d, namespace: kube-system
k8s pod ip: 10.138.0.6, podname: prometheus-to-sd-59trp, namespace: kube-system

k8s pod ip: 10.138.0.5, podname: prometheus-to-sd-rq2zm, namespace: kube-system
k8s pod ip: 10.180.1.3, podname: stackdriver-metadata-agent-cluster-level-6c4f64f8cc-zgnp5, namespace: kube-system
k8s pod ip: 10.180.0.3, podname: nginx-deployment-c68885cbb-sf6f5, namespace: nginx
inx
k8s pod ip: 10.180.1.4, podname: nginx-deployment-c68885cbb-w5w2b, namespace: nginx
inx
kubed get IP address list from Kubernetes:
kubed sdn connector kubernetes2 start updating IP addresses
kubed checking firewall address object gcp-address, vd 0
address num change 0/3, new ip list:
10.180.0.3
10.180.1.4
10.184.0.1
kubed sdn connector kubernetes2 finish updating IP addresses
kubed reap child pid: 1252

```

Nuage SDN connector using server credentials

You can use Nuage SDN connectors in dynamic firewall addresses.

The Fortinet SDN Connector for Cisco ACI and Nuage Networks is a standalone connector that connects to SDN controllers within Cisco ACI and Nuage Networks. You must configure a connection to the Fortinet SDN connector in FortiOS to query the dynamic addresses.

To configure a Nuage connector in the GUI:

1. Create the Nuage SDN connector:
 - a. Go to *Security Fabric > External Connectors* and click *Create New*.
 - b. In the *Private SDN* section, click *Nuage Virtualized Services Platform*.
 - c. Configure the settings as needed.
 - d. Click *OK*.

The screenshot shows the 'New External Connector' dialog box. On the left, under 'Private SDN', the 'Nuage Virtualized Services Platform' is selected with a green checkmark. The 'Connector Settings' section shows 'Name' as 'nuage1' and 'Status' as 'Enabled'. The 'Nuage Connector' section shows 'IP' as '172.18.64.27', 'Port' as '5671' (with 'Specify' selected), 'Username' as 'admin', and 'Password' as masked. On the right, there are links for 'Public SDN Connector Setup Guides' (Amazon Web Services, Google Cloud Platform, Microsoft Azure, Oracle Cloud Infrastructure) and 'Private SDN Connector Setup Guides' (Cisco Application Centric Infrastructure, Nuage Virtualized Services Platform, OpenStack Connector, VMware NSX), along with 'Documentation' links for 'Online Help' and 'Video Tutorials'. At the bottom are 'OK' and 'Cancel' buttons.

2. Create the dynamic firewall address for the connector:
 - a. Go to *Policy & Objects > Addresses* and click *Create New > Address*.
 - b. Configure the following settings:
 - i. For *Type*, select *Dynamic*.
 - ii. For *Sub Type*, select *Fabric Connector Address*.
 - iii. For *SDN Connector*, select the Nuage connector.
 - iv. Configure the remaining settings as needed.

c. Click OK.

To verify the SDN connector resolves the dynamic firewall IP addresses in the GUI:

1. Go to *Policy & Objects > Addresses*.
2. In the address table, hover over an address to view which IP addresses it resolves to.

To configure a Nuage connector in the CLI:

1. Create the SDN connector:

```
config system sdn-connector
  edit "nuage1"
    set type nuage
    set server "172.18.64.27"
    set server-port 5671
    set username "admin"
    set password xxxxxxxx
  next
end
```

2. Create the dynamic firewall address for the connector:

```
config firewall address
  edit "nuage-address1"
    set type dynamic
    set sdn "nuage1"
    set color 19
    set organization "nuage/L3"
    set subnet-name "Subnet20"
  next
end
```

To verify the SDN connector resolves the dynamic firewall IP addresses in the CLI:

```
# diagnose firewall dynamic list
```

List all dynamic addresses:

```
nuage1.nuage.nuage/L3.Subnet20.*: ID(196)
  ADDR(192.168.20.92)
  ADDR(192.168.20.240)
```

Nutanix SDN connector using server credentials

FortiOS automatically updates dynamic addresses for Nutanix using an Nutanix SDN connector, including mapping the following attributes from Nutanix instances to dynamic address groups in FortiOS:

- Cluster name
- Cluster UUID
- Description
- Host name
- Host UUID
- Hypervisor type
- Image name
- Image UUID
- Subnet name
- Subnet UUID
- VM name
- VM UUID

To configure a Nutanix connector using the GUI:

1. Configure the Nutanix SDN connector:
 - a. Go to *Security Fabric > External Connectors*.
 - b. Select *Nutanix*.
 - c. In the *IP address* field, enter the IP address for your Nutanix environment.
 - d. In the *Port* field, enter the desired port.
 - e. In the *Username* and *Password* fields, enter the credentials for your Nutanix environment.
 - f. Click *OK*.
2. Create a dynamic firewall address for the configured Nutanix SDN connector:
 - a. Go to *Policy & Objects > Addresses*.
 - b. Click *Create New*, then select *Address*.
 - c. From the *Type* dropdown list, select *Dynamic*.
 - d. From the *Sub Type* dropdown list, select *Fabric Connector Address*.
 - e. From the *SDN Connector* dropdown list, select the Nutanix connector.
 - f. From the *Filter* dropdown list, select the desired filters.
 - g. Click *OK*.
3. Ensure that the Nutanix SDN connector resolves dynamic firewall IP addresses:
 - a. Go to *Policy & Objects > Addresses*.
 - b. Hover over the address created in step 2 to see a list of IP addresses for instances that satisfy the filter

requirements configured in step 2. In this example, the configured filter is "ClusterName=Fortinet-Lab":

To configure a Nutanix connector using the CLI:

1. Configure the Nutanix SDN connector:

```
config system sdn-connector
edit "nutanix_connector"
set status disable
set type nutanix set server "172.18.33.59"
set server-port 9440
set username "admin"
set password *****
set update-interval 60
next
end
```

2. Create a dynamic firewall address for the configured Nutanix SDN connector:

```
config firewall address
edit "nutanix-addr"
set uuid 382ceafe-8e72-51eb-7300-0807ee907946
set type dynamic
set sdn "nutanix_connector"
set color 2
set filter "ClusterName=Fortinet-Lab"
next
end
```

3. Ensure that the Nutanix SDN connector resolves dynamic firewall IP addresses:

```
config firewall address
edit "nutanix-addr"
set uuid 382ceafe-8e72-51eb-7300-0807ee907946
set type dynamic
set sdn "nutanix_connector"
set color 2
set filter "ClusterName=Fortinet-Lab"
config list
edit "192.168.10.15"
next
edit "192.168.10.16"
next
edit "192.168.11.15"
next
edit "192.168.11.16"
```

```

    next
  end
next
end

```

OCI SDN connector using certificates

You can configure SDN connector integration with Oracle Cloud Infrastructure (OCI).

To configure an OCI SDN connector in the GUI:

1. Go to *Security Fabric > External Connectors* and click *Create New*.
2. In the *Public SDN* section, select *Oracle Cloud Infrastructure (OCI)*.
3. Configure the connector as desired:
 - a. *User ID*: Enter the OCID of the OCI user who belongs to the administrator group. See [Certificate-based SDN connector requirements](#).
 - b. For the *OCI Certificate* field, you must select a certificate that satisfies OCI key size limits. The minimum size is 2048 bits. Do one of the following:
 - i. Select the built-in default certificate called *Fortinet_Factory*.
 - ii. Follow steps 1-2 in [Using custom certificates](#) to configure a custom certificate.

4. Click *OK*.
5. At this stage, you must register the certificate's fingerprint to the specified OCI user.
 - a. Go to the OCI user, then *API Keys > Add Public Key*.
 - b. If you selected the *Fortinet_Factory* certificate in step 2f, do the following:
 - i. In FortiOS, go to *System > Certificate*. Select *Fortinet_Factory*, then click *Download*.
 - ii. You now have the *Fortinet_Factory.cer* file. Create a public key file in PEM format from it, using a freely available tool of your choice such as OpenSSL.
 - c. Copy and paste the content of the certificate PEM key file in the *Add Public Key* window in OCI. Click *Add*.

- d. You now see the fingerprint.

API Keys

You can configure the following for the fingerprint:

1. **Update Interval:** The default value is 60 seconds. You can change the value to between 1 and 3600 seconds.
2. **Status:** Green means that the connector is enabled. You can disable it at any time by toggling the switch.

- e. Click OK.

6. Go to **Policy & Objects > Addresses** and click **Create New > Address**.

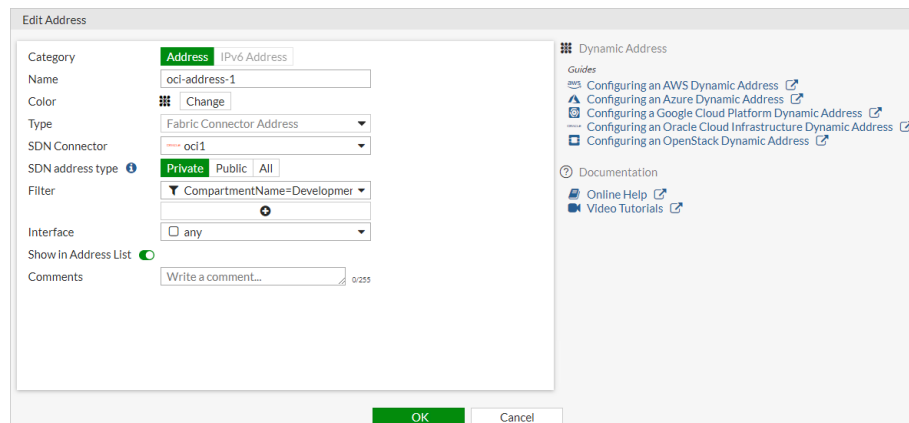

7. Configure the address as needed, selecting the OCI connector in the **SDN Connector** field. The following filters are supported:

'vm_name=<vm name>': matches VM instance name.

'instance_id=<instance id>': matches instance OCID.

'tag.<key>=<value>': matches freeform tag key and its value.

'definedtag.<namespace>.<key>=<value>': matches a tag namespace, tag key, and its value.

8. Click OK.

To configure an OCI SDN connector in the CLI:

1. Configure an SDN connector:

```
config system sdn-connector
edit "oci1"
    set status enable
    set type oci
    set tenant-id
"ocidl.tenancy.oc1..aaaaaaaa3aaaaaaaaaaaaaaaaa77xxxxx54bbbbbb4xxxx35xx55xxxx"
    set user-id
"ocidl.user.oc1..aaaaaaaa2laaaaa3aaaaaaaaabbbbbbbbbbcccc3cccccccccccccccccccc"
    set compartment-id
"ocidl.compartment.oc1..aaaaaaaaaaaaaaaa7bbbbbbbbbcccccccccc6xxx53xxxx7xxxxxxxxxx"
    set oci-region "us-ashburn-1"
```

```

        set oci-region-type commercial
        set oci-cert "cert-sha2"
        set update-interval 30
    next
end

```

2. Create a dynamic firewall address for the SDN connector with a supported filter:

```

config firewall address
    edit "oci-address-1"
        set type dynamic
        set sdn "oci1"
        set filter "CompartmentName=DevelopmentEngineering"
    next
end

```

To confirm that dynamic firewall addresses are resolved by the SDN connector:

1. In the CLI, check that the addresses are listed:

```

config firewall address
    edit "oci-address-1"
        set type dynamic
        set sdn "oci1"
        set filter "CompartmentName=DevelopmentEngineering"
    config list
        edit "10.0.0.11"
        next
        edit "10.0.0.118"
        next
        ...
    next
end
next
end

```

2. In the GUI, go to *Policy & Objects > Addresses* and hover the cursor over the address name.

OpenStack SDN connector using node credentials

To configure OpenStack SDN connector using node credentials:

1. Go to *Security Fabric > External Connectors*.
2. Click *Create New*, then select *OpenStack (Horizon)*.

3. Configure the fields as follows:

- a. **Name:** Name the connector as desired.
- b. **IP:** Enter the OpenStack management component's IP address. Generally you can find it in the OpenStack identity.

- c. **User name:** Enter the specified node's administrator name.
- d. **Password:** Enter the administrator password.

 A screenshot of the 'New Fabric Connector' dialog box. The 'SDN' section is selected, showing an 'OpenStack (Horizon)' icon with a green checkmark. Below this, the 'Connector Settings' section contains the following fields:

- Name: openstack
- IP: 10.210.8.44
- Username: admin
- Password: A field with masked characters (dots) and an eye icon to toggle visibility.
- Status: A toggle switch that is currently turned on.

 At the bottom of the dialog are 'OK' and 'Cancel' buttons.

4. Click OK. The SDN connector is now configured.

To configure a dynamic firewall address:

The next step is to create an address that will be used as an address group or single address that acts as the source/destination for firewall policies. The address is based on IP addresses and contains VM instances' IP addresses.

No matter what changes occur to the instances, the SDN connector populates and updates the changes automatically based on the specified filtering condition so that administrators do not need to reconfigure the address content manually. Appropriate firewall policies using the address are applied to instances that are members of the address.

1. Go to *Policy & Objects > Address*. Click *Create New*, then select *Address*.
2. Configure the address as follows:
 - a. *Name*: Name the address as desired.
 - b. *Type*: Select *Dynamic*.
 - c. *Sub Type*: Select *Fabric Connector Address*.
 - d. *SDN Connector*: Select *openstack*.
 - e. *Filter*: The SDN connector automatically populates and updates only IP addresses belonging to the specified filter that matches the condition. OpenStack Horizon connectors support the following filters:
 - i. `id=<instance id>`: This matches a VM instance ID.
 - ii. `name=<instance name>`: This matches a VM instance name.
 - iii. `flavor=<instance flavor name>`: This matches an instance flavor name.
 - iv. `keypair=<key pair name>`: This matches a key pair name.
 - v. `network=<net name>`: This matches a network name.
 - vi. `project=<project name>`: This matches a project name.
 - vii. `availabilityzone=<zone name>`: This matches an availability zone name.
 - viii. `servergroup=<group name>`: This matches a server group name.
 - ix. `securitygroup=<security group name>`: This matches a security group name.
 - x. `metadata.<key>=<value>`: This matches metadata with its key and value pair.

You can set filtering conditions using multiple entries with AND ("&") or OR ("|"). When both AND and OR are specified, AND is interpreted first, then OR.

For example, you could enter `flavor=m1.nano&project=admin`. In this case, IP addresses of instances that match both the flavor name and project name are populated. Wildcards (asterisks) are not allowed in values.

New Address

SAP SDN connector

The SAP external Fabric connector allows the FortiGate to connect to an SAP instance to synchronize dynamic address objects and ports for SAP workloads. These address objects can be used in firewall policies to grant access control to dynamic SAP workloads.

To configure an SAP connector in the GUI:

1. Configure the SAP SDN connector:
 - a. Go to *Security Fabric > External Connectors* and click *Create New*.
 - b. In the *Private SDN* section, select *SAP*.
 - c. Enter a *Name* (*sap-s4-docker*).
 - d. Enter the *IP* for the SAP instance.
 - e. Enter the *Username* and *Password*.

The screenshot displays the 'New External Connector' configuration window in the FortiGate GUI. The window is titled 'New External Connector' and is divided into two main sections: 'Private SDN' and 'Additional Information'.

Private SDN Section:

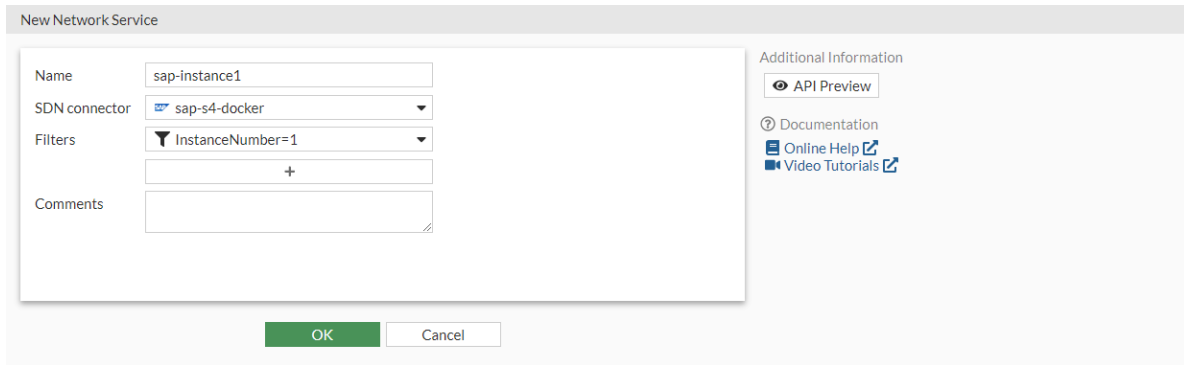

- Connector Settings:**
 - Name:** sap-s4-docker
 - Status:** Enabled (indicated by a green checkmark icon)
 - Update interval:** Use Default (radio button selected)
 - Verify certificate:** Disabled (radio button selected)
- SAP Connector:**
 - IP:** 20.124.134.109
 - Port:** Use Default (radio button selected)
 - Username:** a4hadm
 - Password:** [Masked with dots]

Additional Information Section:

- API Preview:** [Button]
- Public SDN Connector Setup Guides:**
 - Amazon Web Services
 - Google Cloud Platform
 - Microsoft Azure
 - Oracle Cloud Infrastructure
- Private SDN Connector Setup Guides:**
 - Cisco Application Centric Infrastructure
 - Nuage Virtualized Services Platform
 - OpenStack Connector
 - VMware NSX
- Documentation:**
 - Online Help
 - Video Tutorials

At the bottom of the window, there are two buttons: 'OK' and 'Cancel'.

- f. Click **OK**.
2. Configure a network service associated with the configured SAP SDN connector:
 - a. Go to *Policy & Objects > Internet Service Database*, select the *Network Services* tab, and click *Create New*.
 - b. Enter a *Name* (*sap-instance1*).
 - c. Set *SDN connector* to *sap-s4-docker*.
 - d. Select a filter, such as *InstanceNumber=1*. The available filters are for *HostName*, *InstanceNumber*, and *ServiceName*.

OK **Cancel**

Click **OK** to close the list.

4. Configure a firewall policy with the resolved dynamic network service as the destination:

- Go to **Policy & Objects > Firewall Policy** and click **Create New**.
- Set the **Destination** to the *sap-instance1* network service.
- Configure the other settings as needed.
- Click **OK**.

To configure an SAP connector in the CLI:

1. Configure the SAP SDN connector:

```
config system sdn-connector
edit "sap-s4-docker"
set type sap
set verify-certificate disable
set server "20.124.134.109"
```

```

        set server-port 50014
        set username "a4hadm"
        set password *****
    next
end

```

2. Configure a network service associated with the configured SAP SDN connector (available filters are HostName, InstanceNumber, and ServiceName):

```

config firewall network-service-dynamic
    edit "sap-instance1"
        set sdn "sap-s4-docker"
        set filter "InstanceNumber=1"
    next
end

```

3. Ensure that the SAP SDN connector resolves dynamic network services:

```

# diagnose firewall network-service-dynamic list "sap-instance1"
List internet service in kernel(custom):
name=sap-instance1 id=4294770689 reputation=0 (null) singularity=0 flags=0x0 protocol=6
port=8101-8101
addr ip range(1): 172.17.0.2-172.17.0.2
name=sap-instance1 id=4294770689 reputation=0 (null) singularity=0 flags=0x0 protocol=6
port=50114-50114
addr ip range(1): 172.17.0.2-172.17.0.2
name=sap-instance1 id=4294770689 reputation=0 (null) singularity=0 flags=0x0 protocol=6
port=50113-50113
addr ip range(1): 172.17.0.2-172.17.0.2
name=sap-instance1 id=4294770689 reputation=0 (null) singularity=0 flags=0x0 protocol=6
port=3901-3901
addr ip range(1): 172.17.0.2-172.17.0.2
name=sap-instance1 id=4294770689 reputation=0 (null) singularity=0 flags=0x0 protocol=6
port=3601-3601
addr ip range(1): 172.17.0.2-172.17.0.2
name=sap-instance1 id=4294770689 reputation=0 (null) singularity=0 flags=0x0 protocol=6
port=3201-3201
addr ip range(1): 172.17.0.2-172.17.0.2

```

4. Configure a firewall policy with the resolved dynamic network service as the destination:

```

config firewall policy
    edit 2
        set name "FGT97-service-dynamic"
        set srcintf "port3"
        set dstintf "port10"
        set action accept
        set srcaddr "all"
        set internet-service enable
        set network-service-dynamic "sap-instance1"
        set schedule "always"
        set nat enable
    next
end

```

VMware ESXi SDN connector using server credentials

Dynamic addresses for VMware ESXi and vCenter servers can be automatically updated by using a VMware ESXi SDN connector, including mapping the following attributes from VMware ESXi and vCenter objects to dynamic address groups in FortiOS:

- vmid
- host
- name
- uuid
- vmuuid
- vmnetwork
- guestid
- guestname
- annotation
- datacenter
- tag

To configure VMware ESXi SDN connector using the GUI:

1. Configure the VMware ESXi SDN connector:
 - a. Go to *Security Fabric > External Connectors*.
 - b. Click *Create New*, and select *VMware ESXi*.
 - c. Configure as shown, substituting the server IP address, username, and password for your deployment. The update interval is in seconds. The password cannot contain single or double quotes.

2. Create a dynamic firewall address for the configured VMware ESXi SDN connector:
 - a. Go to *Policy & Objects > Addresses* and click *Create New > Address*.
 - b. Configure the address as shown, selecting the desired filter in the *Filter* dropdown list. In this example, the VMware ESXi fabric connector will automatically populate and update IP addresses only for instances that

belong to VLAN80:

3. Ensure that the VMware ESXi SDN connector resolves dynamic firewall IP addresses:
 - a. Go to *Policy & Objects > Addresses*.
 - b. Hover over the address created in step 2 to see a list of IP addresses for instances that belong to VLAN80 as configured in step 2:

To configure VMware ESXi SDN connector using CLI commands:

1. Configure the VMware ESXi SDN connector:

```
config system sdn-connector
  edit "vmware1"
    set type vmware
    set server "172.17.48.222"
    set username "example_username"
    set password xxxxx
    set update-interval 30
  next
end
```

2. Create a dynamic firewall address for the configured VMware ESXi SDN connector with the supported VMware ESXi filter. In this example, the VMware ESXi SDN connector will automatically populate and update IP addresses only for instances that belong to the specified VLAN:

```
config firewall address
  edit "vmware-network"
    set type dynamic
    set sdn "vmware1"
    set filter "vmnetwork=VLAN80"
  next
end
```

3. Confirm that the VMware ESXi SDN connector resolves dynamic firewall IP addresses using the configured filter:

```
config firewall address
  edit "vmware-network"
    set type dynamic
    set sdn "vmware1"
    set filter "vmnetwork=VLAN80"
    config list
      edit "192.168.8.240"
    next
  end
next
end
```

VMware NSX-T Manager SDN connector using NSX-T Manager credentials

This feature provides SDN connector configuration for VMware NSX-T manager. You can import specific groups, or all groups from the NSX-T Manager.

To configure SDN connector for NSX-T Manager in the GUI:

1. Go to *Security Fabric > External Connectors* and click *Create New*.
2. In the *Private SDN* section, click *VMware NSX*.

3. Configure the settings and click *OK*.

To configure SDN connector for NSX-T Manager in the CLI:

```
config system sdn-connector
  edit "nsx_t24"
    set type nsx
    set server "172.18.64.205"
    set username "admin"
    set password xxxxxx
  next
end
```

To import a specific group from the NSX-T Manager:

```
# execute nsx group import nsx_t24 root csf_ns_group
[1] 336914ba-0660-4840-b0f1-9320f5c5ca5e csf_ns_group:
  Name:csf_ns_group
  Address:1.1.1.0
  Address:1.1.1.1
  Address:172.16.10.104
  Address:172.16.20.104
  Address:172.16.30.104
  Address:2.2.2.0
  Address:2.2.2.2
  Address:4.4.4.0
  Address:5.5.5.0
```

Address:6.6.6.6
Address:7.7.7.7

To import all groups from NSX-T Manager:

```
# execute nsx group import nsx_t24 root
[1] 663a7686-b9a3-4659-b06f-b45c908349a0 ServiceInsertion_NSGroup:
  Name:ServiceInsertion_NSGroup
  Address:10.0.0.2
[2] 336914ba-0660-4840-b0f1-9320f5c5ca5e csf_ns_group:
  Name:csf_ns_group
  Address:1.1.1.0
  Address:1.1.1.1
  Address:172.16.10.104
  Address:172.16.20.104
  Address:172.16.30.104
  Address:2.2.2.0
  Address:2.2.2.2
  Address:4.4.4.0
  Address:5.5.5.0
  Address:6.6.6.6
  Address:7.7.7.7
[3] c462ec4d-d526-4ceb-aeb5-3f168cecd89d charlie_test:
  Name:charlie_test
  Address:1.1.1.1
  Address:2.2.2.2
  Address:6.6.6.6
  Address:7.7.7.7
[4] ff4dcb08-53cf-46bd-bef4-f7aeda9c0ad9 fgt:
  Name:fgt
  Address:172.16.10.101
  Address:172.16.10.102
  Address:172.16.20.102
  Address:172.16.30.103
[5] 3dd7df0d-2baa-44e0-b88f-bd21a92eb2e5 yongyu_test:
  Name:yongyu_test
  Address:1.1.1.0
  Address:2.2.2.0
  Address:4.4.4.0
  Address:5.5.5.0
```

To view the dynamic firewall IP addresses that are resolved by the SDN connector in the GUI:

1. Go to *Policy & Objects > Addresses* to view the IP addresses resolved by an SDN connector.

Multiple concurrent SDN connectors

This guide shows how to configure SDN connectors and resolve dynamic firewall addresses through the configured SDN connector in FortiOS.

FortiOS supports multiple SDN connectors including public connectors (AWS, Azure, GCP, OCI, AliCloud) and private connectors (Kubernetes, VMware ESXi, VMware NSX, OpenStack, Cisco ACI, Nuage). FortiOS also supports multiple instances for each type of SDN connector.

This guide uses an Azure SDN connector as an example. The configuration procedure for all supported SDN connectors is the same. In the following topology, the FortiGate accesses the Azure public cloud through the Internet:

This process consists of the following:

1. [Configure the interface.](#)
2. [Configure a static route to connect to the Internet.](#)
3. [Configure two Azure SDN connectors with different client IDs.](#)
4. [Check the configured SDN connectors.](#)
5. [Create two firewall addresses.](#)
6. [Check the resolved firewall addresses after the update interval.](#)
7. [Run diagnose commands.](#)

To configure the interface:

1. In FortiOS, go to *Network > Interfaces*.
2. Edit port1:
 - a. From the *Role* dropdown list, select *WAN*.
 - b. In the *IP/Network Mask* field, enter 10.6.30.4/255.255.255.0 for the interface connected to the Internet.

To configure a static route to connect to the Internet:

1. Go to *Network > Static Routes*. Click *Create New*.
2. In the *Destination* field, enter 0.0.0.0/0.0.0.0.
3. From the *Interface* dropdown list, select *port1*.
4. In the *Gateway Address* field, enter 10.60.30.254.

To configure two Azure SDN connectors with different client IDs:

1. Go to *Security Fabric > External Connectors*.
2. Click *Create New*. Configure the first SDN connector:
 - a. Select *Microsoft Azure*.
 - b. In the *Name* field, enter *azure1*.
 - c. In the *Status* field, select *Enabled*.
 - d. From the *Server region* dropdown list, select *Global*.
 - e. In the *Directory ID* field, enter the directory ID. In this example, it is 942b80cd-1b14-42a1-8dcf-4b21dece61ba.
 - f. In the *Application ID* field, enter the application ID. In this example, it is 14dbd5c5-307e-4ea4-8133-68738141feb1.
 - g. In the *Client secret* field, enter the client secret.
 - h. Leave the *Resource path* disabled.
 - i. Click *OK*.

The screenshot shows the 'New External Connector' configuration window. At the top, it says 'New External Connector'. Below that, there's a 'Public SDN' section with a green checkmark and the Microsoft Azure logo. The 'Connector Settings' section includes:

- Name:** azure1
- Status:** Enabled (with a green checkmark icon) and Disabled (with a red X icon)
- Update interval:** Use Default (selected) and Specify

 The 'Azure Connector' section includes:

- Server region:** Global (dropdown menu)
- Directory ID:** 942b80cd-1b14-42a1-8dcf-4b21dece61ba
- Application ID:** 14dbd5c5-307e-4ea4-8133-68738141
- Client secret:** A field with masked characters (dots) and an eye icon to toggle visibility.
- Resource path:** A toggle switch that is currently turned off.

3. Click *Create New*. Configure the second SDN connector:
 - a. Select *Microsoft Azure*.
 - b. In the *Name* field, enter *azure2*.
 - c. In the *Status* field, select *Enabled*.
 - d. From the *Server region* dropdown list, select *Global*.
 - e. In the *Directory ID* field, enter the directory ID. In this example, it is 942b80cd-1b14-42a1-8dcf-4b21dece61ba.
 - f. In the *Application ID* field, enter the application ID. In this example, it is 3baf0a6c-44ff-4f94-b292-07f7a2c36be6.
 - g. In the *Client secret* field, enter the client secret.
 - h. Leave the *Resource path* disabled.

i. Click OK.

The screenshot shows the 'New External Connector' configuration window. It is titled 'Public SDN' and features the Microsoft Azure logo with a green checkmark. Below the logo, the 'Connector Settings' section includes:

- Name:** azure2
- Status:** Enabled (with a green checkmark icon) and Disabled (with a red X icon)
- Update interval:** Use Default (selected) and Specify

 The 'Azure Connector' section includes:

- Server region:** Global
- Directory ID:** 942b80cd-1b14-42a1-8dcf-4b21dece
- Application ID:** 3baf0a6c-44ff-4f94-b292-07f7a2c36b
- Client secret:** A masked field with dots and an eye icon to toggle visibility.
- Resource path:** A toggle switch.

To check the configured SDN connectors:

1. Go to *Security Fabric > External Connectors*.
2. Click the *Refresh* icon in the upper right corner of each configured SDN connector. A green up arrow appears in the lower right corner, meaning that both SDN connectors are connected to the Azure cloud using different client IDs.

**To create two firewall addresses:**

This process creates two SDN connector firewall addresses to associate with the configured SDN connectors.

1. Go to *Policy & Objects > Addresses*.
2. Click *Create New > Address*. Configure the first SDN connector firewall address:
 - a. In the *Name* field, enter *azure-address-1*.
 - b. From the *Type* dropdown list, select *Dynamic*.
 - c. From the *Sub Type* dropdown list, select *Fabric Connector address*.
 - d. From the *SDN Connector* dropdown list, select *azure1*.
 - e. For *SDN address type*, select *Private*.
 - f. From the *Filter* dropdown list, select the desired filter.
 - g. For *Interface*, select *any*.

h. Click OK.

The 'New Address' configuration window shows the following settings:

- Name: azure-address-1
- Color: Change
- Type: Dynamic
- Sub Type: Fabric Connector Address
- SDN Connector: azure1
- SDN address type: Private (selected), Public, All
- Filter: (empty dropdown)
- Interface: any
- Comments: Write a comment... 0/255

3. Click *Create New > Address*. Configure the second SDN connector firewall address:

- In the *Name* field, enter *azure-address-1*.
- From the *Type* dropdown list, select *Dynamic*.
- From the *Sub Type* dropdown list, select *Fabric Connector address*.
- From the *SDN Connector* dropdown list, select *azure2*.
- For *SDN address type*, select *Private*.
- From the *Filter* dropdown list, select the desired filter.
- For *Interface*, select *any*.
- Click *OK*.

To check the resolved firewall addresses after the update interval:

By default, the update interval is 60 seconds.

- Go to *Policy & Objects > Addresses*.
- Hover over the created addresses. The firewall address that the configured SDN connectors resolved display.

Name	Type
azure-address-1	Fabric Connector Address (AZURE)
azure-address-2	Fabric Connector Address (AZURE)

To run diagnose commands:

Run the `show sdn connector status` command. Both SDN connectors should appear with a status of `connected`.

Run the `diagnose debug application azd -1` command. The output should look like the following:

```
Level2-downstream-D # diagnose debug application azd -1
...
azd sdn connector azure1 start updating IP addresses
azd checking firewall address object azure-address-1, vd 0
IP address change, new list:
10.18.0.4
...
```

To restart the Azure SDN connector daemon, run the `diagnose test application azd 99` command.

Filter lookup in SDN connectors

When configuring dynamic address mappings for filters in SDN connectors for Azure, GCP, OpenStack, Kubernetes, and AliCloud, FortiGate can query the filters automatically.

To use the filter lookup:

1. Navigate to *Policy & Objects > Addresses*.
2. Create or edit an SDN connector type dynamic IP address.
Supported SDN connector types include: AWS, Azure, GCP, OpenStack, Kubernetes, and AliCloud. The example below is for an Azure SDN connector.
3. In the address *Filter* field, you can perform the following actions:
 - List all available filters.

The screenshot shows the 'Edit Address' dialog box. The 'Filter' field is expanded, showing a search bar with the text 'Search' and a list of filters. The filters are categorized by location, resource group, security group, size, and subnet. The 'Subnet' category is selected, showing a list of subnets: 'Subnet=client', 'Subnet=mgmt', and 'Subnet=server'. The 'OK' button is highlighted in green.

- Search the available filters.

The screenshot shows the 'Edit Address' dialog box. The 'Filter' field is expanded, showing a search bar with the text 'subnet' and a list of filters. The filters are categorized by location, resource group, security group, size, and subnet. The 'Subnet' category is selected, showing a list of subnets: 'Subnet=client', 'Subnet=mgmt', and 'Subnet=server'. The 'OK' button is highlighted in green.

- Create custom filters.

- Set filter logic [and|or].

The screenshot shows the 'Edit Address' configuration window. The 'Category' is set to 'Address' (IPv6 Address). The 'Name' is 'azure-address-name1'. The 'Color' is set to 'Change'. The 'Type' is 'Fabric Connector Address'. The 'SDN Connector' is 'azure1'. The 'Filter' section shows three conditions: 'Location=northeurope', 'ResourceGroup=ThomasGuanQA', and 'Subnet=server', connected by 'and' and 'or' operators. The 'Interface' is set to 'any'. The 'Show in Address List' checkbox is checked. The 'Comments' field is empty. At the bottom, there are 'OK' and 'Cancel' buttons.

Support for wildcard SDN connectors in filter configurations

Wildcards are supported for SDN connectors when configuring dynamic address filters.

The following SDN connector types are currently supported:

- AWS
- Azure
- Google Cloud Platform
- Kubernetes
- OpenStack
- Oracle Cloud Infrastructure
- VMware ESXi

To configure a dynamic address filter for AWS in the GUI:

1. Create the SDN connector:
 - a. Go to *Security Fabric > External Connectors*.
 - b. Click *Create New*.
 - c. In the *Public SDN* section, click *Amazon Web Services (AWS)*.
 - d. Configure the settings as needed.
 - e. Click *OK*.
2. Create the dynamic firewall address:
 - a. Go to *Policy & Objects > Addresses*.
 - b. Click *Create New > Address*
 - c. Enter a name for the address, then configure the following settings:
 - Set *Type* to *Dynamic*.
 - Set *Sub Type* to *Fabric Connector Address*.
 - Set *SDN Connector* to *aws1*.
 - Set *SDN address type* to *Private*.

- For **Filter**, click **Create**, enter **Tag.Name=aws***, then click **OK**.

d. Click **OK**.

- In the address table, hover over the address to view what IPs it resolves to.

<div> <div>+ Create New</div> <div>Edit Clone Delete</div> <div>Search</div> </div>					
Name	Type	Details	Interface	Visibility	
FIREWALL_A	aws-address-1 resolves to:	0.0.0.0/0		Hidden	
SSLVPN_TUN	<ul style="list-style-type: none"> 18.234.167.123 3.81.41.167 52.87.157.127 	10.212.134.200 - 10.212.134.210	SSL-VPN tunnel interface (ssl.FG-traffic)	Visible	
all	all	0.0.0.0/0		Visible	
aws-address-1	Dynamic (AWS)			Visible	

- In AWS, verify to confirm the IP addresses match.

Name	Instance ID	Instance Type	Availability Zone	Instance State	Status Checks	IPv4 Public IP	Key Name
aws_ond	i-023b73b73b73b3b7	t2.micro	us-east-1b	running	2/2 checks ...	18.234.167.123	thomaskeypair
aws_ond	i-04c34c34c34c4c4c3	t2.small	us-east-1d	running	2/2 checks ...	3.81.41.167	thomaskeypair
awsondemand	i-0e0a70a70a70a70a7	t2.micro	us-east-1b	running	2/2 checks ...	52.87.157.127	thomaskeypair

To configure a dynamic address filter for AWS in the CLI:

- Configure the SDN connector:

```
config firewall address
  edit "aws-address-1"
    set type dynamic
    set sdn "aws1"
    set filter "Tag.Name=aws*"
    set sdn-addr-type public
  next
end
```

- Create the dynamic firewall address and verify where the IP addresses resolve to:

```
config firewall address
  edit "aws-address-1"
    set type dynamic
    set sdn "aws1"
    set filter "Tag.Name=aws*"
    set sdn-addr-type public
  config list
    edit "18.234.167.123"
```

```
        next
        edit "3.81.41.167"
        next
        edit "52.87.157.127"
        next
    end
next
end
```

3. In AWS, verify that the IP addresses match.

Endpoint/Identity connectors

SSO fabric connectors integrate SSO authentication into the network. This allows users to enter their credentials only once, and have those credentials reused when accessing other network resources through the FortiGate.

The following fabric connectors are available:

- [Fortinet single sign-on agent on page 3084](#)
- [Poll Active Directory server on page 3085](#)
- [Symantec endpoint connector on page 3086](#)
- [RADIUS single sign-on agent on page 3092](#)
- [Exchange Server connector on page 3095](#)

Fortinet single sign-on agent

To create an FSSO agent connector in the GUI:

1. Go to *Security Fabric > External Connectors*.
2. Click *Create New*.

3. In the *Endpoint/Identity* section, click *FSSO Agent on Windows AD*.

4. Fill in the *Name*, and *Primary FSSO Agent* server IP address or name and *Password*.
5. Optionally, add more FSSO agents by clicking the plus icon.
6. Optionally, enable *Trusted SSL certificate* and select or import a certificate.
7. Select the *User group source*:
- *Collector Agent*: User groups will be pushed to the FortiGate from the collector agent. Click *Apply & Refresh* to fetch group filters from the collector agent.
 - *Local*: User groups will be specified in the FortiGate unit's configuration. Select the LDAP server from the list, then click *Edit* to select the *Users*, *Groups*, and *Organizational Units*. Optionally, enable *Proactively retrieve from LDAP server* and configure the *Search filter* and *Interval*.
8. Click *OK*.

Poll Active Directory server

The FortiGate unit can authenticate users and allow them network access based on groups membership in Windows Active Directory (AD).

To create an AD server connector in the GUI:

1. Go to *Security Fabric > External Connectors*.
2. Click *Create New*.

3. In the *Endpoint/Identity* section, click *Poll Active Directory Server*.

4. Fill in the *Server IP/Name*, *User*, and *Password* for the AD server.
5. Select the LDAP server from the list.
6. If necessary, disable *Enable Polling*. This can be used to temporarily stop the FortiGate from polling security event logs on the Windows logon server, for troubleshooting purposes.
7. Click *OK*.

Symantec endpoint connector

With the Fabric connector for Symantec Endpoint Protection Manager (SEPM), you can use the client IP information from SEPM to assign to dynamic IP addresses on FortiOS.

When communication between FortiGate and SEPM is established, FortiGate polls every minute for updates via TLS over port 8446. You can use the CLI to change the default one minute polling interval.

For example, you can create a dynamic Fabric Connector IP address subtype and use it in firewall policies as the source address. The dynamic IP address contains all IP addresses sent by SEPM.

This example shows a dynamic IP address with SEPM and one client PC managed by SEPM using FortiGate as the default gateway.

To configure SEPM on a managed client PC:

1. In SEPM, create client packages for client hosts and group them into SEPM groups. You can install packages locally on clients or download them directly from SEPM.

Package Name	Type	Version	Start Time	Available
Symantec Endpoint Protection version 14.2.3332.1000 for VM64BIT	Symantec Endpoint Protection Client	14.2.3332.1000	September 6, 2019 4:43:14 PM PDT	✓
Symantec Endpoint Protection version 14.2.3332.1000 for VM32BIT	Symantec Endpoint Protection Client	14.2.3332.1000	September 9, 2019 4:43:35 PM PDT	✓

2. When a package is installed on the client host, the host is considered managed by SEPM. Even if the host has multiple interfaces, only one IP per host is displayed.

To configure Symantec endpoint connector on FortiGate in the GUI:

1. Go to *Security Fabric > External Connectors* and click *Create New*:
 - a. In the *Endpoint/Identity* section, click *Symantec Endpoint Protection*.
 - b. Fill in the *Name*, and set the *Status* and *Update Interval*.
 - c. Set *Server* to the SEPM IP address.
 - d. Enter the *Username* and *Password* for the server.
 - e. To limit the domain or group that is monitored, enter them in the requisite fields.

- f. Click **OK**.
When the connection is established, you can see a green up arrow in the bottom right of the card. You might need to refresh your browser to see the established connection.
2. Go to *Policy & Objects > Addresses* and click *Create New > Address*:
 - a. Fill in the address *Name*.
 - b. Set *Type* to *Dynamic*.
 - c. Set *Sub Type* to *Fabric Connector Address*.
 - d. Set *SDN Connector* to the fabric connector that you just created.

e. Add *Filters* as needed.

f. Click OK.

Filter options are only available for active computers that are configured and registered in SEPM. Free-form filters can be created manually by clicking *Create* and entering the filter, in the format: `filter_type=value`.

Possible manual filter types are: `GroupName`, `GroupID`, `ComputerName`, `ComputerUUID`, and `OSName`. For example: `GroupName=MyGroup`.

3. Go to *Policy & Objects* > *Addresses* and hover the cursor over the name of the new address to see the resolved IP addresses of the host.

+ Create New Edit Clone Delete Search					
Name	Type	Details	Interface	Ref.	
FIREWALL_AUTH_PORTAL_ADDRESS	Subnet	0.0.0.0/0		0	
SSL2	Subnet	0.0.0.0/0		0	
SSLVPN_TUNNEL_ADDR1	IP Range	10.212.134.200 - 10.212.134.210	SSL-VPN tunnel interface (ssl.root)	3	
all	Subnet	0.0.0.0/0		4	
dmz	Address	sepm-ip		0	
gmail.com	Type	Dynamic		1	
internal	Sub Type	Fabric Connector Address		0	
login.microsoft.com	SDN Connector	sepm-217		1	
login.microsoft.com	Interface	any		1	
login.microsoft.com	Resolved To	10.1.100.187 10.6.30.187 172.16.200.187		1	
login.windows.net	References	1		1	
none		0.0.0.0/32		0	
sepm-ip	Dynamic (SEPM)	sepm-ip		1	
wildcard.dropbox.com	FQDN	*.dropbox.com		1	
wildcard.google.com	FQDN	*.google.com		2	
Address Group					
G Suite	Address Group	gmail.com wildcard.google.com		0	35% 27

4. Go to *Policy & Objects* > *Firewall Policy*, click *Create New*, and add a policy that uses the dynamic IP address.

To verify the configuration:

1. On the client PC, check that it is managed by SEPM to access the Internet.

The screenshot shows the Symantec Endpoint Protection status window on the left, indicating that the computer is protected. The status window lists several security components: Virus and Spyware Protection, Proactive Threat Protection, and Network and Host Exploit Mitigation. On the right, a Command Prompt window displays the network configuration for three Ethernet adapters (Ethernet 2, Ethernet 3, and Ethernet 4) and the results of a ping command to 8.8.8.8. The ping results show a successful connection with a round trip time of 4ms.

2. On the FortiGate, you can check in *Dashboard > FortiView Sources* and *Log & Report > Forward Traffic*.

Because this traffic is not authenticated traffic but is based on source IP address only, it is not shown in the GUI firewall monitor or in the `diagnose firewall auth list` CLI command.

To configure Symantec endpoint connector on FortiGate in the CLI:**1. Create the fabric connector:**

```
config system sdn-connector
  edit "sepm-217"
    set type sepm
    set server "172.18.60.217"
    set username "admin"
    set password "*****"
    set status enable
  next
end
```

2. Create the dynamic IP address:

```
config firewall address
  edit "sepm-ip"
    set type dynamic
    set sdn "sepm-217"
    set filter "ComputerName=win10-1"
    config list
      edit "10.1.100.187"
      next
      edit "10.6.30.187"
      next
      edit "172.16.200.187"
      next
    end
  next
end
```

3. Add the dynamic IP address to the firewall policy:

```
config firewall policy
  edit 1
    set name "pol1"
    set srcintf "port2"
    set dstintf "port1"
    set srcaddr "sepm-ip"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set ssl-ssh-profile "certificate-inspection"
    set av-profile "default"
    set logtraffic all
    set fsso disable
    set nat enable
  next
end
```

To troubleshoot Symantec SD connector in the CLI:

```
# diagnose debug application sepm -1
```

Output is sent every minute (default). All IPv4 learned from SEPM. IPv6 also sent but not

yet supported.

```

```

To list the SEPM daemon SDN filters:

```
# diagnose test application sepm 2
sepm SDN connector sepm-217 filter list:
  name: sepm-ip, vd 0, filter 'ComputerName=win10-1'
```

Using a self-signed certificate

Users can explicitly specify a certificate or series of certificates for FortiGate to trust during the connection to the Symantec Endpoint Protection Manager (SEPM) server. For example, a self-signed certificate without proper SAN.

The following new options are added in SEPM `sdn-connector`:

Option	Description
<code>server-cert</code>	Trust servers that contain this certificate only.
<code>server-ca-cert</code>	Trust only those servers whose certificate is directly or indirectly signed by this certificate.

When these options are enabled, only the specified certificate or series of certificates will be allowed for SEPM server connection ensuring some level of security by blocking off all unspecified certificates.

To specify SEPM certificates:

```
config system sdn-connector
  edit "sepm-217"
    set type sepm
    set server "172.18.60.217"
    set username "admin"
    set password "*****"
    set status enable
    set server-cert "REMOTE_Cert_1"
    set server-ca-cert "REMOTE_Cert_2"
  next
end
```

The `server-cert` and `server-ca-cert` options are independent of each other and can be set separately. However, when both options are set, both constraints are applied.

RADIUS single sign-on agent

With RADIUS single sign-on (RSSO), a FortiGate can authenticate users who have authenticated on a remote RADIUS server. Based on which user group the user belongs to, the security policy applies the appropriate UTM profiles.

The FortiGate does not interact with the remote RADIUS server; it only monitors RADIUS accounting records that the server forwards (originating from the RADIUS client). These records include the user IP address and user group. The remote RADIUS server sends the following accounting messages to the FortiGate:

Message	Action
Start	If the information in the start message matches the RSSO configuration on the FortiGate, the user is added to the local list of authenticated firewall users.
Stop	The user is removed from the local list of authenticated firewall users because the user session no longer exists on the RADIUS server.

You can configure an RSSO agent connector using the FortiOS GUI; however, in most cases, you will need to use the CLI. There are some default options you may need to modify that can only be done in the CLI.

```
config user radius
  edit <name>
    set rso enable
    set rso-radius-response enable
    set rso-secret <password>
    set rso-endpoint-attribute <attribute>
    set sso-attribute <attribute>
    set delimiter {plus | comma}
  next
end
```

To configure an RSSO agent connector:

1. Create the new connector:
 - a. Go to *Security Fabric > External Connectors*.
 - b. Click *Create New*.
 - c. In the *Endpoint/Identity* section, click *RADIUS Single Sign-On Agent*. The *New Fabric Connector* pane opens.
 - d. Enter the connector name.
 - e. Enable *Use RADIUS Shared Secret*.

The value entered in *Use RADIUS Shared Secret* must be identical to what the remote RADIUS server uses to authenticate when it sends RADIUS accounting messages to the FortiGate.

- f. Enable *Send RADIUS Responses*.

You should enable *Send RADIUS Responses* because some RADIUS servers continue to send the same RADIUS accounting message several times if there is no response.

- g. Click **OK**.
2. Edit the network interface:
 - a. Go to *Network > Interfaces*.
 - b. Double-click the interface that will receive the RADIUS accounting messages. The *Edit Interface* pane opens.
 - c. In the *Administrative Access* section, select the *RADIUS Accounting* checkbox. This will open listening for port 1813 on this interface. The FortiGate will then be ready to receive RADIUS accounting messages.
 - d. Click **OK**.
3. Create a local RSSO user group:
 - a. Go to *User & Authentication > User Groups*.
 - b. Click *Create New*.
 - c. Enter the group name.
 - d. For the *Type* field, click *RADIUS Single-Sign-ON (RSSO)*.
 - e. Enter a value for *RADIUS Attribute Value*.

This value by default is the class attribute. The FortiGate uses the content of this attribute in RADIUS accounting start messages to map a user to a FortiGate group, which then can be used in firewall policies.

In this example configuration, the FortiGate will only add a remote RADIUS user to the local firewall user list if the class attribute in the RADIUS accounting START message contains the value group1.

If your users are in multiple groups, you will need to add multiple local RSSO user group.

If the RADIUS attribute value used to map users to a local RSSO group is different than the RADIUS attribute in the RADIUS accounting messages forwarded by the server, you must change it in the CLI.

- f. Click **OK**.
4. Edit the local RSSO agent to modify default options using the CLI.
For example, the default value for `rsso-endpoint-attribute` might work in common remote access scenarios where users are identified by their unique `Calling-Station-Id`, but in other scenarios the user name might be in a different attribute.

```
config user radius
  edit "Local RSSO Agent"
    set rsso-endpoint-attribute <attribute>
    set sso-attribute <attribute>
```

```

    next
end

```

5. Add the local RSSO user group to a firewall policy.

Verifying the RSSO configuration

Verification requires a working remote RADIUS server configured for RADIUS accounting forwarding and wireless or wired clients that use RADIUS for user authentication.

For a quick test, you can use one of the publicly available RADIUS test tools to send RADIUS accounting start and stop messages to the FortiGate. You can also use [radclient](#).

To verify the RSSO configuration:

1. In radclient, enter the RADIUS attributes. These attributes are then executed with the FortiGate IP parameters (sends accounting messages to port 1813) and shared password you configured. -x is used for verbose output:

```

root@ControlPC:~# echo "Acct-Status-Type =Start,Framed-IP-Address=10.1.100.185,User-
Name=test2,Acct-Session-Id=0211a4ef,Class=group1,Calling-Station-Id=00-0c-29-44-BE-B8" |
radclient -x 10.1.100.1 acct 123456
Sending Accounting-Request of id 180 to 10.1.100.1 port 1813
    Acct-Status-Type = Start
    Framed-IP-Address = 10.1.100.185
    User-Name = "test2"
    Acct-Session-Id = "0211a4ef"
    Class = 0x67726f757031
    Calling-Station-Id = "00-0c-29-44-BE-B8"
rad_recv: Accounting-Response packet from host 10.1.100.1 port 1813, id=180, length=20
root@ControlPC:~#

```

2. Verify that the user is in the local firewall user list with the correct type (rsso) and local firewall group (rsso-group1):

```

# diagnose firewall auth 1

10.1.100.185, test2
    type: rso, id: 0, duration: 5, idled: 5
    flag(10): radius
    server: vdom1
    packets: in 0 out 0, bytes: in 0 out 0
    group_id: 3
    group_name: rso-group-1

----- 1 listed, 0 filtered -----

```

Exchange Server connector

FortiGate can collect additional information about authenticated users from corporate Microsoft Exchange Servers. After a user logs in, the additional information can be viewed in various parts of the GUI.

The Exchange connector must be mapped to the LDAP server that is used for authentication.

The following attributes are retrieved:

USER_INFO_FULL_NAME	USER_INFO_COMPANY	USER_INFO_CITY
---------------------	-------------------	----------------

USER_INFO_FIRST_NAME	USER_INFO_DEPARTMENT	USER_INFO_STATE
USER_INFO_LAST_NAME	USER_INFO_GROUP	USER_INFO_POSTAL_CODE
USER_INFO_LOGON_NAME	USER_INFO_TITLE	USER_INFO_COUNTRY
USER_INFO_TELEPHONE	USER_INFO_MANAGER	USER_INFO_ACCOUNT_EXPIRES
USER_INFO_EMAIL	USER_INFO_STREET	
USER_INFO_USER_PHOTO	USER_INFO_POST_OFFICE_BOX	

Kerberos Key Distribution Center (KDC) automatic discovery is enabled by default. The FortiGate must be able to use DNS to resolve the KDC IP addresses, otherwise the FortiGate will be unable to retrieve additional user information from the Exchange Server.

KDC automatic discovery can be disabled, and one or more internal IP addresses that the FortiGate can reach can be configured for KDC.

The Override server IP address is enabled when the IP address of the Exchange server cannot be resolved by DNS and must be entered manually.

To configure an Exchange connector in the GUI:

1. Go to *Security Fabric > External Connectors* and click *Create New*.
2. In the *Endpoint/Identity* section, click *Exchange Server*.
3. Set *Name* to *exchange140*.
4. Set *Exchange account* to *Administrator@W2K8-SERV1.FORTINET-FSSO.COM*.
Administrator is the username, *W2K8-SERV1* is the exchange server name, and *FORTINET-FSSO.COM* is the domain name.
5. Set *Password* to the password.
6. Enable *Override server IP address* and set it to *10.1.100.140*.
7. Ensure that *Auto-discover KDC* is enabled.

If *Auto-discover KDC* is disabled, one or more KDC IP addresses can be manually entered.

8. Click *OK*.

To link the connector to the LDAP server in the GUI:

1. Go to *User & Authentication > LDAP Servers*.
2. Edit an existing LDAP server, or click *Create New* to create a new one.
3. Enable *Exchange server*, and select the connector from the list.
4. Configure the remaining settings as required.

5. Click **OK**.

To configure an Exchange connector with automatic KDC discovery in the CLI:

```
config user exchange
  edit "exchange140"
    set server-name "W2K8-SERV1"
    set domain-name "FORTINET-FSSO.COM"
    set username "Administrator"
    set password *****
    set ip 10.1.100.140
    set auto-discover-kdc enable
  next
end
```

To link the connector to the LDAP server in the CLI:

```
config user ldap
  edit "openldap"
    set server "172.18.60.213"
    set cnid "cn"
    set dn "dc=fortinet-fsso,dc=com"
    set type regular
    set username "cn=Manager,dc=fortinet-fsso,dc=com"
    set password *****
    set group-member-check group-object
    set group-object-filter "(&(objectclass=groupofnames)(member=*))"
    set member-attr "member"
    set user-info-exchange-server "exchange140"
  next
end
```

Verification

To verify that KDC auto-discovery is working:

```
# diagnose wad debug enable category all
# diagnose wad debug enable level verbose
# diagnose debug enable
# diagnose wad user exchange test-auto-discover

wad_diag_session_acceptor(3115): diag socket 20 accepted.
__wad_fmем_open(557): fmem=0x12490bd8, fmem_name='cmem 9188 bucket', elm_sz=9188, block_
sz=73728, overhead=0, type=advanced
Starting auto-discover test for all configured user-exchanges.
[NOTE]: If any errors are returned, try manually configuring IPs for the reported errors.

wad_rpc_nspi_test_autodiscover_kdc(1835): Starting DNS SRV request for srv(0x7f938e052050)
query(_kerberos._udp.FORTINET-FSSO.COM)

    addr[4]: 2003::131
wad_rpc_nspi_dns_on_discover_kdc_done(1787): Received response for DNS autodiscover req
(0x7f938dfe8050) query(_kerberos._udp.FORTINET-FSSO.COM) n_rsp(3)

Completed auto-discover test for all configured user-exchanges.
```

To check the collected information after the user has been authenticated:

1. In the GUI, go to *Dashboard > Assets & Identities*, expand the *Firewall Users* widget, and hover over the user name.
2. In the CLI, run the following diagnose command:

```
# diagnose wad user info 20 test1
'username' = 'test1'
'sourceip' = '10.1.100.185'
'vdom' = 'root'
'cn' = 'test1'
'givenName' = 'test1'
'sn' = 'test101'
'userPrincipalName' = 'test1@Fortinet-FSSO.COM'
'telephoneNumber' = '604-123456'
'mail' = 'test1@fortinet-fsso.com'
```

```
'thumbnailPhoto' = '/tmp/wad/user_info/76665fff62ffffffffffffffffffff75ff68ffffffffffa'
'company' = 'Fortinet'
'department' = 'Release QA'
'memberOf' = 'CN=group321,OU=Testing,DC=Fortinet-FSSO,DC=COM'
'memberOf' = 'CN=g1,OU=Testing,DC=Fortinet-FSSO,DC=COM'
'memberOf' = 'CN=group21,OU=Testing,DC=Fortinet-FSSO,DC=COM'
'memberOf' = 'CN=group1,OU=Testing,DC=Fortinet-FSSO,DC=COM'
'manager' = 'CN=test6,OU=Testing,DC=Fortinet-FSSO,DC=COM'
'streetAddress' = 'One Backend Street 1901'
'l' = 'Burnaby'
'st' = 'BC'
'postalCode' = '4711'
'co' = 'Canada'
'accountExpires' = '9223372036854'
```

If the results are not as expected, verify what information FortiGate can collect from the Exchanger Server:

```
# diagnose test application wad 2500
# diagnose test application wad 162
```

Threat feeds

The FortiGate dynamically imports an external list from an HTTP/HTTPS server in the form of a plain text file. The imported list is then available as a threat feed, which can be used to enforce special security requirements, such as long-term policies to always allow or block access to certain websites, or short-term requirements to block access to known compromised locations. The threat feeds are dynamically synchronized and are updated periodically so that any changes are immediately imported by FortiOS.

If the FortiGate loses connectivity with the external server, the threat feed will continue to function despite the *Connection Status* error or reboot. However, the threat feed will not be updated and no new entries will be added until the connection is re-established.

FortiOS also supports STIX/TAXII format. See [STIX format for external threat feeds on page 3125](#) for more information.

There are five types of threat feeds:

FortiGuard Category	The FortiGate dynamically imports a text file from an external server, which contains one URL per line. See FortiGuard category threat feed on page 3108 for more information.
IP Address	The FortiGate dynamically imports a text file from an external server, which contains one IP/IP range/subnet per line. See IP address threat feed on page 3112 for more information.
Domain Name	The FortiGate dynamically imports a text file from an external server, which contains one domain per line. Simple wildcards are supported. See Domain name threat feed on page 3115 for more information.
MAC Address	The FortiGate dynamically imports a text file from an external server, which contains one MAC address, MAC range, or MAC OUI per line. See MAC address threat feed on page 3117 for more information.

Malware Hash	The FortiGate dynamically imports a text file from an external server, which contains one hash per line in the format <code><hex hash> [optional hash description]</code> . Each line supports MD5, SHA1, and SHA256 hex hashes. See Malware hash threat feed on page 3119 for more information.
---------------------	--

Additionally, the EMS threat feed is integrated with FortiClient EMS, but it is not configured in the same way as the preceding feeds:

EMS Threat Feed	A FortiGate can pull malware threat feeds from FortiClient EMS, which in turn receives malware hashes detected by FortiClients. The malware hash can be used in an antivirus profile when AV scanning is enabled with block or monitor actions. See Malware threat feed from EMS on page 1449 for an example.
------------------------	---

External resources file format

File format requirements for a HTTP/HTTPS external resources file:

- The file is in plain text format with each URL list, IP address, domain name, or malware hash occupying one line. Comments can be added by using the number sign, for example: `# This is a test.`
- The file is limited to 10 MB or 128 KB ($128 \times 1024 = 131072$) entries, whichever limit is hit first.
- The entry limit also follows the table size limitation defined by CMDB per model.
- The external resources update period can be set to 1 minute, hourly, daily, weekly, or monthly (43200 min, 30 days).
- The external resources type as category (URL list) and domain (domain name list) share the category number range 192 to 221 (total of 30 categories).
- There is no duplicated entry validation for the external resources file (entry inside each file or inside different files).
- If the number of entries exceed the limit, a warning is displayed. Additional entries beyond the threshold will not be loaded.

For URL list (type = category):

- The scheme is optional, and will be truncated if found; `https://` and `http://` are not required.
- Wildcards are allowed at the beginning or end of the URL, for example: `*.domain.com` or `domain.com.*`.
- IDN and UTF encoding URL are supported.
- The URL can be an IPv4 or IPv6 address. An IPv6 URL must be in `[]` format.

For IP address list (type = address):

- The IP address can be a single IP address, subnet address, or address range. For example, `192.168.1.1`, `192.168.10.0/24`, or `192.168.100.1-192.168.100.254`.
- The address can be an IPv4 or IPv6 address. An IPv6 address does not need to be in `[]` format.

For domain name list (type = domain):

- Simple wildcards are allowed in the domain name list, for example: `*.test.com`.
- IDN (international domain name) is supported.

For MAC address list (type = mac-address):

- The MAC address can be a single MAC address, MAC OUI, or MAC range. For example, `01:01:01:01:01:01`, `8c:aa:b5`, or `01:01:01:01:01:01-01:01:02:50:20:ff`.
- The hexadecimal digits in MAC address must only be separated by colons.

For malware hash list (type = malware):

- The malware hash list follows a strict format in order for its contents to be valid. Malware hash signature entries must be separated into each line. A valid signature must follow this format:

```
# MD5 Entry with hash description
aa67243f746e5d76f68ec809355ec234 md5_sample1

# SHA1 Entry with hash description
a57983cb39e25ab80d7d3dc05695dd0ee0e49766 sha1_sample2

# SHA256 Entry with hash description
ae9bc0b4c5639d977d720e4271da06b50f7c60d1e2070e9c75cc59ab30e49379 sha256_sample1

# Entry without hash description
0289b0d967cb7b1fb1451339c7b9818a621903090e0020366ab415c549212521

# Invalid entries
7688499dc71b932feb126347289c0b8a_md5_sample2
7614e98badca10b5e2d08f8664c519b7a906fbd5180ea5d04a82fce9796a4b87sha256_sample3
```

To determine the external resource table size limit for your device:

```
# print tablesize
...
system.external-resource: 0 256 512
...
```

In this example, a FortiGate 60E has a global limit of 512 and a per-VDOM limit of 256. A FortiGate 60E can configure up to 512 feeds. Each feed is limited to a maximum size of 10 MB or 131072 entries, whichever is reached first. The total number of feeds is limited by the available memory on the device.

Configuring a threat feed

A threat feed can be configured on the *Security Fabric > External Connectors* page. After clicking *Create New*, there are four threat feed options available: *FortiGuard Category*, *IP Address*, *Domain Name*, and *Malware Hash*. When configuring the threat feed settings, the *Update method* can be either a pull method (*External Feed*) or a push method (*PUSH API*).

This topic includes three example threat feed configurations:

- [Configuring a threat feed with an external feed update](#)
- [Configuring threat feed authentication](#)
- [Configuring a threat feed with a push API update](#)

When multi VDOM mode is enabled, threat feed external connectors can be defined in the global VDOM or within a VDOM. See [Threat feed connectors per VDOM on page 3121](#) for example configurations.

Configuring a threat feed with an external feed update

The threat feed will periodically fetch entries from the URI using HTTP or HTTPS.

To configure the threat feed in the GUI:

1. Go *Security Fabric > External Connectors* and click *Create New*.
2. In the *Threat Feeds* section, select the required feed type.
3. Configure the connector settings:

Status	Enable/disable the connector.
Name	Enter a name for the threat feed connector.
Update method	Select <i>External Feed</i> .
URL of external resource	Enter the link to the external resource file. HTTP, HTTPS, and STIX protocols are supported.
HTTP basic authentication	Enable/disable basic HTTP authentication. When enabled, enter the username and password in the requisite fields. See Configuring threat feed authentication for more information.
Refresh Rate	The time interval to refresh the external resource, in minutes (1 - 43200, default = 5). The applicable threat feed will be triggered to refresh between 0 minutes and the configured value. When the refresh is triggered, if another task is being processed by the schedule worker, the refresh task will be added to the queue.
Comments	Optionally, enter a description of the connector.

4. Click *OK*.

To configure the threat feed in the CLI:

```

config system external-resource
  edit <name>
    set status {enable | disable}
    set type {category | address | domain | malware}
    set category <integer, 192-221>
    set update-method {feed | push}
    set username <string>
    set password <string>
    set comments <string>
    *set resource <resource-uri>
    set user-agent <string>
    set server-identity-check {none | basic | full}
    set refresh-rate <integer>
    set source-ip <ip address>
    set interface-select-method {auto | sdwan | specify}
  next
end

```

The parameter marked with an asterisk (*) is mandatory and must be filled in. The `category` parameter must be set when the `type` is either `category` or `domain`. Other parameters have either default values or are optional.

To improve the security of the connection, it is recommended to enable server certificate validation (`server-identity-check`) either in basic or full mode.

Configuring threat feed authentication

Threat feed external connectors support username and password authentication.

The *HTTP basic authentication* field is only visible when the *Update method* is set to *External Feed*.

To enable username and password authentication in a threat feed connector:

1. Go *Security Fabric > External Connectors*.
2. Click *Create New*, or edit an existing threat feed connector.
3. Enable *HTTP basic authentication*.
4. Enter the *Username* and *Password*.

5. Click *OK*.

HTTP header

Additional headers can be included in the *user-agent* field. Use `\r\n` to separate the URL headers, for example:

```
# set user-agent "Firefox\r\nheader1: test1\r\nheader2: test2"
```

Sample request:

```
HTTP request: http
GET /filetypes/test.tar.gz HTTP/1.1
Host: 172.17.219.10
User-Agent: Firefox
header1: test1
header2: test2
Accept: */*
Connection: close
```

Threat feed external connectors use this functionality to support authentication using an API key. The API key authentication can only be configured in the CLI with the `set user-agent` command. The API key must be appended with *user-agent* in the following format: `"user-agent\r\nAPI-Key:SecretAPIkey"`. API keys are typically used for programmatic access to the resource by an authorized requester. See [What Is an API Key](#) in the Fortinet Cyber Glossary for more information.

To enable API key authentication in a threat feed connector:

1. Configure the threat feed. See [Configuring a threat feed with an external feed update on page 3101](#).
2. Configure the user-agent with an API key:

```
config system external resources
  edit <name>
    set user-agent "Firefox\r\nAPI-Key:abcdef12345"
  next
end
```

See [Using the AusCERT malicious URL feed with an API key on page 3127](#) for an example.

Configuring a threat feed with a push API update

The threat feed receives entry updates from webhook requests to the FortiGate REST API. This method provides the code samples needed to perform add, remove, and snapshot operations.

In the following example, a *FortiGuard Category* threat feed is used to show the different API push options.

To configure the threat feed in the GUI:

1. Go to *Security Fabric > External Connectors* and click *Create New*.
2. In the *Threat Feeds* section, click *FortiGuard Category*.
3. Enter a name.
4. Set the *Update method* to *Push API*.
5. Click *OK*. The *Threat Feed Push API Information* pane opens that contains the following fields:
 - *URL*: the FortiGate's API URL to call in order to perform the update.
 - *API admin key*: when an API administrator user is configured on the FortiGate, an *API admin key* will be associated with the API administrator. Input the API key to see the final cURL request.
 - *Push command*: select one of three push methods.
 - *Add*: add the specified entries to the threat feed.

The screenshot shows the 'New External Connector' configuration window. On the left, the 'FortiGuard Category' connector is shown with settings: Status (Enabled), Name (ccccc), Update method (Push API), and Comments (0/25). On the right, the 'Threat Feed Push API Information' pane is open. It contains a blue information box stating: 'To update an threat feed that has set Push API update method, make a application/JSON POST request to the URL. Provide the API admin key, push command, and entries to create a working sample cURL request.' Below this, the fields are: URL (https://192.168.1.112/api/v2/monitor/system/external-resource/dynamic), API admin key (masked), Push command (Add, Remove, Snapshot), Entries (dal.ca), and Sample cURL request (curl -k -X POST -H 'Authorization: Bearer *****' -data '{"commands":[[{"name":"ccccc","command":"add","entries":["dal.ca"]}]}]' https://192.168.1.112/api/v2/monitor/system/external-resource/dynamic). An 'OK' button is at the bottom right.

- *Remove*: remove the specified entries from the threat feed.

- **Snapshot:** replace the threat feed with all specified entries.

- **Entries:** enter the entries separated by a comma (,) to be applied to the FortiGuard Category threat feed list.
- **Sample cURL request:** copy this cURL command to perform the push API update on the FortiGate against the list (cccccccc).

See [REST API administrator on page 2399](#) for more information.

6. Copy the content in the *Sample cURL request* field (*Add* is used in this example).
7. Click **OK**.
8. On a client, generate the API request for the threat feed.

To configure the threat feed in the CLI:

```
config system external-resource
  edit "cccccccc"
    set update-method push
    set category 201
  next
end
```

To use the API in the CLI:

```
# diagnose system external-resource {push-add | push-remove | push-snapshot} <ext_name>
<entry>
```

To use the API with a JSON file:

```
# diagnose sys external-resource push-api-json-commands
{
  "commands": [ <Array: Mandatory>
    { <Object: Mandatory>
      "name": <String: Mandatory, Example: "AWS_MALWARE_FEED">
      "command": <String: mandatory, Options: "add", "remove", "snapshot">,
      "entries": [ <Array: Mandatory>
        <String: Mandatory, Example: "10.100.1.1">
      ]
    }
  ]
}
```

Sample:

```
# diagnose sys external-resource push-api-json-commands '{"commands":
[{"name":"test","command":"add","entries":["10.10.10.1","10.10.10.2"]},
{"name":"test","command":"whatever","entries":["10.10.10.3","10.10.10.4"]}]}'
```

command returned: EXT_RESOURCE_PUSH_CMD_RETURN_OK

Returned json:

```
[
  {
    "name":"test",
    "command":"add",
    "status":"success"
  },
  {
    "name":"test",
    "command":"whatever",
    "error":"Invalid command.",
    "status":"error"
  }
]
```

To use the API with a Postman REST client:

1. Create an API administrator in FortiOS with write access.
2. Ensure the API token is generated.
3. Configure the external resource list as needed.
4. In the Postman client, create a new request, set the HTTP method to *POST*, enter the URL.
5. Configure the access token using one of the following methods:
 - To use the bearer token: click the *Authorization* tab, set the *Type* to *Bearer*, and enter the REST API administrator token.
 - To use the access_token parameter: click the *Params* tab and enter the access_token key-value pair (*access_token* and *<key>*).
6. Click the *Body* tab and configure the following:

- a. Select *raw* and set the input type to *JSON*.
- b. Insert the JSON data payload.

7. Click *Send* to send the POST request. If there is a response, the response body appears. For example,

```
POST https://172.18.52.153/api/v2/monitor/system/external-resource/dynamic?access_
token=glmnfs8bzvk5hf8Qwcz4kx7yn3jHmG&vdom=vd1

```

Viewing the update history

To review the update history of a threat feed, go to *Security Fabric > External Connectors*, select a feed, and click *Edit*. The *Last Update* field shows the date and time that the feed was last updated.

Click *View Entries* to view the current entries in the list.

Edit External Connector	
IP Address Threat Feed: AWS_IP_Blocklist

FortiGuard category threat feed

A FortiGuard category threat feed is a dynamic list that contains URLs and is periodically updated from an external server. The list is stored in text file format on an external server. After the FortiGate imports this list, it becomes available as a category in the *Remote Categories* group of web filter profiles that can be used to allow, block, or monitor URLs

matching this category. A category threat feed can also be used solely or grouped with other categories to be used for exemptions within an SSL/SSH profile that performs full SSL inspection.

Multiple custom categories can be defined by creating a FortiGuard Category threat feed for each category.

Text file example:

```
http://example.com.url
https://example.com/url
http://example.com:8080/url
```

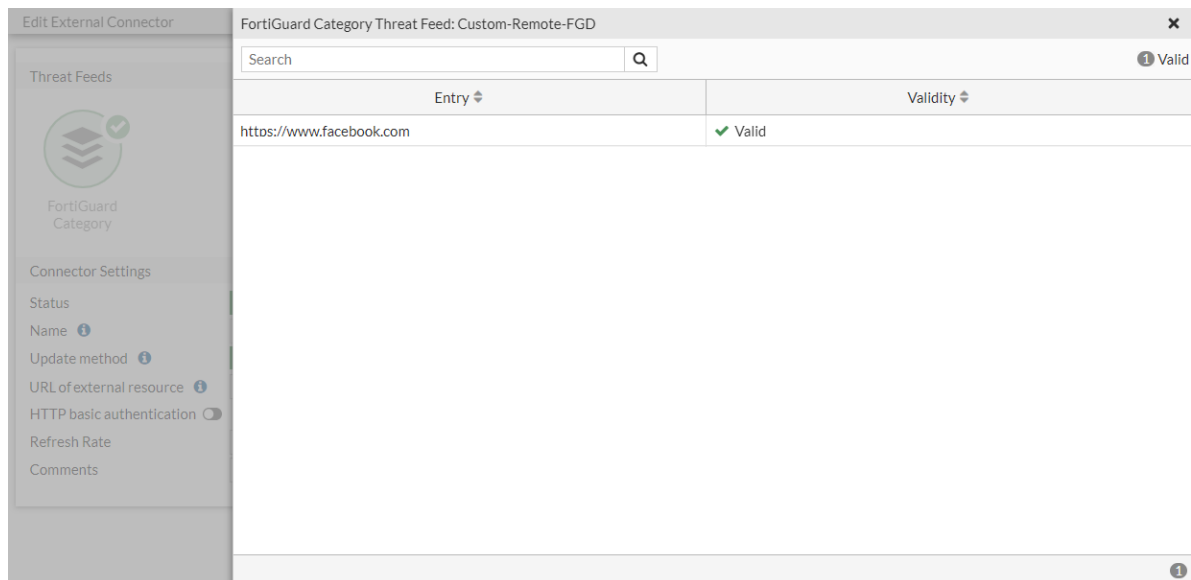

The file contains one URL per line. See [External resources file format](#) for more information about the URL list formatting style.

Example configuration

In this example, a list of URLs is imported using the FortiGuard category threat feed. The newly created threat feed is set to block in the web filter profile, and the web filter profile is applied to a firewall policy. Any traffic that passes through the FortiGate and matches the URLs in the threat feed list will be dropped.

To configure a FortiGuard category threat feed in the GUI:

1. Go to *Security Fabric > External Connectors* and click *Create New*.
2. In the *Threat Feeds* section, click *FortiGuard Category*.
3. Set the *Name* to *Custom-Remote-FGD*.
4. Set the *Update method* to *External Feed*.
5. Set the *URL of external resource* to *https://192.168.10.13/Override_URLs.txt*.
6. Configure the remaining settings as needed, then click *OK*.
7. Edit the connector, then click *View Entries* to view the URL in the feed, which is *https://www.facebook.com*.

To configure a FortiGuard category threat feed in the CLI:

```

config system external-resource
    edit "Custom-Remote-FGD"
        set type category
        set category 192
        set resource "https://192.168.10.13/Override_URLs.txt"
        set server-identity-check {none | basic | full}
    next
end

```

To improve the security of the connection, it is recommended to enable server certificate validation (`server-identity-check`) either in basic or full mode. By default, it is set to none.

To apply a FortiGuard category threat feed in a web filter profile:

1. Go to *Security Profiles > Web Filter* and create a new web filter profile, or edit an existing one.
2. Enable *FortiGuard category based filter*.
3. In the *Remote Categories* group, set the action for the *Custom-Remote-FGD* category to *Block*.
4. Configure the remaining settings as needed, then click *OK*.

To apply the web filter profile in a firewall policy:

1. Go to *Policy & Objects > Firewall Policy* and create a new policy, or edit an existing one.
2. Configure the policy fields as required.
3. Under *Security Profiles*, enable *Web Filter* and select the profile used in the previous procedure.
4. Enable *Log Allowed Traffic*.
5. Click *OK*.

URLs that match the FortiGuard category threat feed list are rated as the category matching the corresponding FortiGuard category threat feed, overriding their original domain rating.

To view the web filter logs:

1. Go to *Log & Report > Security Events* and select *Web Filter*.
2. View the log details in the GUI, or download the log file:

```

Applying a FortiGuard category threat feed in an SSL/SSH profile

A FortiGuard category threat feed can be applied in an SSL/SSH profile where full SSL inspection mode is used. The threat feed category can be selected in the exempt category list. HTTPS requests that match the URLs in the threat feed list will be exempted from SSL deep inspection. This example uses the *Custom-Remote-FGD* threat feed configured in the previous example.

To configure the SSL/SSH profile:

1. Go to *Security Profiles > SSL/SSH Inspection* and create a new profile, or edit an existing one.
2. Set the *Inspection method* to *Full SSL Inspection*.
3. In the *Exempt from SSL Inspection* section, locate *Web categories*. Click the + and add *Custom-Remote-FGD* in the *FORTIGUARD CATEGORY THREAT FEED* section.
4. Enable *Log SSL exemptions*.
5. Click *OK*.

To apply the SSL/SSH inspection profile in a firewall policy:

1. Go to *Policy & Objects > Firewall Policy* and create a new policy, or edit an existing one.
2. Configure the policy fields as required.
3. Under *Security Profiles*, set *SSL Inspection* to the profile used in the previous procedure.
4. Enable *Log Allowed Traffic*.
5. Click *OK*.

URLs that match the FortiGuard category threat feed list are rated as the FortiGuard category threat feed, overriding their original domain rating.

To view the SSL logs:

1. Go to *Log & Report > Security Events* and select *SSL*.
2. View the log details in the GUI, or download the log file:

```
1: date=2023-02-06 time=11:23:54 eventtime=1675711434094550877 tz="-0800"

category rating."
```

IP address threat feed

An IP address threat feed is a dynamic list that contains IPv4 and IPv6 addresses, address ranges, and subnets. The list is periodically updated from an external server and stored in text file format on an external server. After the FortiGate imports this list, it can be used as a source or destination in firewall policies, proxy policies, local-in policies, and ZTNA rules. It can also be used as an external IP block list in DNS filter profiles.

Text file example:

```
192.168.2.100
172.200.1.4/16
172.16.1.2/24
172.16.8.1-172.16.8.100
2001:0db8::eade:27ff:fe04:9a01/120
2001:0db8::eade:27ff:fe04:aa01-2001:0db8::eade:27ff:fe04:ab01
```

The file contains one IPv4 or IPv6 address, address range, or subnet per line. See [External resources file format](#) for more information about the IP list formatting style.

Example configuration

In this example, a list of destination IP addresses is imported using the IP address threat feed. The newly created threat feed is then used as a destination in a firewall policy with the action set to deny. Any traffic that passes through the FortiGate and matches the defined firewall policy will be dropped.

To configure an IP address threat feed in the GUI:

1. Go to *Security Fabric > External Connectors* and click *Create New*.
2. In the *Threat Feeds* section, click *IP Address*.
3. Set the *Name* to *AWS_IP_Blocklist*.
4. Set the *Update method* to *External Feed*.
5. Set the *URL of external resource* to *https://s3.us-east-2.amazonaws.com/ip-blocklist/ip.txt*.
6. Configure the remaining settings as required, then click *OK*.

7. Edit the connector, then click *View Entries* to view the IP addresses in the feed.

Edit External Connector	
IP Address Threat Feed: AWS_IP_Blocklist	
<div> <div>Threat Feeds</div> <div>  <div>IP Address</div> </div> </div> <div> <div>Connector Settings</div> <div> <div>Status</div> <div>Name ⓘ</div> <div>Update method ⓘ</div> <div>URL of external resource ⓘ</div> <div>HTTP basic authentication ⓧ</div> <div>Refresh Rate</div> <div>Comments</div> </div> </div>

To configure an IP address threat feed in the CLI:

```
config system external-resource
  edit "AWS_IP_Blocklist"
    set type address
    set resource "https://s3.us-east-2.amazonaws.com/ip-blocklist/ip.txt"
    set server-identity-check {none | basic | full}
  next
end
```

To improve the security of the connection, it is recommended to enable server certificate validation (`server-identity-check`) either in basic or full mode. By default, it is set to none.

To apply an IP address threat feed in a firewall policy:

1. Go to *Policy & Objects > Firewall Policy* and create a new policy, or edit an existing one.
2. Configure the policy fields as required.
3. In the *Destination* field, click the + and select *AWS_IP_Blocklist* from the list (in the *IP ADDRESS FEED* section).
4. Set *Action* to *DENY*.
5. Enable *Log Allowed Traffic*.
6. Click *OK*.

Applying an IP address threat feed as an external IP block list in a DNS filter profile

An IP address threat feed can be applied by enabling *External IP Block Lists* in a DNS filter profile. Any DNS query that passes through the FortiGate and resolves to any of the IP addresses in the threat feed list will be dropped.

To configure the DNS filter profile:

1. Go to *Security Profiles > DNS Filter* and create a new profile, or edit an existing one.
2. Enable *External IP Block Lists*.
3. Click the + and select *AWS_IP_Blocklist* from the list.
4. Click *OK*.

To apply the DNS filter profile in a firewall policy:

1. Go to *Policy & Objects > Firewall Policy* and create a new policy, or edit an existing one.
2. Configure the policy fields as required.
3. Under *Security Profiles*, enable *DNS Filter* and select the profile used in the previous procedure.
4. Enable *Log Allowed Traffic*.
5. Click *OK*.

IP addresses that match the IP address threat feed list will be blocked.

To view the DNS query logs:

1. Go to *Log & Report > Security Events* and select *DNS Query*.
2. View the log details in the GUI, or download the log file:

```
1: date=2023-02-06 time=15:06:50 eventtime=1675724810452621179 tz="-0800"
logid="1501054400" type="utm" subtype="dns" eventtype="dns-response" level="warning"
vd="root" policyid=0 sessionid=555999 srcip=172.20.120.13 srcport=59602
srccountry="Reserved" srcintf="port2" srcintfrole="undefined" dstip=172.20.120.12
dstport=53 dstcountry="Reserved" dstintf="root" dstintfrole="undefined" proto=17
profile="default" xid=24532 qname="dns.google" qtype="A" qtypeval=1 qclass="IN"
ipaddr="208.91.112.55" msg="Domain was blocked because it is in the domain-filter list"
action="redirect" domainfilteridx=0 domainfilterlist="AWS_IP_Block_list"
```

Applying an IP address threat feed in a local-in policy

An IP address threat feed can be applied as a source or destination in a local-in policy.

In this example, a previously created IP address threat feed named *AWS_IP_Blocklist* is used as a source address in a local-in-policy. Any traffic originating from any of the IP addresses in the threat feed list and destined for the FortiGate will be dropped.

To apply an IP address threat feed in a local-in policy:

```
config firewall local-in-policy
  edit 1
    set intf "any"
    set srcaddr "AWS_IP_Blocklist"
    set dstaddr "all"
    set service "ALL"
    set schedule "always"
  next
end
```

To test the configuration:

1. From one of the IP addresses listed in IP address threat feed (in this case 172.16.200.2), start a continuous ping to port1:

```
ping 172.16.200.1 -t
```

2. On the FortiGate, enable debug flow:

```
# diagnose debug flow filter addr 172.16.200.2
# diagnose debug flow filter proto 1
# diagnose debug enable
# diagnose debug flow trace start 10
```

3. The output of the debug flow shows that traffic is dropped by local-in policy 1:

```
id=65308 trace_id=11 func=print_pkt_detail line=5939 msg="vd-root:0 received a packet
(proto=1, 172.16.200.2:0->172.16.200.1:2048) tun_id=0.0.0.0 from port1. type=8, code=0,
id=0, seq=0."
id=65308 trace_id=11 func=init_ip_session_common line=6121 msg="allocate a new session-

```

Domain name threat feed

A domain name threat feed is a dynamic list that contains domains and periodically updates from an external server. The list is stored in a text file format on an external server. After the FortiGate imports this list, it becomes available as a category in the *Remote Categories* group of DNS filter profiles that can be used to allow, block, or monitor domains matching this category. Multiple custom categories can be defined by creating a domain name threat feed for each category.

Text file example:

```
mail.*.example.com
*-special.example.com
www.*example.com
example.com
```

The file contains one domain name per line. See [External resources file format](#) for more information about the domain list formatting style.

Example configuration

In this example, a list of domain names is imported using the domain name threat feed. The newly created threat feed is set to monitor in the DNS filter profile, and the DNS filter profile is applied to a firewall policy. Any traffic that passes through the FortiGate and matches any of the domain names in the threat feed list will be monitored.

To configure a domain name threat feed in the GUI:

1. Go to *Security Fabric > External Connectors* and click *Create New*.
2. In the *Threat Feeds* section, click *Domain Name*.

3. Set the *Name* to *Domain_monitor_list*.
4. Set the *Update method* to *External Feed*.
5. Set the *URL of external resource* to *https://192.168.10.13/external_domain_list.txt*.
6. Configure the remaining settings as required, then click *OK*.
7. Edit the connector, then click *View Entries* to view the domain names in the feed (fortinet.com and example.com).

Edit External Connector	
Domain Name Threat Feed: Domain_monitor_list	
<div>Threat Feeds</div> <div>  </div> <div>Domain Name</div> <div>Connector Settings</div> <div>Status</div> <div>Name ⓘ</div> <div>Update method ⓘ</div> <div>URL of external resource ⓘ</div> <div>HTTP basic authentication <input type="checkbox"/></div> <div>Refresh Rate</div> <div>Comments</div>	
<div>Search</div> <div>2 Valid</div>	
Entry ↕	Validity ↕
www.fortinet.com	✓ Valid
www.example.com	✓ Valid

To configure a domain name threat feed in the CLI:

```
config system external-resource
  edit "Domain_monitor_list"
    set type domain
    set category 194
    set resource "http://192.168.10.13/external_domain_list.txt"
    set server-identity-check {none | basic | full}
  next
end
```

To improve the security of the connection, it is recommended to enable server certificate validation (*server-identity-check*) either in basic or full mode. By default, it is set to none.

To apply a domain name threat feed in a DNS filter profile:

1. Go to *Security Profiles > DNS Filter* and create a new web filter profile, or edit an existing one.
2. Enable *FortiGuard category based filter*.
3. In the *Remote Categories* group, set the action for the *Domain_monitor_list* category to *Monitor*.
4. Configure the remaining settings as needed, then click *OK*.

To apply the DNS filter profile in a firewall policy:

1. Go to *Policy & Objects > Firewall Policy* and create a new policy, or edit an existing one.
2. Configure the policy fields as required.
3. Under *Security Profiles*, enable *DNS Filter* and select the profile used in the previous procedure.

4. Enable *Log Allowed Traffic*.
5. Click **OK**.

Domains that match the domain threat feed list are rated as domain threat feed, overriding their original domain rating.

To view the DNS query logs:

1. Go to *Log & Report > Security Events* and select *DNS Query*.
2. View the log details in the GUI, or download the log file:

```

```

MAC address threat feed

A MAC address threat feed is a dynamic list that contains MAC addresses, MAC ranges, and MAC OUIs. The list is periodically updated from an external server and stored in text file format on an external server. After the FortiGate imports this list, it can be used as a source in firewall policies, proxy policies, and ZTNA rules. For policies in transparent mode or virtual wire pair policies, the MAC address threat feed can be used as a source or destination address.

Text file example:

```
01:01:01:01:01:01
01:01:01:01:01:01-01:01:02:50:20:ff
8c:aa:b5
```

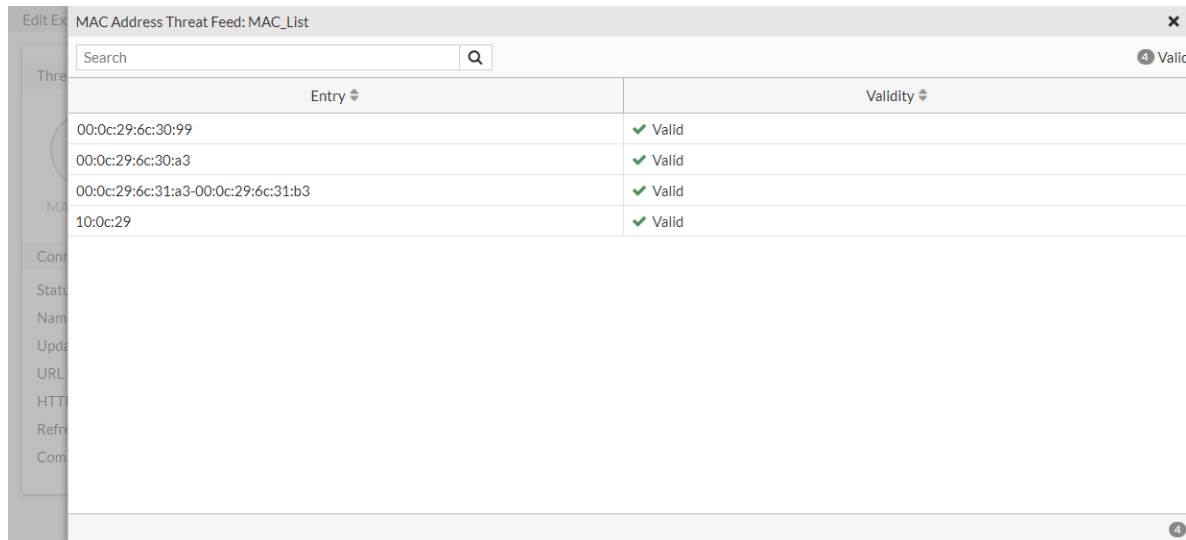

The file contains one MAC address, MAC range, or MAC OUI per line. See [External resources file format](#) for more information about the MAC list formatting style.

Example configuration

In this example, a list of MAC addresses is imported using the MAC address threat feed. The newly created threat feed is then used as a source in a firewall policy with the action set to accept. Any traffic from the client MAC addresses that match the defined firewall policy will be allowed.

To configure a MAC address threat feed in the GUI:

1. Go to *Security Fabric > External Connectors* and click *Create New*.
2. In the *Threat Feeds* section, click *MAC Address*.
3. Set the *Name* to *MAC_List*.
4. Set the *Update method* to *External Feed*.
5. Set the *URL of external resource* to *http://172.16.200.55/external-resources/Ext-Resource-Type-as-Address-mac-1.txt*.
6. Configure the remaining settings as required, then click *OK*.
7. Edit the connector, then click *View Entries* to view the MAC addresses in the feed.

Entry	Validity
00:0c:29:6c:30:99	✓ Valid
00:0c:29:6c:30:a3	✓ Valid
00:0c:29:6c:31:a3-00:0c:29:6c:31:b3	✓ Valid
10:0c:29	✓ Valid

To configure a MAC address threat feed in the CLI:

```

config system external-resource
  edit "MAC_List"
    set type mac-address
    set resource "http://172.16.200.55/external-resources/Ext-Resource-Type-as-Address-mac-1.txt"
    set server-identity-check {none | basic | full}
  next
end

```

To improve the security of the connection, it is recommended to enable server certificate validation (`server-identity-check`) either in basic or full mode. By default, it is set to none.

To apply a MAC address threat feed in a firewall policy in the GUI:

1. Go to *Policy & Objects > Firewall Policy* and create a new policy, or edit an existing one.
2. Configure the policy fields as required.
3. In the *Source* field, click the + and select *MAC_List* from the list (in the *MAC ADDRESS FEED* section).
4. Set *Action* to *ACCEPT*.
5. Click *OK*.

To apply a MAC address threat feed in a firewall policy in the CLI:

```
config firewall policy
  edit 1
    set name "MAC-traffic"
    set srcintf "port2"
    set dstintf "port1"
    set action accept
    set srcaddr "MAC_List"
    set dstaddr "all"
    set srcaddr6 "all"
    set dstaddr6 "all"
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set profile-protocol-options "protocol"
    set nat enable
  next
end
```

To verify the MAC addresses used in the firewall policy:

```
# diagnose sys external-mac-resource list MAC_List
MAC ranges of uuid-idx 574 (num=1)
be:d1:6b:0d:20:61-be:d1:6b:0d:20:61
```

Malware hash threat feed

A malware hash threat feed is a dynamic list that contains malware hashes and periodically updates from an external server. The list is stored in text file format on an external server. After the FortiGate imports this list, it is automatically used for virus outbreak prevention on antivirus profiles when *Use external malware block list* is enabled. Similar to FortiGuard outbreak prevention, the malware hash threat feed is not supported in AV quick scan mode.

Text file example:

```
292b2e6bb027cd4ff4d24e338f5c48de
dda37961870ce079defbf185eeef905 Trojan-Ransom.Win32.Locky.abf1
3fa86717650a17d075d856a41b3874265f8e9eab Trojan-Ransom.Win32.Locky.abf1
c35f705df9e475305c0984b05991d444450809c35dd1d96106bb8e7128b9082f Trojan-
Ransom.Win32.Locky.abf1
```

The file contains one malware hash per line. See [External resources file format](#) for more information about the malware hash list formatting style.

For optimal performance, do not mix different hashes in the list. Only use one MD5, SHA1, or SHA256.

Example configuration

In this example, a list of malware hashes is imported using the malware threat feed. The newly created threat feed is applied to an antivirus profile, and the antivirus profile is applied to a firewall policy. Any traffic that passes through the

FortiGate and matches the malware hashes in the threat feed list will be dropped.

To configure a malware hash threat feed in the GUI:

1. Go to *Security Fabric > External Connectors* and click *Create New*.
2. In the *Threat Feeds* section, click *Malware Hash*.
3. Set the *Name* to *AWS_Malware_Hash*.
4. Set the *Update method* to *External Feed*.
5. Set the *URL of external resource* to *https://s3.us-west-2.amazonaws.com/malware.txt*.
6. Configure the remaining settings as required, then click *OK*.
7. Edit the connector, then click *View Entries* to view the hash list.

Edit External Connector

To configure a malware hash threat feed in the CLI:

```
config system external-resource
  edit "AWS_Malware_Hash"
    set type malware
    set resource "https://s3.us-west-2.amazonaws.com/malware.txt"
    set server-identity-check {none | basic | full}
  next
end
```

To improve the security of the connection, it is recommended to enable server certificate validation (*server-identity-check*) either in basic or full mode. By default, it is set to none.

To apply a malware hash threat feed in an antivirus profile:

1. Go to *Security Profiles > AntiVirus* and create a new web filter profile, or edit an existing one.
2. Enable *Use external malware block list*.
3. Click the + and select *AWS_Malware_Hash* from the list.
4. Configure the remaining settings as needed, then click *OK*.

To apply the antivirus profile in a firewall policy:

1. Go to *Policy & Objects > Firewall Policy* and create a new policy, or edit an existing one.
2. Configure the policy fields as required.
3. Under *Security Profiles*, enable *AntiVirus* and select the profile used in the previous procedure.
4. Set *SSL Inspection* to *deep-inspection* to inspect HTTPS traffic.
5. Enable *Log Allowed Traffic*.
6. Click **OK**.

To view the antivirus logs:

1. Go to *Log & Report > Security Events* and select *AntiVirus*.
2. View the log details in the GUI, or download the log file:

```
1: date=2023-02-03 time=15:42:41 eventtime=1675467761491047388 tz="-0800"
logid="0207008212" type="utm" subtype="virus" eventtype="malware-list" level="warning"
vd="root" policyid=1 poluid="e8b310ba-914f-51ed-9014-7b2a116f29ad" policytype="policy"
msg="Blocked by local malware list." action="blocked" service="HTTP" sessionid=293915

agent="curl/7.55.1" httpmethod="GET" analyticssubmit="false" crscore=10 craction=2
crlevel="medium"
```

To verify the scanunit daemon:

```
# diagnose sys scanunit file-hash list
malware 'a1a74a39788854b75d454dc9c83c612b' vf_id 0 uuid 15752 profile 'AWS_Malware_Hash'
description ''
```

The list of external hashes has been updated.

Threat feed connectors per VDOM

When multi-VDOM mode is enabled, a threat feed external connector can be defined in global or within a VDOM. Global threat feeds can be used in any VDOM, but cannot be edited within the VDOM. FortiGuard category and domain name-based external feeds have an added category number field to identify the threat feed. The threat feed name in global must start with `g-`. Threat feed names in VDOMs cannot start with `g-`.

FortiGuard category and domain name-based external feed entries must have a number assigned to them that ranges from 192 to 221. This number can be assigned to both external feed types. However, when a category number is used under a global entry, such as 192 with the name `g-cat-192`, this category number cannot be used in any other global or VDOM entries. If a category is used under a VDOM entry, such as 192 under VDOM1 with the name `cat-192`, the category 192 can be used in another VDOM or root with the name `cat-192`.

A threat feed connector can only be used in profiles in the VDOM that it was created in. Global connectors can be used in all VDOMs.

Each VDOM can have a maximum of 256 threat feed entries. But in total, a FortiGate can only have 511 threat feed entries.

To improve the security of the connection, it is recommended to enable server certificate validation (`server-identity-check`) either in basic or full mode.

To configure a FortiGuard category threat feed connector under global in the GUI:

1. Go to *Security Fabric > External Connectors* and click *Create New*.
2. In the *Threat Feeds* section, click *FortiGuard Category*.
3. Enter a name that begins with `g-`.
4. Configure the other settings as needed.
5. Click *OK*.

To configure a FortiGuard category threat feed connector under global in the CLI:

```
config global
  config system external-resource
    edit "g-category"
      set status enable
      set type category
      set category 192
      set comments ''
      set resource "http://172.16.200.55/external-resource-test/513-FDGCATEGORY.txt"
      set server-identity-check {none | basic | full}
      set refresh-rate 5
    next
  end
end
```

To configure a domain name threat feed connector under a VDOM in the GUI:

1. Go to *Security Fabric > External Connectors* and click *Create New*.
2. In the *Threat Feeds* section, click *Domain Name*.
3. Enter a name that does not begin with `g-`.
4. Configure the other settings as needed.
5. Click *OK*. The threat feed connector created under global also appears, but it is not editable.

To configure a domain name threat feed connector under a VDOM in the CLI:

```
config vdom
  edit vd1
    config system external-resource
      edit "vd1-domain"
        set status enable
      end
    end
  end
end
```

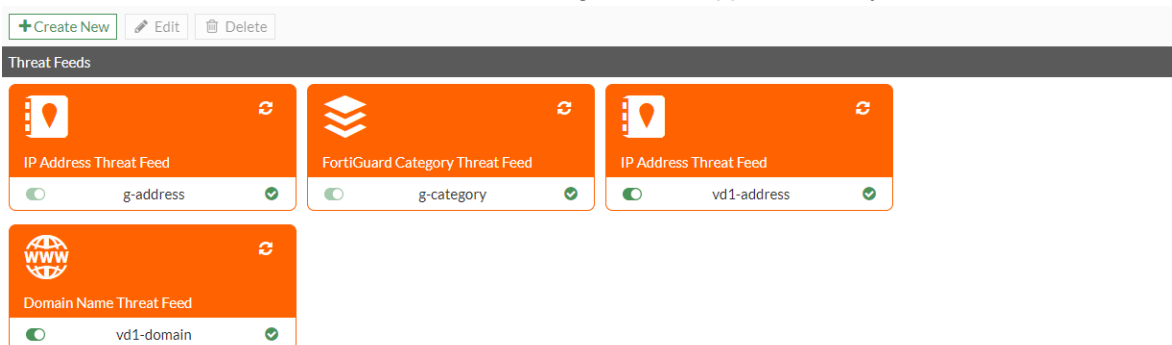

```

        set type domain
        set category 193
        set comments ''
        set resource "http://172.16.200.55/external-resource-test/513-Domain.txt"
        set server-identity-check {none | basic | full}
        set refresh-rate 5
    next
end
next
end

```

To use an IP address threat feed in a policy in the GUI:

1. Configure an IP address connector in global:
 - a. Go to *Security Fabric > External Connectors* and click *Create New*.
 - b. In the *Threat Feeds* section, click *IP Address*.
 - c. Enter a name that begins with *g-*.
 - d. Configure the other settings as needed.
 - e. Click *OK*.
2. Configure an IP address connector in the VDOM (vd1):
 - a. Go to *Security Fabric > External Connectors* and click *Create New*.
 - b. In the *Threat Feeds* section, click *IP Address*.
 - c. Enter a name that does not begin with *g-*.
 - d. Configure the other settings as needed.
 - e. Click *OK*. The threat feed connectors created under global also appear, but they are not editable.

3. Configure the firewall policy in the VDOM (vd1):
 - a. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
 - b. For *Destination*, select *vd1-address*. Since this policy is configured under *vd1*, *g-address* can also be set as the destination.

- c. Configure the other settings as needed.
- d. Click OK.

To use an IP address threat feed in a policy in the CLI:

1. Configure the IP address connectors:

```
config global
    config system external-resource
        edit "g-address"
            set status enable
            set type address
            set username ''
            set comments ''
            set resource "http://172.16.200.55/external-resource-test/513-IP.txt"
            set server-identity-check {none | basic | full}
            set refresh-rate 5
        next
    end
end

config vdom
    edit vd1
        config system external-resource
            edit "vd1-address"
                set status enable
                set type address
                set comments ''
                set resource "http://172.16.200.55/external-resource-test/513-IP.txt"
                set user-agent "curl/7.58.0"
                set server-identity-check {none | basic | full}
                set refresh-rate 5
            next
        end
    next
end
```

2. In the VDOM, configure a firewall policy with the external address as the destination address:

```
config vdom
  edit vd1
    config firewall policy
      edit 1
        set name "test"
        set srcintf "port10"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "vd1-address"
        set action accept
        set schedule "always"
        set service "ALL"
        set profile-protocol-options "protocol"
        set nat enable
      next
    end
  next
end
```

Since this firewall policy is configured under `vd1`, `g-address` can also be set as the `dstaddr`.

STIX format for external threat feeds

The FortiGate's external threat feeds support feeds that are in the STIX/TAXII format. Use the `stix://` prefix in the URI to denote the protocol.

All external threat feeds support the STIX format. In this example, a FortiGuard Category threat feed in the STIX format is configured.

To configure a FortiGuard Category threat feed in the STIX format in the GUI:

1. Go to *Security Fabric > External Connectors* and click *Create New*.
2. Select *FortiGuard Category* from the *Threat Feeds* section.
3. Configure the connector:
 - *Name*: `category-taxii`
 - *Update method*: `External Feed`
 - *URL of external resource*: `stix://limo.anomali.com/api/v1/taxii2/feeds/collections/200/objects/`
 - *HTTP basic authentication*: Enable and enter the username and password, such as `guest` and `guest`.

4. Click **OK**.
5. Edit the connector, and click **View Entries** in the right side bar to view the retrieved entries.

Entry	Validity
www.assculturaleincontri.it	Valid
dancecourt.com	Valid
strangeduckfilms.com	Valid
ukonline.hc0.me	Valid
boschetto-hotel.gr	Valid
tecslide.com	Valid
dl.microsword.net	Valid
axisbuild.com	Valid
romvarimarton.hu	Valid
rsiuk.co.uk	Valid
www.catgallery.com	Valid

To configure a FortiGuard Category threat feed in the STIX format in the CLI:

```

config system external-resource
  edit "category-taxii"
    set category 194
    set username "guest"
    set password guest
    set resource "stix://limo.anomali.com/api/v1/taxii2/feeds/collections/200/objects/"
    set server-identity-check {none| basic | full}
    set update-method feed
  next
end

```

To improve the security of the connection, it is recommended to enable server certificate validation (`server-identity-check`) either in basic or full mode. By default, `server-identity-check` is set to none.

If the connector is used in webfilter that blocks category 194, the traffic that matches the retrieved URLs, such as `rsiuk.co.uk`, is blocked:

```
1: date=2021-10-06 time=18:07:46 eventtime=1633568867163763708 tz="-0700" logid="0316013056"
type="utm" subtype="webfilter" eventtype="ftgd_blk" level="warning" vd="vd1" policyid=1

dstintf="port1" dstintfrole="undefined" dstuuid="c6753ba2-231b-51ec-1675-090f2b5f1384"
proto=6 service="HTTPS" hostname="rsiuk.co.uk" profile="test" action="blocked"
reqtype="direct" url="https://rsiuk.co.uk/" sentbyte=75 rcvbyte=0 direction="outgoing"
msg="URL belongs to a denied category in policy" method="domain" cat=194 catdesc="category-
taxii"
```

Using the AusCERT malicious URL feed with an API key

In this example, a list of malicious URLs is imported from AUSCERT, an Australian not for profit organization. See [AUSCERT](#) for more information.

The FortiGuard threat feed is used to import the malicious URL feed by appending the API key to the user-agent. See [HTTP header on page 3103](#) for more information. The newly created threat feed is set to block in the web filter profile, and the web filter profile is applied to a firewall policy. Any traffic that passes through the FortiGate and matches the URLs in the threat feed list will be dropped, and a replacement message will be shown.

To configure the FortiGuard category threat feed in the GUI:

1. Go *Security Fabric > External Connectors* and click *Create New*.
2. In the *Threat Feeds* section, select *FortiGuard Category*.
3. Configure the following settings:

Status	Enabled
Name	AusCERT_Feed
Update method	External Feed
URL of external resource	https://www.auscert.org.au/api/v1/malurl/combo-7-txt/

4. Click *OK*.
5. In the CLI, enter the following:

```
config system external-resource
    edit "AusCERT_Feed"
        set user-agent "Firefox\r\nAPI-Key:SECRETAPIKEY"
    next
end
```
6. In the GUI, edit the connector and configure the remaining settings as needed, then click *OK*.
7. Edit the connector again, and click *View Entries* in the right pane to view the URL list.

To configure the FortiGuard category threat feed in the CLI:

```

config system external-resource
    edit "AusCERT_Feed"
        set category 194
        set resource "https://www.uscert.org.au/api/v1/malurl/combo-7-txt/"
        set user-agent "Firefox\r\nAPI-Key:SECRETAKEY"
    next
end

```

When configuring a FortiGuard category threat feed in the GUI, the category is set automatically. When configuring a the threat feed in the CLI, the category must be set manually. The category must be unique and in the range of 192 - 221.

To improve the security of the connection, it is recommended to enable server certificate validation (`server-identity-check`) in either `basic` or `full` mode. By default, it is set to `none`.

To apply the FortiGuard category threat feed to a web filter profile:

1. Go to *Security Profiles > Web Filter* and create a new web filter profile, or edit an existing one.
2. Enable *FortiGuard category based filter*.
3. In the *Remote Categories* group, set the action for the *AusCERT_Feed* category to *Block*.
4. Configure the remaining settings as needed, then click *OK*.

To apply the web filter profile in a firewall policy:

1. Go to *Policy & Objects > Firewall Policy* and create a new policy, or edit an existing one.
2. Configure the policy fields as required.
3. Under *Security Profiles*, enable *Web Filter* and select the profile used in the previous procedure.
4. Enable *Log Allowed Traffic*.
5. Click *OK*.

URLs that match the FortiGuard category threat feed list are rated as the category matching the corresponding FortiGuard category threat feed, overriding their original domain rating.

To verify that FortiGate is blocking URLs from the AusCERT feed list:

1. Visit one of the URLs from the AusCERT_Feed list.
A replacement message should be shown.

FortiGuard Intrusion Prevention - Access Blocked

Web Page Blocked

You have tried to access a web page that is in violation of your Internet usage policy.

Category AusCERT_Feed
URL <http://pcmach.co.nz/>

To have the rating of this web page re-evaluated [please click here](#).

2. Go to *Log & Report > Security Events* and select *Web Filter*.
3. View the log details in the GUI, or download the log file:

```
1: date=2023-04-11 time=14:18:02 eventtime=1681247882561766251 tz="-0700"
logid="0316013056" type="utm" subtype="webfilter" eventtype="ftgd_blk" level="warning"
vd="root" policyid=1 poluuid="26540ed0-ae54-51ed-80eb-89af8af4d53f" policytype="policy"

```

Troubleshooting a threat feed

In this example, the user entered the URL of external resource without the trailing slash. The following commands can be used to troubleshoot connectivity issues between a FortiGate and external resource:

```
diagnose debug app dnsproxy -1
diagnose debug app forticron -1
diagnose debug enable
```

This output shows that the DNS resolution is successful, indicating that the FortiGate has connectivity to the external server:

```
#diagnose debug app dnsproxy -1
[worker 0] dns_local_lookup()-2476: vfid=0, real_vfid=0, qname=www.auscert.org.au, qtype=1,
qclass=1, offset=36, map#=4 max_sz=512
[worker 0] dns_lookup_aa_zone()-608: vfid=0, fqdn=www.auscert.org.au
[worker 0] dns_send_request()-1398
[worker 0] dns_send_resol_request()-1234: orig id: 0xa002 local id: 0xa002
domain=www.auscert.org.au
[worker 0] dns_find_best_server()-595: found server: 96.45.46.46
...
id:0xa002 domain=www.auscert.org.au active
```

This output shows that the requested resource was missing a trailing slash:

```
#diagnose debug app forticron -1
fcron_timer_func()-23: Timer ext_upd fired
```

```

6745-before-init: fd=-1 name='ext-root.AusCERT_Feed' http_1=0 loc=0 state=send.body info=0-
DNS fail chunk=0 content=0 etag=0 csum=0 done=0 closed=0
    sync-0(len=0 note=0 err=0) buf-1(sz=8192 data=179 free=8013 pos=0 end=179 max=10485760)
6745-init-as: fd=-1 name='ext-root.AusCERT_Feed' http_1=0 loc=0 state=send.body info=0-None
chunk=0 content=0 etag=0 csum=0 done=0 closed=0
    sync-0(len=0 note=0 err=0) buf-1(sz=8192 data=0 free=8192 pos=0 end=0 max=10485760)
http_request_make()-2066: HTTP request: https

```

```
GET /api/v1/malurl/combo-7-txt HTTP/1.1
```

```
Host: www.auscert.org.au
```

```
User-Agent: Firefox
```

```
API-Key: <obfuscated>
```

```
Accept: */*
```

```
Connection: close
```

```
http_request_make()-2101: fcron_get_addr(www.auscert.org.au)
```

```
__update_ext()-187: Updating EXT 'AusCERT_Feed' with HTTP
```

```
fcron_update_ext_func()-611: update ver: 0
```

```
fcron_timer_func()-32: Timer ext_upd done
```

```
fcron_epoll_before_handle()-297: BEFORE READ fd 11 handle event 0x01 read 0xc55a40 epoll
events 0x01
```

```
dns_parse_resp()-102: DNS www.auscert.org.au -> 54.253.78.74
```

```
dns_parse_resp()-102: DNS www.auscert.org.au -> 13.54.251.23
```

```
...
```

```
HTTP/1.1 301 Moved Permanently
```

```
...
```

```
Location: /api/v1/malurl/combo-7-txt/
```

After adding a trailing slash to the external resource URL, the connection is now working:

```
#diagnose debug app forticron -1
```

```
fcron_timer_func()-23: Timer ext_upd fired
```

```
2832-before-init: fd=-1 name='ext-root.AusCERT_Feed' http_1=0 loc=0 state=send.header
info=0-None chunk=0 content=0 etag=0 csum=0 done=0 closed=0
```

```
    sync-0(len=0 note=0 err=0) buf-0(sz=0 data=0 free=0 pos=0 end=0 max=10485760)
```

```
2832-init-as: fd=-1 name='ext-root.AusCERT_Feed' http_1=0 loc=0 state=send.header info=0-
None chunk=0 content=0 etag=0 csum=0 done=0 closed=0
```

```
    sync-0(len=0 note=0 err=0) buf-1(sz=8192 data=0 free=8192 pos=0 end=0 max=10485760)
```

```
http_request_make()-2066: HTTP request: https
```

```
GET /api/v1/malurl/combo-7-txt/ HTTP/1.1
```

```
Host: www.auscert.org.au
```

```
User-Agent: Firefox
```

```
API-Key: <obfuscated>
```

```
Accept: */*
```

```
Connection: close
```

```
...
```

```
HTTP/1.1 200 OK
```

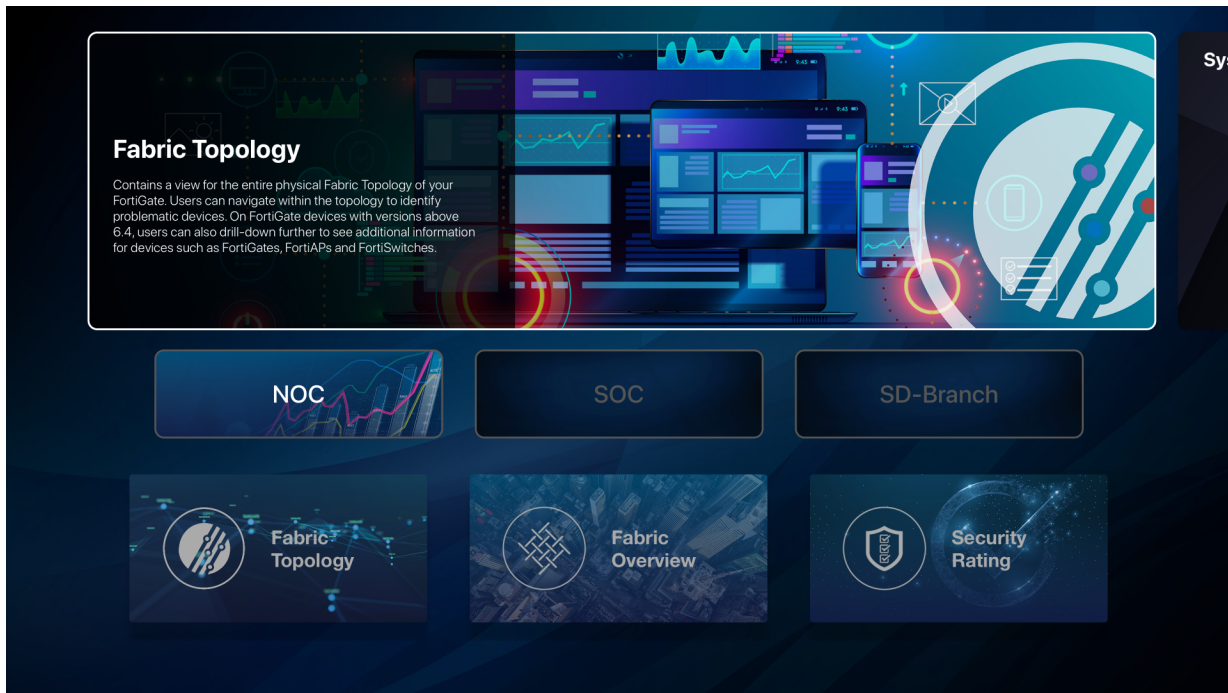

These troubleshooting commands can be used to resolve a variety of issues. they are not limited to this specific use case.

Monitoring the Security Fabric using FortiExplorer for Apple TV

FortiExplorer for Apple TV allows you to use a TV screen to monitor your entire Security Fabric.

FortiExplorer for Apple TV is an analysis tool that provides easy to use NOC and SOC monitoring capabilities. The app features real-time data traffic, visual alerts, as well as a general overview of hardware devices, operating systems, and interfaces. The monitor also provides a wireless health summary of your entire network across multiple buildings. If an access point goes offline, you will be notified about the network's health. After the issues are resolved, you will immediately see the health update on your screen.

Getting started with FortiExplorer for Apple TV

Download FortiExplorer for Apple TV from the app store on Apple TV. After the app is installed, add devices using the Apple TV remote or by sharing a login profile with FortiExplorer. Once the devices are added, you can use FortiExplorer for Apple TV to view real-time data in the Network Operations Center, Security Operations Center, and Software-Defined Branch.

To get started with FortiExplorer for Apple TV:

1. [Download the app and add devices to FortiExplorer for Apple TV.](#)
You can add devices by sharing a login profile with FortiExplorer or logging into the device directly on FortiExplorer for Apple TV.
2. [View the physical topology of the Fabric to identify risks](#)
3. [View the Fabric components as seen on the root FortiGate.](#)
4. [View an executive summary of the three largest areas of security focus in the Security Fabric.](#)
5. [View data collected by FortiAnalyzer on the endpoints on your network.](#)
6. [View vulnerability data collected by FortiClient EMS.](#)

7. Use the Software-Defined Branch module to monitor interface SD-WAN usage and associated service level agreements.

NOC and SOC example

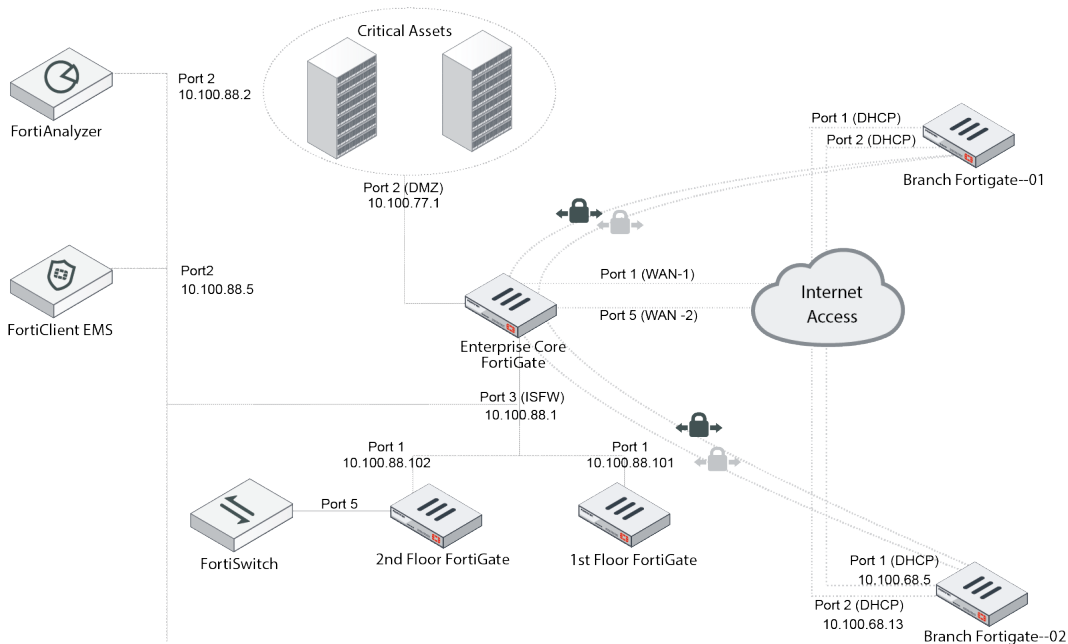

In this example, you have configured your FortiGates, FortiAnalyzer and other devices in your Security Fabric. Now you want to use FortiExplorer for Apple TV to display the status of the devices on a TV in your Network Operation Center or Security Operation Center.

Topology

This topology has a Headquarter and two Branches. Within the Headquarter is the Enterprise Core and two FortiGates acting as ISFWs. In addition, an on-premise FortiAnalyzer collects all logging information from the Fabric devices. The FortiClient EMS manages all the endpoints within the topology.

The two branches are configured with SD-WAN with VPN overlays to the Enterprise Core. Traffic is steered towards the overlays and underlays based on SD-WAN Rules.

Using FortiExplorer for Apple TV, you will be able to monitor the different components in this topology.

To take advantage of the views in the FortiExplorer for Apple TV, you should configure:

- Security Fabric on all FortiGates. See [Configuring the root FortiGate and downstream FortiGates on page 2770](#).
- FortiAnalyzer Logging. See [Configuring FortiAnalyzer on page 2779](#).
- FortiClient EMS. See [Configuring FortiClient EMS on page 2789](#)

Adding the root FortiGate to FortiExplorer for Apple TV

By adding the root FortiGate, you can view the entire topology and navigate to branch FortiGates in the SD-WAN view. If you are already using FortiExplorer on a mobile device, you can connect the same FortiGate device to Apple TV by sharing the login credentials on both devices. Alternatively, you can manually connect to your root FortiGate directly from the app.

To share login credentials between FortiExplorer and FortiExplorer for Apple TV:

1. Connect the FortiExplorer and FortiExplorer for Apple TV devices to the same network.
2. On FortiExplorer for Apple TV, click *New FortiGate*.
3. In FortiExplorer, go to *My Fabric*.
4. Swipe right on the device you want to share, and tap *Share Login Profile*.

5. Tap *Share to Apple TV*.**6. On Apple TV, click *Accept*. FortiExplorer for Apple TV confirms the request and proceeds to the device main menu.**

To add devices to FortiExplorer for Apple TV:

1. In the *Devices* menu, click *New FortiGate*. The *Login to FortiGate* dialog box is displayed.
2. In the *IP Address/Host Name* field, take one of the following actions:
 - Enter the device IP address and port, if not using the default admin port 443
 - Enter the full host name including the domain. Enter port if not using the default admin port 443.

IP Address

fortinet.com:10403

SPACE a b c d e f g h i j k l m n o p q r s t u v w x y z

1 2 3 4 5 6 7 8 9 0 . - _ ! @ # \$ % ^ & *

ABC abc #+~

next

3. Enter the *Username* and *Password* for the FortiGate device.
4. Click *Remember* to save time entering the login credentials later.
5. Click *Login*. The device is added to FortiExplorer for Apple TV.

If the IP or hostname is not defined in the CN or SAN field of your certificate, you will receive a prompt that "Your connection is not private". You may choose to continue with your connection.

Viewing the Fabric Topology monitor

Use the Fabric Topology monitor to view the physical topology of the Fabric to identify risks. FortiGate devices with version 6.4. and above can drilldown further to see additional information for devices such as FortiGates, FortiAPs, and FortiSwitches.

To view the Fabric Topology monitor, go to *Network Operations Center > Fabric Topology*. This monitor displays the same information as the *Physical Topology* on the FortiGate

Use your remote to navigate through the devices in the Fabric topology. Click a device to view the drilldown information. To return to the default view, click the *Menu* button.

Viewing the Fabric Overview monitor

Use the Fabric Overview monitor to view the Fabric components as seen on the Dashboard of the Fabric Root FortiGate in the example topology. Each device must be authorized and be part of the Fabric.

For information about configuring the Security Fabric, see [Fortinet Security Fabric on page 2765](#)

To view the Fabric Overview monitor, go to *Network Operations Center > Fabric Overview*.

The Security Fabric monitor has multiple panes. To see data populated on the panes, ensure that proper configurations are applied on the Fabric devices:

Pane	Description	Configuration
Fabric Connectors	Displays external SDN connectors that are enabled.	Configure <i>Security Fabric > External Connectors</i> .
Security Fabric Overview	Displays the number of devices in the topology.	Configure <i>Security Fabric > Fabric Connectors</i> .
Attack Surface	Displays devices detected by the FortiGate with a server tag.	Ensure Device Detection is configured on the interface(s). Go to <i>Network > Interfaces</i> .
Device Inventory	Displays devices based on Hardware Vendor and detected OS	Ensure Device Detection is configured on the interface(s). Go to <i>Network > Interfaces</i> .
Endpoint Coverage	Displays the number of online devices and the percentage of Unscanned, Vulnerable, and Secured devices.	Ensure Device Detection is configured on the interface(s). Vulnerability scan results come from FortiClient EMS. Go to <i>Network > Interfaces</i> .

Device related information only corresponds to devices local to the FortiGate. Device information from downstream FortiGates do not propagate to the Upstream FortiGate.

Viewing the Security Rating monitor

The Security Rating monitor is separated into three major scorecards: *Security Posture*, *Fabric Coverage*, and *Optimization*, which provide an executive summary of the three largest areas of security focus in the Security Fabric.

To see the Security Rating summary, the root FortiGate and all FortiGates within the Fabric should have the proper FortiGuard Security Rating license. Security rating is performed on the root FortiGate. Its reports are generated periodically.

To view the Security Rating monitor, go to *Network Operations Center > Security Rating*.

The scorecards show an overall score of the performance and sub-categories. The point score represents the net score for all passed and failed items in that area.

For more information about the Security Rating score, see [Security Fabric score on page 2915](#).

Viewing the Compromised Hosts monitor

The Compromised Hosts monitor leverages the data collected by FortiAnalyzer on the endpoints on your network. To see compromised hosts, the FortiAnalyzer must have a FortiGuard Indicators of Compromise license. The IOC service helps identify compromised hosts based on infected websites that it may have visited.

This monitor captures the same information as seen on the *Compromised Hosts* monitor on the FortiGate.

The screenshot displays the Fortinet Security Fabric interface with the 'Compromised Hosts' monitor selected. The interface is divided into three main sections:

- Left Panel (User List):** A list of users with their status. Jesse Hughes is highlighted as 'Compromised'.
- USER INFORMATION Panel:**
 - User:** Jesse Hughes
 - Status:** Not Registered
 - Phone:** 1778160275
 - IP:** 10.200.1.18
 - Email:** JesseHughes@hotmail.com
 - OS:** Linux LUBUNTU 16.0.4
 - Time:** 14:03:04:69:1b:20
- TOPOLOGY VIEW Panel:** A network diagram showing the user's location. Jesse Hughes is connected to 'Enterprise_Second_Floor', which is connected to 'jko-testapptv'.
- VERDICT VIEW Panel:**
 - Threats:** 1 Threat Detected (indicated by a red robot icon).
 - Malware Sinkhole - 176.31.62.76:**
 - Detected Method:** infected-ip
 - Security Action:** close
 - Malware Sinkhole - 23.253.46.64:**
 - Detected Method:** infected-ip
 - Security Action:** close

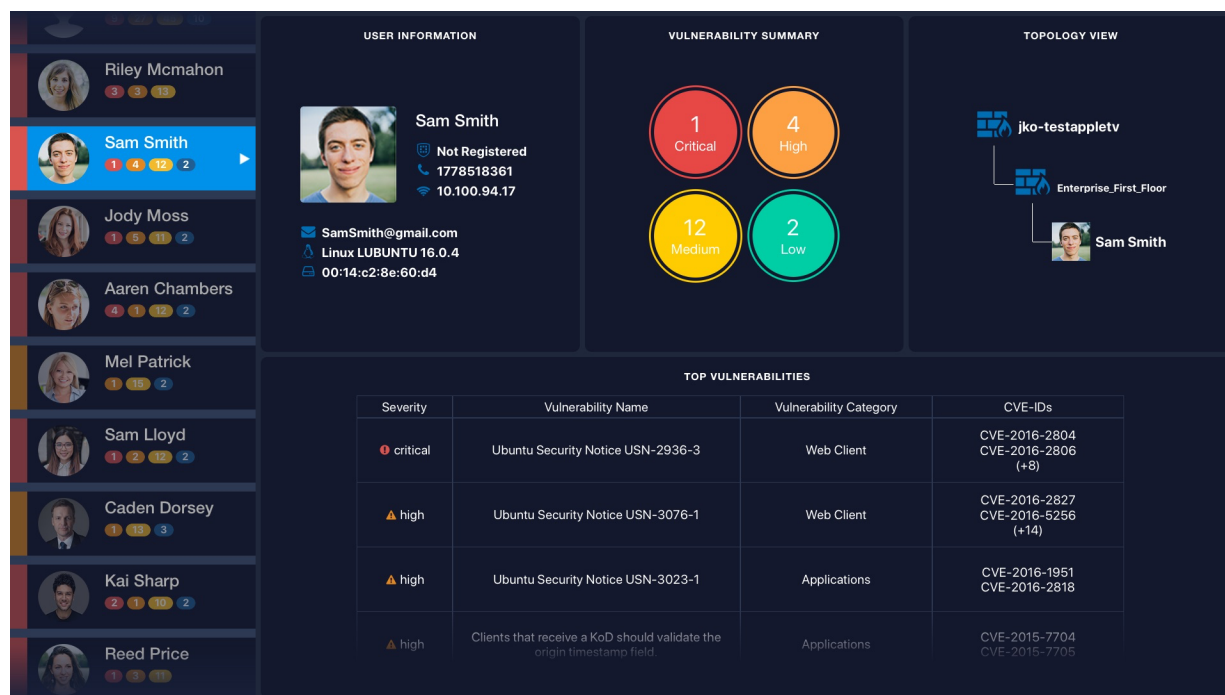

To view the Compromised Hosts monitor:

1. Go to *Security Operations Center > Compromised Hosts*.
2. In the left-hand pane, scroll through the user list. The monitor displays three panes:
 - The *User Information* pane displays the user's contact information and IP address.
 - The *Topology View* pane displays the user's location in the topology.
 - The *Verdict View* pane displays the *Malware*, *Detected Method*, and *Security Action*.

Viewing the Vulnerability Monitor

The Vulnerability Monitor obtains data from FortiClient EMS. It displays vulnerabilities detected by the FortiClient endpoint, categorized into Critical, High, Medium and Low risk. In this example, an on-premise FortiClient EMS is connected on the root FortiGate's Fabric Connector.

This monitor captures the same information as seen on the *Top Vulnerable Endpoint Devices* monitor on the FortiGate.

To view the Vulnerability Monitor:

1. Go to *Security Operations Center > Vulnerability Monitor*. The monitor displays a user list and their vulnerabilities.
2. Use your remote to scroll through the user list. The vulnerability details are displayed on the right side of the monitor.
 - The *User Information* pane displays the user's contact details and IP address.
 - The *Vulnerability Summary* pane displays the number of vulnerabilities categorized into *Critical*, *High*, *Medium* and *Low* risk.
 - The *Topology View* pane displays the user's location in the topology.
 - The *Top Vulnerabilities* pane displays the top vulnerabilities by severity.

Using the SD-WAN monitor

In the example topology, the branches are configured to use SD-WAN. You can use the top-right navigation menu in the SD-WAN monitor to navigate to the Branch FortiGate to display information about the SD-WAN.

To view the SD-WAN monitor, go to *Software-Defined Branch > SD-WAN Monitor*.

The SD-WAN monitor summarizes the SD-WAN members, Zones, SD-WAN Rules and health checks deployed on the FortiGate. It shows the interface member's SD-WAN usage and its associated service level agreements. The monitor contains a chart that shows if the ports are meeting the SLA target for bandwidth, jitter and latency per the health check in use in each SD-WAN Rule.

Some of the SD-WAN statistics are only available in FOS 6.4.1 and higher.

To view SD-WAN usage charts:

1. In the *SD-WAN Overview* area, Use your remote to select the *SD-WAN Usage* pane.
2. Scroll left and right to view *Bandwidth*, *Volume* and *Sessions* charts for the *VIRTUAL-WAN-LINK* and *Underlay* interfaces in the *SD-WAN Zones* pane.

To view SLA targets:

1. In the *SD-WAN Rules* area, use your remote to scroll the rules pane at the left-side of the monitor.
 - The *Destinations* pane displays the destination details.
 - The *Performance SLA* pane displays the SLA targets for the rule.
 - The *SD-WAN Active Interface* pane displays a checkmark next to the active interface.

2. Use your remote to navigate between the *Latency*, *Jitter*, and *Packet Loss* charts.

To view a branch in the topology:

1. Use your remote to swipe to the top navigation in the monitor. Wait for the topology to load.
2. At the top-right of the monitor, select the current device.

3. Select the device you want to view.

Troubleshooting

The following topics provide troubleshooting information for the Fortinet Security Fabric:

- [Viewing a summary of all connected FortiGates in a Security Fabric on page 3143](#)
- [Diagnosing automation stitches on page 3145](#)

Viewing a summary of all connected FortiGates in a Security Fabric

In downstream FortiGates, the `diagnose sys csf global` command shows a summary of all of the connected FortiGates in the Security Fabric.

To view a Security Fabric summary on a downstream FortiGate:

```
# diagnose sys csf global
Current vision:
[

Diagnosing automation stitches

Diagnose commands are available to:

- Test an automation stitch
- Enable or disable log dumping for automation stitches
- Display the settings of every automation stitch
- Display statistics on every automation stitch

To test an automation stitch:

```
diagnose automation test <automation-stitch-name>
```

Example:

```
# diagnose automation test HA-failover
automation test is done. stitch:HA-failover
```

To toggle log dumping:

```
diagnose test application autod 1
```

Examples:

```
# diagnose test application autod 1
autod log dumping is enabled

# diagnose test application autod 1
autod log dumping is disabled

autod logs dumping summary:
autod dumped total:7 logs, num of logids:4
```

To display the settings for all of the automation stitches:

```
diagnose test application autod 2
```

Example:

```
# diagnose test application autod 2
csf: enabled root:yes
total stitches activated: 3

stitch: Compromised-IP-Banned
destinations: all
trigger: Compromised-IP-Banned

local hit: 0 relayed to: 0 relayed from: 0
actions:
    Compromised-IP-Banned_ban-ip type:ban-ip interval:0

stitch: HA-failover
destinations: HA-failover_ha-cluster_25;
trigger: HA-failover

local hit: 0 relayed to: 0 relayed from: 0
actions:
    HA-failover_email type:email interval:0
    subject: HA Failover

Log and Report

Logging and reporting are useful components to help you understand what is happening on your network, and to inform you about certain network activities, such as the detection of a virus, a visit to an invalid website, an intrusion, a failed log in attempt, and myriad others.

Logging records the traffic that passes through, starts from, or ends on the FortiGate, and records the actions the FortiGate took during the traffic scanning process. After this information is recorded in a log message, it is stored in a log file that is stored on a log device (a central storage location for log messages). FortiGate supports sending all log types to several log devices, including FortiAnalyzer, FortiAnalyzer Cloud, FortiGate Cloud, and syslog servers. Approximately 5% of memory is used for buffering logs sent to FortiAnalyzer. The FortiGate system memory and local disk can also be configured to store logs, so it is also considered a log device. See [Log settings and targets on page 3164](#) for more information.

Reports show the recorded activity in a more readable format. A report gathers all the log information that it needs, then presents it in a graphical format with a customizable design and automatically generated charts showing what is happening on the network. Reports can be generated on FortiGate devices with disk logging and on FortiAnalyzer devices.

FortiView is a more comprehensive network reporting and monitoring tool. It integrates real-time and historical data into a single view in FortiOS. For more information, see [FortiView monitors on page 134](#).

Performance statistics are not logged to disk. Performance statistics can be received by a syslog server or by FortiAnalyzer.

The following topics provide information about logging and reporting:

- [Viewing event logs on page 3149](#)
- [System Events log page on page 3152](#)
- [Security Events log page on page 3157](#)
- [Reports page on page 3160](#)
- [Log settings and targets on page 3164](#)
- [Logging to FortiAnalyzer on page 3169](#)
- [Advanced and specialized logging on page 3179](#)
- [Sample logs by log type on page 3195](#)
- [Troubleshooting on page 3216](#)

Viewing event logs

Event log subtypes are available on the *Log & Report > System Events* page. Not all of the event log subtypes are available by default. See [System Events log page on page 3152](#) for more information.

When viewing event logs in the *Logs* tab, use the event log subtype dropdown list on the to navigate between event log types.

Summary Logs

2022/08/02 09:58:43	Notice		Global sync report for down...

System Events Always available.

Router Events Always available.

VPN Events Available when *VPN* is enabled in *System > Feature Visibility*.

SD-WAN Events Always available.

User Events Always available.

Endpoint Events	Available when <i>Endpoint Control</i> is enabled in <i>System > Feature Visibility</i> .
HA Events	Always available.
Security Rating Events	Always available, but logs are only generated when a Security Rating License is registered.
WAN Opt. & Cache Events	Available on devices with two hard disks by default. On devices with one hard disk, the disk usage must be set to <code>wanopt</code> and then <i>WAN Opt. & Cache</i> must be enabled in <i>System > Feature Visibility</i> .
WiFi Events	Available on hardware devices when <i>WiFi Controller</i> is enabled in <i>System > Feature Visibility</i> .
FortiExtender Events	Available when <i>FortiExtender</i> is enabled in <i>System > Feature Visibility</i> .
SDN Connector Events	Always available.
FortiSwitch Events	Available when <i>Switch Controller</i> is enabled in <i>System > Feature Visibility</i> .
CIFS Events	Always available.
REST API Events	Always available.

Logs can be filtered by date and time in the *Log & Report > System Events* page. The log viewer can be filtered with a custom range or with specific time frames.

UTM logs can also be filtered by date and time in *Log & Report > Security Events*. See [Security Events log page on page 3157](#).

The time frame available is dependent on the source:

- Logs sourced from FortiAnalyzer, FortiGate Cloud, and FortiAnalyzer Cloud have the same time frame options as FortiView (5 minutes, 1 hour, 24 hours, or 7 days).

- Logs sourced from the Disk have the time frame options of 5 minutes, 1 hour, 24 hours, 7 days, or None.

- Logs source from Memory do not have time frame filters.

A custom time frame can be applied using the *Date/Time* filter. If the *Date/Time* filter is applied, the time frame will be disabled and set to *custom*.

Summary		Logs				
		<div> <div>Application Control</div> <div>Disk</div> <div>custom</div> <div>Details</div> </div>				
Date/Time 2022-07-22 13:11:00 -> 2022-07-29 13:11:00		<div> <div>Search</div> </div>				
Date/Time	Source	Destination	Application Name	Action	Application User	Application De
2022/07/29 13:11:00	10.100.93.2	172.217.13.142 (youtube.com)	YouTube	Pass		
2022/07/29 13:11:00	10.200.1.7	204.2.134.163 (0.debian.pool.ntp.org)	NTP	Pass		

Time frame settings for each *Log & Report* page are independent of each other. For example, if you change the time frame on the *System Events* page, the time frame will be different than that of the *Security Events* page unless it is also changed to match.

System Events log page

The *Log & Report > System Events* page includes:

- A *Summary* tab that displays the top five most frequent events in each type of event log and a line chart to show aggregated events by each severity level. Clicking on a peak in the line chart will display the specific event count for the selected severity level.
- A *Logs* tab that displays individual, detailed log views for event type.

The *Summary* tab includes the following:

- Event list footers show a count of the events that relate to the type.

General System Events		
Top Event	Level	Count
Test	Warning	11
Admin login successful	Information	7
Admin logout successful	Information	6
Super admin entered VDOM	Information	6
Admin login failed	Alert	1
34 events		

- A count of the total events is shown at the top of the *Summary*. Hovering over the count shows the number of events with a time stamp.

- Hovering over the *Total Events By Level* shows the number of events with a time stamp.

- Clicking on any event type title opens the *Logs* page for that event type filtered by the selected time span. For example, clicking *VPN Events* opens the following page:

Summary **Logs**

Date/Time 2022-08-03 14:42:55 -> 2022-08-03 15:42:55 Search VPN Events Disk custom Details

Date/Time	Level	Action	Status	Message	VPN Tunnel

Disk logging and historical FortiView must be enabled for the **Summary** tab to display valid data. See [Log settings and targets on page 3164](#) for more information.

A FortiOS Event Log trigger can be created using the shortcut on any **Logs** tab. Select a log, then right-click and select **Create Automation Trigger**. See [System Events page shortcut on page 2943](#) for more information.

A time frame can be selected from the dropdown.

The line chart will display all of the system events, and the non-empty event cards will list up to five **Top Event** entries within the time frame set.

Data is retrieved from FortiView with the **5 minutes** range updated first. When selecting either the **1 hour** or **24 hours** time range, there may be a delay to update **Top Event** entries.

Up to 100 **Top Event** entries can be listed in the CLI using the `diagnose fortiview result event-log` command.

To view filtered log information:

1. Go to **Log & Report > System Events**.
2. Select the **Logs** tab.

3. Hover over the leftmost column and click the gear icon. A list of column you can filter is displayed.

```

The data is collected from FortiView for the last 24 hours by default. To specify a specific time range, customize the time filter using the `diagnose fortiview time` command.

To filter the time range of system events in the CLI:

```
# diagnose fortiview time <arg1> <arg2>
```

Where `<arg1>` is the start time in YYYY-MM-DD HH:MM:SS and `<arg2>` is the end time in YYYY-MM-DD HH:MM:SS.

Security Events log page

The *Log & Report > Security Events* log page includes:

- A *Summary* tab that displays the five most frequent events for all of the enabled UTM security events.
- A *Logs* tab that displays individual, detailed logs for each UTM type.

The *Summary* tab includes the following:

- Event list footers show a count of the events that relate to the type.

Application Control ↗		
Top Category	Action	Count
Network.Service	Pass	11 <div></div>
Storage.Backup	Pass	9 <div></div>
Video/Audio	Pass	3 <div></div>
im	Pass	1 <div></div>
P2P	Pass	1 <div></div>
25 events		

- A count of the total events is shown at the top of the *Summary*. Hovering over the count shows the number of events with a time stamp.

Application Control ↗		
Top Category	Action	Count
Storage.Backup	Pass	18 <div></div>
Network.Service	Pass	10 <div></div>
Video/Audio	Pass	6 <div></div>
im	Pass	2 <div></div>
P2P	Pass	2 <div></div>
63 Events		

AntiVirus ↗		
Top Virus/Botnet	Action	Count
virus_test3	Passthrough	2 <div></div>
filename	Passthrough	2 <div></div>
EXCAR_TEST_FILE	Blocked	1 <div></div>
3 events		

- Clicking on any event type title opens the *Logs* page for that event type filtered by the selected time span. For example, clicking *Application Control* opens the following page:

1,860 events

Top Attack	Action	Count
BlackMoon	Dropped	1

1 events

The non-empty security event cards will list up to five top entries within the time range set.

Data is retrieved from FortiView with the *5 minutes* range updated first. When selecting either the *1 hour* or *24 hours* time range, there may be a delay to update top security event entries. Logs sourced from the Disk have different time frames available for filtering. See [Viewing event logs on page 3149](#).

Up to 100 top security event entries can be listed in the CLI using the `diagnose fortiview result security-log` command.

To list security events in the CLI:

```
# diagnose fortiview result security-log [<filters>]
```

To list security events in the CLI with no filters applied:

```
# diagnose fortiview result security-log

Reports page

The *Log & Report > Reports* page consolidates FortiAnalyzer, FortiGate Cloud, and Local log reports. Administrators can generate, delete, and edit report schedules, and view and download generated reports. The *Reports* page is organized into dedicated tabs:

- [FortiAnalyzer on page 3160](#)
- [FortiGate Cloud on page 3162](#)
- [Local on page 3163](#)

FortiAnalyzer

FortiAnalyzer reports can be viewed in the *FortiAnalyzer* tab.

FortiAnalyzer must be configured in FortiOS. If the FortiGate is unauthorized on FortiAnalyzer, or the connection to FortiAnalyzer is down, the *FortiAnalyzer* tab loads with *No results*.

When the Security Fabric is enabled, only the root FortiGate can run, edit, and delete FortiAnalyzer reports. Downstream FortiGates can only view the generated reports.

To edit a report schedule:

1. Go to **Log & Report > Reports** and select the **FortiAnalyzer** tab.
2. Select **Scheduled**.

FortiAnalyzer FortiGate Cloud Local				
Run Report Edit Schedule		Q Search		Generated Scheduled
Report Title	Description	Schedule	Schedule Status	Time Pe
Application				
Application Risk and Control	Application risk, categories, bandwidth by app...	Every 1 week(s)	✖ Disabled	Last 7 D
Bandwidth and Applications Report	Traffic, Bandwidth, Sessions, Destinations summ...			
Cyber-Bullying Indicators Report	Cyber-Bullying Indicators Report.			
High Bandwidth Application Usage Report	High Bandwidth Application Usage Report.			
Security				
Cyber Threat Assessment	Cyber Threat review of Application Visibility an...	Every 1 week(s) from 2012/10/01 03:00	✔ Enabled	Last 7 D
Security Events and Incidents Summary	Present a brief summary of the events/incidents...			
Threat Report	Malware, Botnets - detected, victims and source...			
VPN Report	VPN Traffic, authenticated and failed User login...			
Web Usage Report	Web usage requests, browsing and bandwidth s...			

3. Select a report and click **Edit Schedule**. The **Edit Schedule** pane opens. In this example, the schedule for the Bandwidth and Applications report is changed to run from every week to every two weeks.
4. In the **Schedule** section, set the values for **Generate report every** to **2 week(s)**.

5. Click **OK**.

The schedule is also updated automatically in FortiAnalyzer for the same report (go to **Reports > Report Definitions > All Reports** and edit the report to view the settings).

To view and download reports:

1. Go to *Log & Report > Reports* and select the *FortiAnalyzer* tab.

A pie chart displays the total count of FortiAnalyzer reports, categorized by report title. Generated reports are listed below and arranged by title, which includes reports from all VDOMs.

2. In the pie chart, click the a segment to filter reports.
3. In the filtered results, select the report. Right-click and select *Download*.

4. Select a file format. The report is saved to the default download location.

FortiGate Cloud

Reports can be viewed and downloaded from the *FortiGate Cloud* tab. Select *Refresh* to regenerate the available reports.

FortiAnalyzer FortiGate Cloud Local

Refresh

Download

View

Launch Portal

Name	Start Time	End Time	Schedule
360 Degree Activities Report	2022/11/20 00:00:00	2022/11/27 00:00:00	Weekly
360 Degree Activities Report	2022/11/13 00:00:00	2022/11/20 00:00:00	Weekly
360 Degree Activities Report	2022/11/13 10:52:00	2022/11/14 10:52:00	Once

To download a report:

1. Go to *Log & Report > Reports* and select the *FortiGate Cloud* tab.
2. Select the report.
3. Click *Download*. The report is saved to the default download location.

To view a report:

1. Go to *Log & Report > Reports* and select the *FortiGate Cloud* tab.
2. Select the report.
3. Click *View*. The report is displayed.

You can launch the FortiGate Cloud portal from the *FortiGate Cloud* tab.

To launch the FortiGate Cloud portal:

1. Go to *Log & Report > Reports* and select the *FortiGate Cloud* tab.
2. Select *Launch Portal*. The FortiGate Cloud landing page opens.

Local

Reports can be generated, scheduled, viewed, and downloaded in the *Local* tab.

To generate a report:

1. Go to *Log & Report > Reports* and select the *Local* tab.
2. Select *Generate Now*. The *Confirm* pane opens.

3. Click *OK*.

To view a report:

1. Go to *Log & Report > Reports* and select the *Local* tab.
2. Select the report.
3. Click *View*. The report is displayed.

To download a report:

1. Go to *Log & Report > Reports* and select the *Local* tab.
2. Select the report.
3. Click *Download*. The report is saved to the default download location.

To schedule reports:

1. Go to *Log & Report > Reports* and select the *Local* tab.
2. Click *Report Schedule*. The *Report Schedule* pane opens.

3. Set the schedule details.
4. Click **OK**.

Log settings and targets

Log settings determine what information is recorded in logs, where the logs are stored, and how often storage occurs. Log settings can be configured in the GUI and CLI. In the GUI, *Log & Report > Log Settings* provides the settings for local and remote logging.

Log & Report > Log Settings is organized into tabs:

- [Global Settings on page 3164](#)
- [Local Logs on page 3165](#)
- [Threat Weight on page 3165](#)

Global Settings

Settings available in the *Global Settings* tab include:

UUIDs in Traffic Log

Policy

Define the use of policy UUIDs in traffic logs:

- **Enable:** Policy UUIDs are stored in traffic logs. UUIDs can be matched for each source and destination that match a policy in the traffic log. See [Source and destination UUID logging on page 3183](#) for more information.
- **Disable:** Policy UUIDs are excluded from the traffic logs.

Address

Define the use of address UUIDs in traffic logs:

- **Enable:** Address UUIDs are stored in traffic logs. When viewing *Forward Traffic* logs, a filter is automatically set based on UUID.
- **Disable:** Address UUIDs are excluded from traffic logs.

Log Settings

Event Logging

Define the allowed set of event logs to be recorded:

- **All:** All event logs will be recorded.
- **Customize:** Select specific event log types to be recorded. Deselect all options to disable event logging.

Local Traffic Log

Define the allowed set of traffic logs to be recorded:

- **All:** All traffic logs to and from the FortiGate will be recorded.

- *Customize*: Select specific traffic logs to be recorded. Deselect all options to disable traffic logging. Local traffic logging is disabled by default due to the high volume of logs generated.

GUI Preferences

Resolve Hostnames

Define the translation of IP addresses to host names:

- *Enable*: IP addresses are translated to host names using reverse DNS lookup. If the DNS server is not available or is slow to reply, requests may time out.
- *Disable*: IP addresses are not translated to host names.

Resolve Unknown Applications

Define the resolution of unknown applications:

- *Enable*: Unknown applications are resolved using the Internet Service Database.
- *Disable*: Unknown applications are not resolved.

Local Logs

Settings available in the *Local Logs* tab include:

Local Logs

Disk logging

Define local log storage on the FortiGate:

- *Enable*: Logs will be stored on a local disk. Local disk logging is not available in the GUI if the Security Fabric is enabled. When the Security Fabric is enabled, disk logging can still be configured on the root FortiGate in the CLI but is not available for downstream FortiGates.
- *Disable*: Logs will be stored remotely to FortiAnalyzer/FortiManager or to a Cloud logging device.

Local Reports

Define log reporting on the FortiGate:

- *Enable*: Local reports will be available on the FortiGate. Reports can be reviewed in *Log & Report > Reports* in the *Local* tab.
- *Disable*: Local reports will not be available on the FortiGate.

Historical FortiView

Define the presentation of log information on FortiView:

- *Enable*: Historical log data will be available on a FortiView monitor. By default, logs older than seven days are deleted. Disk logging must be enabled.
- *Disable*: Historical log data will not be available on FortiView.

Disk Usage

Presents the disk space used and the total disk space available on the disk.

Threat Weight

Threat weight helps aggregate and score threats based on user-defined severity levels. It adds several fields such as threat level (*crlevel*), threat score (*crscore*), and threat type (*craction*) to traffic logs. Threat weight logging is

enabled by default and the settings can be customized. Threats can be viewed from the *Top Threats* FortiView dashboard.

To configure threat weight settings:

1. Go to *Log & Report > Log Settings* and select the *Threat Weight* tab.
2. Adjust the settings as needed, such as individual weights per threat type and risk level values.
3. Click *Apply*.

To add the Top Threats monitor to the dashboard:

1. In the tree menu, click *Dashboard* and in the FortiView section, click the + sign (*Add Monitor*).
2. In the *Security* section, enable *Show More* and click *Top Threats*.
3. Configure the settings as needed.
4. Click *Add Monitor*.
5. Go to *Dashboard > Top Threats*. The *Top Threats* monitor displays threats based on the scores in the traffic logs.

6. Double-click a threat to view the summary.
7. Click *Sources*, *Destinations*, *Countries/Regions*, or *Sessions* to view more information. Double-click an entry to view the log details.

Configuring logs in the CLI

The FortiGate can store logs locally to its system memory or a local disk. Logs can also be stored externally on a storage device, such as FortiAnalyzer, FortiAnalyzer Cloud, FortiGate Cloud, or a syslog server.

Disk logging

Disk logging must be enabled for logs to be stored locally on the FortiGate. By default, logs older than seven days are deleted from the disk. Log age can be configured in the CLI. Approximately 75% of disk space is available for log storage. Log storage space can be determined using the `diagnose sys logdisk usage` command.

To configure local disk logging:

```
config log disk setting
    set status enable
    set maximum-log-age <integer>
    set max-log-file-size <integer>
end
```

Remote logging

The process to configure FortiGate to send logs to FortiAnalyzer or FortiManager is identical. Remote logging to FortiAnalyzer and FortiManager can be configured using both the GUI and CLI. When using the CLI, use the `config log fortianalyzer setting` command for both FortiAnalyzer and FortiManager.

If VDOMs are configured on the FortiGate, multiple FortiAnalyzers and syslog servers can be added globally. See [Configuring multiple FortiAnalyzers \(or syslog servers\) per VDOM on page 3172](#) and [Configuring multiple FortiAnalyzers on a FortiGate in multi-VDOM mode on page 3173](#) for more information.

To configure remote logging to FortiAnalyzer:

```
config log fortianalyzer setting
    set status enable
    set server <server_IP>
    set upload option {store-and-upload | realtime | 1-minute | 5-minute}
end
```

Remote logging can also be configured to FortiCloud, FortiSIEM, and syslog servers. Up to four syslog servers or FortiSIEM devices can be configured using the `config log syslogd` command and can send logs to syslog in CSV and CEF formats.

To configure remote logging to FortiCloud:

```
config log fortiguard setting
    set status enable
    set source-ip <source IP used to connect FortiCloud>
end
```

To configure remote logging to a syslog server:

```
config log syslogd setting
    set status enable
    set server <syslog_IP>
    set format {default | cev | cef}
end
```

Log filters

Log filter settings can be configured to determine which logs are recorded to the FortiAnalyzer, FortiManager, and syslog servers. This allows certain logging levels and types of logs to be directed to specific log devices.

To configure log filters for FortiAnalyzer:

```
config log fortianalyzer filter
    set severity <level>
    set forward-traffic {enable | disable}
    set local-traffic {enable | disable}
    set multicast-traffic {enable | disable}
    set sniffer-traffic {enable | disable}
end
```

To configure log filters for a syslog server:

```
config log syslogd filter
    set severity <level>
    set forward-traffic {enable | disable}
    set local-traffic {enable | disable}
    set multicast-traffic {enable | disable}
    set sniffer-traffic {enable | disable}
end
```

Email alerts

FortiGate events can be monitored at all times using email alerts. Email alerts send notifications to up to three recipients and can be triggered based on log event and severity level. Email alerts will be sent every five minutes by default but this can be configured in the CLI.

To configure email alerts:

```
config alertemail setting
    set username <name>
    set mailto1 <email>
    set filter-mode {category | threshold}
    set email-interval <integer>
    set IPS-logs {enable | disable}
    set HA-logs {enable | disable}
    set antivirus-logs {enable | disable}
    set webfilter-logs {enable | disable}
    set log-disk-usage-warning {enable | disable}
end
```

Logging to FortiAnalyzer

The following topics provide instructions on logging to FortiAnalyzer:

- [FortiAnalyzer log caching on page 3169](#)
- [Configuring multiple FortiAnalyzers \(or syslog servers\) per VDOM on page 3172](#)
- [Configuring multiple FortiAnalyzers on a FortiGate in multi-VDOM mode on page 3173](#)
- [Switching to an alternate FortiAnalyzer if the main FortiAnalyzer is unavailable NEW on page 3176](#)

FortiAnalyzer log caching

Reliable logging to FortiAnalyzer prevents lost logs when the connection between FortiOS and FortiAnalyzer is disrupted. When reliable mode is enabled:

1. Logs are cached in a FortiOS memory queue.
2. FortiOS sends logs to FortiAnalyzer, and FortiAnalyzer uses `seq_no` to track received logs.
3. After FortiOS sends logs to FortiAnalyzer, logs are moved to a confirm queue in FortiOS.
4. FortiOS periodically queries FortiAnalyzer for the latest `seq_no` of the last log received, and clears logs from the confirm queue up to the `seq_no`.
5. If the connection between FortiOS and FortiAnalyzer is disrupted, FortiOS resends the logs in the confirm queue to FortiAnalyzer when the connection is reestablished.

FortiAnalyzer 7.2.0 and later is required.

To enable reliable mode:

```
config log fortianalyzer setting
    set reliable enable
end
```

To view the memory and confirm queues:

1. Verify that log synchronization is enabled for FortiAnalyzer:

```
# diagnose test application fgtlogd 1
vdom-admin=0
mgmt=root

fortilog:
faz: global , enabled
    server=172.16.200.251, realtime=1, ssl=1, state=connected
    server_log_status=Log is allowed.,
    src=, mgmt_name=FGh_Log_root_172.16.200.251, reliable=1, sni_prefix_type=none,
    required_entitlement=none, region=ca-west-1,,
    logsync_enabled:1, logsync_conn_id:65535, seq_no:790
...
```

2. When a network disruption disconnects FortiOS from FortiAnalyzer and FortiOS continues to generate logs, the logs are cached in the memory queue.

- View the number of logs in the cache and queue:

```
# diagnose test application fgtlogd 41

cache maximum: 189516595(180MB) objects: 40 used: 27051(0MB) allocated: 29568(0MB)

VDOM:root
Memory queue for: global-faz
queue:
    num:9 size:6976(0MB) total size:26068(0MB) max:189516595(180MB) logs:28
Confirm queue for: global-faz
queue:
    num:29 size:19092(0MB) total size:27051(0MB) max:189516595(180MB) logs:7

# diagnose test application fgtlogd 30
VDOM:root
Memory queue for: global-faz
queue:
    num:9 size:6976(0MB) total size:26068(0MB) max:189516595(180MB)
        type:3, cat=1, log_count=1, seq_no=0, data len=359 size:435
        type:3, cat=1, log_count=1, seq_no=0, data len=307 size:383
        .....
        type:3, cat=0, log_count=4, seq_no=0, data len=1347 size:1423
        type:3, cat=4, log_count=1, seq_no=0, data len=653 size:729
    'total log count':28, 'total data len':6292

Confirm queue for: global-faz
queue:
    num:29 size:19092(0MB) total size:26068(0MB) max:189516595(180MB)
        type:3, cat=1, log_count=1, seq_no=1, data len=290 size:366
        type:3, cat=1, log_count=1, seq_no=2, data len=233 size:309
        .....
        type:3, cat=0, log_count=1, seq_no=28, data len=524 size:600
        type:3, cat=1, log_count=1, seq_no=29, data len=307 size:383
    'total log count':76, 'total data len':16888
```

There are nine OFTP items cached to the memory queue, and 29 OFTP items to send from FortiOS to FortiAnalyzer that are waiting for confirmation from FortiAnalyzer.

- Go to *Log & Report > Log Settings* to view the queue in the GUI:

Log Settings

Remote Logging and Archiving

Send logs to FortiAnalyzer/FortiManager Enabled Disabled

Server Test Connectivity

Connection status Unauthorized Authorize

Upload option ⓘ Real Time Every Minute Every 5 Minutes

Connectivity issue, 217814 logs queued

Allow access to FortiGate REST API ☒

Verify FortiAnalyzer certificate ☒ FAZVM

3. Re-establish the connection between FortiOS and FortiAnalyzer and confirm that the queue has cleared by checking the `seq_no`, which indicates the latest confirmation log from FortiAnalyzer:

```
# diagnose test application fgtlogd 30
VDOM:root
Memory queue for: global-faz
queue:
  num:0 size:0(0MB) total size:0(0MB) max:189516595(180MB)
  'total log count':0, 'total data len':0
```

```
Confirm queue for: global-faz
queue:
  num:0 size:0(0MB) total size:0(0MB) max:189516595(180MB)
  'total log count':0, 'total data len':0
```

The queue has been cleared, meaning that FortiOS received confirmation from FortiAnalyzer and cleared the confirm queue.

```
# diagnose test application fgtlogd 1
vdom-admin=0
mgmt=root

fortilog:
faz: global , enabled
  server=172.16.200.251, realtime=1, ssl=1, state=connected
  server_log_status=Log is allowed.,
  src=, mgmt_name=FGh_Log_root_172.16.200.251, reliable=1, sni_prefix_type=none,
  required_entitlement=none, region=ca-west-1,
  logsync_enabled:1, logsync_conn_id:65535, seq_no:67
  status: ver=6, used_disk=0, total_disk=0, global=0, vfid=0 conn_verified=Y
  SNs: last sn update:38 seconds ago.
  Sn list:
    (FAZ-VMTM21000000,age=38s)
  queue: qlen=0.
```

OFTP items with a `seq_no` lower than 67 have been sent to FortiAnalyzer and were confirmed.

Configuring multiple FortiAnalyzers (or syslog servers) per VDOM

In a VDOM, multiple FortiAnalyzer and syslog servers can be configured as follows:

- Up to three override FortiAnalyzer servers
- Up to four override syslog servers

If the VDOM `faz-override` and/or `syslog-override` setting is enabled or disabled (default) before upgrading, the setting remains the same after upgrading.

If the override setting is disabled, the GUI displays the global FortiAnalyzer1 or syslog1 setting. If the override setting is enabled, the GUI displays the VDOM override FortiAnalyzer1 or syslog1 setting.

You can only use CLI to enable the override to support multiple log servers.

To enable FortiAnalyzer and syslog server override under VDOM:

```
config log setting
    set faz-override enable
    set syslog-override enable
end
```

When `faz-override` and/or `syslog-override` is enabled, the following CLI commands are available for configuring VDOM override:

To configure VDOM override for FortiAnalyzer:

1. Configure the FortiAnalyzer override settings:

```
config log fortianalyzer/fortianalyzer2/fortianalyzer3 override-setting
    set status enable
    set server "123.12.123.123"
    set reliable enable
end
```

2. Configure the override filters:

```
config log fortianalyzer/fortianalyzer2/fortianalyzer3 override-filter
    set severity information
    set forward-traffic enable
    set local-traffic enable
    set multicast-traffic enable
    set sniffer-traffic enable
    set anomaly enable
    set voip enable
    set dlp-archive enable
    set dns enable
    set ssh enable
    set ssl enable
end
```

To configure VDOM override for a syslog server:

1. Configure the syslog override settings:

```
config log syslogd/syslogd2/syslogd3/syslogd4 override-setting
    set status enable
```

```
    set server "123.12.123.12"
    set facility local1
end
```

2. Configure the override filters:

```
config log syslogd/syslogd2/syslogd3/syslogd4 override-filter
    set severity information
    set forward-traffic enable
    set local-traffic enable
    set multicast-traffic enable
    set sniffer-traffic enable
    set anomaly enable
    set voip enable
    set dns enable
    set ssh enable
    set ssl enable
end
```

Configuring multiple FortiAnalyzers on a FortiGate in multi-VDOM mode

This topic shows a sample configuration of multiple FortiAnalyzers on a FortiGate in multi-VDOM mode.

In this example:

- The FortiGate has three VDOMs:
 - Root (management VDOM)
 - VDOM1
 - VDOM2
- There are four FortiAnalyzers.
These IP addresses are used as examples in the instructions below.
 - FAZ1: 172.16.200.55
 - FAZ2: 172.18.60.25
 - FAZ3: 192.168.1.253
 - FAZ4: 192.168.1.254
- Set up FAZ1 and FAZ2 under global.
 - These two collect logs from the root VDOM and VDOM2.
 - FAZ1 and FAZ2 must be accessible from management VDOM root.
- Set up FAZ3 and FAZ4 under VDOM1.
 - These two collect logs from VDOM1.
 - FAZ3 and FAZ4 must be accessible from VDOM1.

To set up FAZ1 as global FortiAnalyzer 1 from the GUI:

Prerequisite: FAZ1 must be reachable from the management root VDOM.

1. Go to *Global > Log & Report > Log Settings*.
2. Enable *Send logs to FortiAnalyzer/FortiManager*.
3. Enter the FortiAnalyzer IP.
In this example: 172.16.200.55.

4. For *Upload option*, select *Real Time*.
5. Click *Apply*.

To set up FAZ2 as global FortiAnalyzer 2 from the CLI:

Prerequisite: FAZ2 must be reachable from the management root VDOM.

```
config log fortianalyzer2 setting
    set status enable
    set server "172.18.60.25"
    set upload-option realtime
end
```

To set up FAZ3 and FAZ4 as VDOM1 FortiAnalyzer 1 and FortiAnalyzer 2:

Prerequisite: FAZ3 and FAZ4 must be reachable from VDOM1.

```
config log setting
    set faz-override enable
end

config log fortianalyzer override-setting
    set status enable
    set server "192.168.1.253"
    set upload-option realtime
end

config log fortianalyzer2 override-setting
    set status enable
    set server "192.168.1.254"
    set upload-option realtime
end
```

Checking FortiAnalyzer connectivity

To use the diagnose command to check FortiAnalyzer connectivity:

1. Check the global FortiAnalyzer status:

```
FGTA(global) # diagnose test application fgtlogd 1
vdom-admin=1
mgmt=root
faz: global , enabled
    server=172.16.200.55, realtime=1, ssl=1, state=connected
    server_log_status=Log is allowed.,
    src=, mgmt_name=FGh_Log_root_172.16.200.55, reliable=0, sni_prefix_type=none,
    required_entitlement=none, region=ca-west-1,
    logsync_enabled:1, logsync_conn_id:65535, seq_no:0
        status: ver=6, used_disk=0, total_disk=0, global=0, vfid=0 conn_
verified=Y
    SNs: last sn update:383 seconds ago.
        Sn list:
            (FAZ-VM2M2200****,age=383s)
        queue: qlen=0.
filter: severity=6, sz_exclude_list=0
```

```

    traffic virus webfilter ips emailfilter anomaly voip dlp app-ctrl waf dns ssh
ssl file-filter icap sctp-filter
subcategory:
    traffic: forward local multicast sniffer ztna
    anomaly:all subcategories are enabled.
    server: global, id=0, ready=1, name=172.16.200.55 addr=172.16.200.55:514
    oftp-state=connected
faz2: global , enabled
    server=172.18.60.25, realtime=3, ssl=1, state=connected
    server_log_status=Log is allowed.,
    src=, mgmt_name=FGh_Log_root_172.18.60.25, reliable=0, sni_prefix_type=none,
    required_entitlement=none, region=ca-west-1,
    logsync_enabled:1, logsync_conn_id:131071, seq_no:0
        status: ver=6, used_disk=0, total_disk=0, global=0, vfid=0 conn_
verified=Y
    SNs: last sn update:383 seconds ago.
        Sn list:
            (FAZ-VMTM2201****,age=383s)
        queue: qlen=0.
filter: severity=6, sz_exclude_list=0
    traffic virus webfilter ips emailfilter anomaly voip dlp app-ctrl waf dns ssh
ssl file-filter icap sctp-filter
subcategory:
    traffic: forward local multicast sniffer ztna
    anomaly:all subcategories are enabled.
    server: global, id=1, ready=1, name=172.18.60.25 addr=172.18.60.25:514
    oftp-state=connected

```

2. Check the VDOM1 override FortiAnalyzer status:

```

FGTA(global) # diagnose test application fgtlogd 3101
vdom VDOM1: id=3
event filter:
    event
system vpn user router wireless wanopt endpoint ha security-rating fortixtender
connector sdwan cifs-auth-fail switch-controller rest-api webproxy

server: vdom, id=1, ready=1, name=192.168.1.254 addr=192.168.1.254:514
oftp-state=connected
faz3: vdom, disabled, override

```

Switching to an alternate FortiAnalyzer if the main FortiAnalyzer is unavailable - NEW

FortiOS supports switching to an alternate FortiAnalyzer if the main FortiAnalyzer is unavailable. Once the connectivity is restored, it will automatically fall back to the primary FortiAnalyzer.

This feature can be used in multi VDOM mode when FortiAnalyzer override settings are configured.

To configure switching to an alternate FortiAnalyzer when the main FortiAnalyzer is unavailable:

1. Configure primary and alternate FortiAnalyzer servers:

```

config log fortianalyzer setting
    set status enable
    set server "172.16.200.250"
    set alt-server "172.16.200.251"
    set fallback-to-primary enable
    set serial "FAZ-VMTM22000000" "FAZ-VMTM23000003"
end

```

2. Verify the primary and alternate FortiAnalyzer server IPs:

```
# diagnose test application fgtlogd 1
vdom-admin=1
mgmt=vdom1

fortilog:
faz: global , enabled
    server=172.16.200.250, alt-server=172.16.200.251, active-server=172.16.200.250,
realtime=3, ssl=1, state=connected
    server_log_status=Log is allowed.,
    src=, mgmt_name=FGh_Log_vdom1_172.16.200.250, reliable=0, sni_prefix_type=none,
    required_entitlement=none, region=ca-west-1,
    logsync_enabled:1, logsync_conn_id:65535, seq_no:0
    disconnect_jiffies:0
        status: ver=6, used_disk=0, total_disk=0, global=0, vfid=0 conn_
verified=Y
    SNs: last sn update:11 seconds ago.
        Sn list:
            (FAZ-VMTM22000000,age=11s)          (FAZ-VMTM23000003,age=12s)
        queue: qlen=0.
filter: severity=6, sz_exclude_list=0
    traffic virus webfilter ips emailfilter anomaly voip dlp app-ctrl waf dns ssh
ssl file-filter icap sctp-filter virtual-patch
subcategory:
    traffic: forward local multicast sniffer ztna
    virus:all subcategories are enabled.
    webfilter:all subcategories are enabled.
    ips:all subcategories are enabled.
    emailfilter:all subcategories are enabled.
    anomaly:all subcategories are enabled.
    voip:all subcategories are enabled.

    app-ctrl:all subcategories are enabled.
    waf:all subcategories are enabled.
    dns:all subcategories are enabled.
    ssh:all subcategories are enabled.
    ssl:all subcategories are enabled.
    file-filter:all subcategories are enabled.
    icap:all subcategories are enabled.
    sctp-filter:all subcategories are enabled.
    virtual-patch:all subcategories are enabled.

    server: global, id=0, ready=1, name=172.16.200.250 addr=172.16.200.250:514
    oftp-state=connected
    probe oftp status:null, 38

```

The 172.16.200.251 server is currently active and acting as the primary FortiAnalyzer.

5. Restore the connection to the 172.16.200.250 server. The FortiGate will automatically reconnect to this FortiAnalyzer server.
6. Verify the FortiAnalyzer server status information:

```

# diagnose test application fgtlogd 1
vdom-admin=1
mgmt=vdom1

fortilog:
faz: global , enabled
    server=172.16.200.250, alt-server=172.16.200.251, active-server=172.16.200.250,

server: global, id=0, ready=1, name=172.16.200.250 addr=172.16.200.250:514
oftp-state=connected
primary oftp status:null
probe oftp status:null, 530

```

The 172.16.200.250 server is currently active and acting as the primary FortiAnalyzer again.

To manually switch from the primary to alternate FortiAnalyzer (and vice-versa):

```
# execute log {fortianalyzer | fortianalyzer2 | fortianalyzer3} manual-failover
```

If the primary server is still up, the behavior resulting from running this command is based on the `fallback-to-primary` setting configured in the global FortiAnalyzer log settings.

- If `fallback-to-primary` is enabled (default), running `execute log fortianalyzer manual-failover` will switch to the alternate FortiAnalyzer, but it will switch back to the primary since it is not actually down.
- If `fallback-to-primary` is disabled, running `execute log fortianalyzer manual-failover` will switch to the alternate FortiAnalyzer, and it will not switch back to the primary.

Advanced and specialized logging

The following topics provide information on advanced and specialized logging:

- [Logs for the execution of CLI commands on page 3180](#)
- [Log buffer on FortiGates with an SSD disk on page 3181](#)
- [Source and destination UUID logging on page 3183](#)
- [Configuring and debugging the free-style filter on page 3184](#)
- [Logging the signal-to-noise ratio and signal strength per client on page 3186](#)
- [RSSO information for authenticated destination users in logs on page 3188](#)
- [Destination user information in UTM logs on page 3191](#)

Logs for the execution of CLI commands

The `cli-audit-log` option records the execution of CLI commands in system event logs (log ID 44548). In addition to `execute` and `config` commands, `show`, `get`, and `diagnose` commands are recorded in the system event logs.

The `cli-audit-log` data can be recorded on memory or disk, and can be uploaded to FortiAnalyzer, FortiGate Cloud, or a syslog server.

To enable the CLI audit log option:

```
config system global
    set cli-audit-log enable
end
```

To view system event logs in the GUI:

1. Run the command in the CLI (`# show log fortianalyzer setting`).
2. Go to **Log & Report > System Events**.
3. Select **General System Events**.
4. Select the log entry and click **Details**.

Log buffer on FortiGates with an SSD disk

FortiGates with an SSD disk have a configurable log buffer. When the connection to FortiAnalyzer is unreachable, the FortiGate is able to buffer logs on disk if the memory log buffer is full. The logs queued on the disk buffer can be sent successfully once the connection to FortiAnalyzer is restored.

The queued logs are buffered to the memory first and then disk. If the total buffer is full, new logs will overwrite the old logs.

To configure the log buffer:

1. Allocate disk space (MB) to temporarily store logs to FortiAnalyzer:

```
config system global
    set faz-disk-buffer-size 200
end
```

2. Check the `fgtlogd` statistics. The 200 MB disk buffer has been set, and there are currently no logs buffered in memory or on disk when FortiAnalyzer is reachable:

```
# diagnose test application fgtlogd 41
cache maximum: 19569745(18MB) objects: 0 used: 0(0MB) allocated: 0(0MB)
VDOM:root
Memory queue for: global-faz
    queue:
        num:0 size:0(0MB) total size:0(0MB) max:15375441(14MB) logs:0
    queue disk total size:0MB, max size:200MB
        total items:0
            devid:-1-13-0-0
            buffer path:/var/log/log/qbuf/13.0/0
            saved size:0MB, lost files: 0
```

```

                save roll:0 restore roll:0
Confirm queue for: global-faz
    queue:
        num:0 size:0(0MB) total size:0(0MB) max:15375441(14MB) logs:0

```

3. Disable the connection between the FortiGate and FortiAnalyzer. For example, delete the FortiGate from the FortiAnalyzer authorized device list.

Assuming a massive number of logs (~ 300000) are recorded during this downtime, the logs will be queued in the memory buffer first. If the memory buffer is full, then the remaining logs will be queued on the disk buffer.

4. Recheck the `fgtlogd` statistics. Currently, there are logs buffered in both memory and disk:

```

# diagnose test application fgtlogd 41
cache maximum: 19569745(18MB) objects: 14391 used: 10450754(9MB) allocated: 12089088
(11MB)
    VDOM:root
Memory queue for: global-faz
    queue:
        num:14245 size:9306505(8MB) total size:10450754(9MB) max:15375441(14MB)
logs:14245
    queue disk total size:199MB, max size:200MB
        total items:321085
            devid:-1-13-0-0
            buffer path:/var/log/log/qbuf/13.0/0
            saved size:199MB, lost files: 10
            save roll:60 restore roll:10
Confirm queue for: global-faz
    queue:
        num:0 size:0(0MB) total size:10450754(9MB) max:15375441(14MB) logs:0

```

The overall `fgtlogd` statistics shows the total cached logs is the sum of the logs buffered in memory and on disk:

```

# diagnose test application fgtlogd 4
Queues in all miglogds: cur:1 total-so-far:727973
global log dev statistics:
faz=399411, faz_cloud=0, fds_log=399411
faz 0: sent=0, failed=0, cached=335480, dropped=0
Num of REST URLs: 0

```

5. Enable the connection between FortiAnalyzer and the FortiGate.
6. After a while, check the `fgtlogd` statistics to confirm that all buffered logs are being sent to FortiAnalyzer successfully:

```

# diagnose test application fgtlogd 4
Queues in all miglogds: cur:1 total-so-far:727973
global log dev statistics:
faz=399411, faz_cloud=0, fds_log=399411
faz 0: sent=335487, failed=0, cached=0, dropped=0
Num of REST URLs: 0

# diagnose test application fgtlogd 41
cache maximum: 19569745(18MB) objects: 0 used: 0(0MB) allocated: 0(0MB)
VDOM:root
Memory queue for: global-faz
    queue:
        num:0 size:0(0MB) total size:0(0MB) max:15375441(14MB) logs:0
    queue disk total size:0MB, max size:200MB
        total items:0

```

```

devid:-1-13-0-0
buffer path:/var/log/log/qbuf/13.0/0
saved size:0MB, lost files: 10
save roll:60 restore roll:60
Confirm queue for: global-faz
queue:
    num:0 size:0(0MB) total size:0(0MB) max:15375441(14MB) logs:0

```

Source and destination UUID logging

The `log-uuid` setting in system global is split into two settings: `log-uuid-address` and `log-uuid-policy`.

The traffic log includes two `internet-service` name fields: *Source Internet Service* (`srcinetsvc`) and *Destination Internet Service* (`dstinetsvc`).

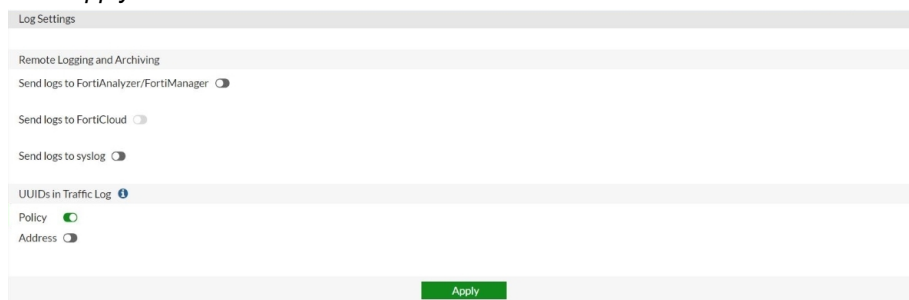

Log UUIDs

UUIDs can be matched for each source and destination that match a policy that is added to the traffic log. This allows the address objects to be referenced in log analysis and reporting.

As this may consume a significant amount of storage space, this feature is optional. By default, policy UUID insertion is enabled and address UUID insertion is disabled.

To enable address and policy UUID insertion in traffic logs using the GUI:

1. Go to *Log & Report > Log Settings*.
2. Under *UUIDs in Traffic Log*, enable *Policy* and/or *Address*.
3. Click *Apply*.

To enable address and policy UUID insertion in traffic logs using the CLI:

```

config system global
    set log-uuid-address enable
    set log-uuid-policy enable
end

```

Sample log

```

date=2019-01-25 time=11:32:55 logid="0000000013" type="traffic" subtype="forward"

Internet service name fields

Traffic logs for `internet-service` include two fields: *Source Internet Service* and *Destination Internet Service*.

To view the internet service fields using the GUI:

1. Go to *Log & Report > Forward Traffic*.
2. Double-click on an entry to view the *Log Details*. The *Source Internet Service* and *Destination Internet Service* fields are visible in the *Log Details* pane.

Configuring and debugging the free-style filter

Free-style filters allow users to define a filter for logs that are captured to each individual logging device type. Filters can include log categories and specific log fields. The filters can be created as an inclusive list or exclusive list.

Free-style filters can also be used to filter logs that have been captured on logging devices already to narrow down the list of logs to view.

```
config log syslogd filter
  config free-style
    edit <id>
      set category <option>
      set filter <string>
      set filter-type {include | exclude}
    next
  end
end
```

category <option>	Set the log category. The following options are available: traffic, event, virus, webfilter, attack, spam, anomaly, voip, dlp, app-ctrl, waf, dns, ssh, ssl, file-filter, icap, and ztna.
filter <string>	Enter the filter criteria. Multiple values can be added, for example: set filter "logid <id> <id>"
filter-type {include exclude}	Include/exclude logs that match the filter.

Use the following commands to view the results when multiple fields are used:

```
# execute log filter free-style "logid <id> <id>"
# execute log filter free-style "srcip <IP_address> <IP_address>"
# execute log filter free-style "(logid <id>) or (srcip <IP_address> <IP_address>)"
# execute log filter free-style "(srcip <IP_address>) and (dstip <IP_address>)"
```

In this example, the free-style filter is set to filter log IDs 0102043039 and 0102043040. The source IPs, 192.168.2.5 and 192.168.2.205, are also checked.

To configure the syslogd free-style filter with multiple values:

```
config log syslogd filter
  config free-style
    edit 1
      set category event
      set filter "logid 0102043039 0102043040"
    next
  end
end
```

To view the syslogd free-style filter results:

```
# execute log filter free-style "logid 0102043039 0102043040"
# execute log filter dump
category: event
device: disk
start-line: 1
view-lines: 10
max-checklines: 0
HA member:
log search mode: on-demand
```

```

pre-fetch-pages: 2
Filter: logid 0102043039 0102043040
Oftp search string: (and (or logid=="0102043039" not-exact logid=="0102043040" not-exact))

# execute log filter free-style "(logid 0102043039) or (srcip 192.168.2.5 192.168.2.205)"
# execute log filter dump
category: event
device: disk
start-line: 1
view-lines: 10
max-checklines: 0
HA member:
log search mode: on-demand
pre-fetch-pages: 2
Filter: (logid 0102043039) or (srcip 192.168.2.5 192.168.2.205)
Oftp search string: (or (or (or srcip==192.168.2.5) (or srcip==192.168.2.205)) (or
logid=="0102043039" not-exact))

```

Logging the signal-to-noise ratio and signal strength per client

The signal-to-noise ratio (`snr`) and signal strength (`signal`) are logged per client in the WiFi event and traffic logs.

When a WiFi client connects to a tunnel or local-bridge mode SSID on an FortiAP that is managed by a FortiGate, signal-to-noise ratio and signal strength details are included in WiFi event logs for local-bridge traffic statistics and authentication, and in forward traffic logs for tunnel traffic. This allows you to store and view clients' historical signal strength and signal-to-noise ratio information.

To verify when a client is connecting to an SSID:

1. Go to *Log & Report > System Events* and select *WiFi Events*.

The *Signal* and *Signal/Noise* columns show the signal strength and signal-to-noise ratio for each applicable client.

```

RSSO information for authenticated destination users in logs

FortiGate can use RSSO accounting information from authenticated RSSO users to populate destination users and groups, along with source users and groups.

RSSO user login information can be forwarded by the RADIUS server to the FortiGate that is listening for incoming RADIUS accounting start messages on the RADIUS accounting port. Accounting start messages usually contain the IP address, user name, and user group information. FortiGate uses this information in traffic logs, which include *dstuser* and *dstgroup* fields for user and group destination information.

For instructions on configuring RSSO, see [RADIUS single sign-on agent on page 3092](#).

The three following scenarios show traffic between pc1 and the internet, and pc1 and pc2.

Scenario 1

In this scenario, RSSO user *test2* in group *rsso-grp1* is authenticated on pc1. Traffic flows from pc1 to the internet.

Expected result:

In the logs, user *test2* is shown as the source user in the *rsso-grp1* group.

To verify the results:

1. In the GUI, go to **Log & Report > Forward Traffic** and view the details of an entry with *test2* as the source.
2. In the **Source** section, **User** is *test2* and **Group** is the *rsso-grp1*.

3. The log message shows the user and group:

```

10: date=2020-05-25 time=15:34:43 logid="0000000013" type="traffic" subtype="forward"
level="notice" vd="vdom1" eventtime=1590446083718007055 tz="-0700" srcip=10.1.100.188
srcname="win7-2-A.Fortinet-FSSO.COM" srcport=56982 srcintf="port10"
srcintfrole="undefined" dstip=172.217.3.195 dstport=443 dstintf="port9"
dstintfrole="undefined" srccountry="Reserved" dstcountry="United States"
sessionid=120651 proto=17 action="accept" policyid=1 policytype="policy"
  
```

```
poluuid="d130f886-9ec6-51ea-206e-8c561c5244c6" policyname="poll" user="test2"
group="rso-grpl" authserver="vdom1" service="udp/443" trandisp="snat"
transip=172.16.200.1 transport=56982 duration=181 sentbyte=2001 rcvdbyte=1820 sentpkt=6
rcvdpkt=4 appcat="unscanned" sentdelta=0 rcvddelta=0 srchwvndor="VMware"
osname="Windows" srcswversion="7" mastersrcmac="00:0c:29:44:be:b9"
srcmac="00:0c:29:44:be:b9" srcserver=0
```

Scenario 2

In this scenario, RSSO user *test2* is authenticated on pc1. Traffic is initialized on pc2 (172.16.200.185) going to pc1 (10.1.100.188).

Expected result:

In the logs, user `test2` is shown as the destination user (`dstuser`). No destination group (`dstgroup`) is logged because no RSSO user is logged in on `pc2`, so the traffic from `pc2` is unauthenticated.

To verify the results:

1. In the GUI, go to *Log & Report > Forward Traffic* and view the details of an entry with 172.16.200.185 (pc2) as the source.
2. In the *Other* section, *Destination User* is test2 and no destination group is shown.

[illegible]

- 3.** The log message shows the destination user:

```
1: date=2020-05-22 time=07:38:06 logid="0000000020" type="traffic" subtype="forward"
level="notice" vd="root" eventtime=1590158286585506922 tz="-0700" srcip=172.16.200.185
identifier=1 srcintf="port9" srcintfrole="undefined" dstip=10.1.100.188 dstintf="port10"
dstintfrole="undefined" srccountry="Reserved" dstcountry="Reserved" sessionid=4395
proto=1 action="accept" policyid=3 policytype="policy" poluuid="d4f18ele-9c36-51ea-6ec0-
3a354d5910ee" policyname="pol2" dstuser="test2" dstauthserver="root" service="PING"
trandisp="snat" transip=10.1.100.1 transport=0 duration=128 sentbyte=7620 rcvdbyte=5220
sentpkt=127 rcvdpkt=87 appcat="unscanned" sentdelta=7620 rcvddelta=5220
```

Scenario 3

In this scenario, RSSO user *test2* in group *rsso-grp1* is authenticated on pc1, and user *test3* in group *rsso-grp2* is authenticated on pc2. Traffic flows from pc2 to pc1.

Expected result:

In the logs, user *test3* is shown as the source user in the *rsso-grp1* group. User *test2* is shown as destination user (*dstuser*) in the *rsso-grp1* destination group (*dstgroup*). The destination group is logged because an RSSO user is logged in to pc2.

To verify the results:

1. In the GUI, go to *Log & Report > Forward Traffic* and view the details of an entry with 172.16.200.185 (pc2) as the source.
2. In the *Source* section, *User* is *test3* and *Group* is the *rsso-grp2*. In the *Other* section, *Destination User* is *test2* and *Destination Group* is *rsso-grp1*.

The screenshot shows the FortiGate Log & Report interface. The top section displays a list of traffic logs with columns for Date/Time, Source, Device, Destination, Application Name, Result, and Policy. The bottom section shows detailed information for a selected log entry, including Log Details, Application Control, Data, Action, Security, and Other.

Date/Time	Source	Device	Destination	Application Name	Result	Policy

Log Details:

- Source Interface: port0
- User: test3
- Group: rsso-grp2
- Destination: 10.1.100.188
- Port: 80
- Destination MAC: 00:0c:29:44:be:b9
- Country/Region: Reserved
- Destination Interface: port0

Application Control:

- Application Name: undefined
- Category: unscanned
- Risk: undefined
- Protocol: HTTP
- Service: HTTP

Data:

- Received Bytes: 563 B
- Received Packets: 5
- Sent Bytes: 328 B
- Sent Packets: 6

Action:

- Action: Accept session close
- Policy ID: pol2 (3)
- Policy: 5894c368-9eca-51ea-fb4c-ec5a6c1d5043
- UID: ec5a6c1d5043
- Policy Type: Firewall

Security:

- Level: [|||||]

Other:

- Log ID: 0000000013
- Type: traffic
- Sub Type: forward
- Log event original timestamp: 1590441786958007914
- Timestamp: -0700
- Source Interface Role: undefined
- Destination Interface Role: pol2
- Policy Name: undefined
- Authentication Server: vdom1
- Destination User: test2
- Destination Group: rsso-grp1
- Destination Authentication: vdom1

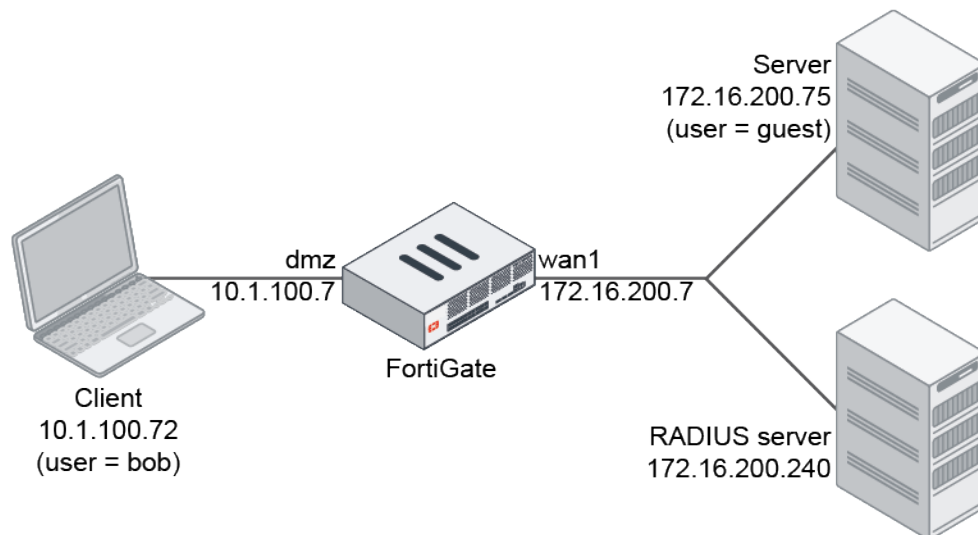

3. The log message shows both the source and the destination users and groups:

```

```

Destination user information in UTM logs

The *dstuser* field in UTM logs records the username of a destination device when that user has been authenticated on the FortiGate.

In the following example topology, the user, bob, is authenticated on a client computer. The user, guest, is authenticated on the server. Log are collected for AV and IPS in flow inspection mode. Logs are collected for application control and web filter in proxy mode.

To configure the RADIUS user and user groups:

1. Configure the RADIUS server:

```
config user radius
    edit "Ubuntu_docker"
        set server "172.16.200.240"
        set secret *****
    next
end
```

2. Configure the local user:

```
config user local
    edit "guest"
        set type password
        set passwd *****
    next
end
```

3. Configure the RADIUS user groups:

```
config user group
    edit "RADIUS_User_Group"
        set member "Ubuntu_docker"
    next
    edit "Local_User"
        set member "guest"
    next
end
```

Flow inspection mode

To verify AV and IPS logs in flow mode:

1. Configure the firewall policies:

```
config firewall policy
  edit 1
    set name "WAN_out"
    set srcintf "dmz"
    set dstintf "wan1"
    set action accept
    set srcaddr "all"
    set dstaddr "all"
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set ssl-ssh-profile "deep-inspection"
    set av-profile "g-default"
    set ips-sensor "sensor-11"
    set nat enable
    set groups "RADIUS_User_Group" "Local_User"
  next
  edit 3
    set name "WAN_in"
    set srcintf "wan1"
    set dstintf "dmz"
    set action accept
    set srcaddr "all"
    set dstaddr "all"
    set schedule "always"
    set service "ALL"
    set logtraffic all
    set nat enable
    set groups "RADIUS_User_Group" "Local_User"
  next
end
```

2. Verify the AV log:

```
date=2021-09-14 time=16:37:25 eventtime=1631662646131356720 tz="-0700"
logid="0211008192" type="utm" subtype="virus" eventtype="infected" level="warning"

C9QQUNLRVQ+"

```

Proxy inspection mode

To verify application control and web filter logs in proxy mode:

1. Configure the firewall policies:

```
config firewall policy
  edit 1
    set name "WAN_out"
    set srcintf "dmz"
    set dstintf "wan1"
    set action accept
    set srcaddr "all"
    set dstaddr "all"
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set inspection-mode proxy
    set ssl-ssh-profile "deep-inspection"
    set av-profile "g-default"
    set application-list "g-default"
    set webfilter-profile "1"
    set nat enable
    set groups "RADIUS_User_Group" "Local_User"
  next
  edit 3
    set name "WAN_in"
    set srcintf "wan1"
    set dstintf "dmz"
    set action accept
    set srcaddr "all"
    set dstaddr "all"
    set schedule "always"
    set service "ALL"
    set inspection-mode proxy
    set logtraffic all
    set nat enable
    set groups "RADIUS_User_Group" "Local_User"
  next
end

```

2. Verify the application control log:

```
date=2021-09-14 time=17:05:45 eventtime=1631664345570951500 tz="-0700"
logid="1059028704" type="utm" subtype="app-ctrl" eventtype="signature"
level="information" vd="vdom1" appid=38783 user="bob" group="RADIUS_User_Group"
authserver="Ubuntu_docker" dstuser="guest" srcip=10.1.100.72 dstip=172.16.200.75
srcport=60098 dstport=80 srcintf="dmz" srcintfrole="undefined" dstintf="wan1"
dstintfrole="undefined" proto=6 service="HTTP" direction="outgoing" policyid=1
sessionid=10871 applist="g-default" action="pass" appcat="General.Interest" app="Wget"
hostname="172.16.200.75" incidentserialno=17825796 url="/eicar.com"
msg="General.Interest: Wget," apprisk="low"
```

3. Verify the web filter log:

```
date=2021-09-14 time=17:14:46 eventtime=1631664886585770420 tz="-0700"
logid="0315012546" type="utm" subtype="webfilter" eventtype="urlfilter"

        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set logtraffic all
        set ssl-ssh-profile "deep-inspection"
        set nat enable
    next
end
```

For SSL-UTM-log

```
#EVENTTYPE="SSL-ANOMALIES"
```

By default, ssl-anomaly-log is enabled.

```
config firewall ssl-ssh-profile
  edit "deep-inspection"
    set comment "Read-only deep inspection profile."
    set server-cert-mode re-sign
    set caname "Fortinet_CA_SSL"
    set untrusted-caname "Fortinet_CA_Untrusted"
    set ssl-anomaly-log enable
    set ssl-exemption-log disable
    set ssl-negotiation-log disable
    set rpc-over-https disable
    set mapi-over-https disable
    set use-ssl-server disable
  next
end

# EVENTTYPE="SSL-EXEMPT"
```

Enable ssl-exemption-log to generate ssl-utm-exempt log.

```
config firewall ssl-ssh-profile
  edit "deep-inspection"
    set comment "Read-only deep inspection profile."
    set server-cert-mode re-sign
    set caname "Fortinet_CA_SSL"
    set untrusted-caname "Fortinet_CA_Untrusted"
    set ssl-anomaly-log enable
    set ssl-exemption-log enable
    set ssl-negotiation-log disable
    set rpc-over-https disable
    set mapi-over-https disable
    set use-ssl-server disable
  next
end

# EVENTTYPE="SSL-negotiation"
```

Enable ssl-negotiation-log to log SSL negotiation. Enable ssl-server-cert-log to log server certificate information. Enable ssl-handshake-log to log TLS handshakes.

```
config firewall ssl-ssh-profile
  edit "deep-inspection"
    set comment "Read-only deep inspection profile."
    set server-cert-mode re-sign
    set caname "Fortinet_CA_SSL"
    set untrusted-caname "Fortinet_CA_Untrusted"
    set ssl-anomaly-log enable
    set ssl-exemption-log enable
    set ssl-negotiation-log enable
    set rpc-over-https disable
    set mapi-over-https disable
    set use-ssl-server disable
    set ssl-server-cert-log enable
    set ssl-handshake-log enable
  next
end
```

Troubleshooting

The following topics provide information about troubleshooting logging and reporting:

- [Log-related diagnostic commands on page 3217](#)
- [Backing up log files or dumping log messages on page 3222](#)
- [SNMP OID for logs that failed to send on page 3224](#)

Log-related diagnostic commands

This topic contains examples of commonly used log-related diagnostic commands. Local logging is handled by the `locallogd` daemon, and remote logging is handled by the `ftglogd` daemon.

Log search debugging

The `diagnose debug application miglogd 0x1000` command is used to show log filter strings used by the log search backend. It also shows which log files are searched.

To run log search debugging:

```
# diagnose debug application miglogd 0x1000
Debug messages will be on for 28 minutes.
# diagnose debug enable

# Files to be searched:
file_no=65422, start_line=0, end_line=805
file_no=65423, start_line=0, end_line=221
session ID=2, total logs=1028
back ground search. process ID=2913, session_id=2
  start_line=1 view_line=10 pre-fetch-pages=2

back ground search. next log file roll number is: 65422
ID=2, total=1028, checked=806, found=806
on-demand back ground search exit. process ID=2913, session_id=2, status=process_on-demand_
pending
```

Log filtering

The `execute log filter` command can be used to define and display specific log messages based on the parameters entered.

To display all login system event logs:

```
# execute log filter device disk
# execute log filter category event
# execute log filter field action login
# execute log display

Files to be searched:
file_no=65523, start_line=0, end_line=237
file_no=65524, start_line=0, end_line=429
file_no=65525, start_line=0, end_line=411
file_no=65526, start_line=0, end_line=381
file_no=65527, start_line=0, end_line=395
```

```

file_no=65528, start_line=0, end_line=458
file_no=65529, start_line=0, end_line=604
file_no=65530, start_line=0, end_line=389
file_no=65531, start_line=0, end_line=384
session ID=1, total logs=3697
back ground search. process ID=26240, session_id=1
  start_line=1  view_line=10
( action "login" )
ID=1, total=3697, checked=238, found=5
ID=1, total=3697, checked=668, found=13
ID=1, total=3697, checked=1080, found=23
ID=1, total=3697, checked=1462, found=23
ID=1, total=3697, checked=1858, found=23
ID=1, total=3697, checked=2317, found=54
ID=1, total=3697, checked=2922, found=106
ID=1, total=3697, checked=3312, found=111
ID=1, total=3697, checked=3697, found=114

```

Checking the FortiGate to FortiAnalyzer connection

To check the FortiGate to FortiAnalyzer connection status:

```

# diagnose test application fgtlogd 1
faz: global , enabled
    server=172.16.200.251, realtime=3, ssl=1, state=connected

app-ctrl: logs=1 len=692, Sun=0 Mon=0 Tue=0 Wed=0 Thu=0 Fri=1 Sat=0
```

To check the remote queue and see the maximum buffered memory size:

```
# diagnose test application fgtlogd 41
cache maximum: 19569745(18MB) objects: 0 used: 0(0MB) allocated: 0(0MB)
VDOM:root
Memory queue for: global-faz
    queue:
        num:0 size:0(0MB) total size:0(0MB) max:19569745(18MB) logs:0
Confirm queue for: global-faz
    queue:
        num:0 size:0(0MB) total size:0(0MB) max:19569745(18MB) logs:0
Memory queue for: fds
    queue:
        num:0 size:0(0MB) total size:0(0MB) max:19569745(18MB) logs:0
Confirm queue for: fds
    queue:
        num:0 size:0(0MB) total size:0(0MB) max:19569745(18MB) logs:0
```

miglogd diagnostics

The miglogd daemon includes a publisher/subscriber framework that separates functions into different daemons. The miglogd daemon is responsible for building and publishing logs, while device-related details are managed by subscriber daemons.

To enable debugging the miglogd (log daemon) at the proper debug level:

```
# diagnose debug application miglogd <integer>
# diagnose debug enable
```

To display the status or statistics at the proper debug level:

```
# diagnose test application miglogd <integer>
# diagnose debug enable
```

When using the preceding commands, press **Enter** after `diagnose debug application miglogd` or `diagnose test application miglogd` to view the list of available levels.

To check log statistics to the local/remote log device since the miglogd daemon start:

```
# diagnose test application miglogd 6
mem=4288, disk=4070, alert=0, alarm=0, sys=5513, faz=4307, webt=0, fds=0
interface-missed=208
```

To check the miglogd daemon number:

```
# diagnose test application miglogd 15
Main miglogd: ID=0, children=2, active-children=2
```

```
ID=1, duration=70465.  
ID=2, duration=70465.
```

To increase one miglogd child:

```
# diagnose test application miglogd 13  
# diagnose test application miglogd 15  
Main miglogd: ID=0, children=3, active-children=3  
ID=1, duration=70486.  
ID=2, duration=70486.  
ID=3, duration=1.
```

To decrease one miglogd child:

```
# diagnose test application miglogd 14  
# diagnose test application miglogd 15  
Main miglogd: ID=0, children=2, active-children=2  
ID=1, duration=70604.  
ID=2, duration=70604.
```

Backing up log files or dumping log messages

When a log issue is caused by a particular log message, it is very help to get logs from that FortiGate. This topic provides steps for using `execute log backup` or dumping log messages to a USB drive.

Backing up full logs using `execute log backup`

This command backs up all disk log files and is only available on FortiGates with an SSD disk.

Before running `execute log backup`, we recommend temporarily stopping `miglogd` and `reportd`.

To stop and kill miglogd and reportd:

```
diagnose sys process daemon-auto-restart disable miglogd  
diagnose sys process daemon-auto-restart disable reportd
```

Or

1. Determine the process, or thread, ID (PID) of `miglogd` and `reportd`:

```
# diagnose sys top 10 99
```

2. Kill each process:

```
# diagnose sys kill 9 <PID>
```

To store the log file on a USB drive:

1. Plug in a USB drive into the FortiGate.
2. Run this command:

```
execute log backup /usb/log.tar
```

To restart miglogd and reportd:

```
diagnose sys process daemon-auto-restart enable miglogd
diagnose sys process daemon-auto-restart enable reportd
```

Dumping log messages**To dump log messages:****1. Enable log dumping for miglogd daemon:**

```
(global) # diagnose test application miglogd 26 1
miglogd(1) log dumping is enabled
```

2. Display all miglogd dumping status:

```
global) # diagnose test application miglogd 26 0 255
miglogd(0) log dumping is disabled
miglogd(1) log dumping is enabled
miglogd(2) log dumping is disabled

(global) # diagnose test application miglogd 26 2
miglogd(2) log dumping is enabled

(global) # diagnose test application miglogd 26 0
miglogd(0) log dumping is enabled

(global) # diagnose test application miglogd 26 0 255
miglogd(0) log dumping is enabled
miglogd(1) log dumping is enabled
miglogd(2) log dumping is enabled
```

3. Let the FortiGate run and collect log messages.**4. List the log dump files:**

```
(global) # diagnose test application miglogd 33
2019-04-17 15:50:02      20828      log-1-0.dat
2019-04-17 15:48:31      4892      log-2-0.dat
```

5. Back up log dump files to the USB drive:

```
(global) # diagnose test application miglogd 34

Dumping file miglog1_index0.dat copied to USB disk OK.

Dumping file miglog2_index0.dat copied to USB disk OK.
```

6. Disable log dumping for miglogd daemon:

```
(global) # diagnose test application miglogd 26 0
miglogd(0) log dumping is disabled

(global) # diagnose test application miglogd 26 1
miglogd(1) log dumping is disabled

(global) # diagnose test application miglogd 26 2
miglogd(2) log dumping is disabled

(global) # diagnose test application miglogd 26 0 255
```

```

miglogd(0) log dumping is disabled
miglogd(1) log dumping is disabled
miglogd(2) log dumping is disabled

```

SNMP OID for logs that failed to send

When a syslog server encounters low-performance conditions and slows down to respond, the buffered syslog messages in the kernel might overflow after a certain number of retransmissions, causing the overflowed messages to be lost. OIDs track the lost messages or failed logs.

SNMP query OIDs include log statistics for global log devices:

- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDeviceNumber 1.3.6.1.4.1.12356.101.21.1.1
- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDevices.fgLogDeviceTable.fgLogDeviceEntry.fgLogDeviceEntryIndex 1.3.6.1.4.1.12356.101.21.2.1.1.1
- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDevices.fgLogDeviceTable.fgLogDeviceEntry.fgLogDeviceEnabled 1.3.6.1.4.1.12356.101.21.2.1.1.2
- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDevices.fgLogDeviceTable.fgLogDeviceEntry.fgLogDeviceName 1.3.6.1.4.1.12356.101.21.2.1.1.3
- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDevices.fgLogDeviceTable.fgLogDeviceEntry.fgLogDeviceSentCount 1.3.6.1.4.1.12356.101.21.2.1.1.4
- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDevices.fgLogDeviceTable.fgLogDeviceEntry.fgLogDeviceRelayedCount 1.3.6.1.4.1.12356.101.21.2.1.1.5
- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDevices.fgLogDeviceTable.fgLogDeviceEntry.fgLogDeviceCachedCount 1.3.6.1.4.1.12356.101.21.2.1.1.6
- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDevices.fgLogDeviceTable.fgLogDeviceEntry.fgLogDeviceFailedCount 1.3.6.1.4.1.12356.101.21.2.1.1.7
- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDevices.fgLogDeviceTable.fgLogDeviceEntry.fgLogDeviceDroppedCount 1.3.6.1.4.1.12356.101.21.2.1.1.8

Where:

- fgLogDeviceNumber is the number of devices in the table.
- fgLogDeviceEnabled is either 1 or 0, indicating whether the device is enabled.
- fgLogDeviceName is the name of the device.

A FortiGate connected to a syslog server or FortiAnalyzer generates statistics that can be seen using the `diagnose test application syslogd` command:

```

(global) # diagnose test application syslogd 4
syslog=437, nulldev=0, webtrends=0, localout_ioc=258, alarms=0
global log dev statistics:
syslog 0: sent=222, failed=0, cached=0, dropped=0
syslog 1: sent=215, failed=0, cached=0, dropped=0
syslog 2: sent=95, failed=0, cached=0, dropped=0

```

The same statistics are also available in `snmpwalk/snmppget` on the OID 1.3.6.1.4.1.12356.101.21.

```
snmpwalk -v2c -c REGR-SYS 172.16.200.1 1.3.6.1.4.1.12356.101.21

FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.8.4 = Counter32: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.8.5 = Counter32: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.8.6 = Counter32: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.8.7 = Counter32: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.8.8 = Counter32: 0
```

To get the type of logging device that is attached to the FortiGate:

```
root@PC05:/home/tester/autolib/trunk# snmpwalk -v2c -c REGR-SYS 172.16.200.1
1.3.6.1.4.1.12356.101.21.2.1.1.3
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.0 = STRING: "syslog"
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.1 = STRING: "syslog2"
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.2 = STRING: "syslog3"
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.3 = STRING: "syslog4"
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.4 = STRING: "faz"
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.5 = STRING: "faz2"
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.6 = STRING: "faz3"
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.7 = STRING: "webtrends"
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.8 = STRING: "fds"
```

To get the present state of the logging device that is attached to the FortiGate:

```
root@PC05:/home/tester/autolib/trunk# snmpwalk -v2c -c REGR-SYS 172.16.200.1
1.3.6.1.4.1.12356.101.21.2.1.1.2
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.0 = INTEGER: 1
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.1 = INTEGER: 1
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.2 = INTEGER: 1
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.3 = INTEGER: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.4 = INTEGER: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.5 = INTEGER: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.6 = INTEGER: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.7 = INTEGER: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.8 = INTEGER: 0
```

To get the failed log count value:

```
root@PC05:/home/tester/autolib/trunk# snmpwalk -v2c -c REGR-SYS 172.16.200.1
1.3.6.1.4.1.12356.101.21.2.1.1.7
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.7.0 = Counter32: 139
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.7.1 = Counter32: 139
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.7.2 = Counter32: 73
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.7.3 = Counter32: 0
```

```
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.7.4 = Counter32: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.7.5 = Counter32: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.7.6 = Counter32: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.7.7 = Counter32: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.7.8 = Counter32: 0
```

WAN optimization

Many multi-location enterprise environments reduce costs and consolidate resources by centralizing applications or providing applications in the cloud. Applications that work fine on a local LAN, such as Windows File Sharing (CIFS), email exchange (MAPI), and many others, suffer from bandwidth limitations and latency issues when accessed over a WAN. This results in a loss of productivity and a perceived need for expensive network upgrades. WAN optimization reduces your network overhead and removes unnecessary traffic for a better overall performance experience and eliminates the need for costly WAN link upgrades between data centers and other expensive solutions for your network traffic growth.

FortiOS WAN optimization provides an inexpensive and comprehensive solution that maximizes your WAN performance and provides intelligent bandwidth management and unmatched consolidated security performance.

FortiOS includes license-free WAN optimization on most current FortiGate devices with internal storage that also support SSL offloading.

Features

The following features are available through WAN optimization:

Protocol optimization

Protocol optimization is effective for applications designed for the LAN that do not function well on low bandwidth, high latency networks. See [Protocol optimization on page 3236](#) for more information.

Byte caching

Byte caching improves caching by accelerating the transfer of similar, but not identical content. See [Byte caching on page 3236](#) for more information.

SSL offloading

SSL is used by many organizations to keep WAN communications private. WAN optimization utilizes the SSL offloading capabilities of the FortiGate FortiASIC hardware to accelerate SSL traffic across the WAN. The FortiGate unit handles SSL encryption and decryption for corporate servers providing SSL encrypted connections over the WAN. See [SSL Offloading on page 3232](#) for more information.

WAN optimization and HA

You can configure WAN optimization on a FortiGate HA cluster. See [HA on page 3240](#) for more information.

Secure tunneling

FortiOS WAN optimization supports secure SSL-encrypted tunnels between FortiGate units on the WAN. See [Secure tunneling on page 3234](#) for more information.

Prerequisites

FortiGate WAN optimization is proprietary to Fortinet Inc.. It will not work with other vendors' WAN optimization or offloading features.

Before you begin to configure WAN optimization, please go through the following steps:

1. To use WAN optimization, your FortiGate unit must support it and not all FortiGate units do. In general, your FortiGate unit must include a hard disk to support these features. See [Feature Platform Matrix](#).
2. If the physical FortiGate has only one hard disk, make sure it is selected for WAN optimization. See [Disk usage on page 3229](#) for more information.
3. For FortiGate-VM, ensure you create two virtual disks besides the boot disk for WAN optimization to work.
4. To be able to configure WAN optimization from the GUI you should begin by going to *System > Feature Visibility* and turning on *WAN Opt. & Cache*.
5. If you enable virtual domains (VDOMs) on the FortiGate unit, WAN optimization is available separately for each VDOM.

At this stage, the following installation and configuration conditions are assumed:

- For WAN optimization you have already successfully installed two or more FortiGate units at various locations across your WAN.
- You have administrative access to the GUI or CLI.
- The FortiGate units are integrated into your WAN or other networks.
- The system time, DNS settings, administrator password, and network interfaces have been configured.
- Firmware, FortiGuard Antivirus, and FortiGuard Antispam updates are completed.
- Your Fortinet products have been registered. Register your Fortinet Inc. products at the Fortinet Technical Support website, <https://support.fortinet.com>.

Disk usage

Both logging and WAN optimization use hard disk space to save data. In FortiOS, you cannot use the same hard disk for both WAN optimization and logging.

- If the FortiGate has one hard disk, then it can be used for either disk logging or WAN optimization, but not both. By default, the hard disk is used for disk logging.

Only physical FortiGate devices can switch between disk logging and WAN optimization in the case of a single hard disk. FortiGate-VM must have two virtual disks apart from the boot disk for WAN optimization to work.

- If the FortiGate has two hard disks, then one disk is always used for disk logging and the other disk is always used for WAN optimization.

On the FortiGate, go to *System > Settings > Disk Settings* to switch between *Local Log* and *WAN Optimization*.

You can also change disk usage from the CLI using the following command:

```
config system storage
  edit <name>
    set usage {log | wanopt}
    set wanopt-mode {mix | wanopt | webcache}
  next
end
```

Option	Description
wanopt-mode	<p>WAN optimization mode:</p> <ul style="list-style-type: none"> • mix: This is the default mode. • wanopt: Recommended if only the WANopt feature is enabled. • webcache: Recommended if only the webcache feature is enabled. <p>If only one of the two features is being used, using the applicable recommended mode will give a higher cache capacity and improve performance.</p>

Enabling WAN optimization affects more than just disk logging. The following table shows other features affected by the FortiGate disk configuration.

Feature	1 hard disk	2 hard disks
Logging	Not supported	Supported
Report/Historical FortiView	Not supported	Supported
Firewall Packet Capture (Policy Capture and Interface Capture)	Not supported	Supported
AV Quarantine	Not supported	Supported
IPS Packet Capture	Not supported	Supported
DLP Archive	Not supported	Supported
Sandbox DB & Results	FortiSandbox database and results are also stored on disk, but will not be affected by this feature.	
Remote Logging	Remote logging (including logging to FortiAnalyzer and Syslog servers) is not affected by this features.	

Changing the disk setting formats the disk, erases current data stored on the disk, and disables either disk logging or WAN optimization.

The following sections provide information about WAN optimization:

- [Overview on page 3231](#)
- [Example topologies on page 3242](#)

- [Configuration examples on page 3244](#)

Overview

The following topics provide an overview on WAN optimization:

- [Monitoring performance on page 3239](#)
- [System and feature operation with WAN optimization on page 3239](#)
- [Best practices on page 3242](#)

Client/server architecture

Traffic across a WAN typically consists of clients on a client network communicating across a WAN with a remote server network. The clients do this by starting communication sessions from the client network across a WAN to the server network. When you have FortiGates on each end, you can optimize these sessions by adding a WAN optimization profile.

To use WAN optimization, the FortiGate units can operate in either NAT or transparent mode. The client-side and server-side FortiGate units do not have to be operating in the same mode. The client-side FortiGate unit is located between the client network and the WAN. The server-side FortiGate unit is located between the server network and the WAN.

WAN optimization profiles are only added to the client-side. The server-side FortiGate unit employs the WAN optimization settings set in the WAN optimization profile on the client-side FortiGate unit.

Profiles

Use WAN optimization profiles to apply WAN optimization techniques to traffic to be optimized. In a WAN optimization profile you can select the protocols to be optimized and for HTTP protocol. You can also enable SSL offloading (if supported), secure tunneling, byte caching, transparent mode, and optionally select an authentication group. You can edit the default WAN optimization profile or create new ones. See [Configuration examples on page 3244](#) for sample configuration.

Transparent mode	Servers receiving packets after WAN optimization see different source addresses depending on whether or not you select <i>Transparent Mode</i> . See Transparent mode on page 3235 for more information.
Authentication group	Select this option and select an authentication group so that the client and server-

	side FortiGate units must authenticate with each other before starting the WAN optimization tunnel. See Peers and authentication groups on page 3232 for more information.
Protocol	Select CIFS, FTP, HTTP, MAPI or TCP to apply protocol optimization for the selected protocols. See Protocol optimization on page 3236 for more information.
SSL Offloading	<p>Select to apply SSL offloading for HTTPS traffic. You can use SSL offloading to offload SSL encryption and decryption from one or more HTTP servers to the FortiGate unit. If you enable this option, you must also use one of the following option to achieve SSL offloading:</p> <ul style="list-style-type: none"> • Enable ssl profile with <i>ssl deep-inspection</i> in the WAN optimization firewall policy on the client-side and use the CLI command <code>config firewall ssl-server</code> to add an SSL server on the server-side for each HTTP server that you want to offload SSL encryption and decryption for. • Enable ssl profile with <i>ssl deep-inspection</i> in the WAN optimization firewall policy on client-side and WAN optimization proxy policy on server-side to accept SSL encrypted traffic.
SSL Secure Tunneling	The WAN optimization tunnel is encrypted using SSL encryption. You must also add an authentication group to the profile. See Secure tunneling on page 3234 for more information.
Byte Caching	Select to apply WAN optimization byte caching to the sessions accepted by this rule. See Byte caching on page 3236 for more information.

Peers and authentication groups

The client-side and server-side FortiGate units are called WAN optimization peers. The client and server roles relate to how a session is started. Any FortiGate unit configured for WAN optimization can be a client-side and a server-side FortiGate unit at the same time, depending on the direction of the traffic. Client-side FortiGate units initiate WAN optimization sessions and server-side FortiGate units respond to the session requests.

During this process, the WAN optimization peers identify and optionally authenticate each other. The authentication group is optional unless the tunnel is a secure tunnel. You need to add authentication groups to support secure tunneling between WAN optimization peers.

Peer requirements

WAN optimization requires the following configuration on each peer:

- The peer must have a unique host ID.
- Unless authentication groups are used, peers authenticate each other using host ID values. Do not leave the local host ID at its default value.
- The peer must know the host IDs and IP addresses of all of the other peers that it can start WAN optimization tunnels with. This does not apply if you use authentication groups that accept all peers.
- If a FortiGate unit or VDOM is operating in transparent mode, WAN optimization uses the management IP address as the peer IP address of the FortiGate unit instead of the address of an interface.

- All peers must have the same local certificate installed on their FortiGate units if the units authenticate by local certificate. Furthermore, system time must be enabled to ensure that SSL/TLS certificate expiry can be validated. Similarly, if the units authenticate by pre-shared key (password), administrators must know the password. The type of authentication is selected in the authentication group. This applies only if you use authentication groups.

Tunnel requests for peer authentication

When a client-side FortiGate unit attempts to start a WAN optimization tunnel with a peer server-side FortiGate unit, the tunnel request includes the following information:

- The client-side host ID.
- The name of an authentication group, if included in the rule that initiates the tunnel.
- The authentication method it specifies (pre-shared key or certificate), if an authentication group is used.
- The type of tunnel (secure or not).

If the tunnel request does not include an authentication group, authentication will be based on the client-side host ID in the tunnel request.

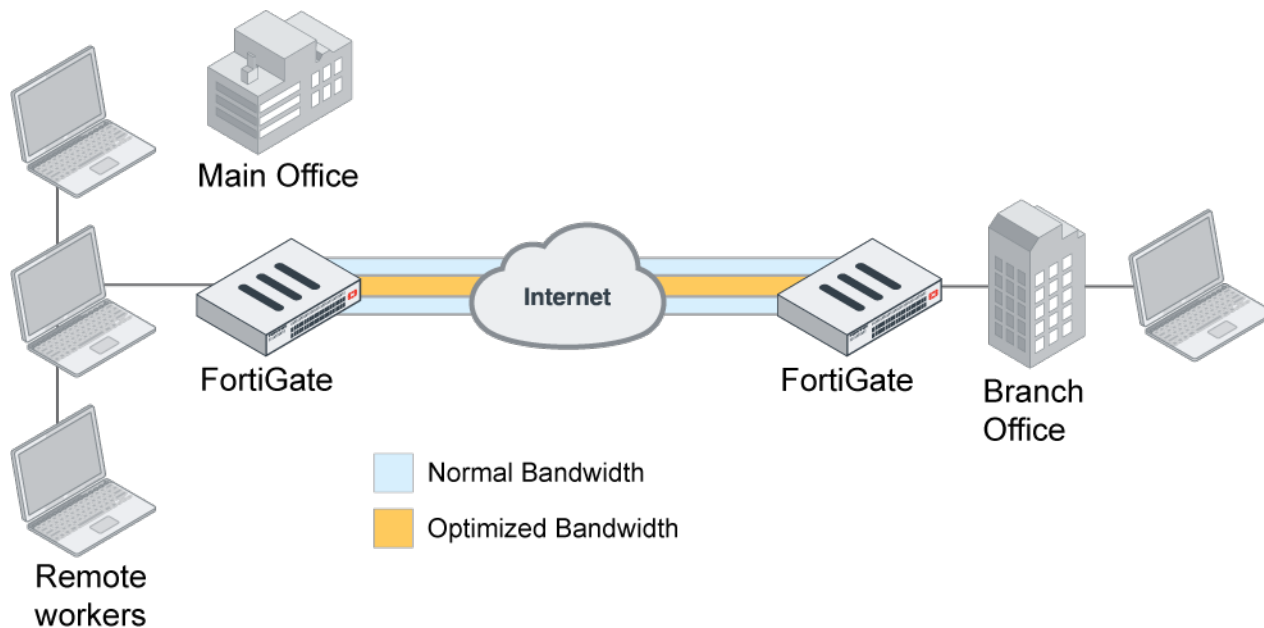

If the tunnel request includes an authentication group, the authentication will be based on the settings of this group as follows:

- The server-side FortiGate unit searches its own configuration for the name of the authentication group in the tunnel request. If no match is found, the authentication fails.
- If a match is found, the server-side FortiGate unit compares the authentication method in the client and server authentication groups. If the methods do not match, the authentication fails.
- If the authentication methods match, the server-side FortiGate unit tests the peer acceptance settings in its copy of the authentication group.
 - If the *Accept peer(s)* setting is *Any*, the authentication is successful.
 - If the *Accept peer(s)* setting is *One*, the server-side FortiGate unit compares the client-side host ID in the tunnel request with the peer name in the server-side authentication group. If the names match, authentication is successful. If a match is not found, authentication fails.
 - If the *Accept peer(s)* setting is *Defined Peers Only*, the server-side FortiGate unit compares the client-side host ID in the tunnel request with the server-side peer list. If a match is found, authentication is successful. If a match is not found, authentication fails.

After a tunnel is established, multiple WAN optimization sessions can start and stop between peers without restarting the tunnel.

Tunnels

All optimized traffic passes between the FortiGate units over a WAN optimization tunnel. Traffic in the tunnel can be sent in plain text or encrypted. Both plain text and the encrypted tunnels use TCP destination port 7810.

Secure tunneling

You can configure a WAN optimization profile to use SSL secure tunneling to encrypt the traffic in the WAN optimization tunnel using AES-128bit-CBC SSL. WAN optimization uses FortiASIC acceleration to accelerate SSL decryption and encryption of the secure tunnel. Secure tunneling can be enabled in both manual and active-passive WAN optimization configuration. See [Manual and active-passive on page 3238](#) for more information.

To use secure tunneling, you must add an authentication group and enable *SSL Secure Tunneling* in a WAN optimization profile. The *Accept peers(s)* setting of the authentication group does not affect secure tunneling. See [Secure tunneling configuration example on page 3255](#) for sample configuration.

Tunnel sharing

Tunnel sharing means multiple WAN optimization sessions share the same tunnel. It can improve performance by reducing the number of WAN optimization tunnels between FortiGate units. Having fewer tunnels means less data to manage. Also, tunnel setup requires more than one exchange of information between the ends of the tunnel. Once the tunnel is set up, each new session that shares the tunnel avoids tunnel setup delays.

Tunnel sharing also uses bandwidth more efficiently by reducing the chances that small packets will be sent down the tunnel. For example, suppose a FortiGate unit is processing five WAN optimization sessions and each session has 100 bytes to send. If these sessions use a shared tunnel, WAN optimization combines the packets from all five sessions into one 500-byte packet. If each session uses its own private tunnel, five 100-byte packets will be sent instead. Each packet also requires a TCP ACK reply. The combined packet in the shared tunnel requires one TCP ACK packet. The separate packets in the private tunnels require five.

Tunnel sharing is not always recommended and may not always be the best practice. For instance, aggressive and non-aggressive protocols should not share the same tunnel. An aggressive protocol can be defined as a protocol that is able to get more bandwidth than a non-aggressive protocol, for example, HTTP and FTP. If aggressive and non-aggressive protocols share the same tunnel, the aggressive protocols may take all of the available bandwidth. As a result, the performance of less aggressive protocols could be reduced.

To avoid this problem, rules for HTTP and FTP traffic should have their own tunnel. To do this, set `tunnel-sharing` to `private` for WAN optimization rules that accept HTTP or FTP traffic.

It is also useful to set `tunnel-sharing` to `express-shared` for applications, such as Telnet, that are very interactive but not aggressive.

Set `tunnel-sharing` to `shared` for applications that are not aggressive and are not sensitive to latency or delays.

Example configuration

To configure tunnel sharing for HTTP traffic in a WAN optimization profile:

```
config wanopt profile
  edit default
    config http
      set tunnel-sharing {express-shared | private | shared}
    end
  next
end
```

Transparent mode

WAN optimization is transparent to users. This means that with WAN optimization in place, clients connect to servers in the same way as they would without WAN optimization. However, servers receiving packets after WAN optimization see different source addresses depending on whether or not transparent mode is selected for WAN optimization. If transparent mode is selected, WAN optimization keeps the original source address of the packets, so servers appear to receive traffic directly from clients. Routing on the server network should be configured to route the traffic back to the client network.

Some protocols, for example CIFS, may not function as expected if transparent mode is not selected. In most cases, for CIFS WAN optimization you should select transparent mode and confirm the server network can route traffic as described to support transparent mode.

If transparent mode is not selected, the source address of the packets received by servers is changed to the address of the server-side FortiGate unit interface that sends the packets to the servers. So servers appear to receive packets from the server-side FortiGate unit. Routing on the server network is simpler in this case because client addresses are not involved. All traffic appears to come from the server-side FortiGate unit and not from individual clients.

Do not confuse WAN optimization transparent mode with FortiGate transparent mode. WAN optimization transparent mode is similar to source NAT. FortiGate's transparent mode is a system setting that controls how the FortiGate unit (or a VDOM) processes traffic.

Configuring transparent mode

You can configure transparent mode by selecting *Transparent* in a WAN optimization profile. The profile is added to an active WAN optimization policy.

When you configure a passive WAN optimization policy you can accept or override the active policy transparent setting. From the GUI you can do this by setting the *Passive* option as follows:

- *Default*: Use the transparent setting in the WAN optimization profile added to the active policy (client-side configuration).
- *Transparent*: Override the active policy transparent mode setting and impose transparent mode. Packets exiting the FortiGate keep their original source addresses.
- *Non-transparent*: Override the active policy transparent mode setting and impose non-transparent mode. Packets exiting the FortiGate have their source address changed to the address of the server-side FortiGate unit interface that sends the packets to the servers.

To configure a passive wan optimization policy in the CLI:

```
config firewall policy
  edit <policy ID>
    set srcintf <Incoming interface>
    set wanopt-passive-opt {default | transparent | non-transparent}
  next
end
```

Protocol optimization

Protocol optimization techniques optimize bandwidth use across the WAN. These techniques can improve the efficiency of communication across the WAN optimization tunnel by reducing the amount of traffic required by communication protocols. You can apply protocol optimization to CIFS, FTP, HTTP, MAPI, and general TCP sessions. You can apply general TCP optimization to MAPI sessions.

For example, CIFS provides file access, record locking, read/write privileges, change notification, server name resolution, request batching, and server authentication. CIFS requires many background transactions to successfully transfer a single file. This is usually not a problem across a LAN. However, across a WAN, latency and bandwidth reduction can slow down CIFS performance.

When you select the CIFS protocol in a WAN optimization profile, the FortiGate units at both ends of the WAN optimization tunnel use a number of techniques to reduce the number of background transactions that occur over the WAN for CIFS traffic.

If a policy accepts a range of different types of traffic, you can set *Protocol* to *TCP* to apply general optimization techniques to TCP traffic. However, applying this TCP optimization is not as effective as applying more protocol-specific optimization to specific types of traffic. TCP protocol optimization uses techniques such as TCP SACK support, TCP window scaling and window size adjustment, and TCP connection pooling to remove TCP bottlenecks.

Byte caching

Byte caching breaks large units of application data (for example, a file being downloaded from a web page) into small chunks of data, labeling each chunk of data with a hash of the chunk and storing those chunks and their hashes in a database. The database is stored on a WAN optimization storage device. Then, instead of sending the actual data over the WAN tunnel, the FortiGate unit sends the hashes. The FortiGate unit at the other end of the tunnel receives the hashes and compares them with the hashes in its local byte caching database. If any hashes match, that data does not have to be transmitted over the WAN optimization tunnel. The data for any hashes that does not match is transferred over the tunnel and added to that byte caching database. Then the unit of application data (the file being downloaded) is reassembled and sent to its destination.

The stored byte caches are not application specific. Byte caches from a file in an email can be used to optimize downloading that same file or a similar file from a web page.

The result is less data transmitted over the WAN. Initially, byte caching may reduce performance until a large enough byte caching database is built up.

To enable byte caching, select *Byte Caching* in a WAN optimization profile.

Byte caching cannot determine whether or not a file is compressed (for example a zip file), and caches compressed and non-compressed versions of the same file separately.

Dynamic data chunking for byte caching

Dynamic data chunking can improve byte caching by improving detection of data chunks that are already cached in changed files or in data embedded in traffic using an unknown protocol. Dynamic data chunking can only be enabled from the CLI and is available for HTTP, CIFS and FTP.

Dynamic data chunking is disabled by default and `prefer-chunking` is set to `fix`.

To enable dynamic data chunking for HTTP in the default WAN optimization profile:

```
config wanopt profile
  edit default
    config http
      set prefer-chunking dynamic
    end
  next
end
```

Cache service and video caching

Two features that can only be configured in the CLI include cache service and video caching.

Cache service

The `config wanopt cache-service` command is used to configure cache-service clusters between multiple FortiGates. The result is that the cache-service daemons of the different FortiGates can collaborate for serving web cache entries.

See [config wanopt cache-service](#) in the CLI Reference guide for more configuration information.

Video caching

The `config wanopt content-delivery-network-rule` command configures web-caching, including the video-cache matching rules.

See [config wanopt content-delivery-network-rule](#) in the CLI Reference guide for more configuration information.

Manual and active-passive

You can create manual (peer-to-peer) and active-passive WAN optimization configurations.

There are a few key differences between manual and active-passive mode:

- For manual mode, the tunnels are always up which makes it more resource extensive as compared to active-passive.
- The performance of active-passive mode is lower than manual mode for the new connection.
- The active-passive mode can be used to deploy tunnel dynamically using *Authentication groups* set to accept *Any* peers which eliminates the need of defining peers manually. This is not possible with manual mode.

This setting is only recommended when you do not know the peer host IDs or IP addresses of the peers that will use this authentication group. This setting is most often used with FortiGate units that do not have static IP addresses, for example units that use DHCP.

-
- For manual mode, traffic shaping cannot be applied to traffic on the server-side. See [Traffic shaping on page 3241](#) for more information.

Manual (peer to peer) configurations

Manual configurations allow for WAN optimization between one client-side FortiGate unit and one server-side FortiGate unit. Manual WAN optimization requires a manual WAN optimization firewall policy on the client-side FortiGate unit and a WAN optimization proxy policy on the server-side FortiGate unit.

In a manual mode configuration, the client-side peer can only connect to the named server side peer. When the client-side peer initiates a tunnel with the server-side peer, the packets that initiate the tunnel include extra information so that the server-side peer can determine that it is a peer-to-peer tunnel request. This extra information is required because the server-side peer does not require a WAN optimization firewall policy; however, you need to add the client peer host ID and IP address to the server-side FortiGate unit peer list. See [Manual \(peer-to-peer\) WAN optimization configuration example on page 3245](#) for a sample configuration.

Active-passive configurations

Active-passive WAN optimization requires an active WAN optimization firewall policy on the client-side FortiGate unit and a passive WAN optimization firewall policy on the server-side FortiGate unit. The server-side FortiGate unit also requires a WAN optimization proxy policy.

You can use the passive policy to control WAN optimization address translation by specifying transparent mode or non-transparent mode. You can also use the passive policy to apply security profiles, web caching, and other FortiGate features at the server-side FortiGate unit. For example, if a server-side FortiGate unit is protecting a web server, the passive policy could enable web caching.

A single passive policy can accept tunnel requests from multiple FortiGate units as long as the server-side FortiGate unit includes their peer IDs and all of the client-side FortiGate units include the server-side peer ID. See [Active-passive WAN optimization configuration example on page 3250](#) for a sample configuration.

The WAN optimization proxy policy can only be added from the CLI and policies with `proxy` set to `wanopt` do not appear on the GUI.

Monitoring performance

Using *WAN Opt. & Cache* widgets, you can confirm that a FortiGate unit is optimizing traffic and view estimates of the amount of bandwidth saved. These include peers manually added to the configuration as well as discovered peers.

To add *WAN Opt. & Cache* widgets go to *Dashboard > Status > Add Widget > WAN Opt. & Cache* and add *WAN Opt. Monitor* and *Peer Monitor*.

Wan Opt. Monitor

The *Wan Opt. Monitor* shows how WAN optimization is reducing the amount of traffic on the WAN for each WAN optimization protocol by showing the amount of WAN and LAN traffic. If WAN optimization is being effective, the amount of WAN traffic should be lower than the amount of LAN traffic.

Peer Monitor

The *Peer Monitor* lists all of the WAN optimization peers that a FortiGate unit can perform WAN optimization with.

Peer Monitor ↻ ⋮ ▾

Peer Host ID ▾	Peer IP Address ▾	Peer Type ▾

System and feature operation with WAN optimization

This section contains the following information:

- [HA on page 3240](#)
- [Memory usage on page 3240](#)
- [Distributing WAN optimization processing on page 3240](#)
- [Distributing WAN optimization to multiple CPU cores on page 3241](#)
- [Identity policies and load balancing on page 3241](#)
- [Traffic shaping on page 3241](#)

HA

You can configure WAN optimization on a FortiGate HA cluster. The recommended best practice HA configuration for WAN optimization is active-passive mode. When the cluster is operating, all WAN optimization sessions are processed by the primary unit only. Even if the cluster is operating in active-active mode, HA does not load-balance WAN optimization sessions.

You can also form a WAN optimization tunnel between a cluster and a standalone FortiGate unit or between two clusters.

In a cluster, only the primary unit stores the byte cache database. This database is not synchronized to the subordinate units. So, after a failover, the new primary unit must rebuild its byte cache. Rebuilding the byte cache can happen relatively quickly because the new primary unit gets byte cache data from the other FortiGate unit that it is participating with in WAN optimization tunnels.

Memory usage

To accelerate and optimize disk access and to provide better throughput and less latency, FortiOS WAN optimization uses provisioned memory to reduce disk I/O and increase disk I/O efficiency. In addition, WAN optimization requires a small amount of additional memory per session for comprehensive flow control logic and efficient traffic forwarding.

When WAN optimization is enabled you will see a reduction in available memory. The reduction increases when more WAN optimization sessions are being processed. If you are thinking of enabling WAN optimization on an operating FortiGate unit, make sure its memory usage is not maxed out during high traffic periods.

In addition to using the system dashboard to see the current memory usage you can use the `get test wad 2` command to see how much memory is currently being used by WAN optimization.

Distributing WAN optimization processing

The `wad-worker` balancing algorithm supports a more balanced dispersal of traffic to the wad processes even if the bulk of the traffic is coming from a small set of sources or single source.

By default, dispatching traffic to WAD workers is based on source affinity. This may negatively affect performance when users have another explicit proxy in front of the FortiGate. Source affinity causes the FortiGate to process the traffic as if it originated from the single (or small set of) IP address of the outside proxy. This results in the use of one, or a small number, of WAD processes.

By disabling `wad-source-affinity` the traffic is balanced over all of the WAD processes. The WAD dispatcher will not assign the traffic based on the source IP address, but will assign the traffic to available workers in a round-robin fashion.

To configure WAD source affinity:

```
config system global
    set wad-source-affinity {enable | disable}
end
```

Handling the traffic by different WAD workers results in losing cached related benefits of using source affinity, as there is the memory cache on the current wad worker and if a new connection is handled by another worker, the cache will not be hit.

This is explained by the warning message that appears when it is disabled:

```
WARNING: Disabling this option results in some features to be
unsupported. IP-based user authentication, disclaimer messages, security
profile override, authentication cookies, MAPI scanning, and some video
caches such as YouTube are not supported.
```

```
Do you want to continue? (y/n)
```

Distributing WAN optimization to multiple CPU cores

By default WAN optimization is handled by half of the CPU cores in a FortiGate unit. For example, if your FortiGate unit has 4 CPU cores, by default two will be used for WAN optimization. You can use the following command to change the number of CPU cores that are used.

```
config system global
    set wad-worker-count <number>
end
```

The `wad-worker-count` can be between 1 and the total number of CPU cores in your FortiGate unit. Adding more cores may enhance WAN optimization but reduce the performance of other FortiGate systems.

Identity policies and load balancing

WAN optimization and firewall policies compatibility varies depending on the type of policy:

- WAN optimization is not compatible with firewall load balancing.
- WAN optimization is compatible with source and destination NAT options in firewall policies (including firewall virtual IPs). If a virtual IP is added to a policy, the traffic that exits the WAN optimization tunnel has its destination address changed to the virtual IPs mapped to IP address and port.
- WAN optimization is compatible with user identity-based and device identity security policies. If a session is allowed after authentication or device identification the session can be optimized.

Traffic shaping

Traffic shaping works for WAN optimization traffic that is not in a WAN optimization tunnel. So traffic accepted by a WAN optimization policy on a client-side FortiGate unit can be shaped on ingress. However, when the traffic enters the WAN optimization tunnel, traffic shaping is not applied.

In manual mode:

- Traffic shaping works as expected on the client-side FortiGate unit.
- Traffic shaping cannot be applied to traffic on the server-side FortiGate unit.

In active-passive mode:

- Traffic shaping works as expected on the client-side FortiGate unit.
- If transparent mode is enabled in the WAN optimization profile, traffic shaping also works as expected on the server-side FortiGate unit.
- If transparent mode is not enabled, traffic shaping works partially on the server-side FortiGate unit.

Best practices

WAN optimization and explicit proxy best practices include:

- WAN optimization tunnel sharing is recommended for similar types of WAN optimization traffic. However, tunnel sharing for different types of traffic is not recommended. For example, aggressive and non-aggressive protocols should not share the same tunnel.
- Active-passive HA is the recommended HA configuration for WAN optimization.
- Configure WAN optimization authentication with specific peers. Accepting any peer is not recommended as this can be less secure.

Example topologies

All FortiGate WAN optimization topologies consist of two FortiGate units operating as WAN optimization peers intercepting and optimizing traffic crossing the WAN between the private networks.

The following topics cover a few of the example topologies:

- [In-path WAN optimization topology on page 3242](#)
- [Out-of-path WAN optimization topology on page 3243](#)
- [Topology for multiple networks on page 3243](#)

In-path WAN optimization topology

FortiGate units can be deployed as typical security devices that protect private networks connected to the WAN and also perform WAN optimization. The WAN optimization configuration intercepts traffic to be optimized as it passes through the FortiGate unit and uses a WAN optimization tunnel with another FortiGate unit to optimize the traffic that crosses the WAN.

You can add web caching to any WAN optimization topology when users on a private network communicate with web servers located across the WAN on another private network.

Out-of-path WAN optimization topology

In an out-of-path topology, one or both of the FortiGate units configured for WAN optimization are not directly in the main data path. Instead, the out-of-path FortiGate unit is connected to FortiGate units in the data path, and the device is configured to redirect sessions to be optimized to the out-of-path FortiGate unit. The FortiGate units in the data path use a method such as policy routing to redirect traffic to be optimized to the out-of-path FortiGate units. The out-of-path FortiGate units establish a WAN optimization tunnel between each other and optimize the redirected traffic.

One of the benefits of out-of-path WAN optimization is that out-of-path FortiGate units only perform WAN optimization and do not have to process other traffic. An in-path FortiGate unit configured for WAN optimization also has to process other non-optimized traffic on the data path.

Topology for multiple networks

As shown below, you can create multiple WAN optimization configurations between many private networks. Whenever WAN optimization occurs, it is always between two FortiGate units, but you can configure any FortiGate unit to perform WAN optimization with any of the other FortiGate units that are part of your WAN.

You can also configure WAN optimization between FortiGate units with different roles on the WAN. FortiGate units configured as security devices and for WAN optimization can perform WAN optimization as if they are single-purpose FortiGate units just configured for WAN optimization. The WAN optimization configuration is the same for FortiGate units deployed as security devices and for single-purpose WAN optimization FortiGate units. The only differences would result from the different network topologies.

Configuration examples

The following pages are used in the WAN optimization configuration examples demonstrated in the subsequent sections:

- **WAN Opt. & Cache > Profiles:** Configure the default WAN optimization profile to optimize HTTP traffic on client side.

+ Create New Edit Clone Delete <input type="text" value="Search"/>					
Name	Protocol/Port	Transparent	Authentication Group	Comments	Ref.
default	HTTP	Enabled		Default WANopt profile.	1

- **WAN Opt. & Cache > Peers:** Change the *Host ID* and add *Peer Host ID* and *IP address* on both client and server side.

A WAN optimization firewall policy is a firewall policy running in *Proxy-based* inspection mode with *WAN Optimization* enabled. A WAN optimization firewall policy cannot be configured with inspection mode set to *Flow-based*.

The following topics provide instructions on different WAN optimization configuration examples:

- [Manual \(peer-to-peer\) WAN optimization configuration example on page 3245](#)
- [Active-passive WAN optimization configuration example on page 3250](#)
- [Secure tunneling configuration example on page 3255](#)
- [Testing and troubleshooting the configuration on page 3260](#)

Manual (peer-to-peer) WAN optimization configuration example

Please ensure that the [Prerequisites on page 3229](#) are met before proceeding with the configuration example.

FortiOS 7.4.1 Administration Guide
Fortinet Inc.

3245

See [Manual \(peer to peer\) configurations on page 3238](#) for conceptual information.

This example configuration includes a client-side FortiGate unit called Client-Fgt with a WAN IP address of 172.20.34.12. This unit is in front of a network with IP address 172.20.120.0. The server-side FortiGate unit is called Server-Fgt with a WAN IP address of 192.168.30.12. This unit is in front of a web server network with IP address 192.168.10.0.

This example customizes the default WAN optimization profile on the client-side FortiGate unit and adds it to the WAN optimization firewall policy. You can also create a new WAN optimization profile.

General configuration steps

This section breaks down the configuration for this example into smaller procedures:

1. Configure the client-side FortiGate unit:
 - Add peers.
 - Configure the default WAN optimization profile to optimize HTTP traffic.
 - Add a manual WAN optimization firewall policy.
2. Configure the server-side FortiGate unit:
 - Add peers.
 - Add a WAN optimization proxy policy.

Configuring manual WAN optimization from the GUI

Use the following steps to configure the example configuration from the GUI:

To configure the client-side FortiGate unit:

1. Go to *WAN Opt. & Cache > Peers* and change the *Host ID* of the client-side FortiGate unit:
 - a. Click *Change*. The *Host ID* pane opens.
 - b. Enter a new *Host ID*:

Host ID	Client-Fgt
----------------	------------

- c. Click OK.
2. Create the server-side FortiGate unit peer:
 - a. Select *Create New*. The *New WAN Optimization Peer* opens.
 - b. Configure the following settings:

Peer Host ID	Server-Fgt
IP address	192.168.30.12

- c. Click OK.
3. Go to *WAN Opt. & Cache > Profiles* and edit the default profile:
 - a. Select the default profile and click *Edit*.
 - b. Under *Protocol Options*, edit *HTTP*.
 - c. Set *Status* to *Enable* and click *Apply*.
 - d. Click OK.
4. Go to *Policy & Objects > Firewall Policy* to add a manual WAN optimization firewall policy to the client-side FortiGate unit that accepts traffic to be optimized:
 - a. Click *Create New*.
 - b. Enter a *Name* and configure the following settings:

Incoming Interface	port2
Outgoing Interface	port3
Source	all
Destination	all
Schedule	always
Service	ALL
Action	ACCEPT

- c. Set *Inspection Mode* to *Proxy-based*.
- d. Enable *WAN Optimization* and configure the following settings:

WAN Optimization	Manual
Profiles	default
Peers	Server-Fgt

- e. Click OK to save the policy.

To configure the server-side FortiGate unit:

1. Go to *WAN Opt. & Cache > Peers* and change the *Host ID* of the server-side FortiGate unit:
 - a. Click *Change*. The *Host ID* pane opens.
 - b. Enter a new *Host ID*:

Host ID	Server-Fgt
---------	------------

c. Click OK.

2. Create the client-side FortiGate unit peer:

- a. Select *Create New*. The *New WAN Optimization Peer* opens.
- b. Configure the following settings:

Peer Host ID	Client-Fgt
IP address	172.20.34.12

c. Click OK.

3. Enter the following CLI command to add a WAN optimization proxy policy to accept WAN optimization tunnel connections:

```
config firewall proxy-policy
  edit 0
    set proxy wanopt
    set dstintf port5
    set srcaddr all
    set dstaddr all
    set action accept
    set schedule always
    set service ALL
  next
end
```

Configuring basic WAN optimization from the CLI

Use the following steps to configure the example configuration from the CLI.

To configure the client-side FortiGate unit:

1. Change the Host ID of the client-side FortiGate:

```
config wanopt settings
  set host-id Client-Fgt
end
```

2. Add the Host ID of the server-side FortiGate:

```
config wanopt peer
  edit Server-Fgt
    set ip 192.168.30.12
  next
end
```

3. Edit the *default* WAN optimization profile and enable HTTP WAN optimization:

```
config wanopt profile
  edit default
    config http
      set status enable
    end
```

```
    next
end
```

4. Add a WAN optimization firewall policy to accept the traffic to be optimized:

```
config firewall policy
  edit 0
    set srcintf port2
    set dstintf port3
    set srcaddr all
    set dstaddr all
    set action accept
    set service ALL
    set schedule always
    set inspection-mode proxy
    set wanopt enable
    set wanopt-profile default
    set wanopt-detection off
    set wanopt-peer Server-Fgt
  next
end
```

When you set the detection mode to off, the policy becomes a manual mode WAN optimization firewall, which is reflected on the GUI.

To configure the server-side FortiGate unit:

1. Change the Host ID of the server-side FortiGate:

```
config wanopt settings
  set host-id Server-Fgt
end
```

2. Add the Host ID of the client-side FortiGate:

```
config wanopt peer
  edit Client-Fgt
    set ip 172.20.34.12
  next
end
```

3. Add a WAN optimization proxy policy:

```
config firewall proxy-policy
  edit 0
    set proxy wanopt
    set dstintf port5
    set srcaddr all
    set dstaddr all
    set action accept
    set schedule always
    set service ALL
  next
end
```

Active-passive WAN optimization configuration example

Please ensure that the [Prerequisites on page 3229](#) are met before proceeding with the configuration example.

See [Active-passive configurations on page 3238](#) for conceptual information.

This example configuration includes a client-side FortiGate unit called Client-Fgt with a WAN IP address of 172.30.120.1. This unit is in front of a network with IP address 172.20.120.0. The server-side FortiGate unit is called Server-Fgt and has a WAN IP address of 192.168.20.1. This unit is in front of a web server network with IP address 192.168.10.0.

General configuration steps

This section breaks down the configuration for this example into smaller procedures:

1. Configure the client-side FortiGate unit:
 - Add peers.
 - Add a WAN optimization profile to optimize CIFS, FTP, and HTTP traffic.
 - Add an active WAN optimization firewall policy.
2. Configure the server-side FortiGate unit:
 - Add peers.
 - Add a passive WAN optimization firewall policy.
 - Add a WAN optimization proxy policy.

Configuring active-passive WAN optimization from the GUI

Use the following steps to configure the example configuration from the GUI.

To configure the client-side FortiGate unit:

1. Go to *WAN Opt. & Cache > Peers* and change the *Host ID* of the client-side FortiGate unit:
 - a. Click *Change*. The *Host ID* pane opens.
 - b. Enter a new *Host ID*:

Host ID	Client-Fgt
----------------	------------

- c. Click *OK*.
2. Create the server-side FortiGate unit peer:
 - a. Select *Create New*. The *New WAN Optimization Peer* opens.
 - b. Configure the following settings:

Peer Host ID	Server-Fgt
IP address	192.168.20.1

- c. Click *OK*.
3. Go to *WAN Opt & Cache > Profiles* to add a WAN optimization profile to optimize CIFS, HTTP, and FTP traffic:
 - a. Select *Create New*.
 - b. Enter the profile name:

Name	Custom-wan-opt-pro
-------------	--------------------

- c. In the *Protocol Options* section:
 - i. Edit *CIFS*.
 - ii. Set *Status* to *Enable*.
 - iii. Click *Apply*.
 - iv. Repeat these steps to edit and enable *FTP* and *HTTP*.
 - d. Click *OK*.
4. Go to *Policy & Objects > Firewall Policy* to add an active WAN optimization firewall policy:
 - a. Click *Create New*.
 - b. Enter a *Name* and configure the following settings:

Incoming Interface	port2
Outgoing Interface	port3
Source	all
Destination	all
Schedule	always
Service	HTTP FTP SMB
Action	ACCEPT

- c. Set *Inspection Mode* to *Proxy-based*.

- d. Enable WAN optimization and configure the following settings:

WAN Optimization	Active
Profile	Custom-wan-opt-pro

- e. Click *OK*.

To configure the server-side FortiGate unit:

1. Go to *WAN Opt. & Cache > Peers* and change the *Host ID* of the server-side FortiGate unit:

- a. Click *Change*. The *Host ID* pane opens.
b. Enter a new *Host ID*:

Host ID	Server-Fgt
----------------	------------

- c. Click *OK*.

2. Create the client-side FortiGate unit peer:

- a. Select *Create New*. The *New WAN Optimization Peer* opens.
b. Configure the following settings:

Peer Host ID	Client-Fgt
IP address	172.30.120.1

- c. Click *OK*.

3. Go to *Policy & Objects > Firewall Policy* to add a passive WAN optimization firewall policy:

- a. Click *Create New*.
b. Enter a *Name* and configure the following settings:

Incoming Interface	port4
Outgoing Interface	port5
Source	all
Destination	all
Schedule	always
Service	ALL
Action	ACCEPT

- c. Set *Inspection Mode* to *Proxy-based*.
d. Enable *WAN Optimization* and configure the following settings:

WAN Optimization	Passive
Passive Option	Default

- e. Click *OK*.

4. Add a WAN optimization proxy policy from the CLI:

```
config firewall proxy-policy
  edit 0
    set proxy wanopt
    set dstintf port5
    set srcaddr all
    set dstaddr all
    set action accept
    set schedule always
    set service ALL
  next
end
```

Configuring basic active-passive WAN optimization from the CLI

Use the following steps to configure the example configuration from the CLI.

To configure the client-side FortiGate unit:

1. Change the Host ID of the client-side FortiGate:

```
config wanopt settings
  set host-id Client-Fgt
end
```

2. Add the Host ID of the server-side FortiGate:

```
config wanopt peer
  edit Server-Fgt
    set ip 192.168.20.1
  next
end
```

3. Add a WAN optimization profile to optimize CIFS, HTTP, and FTP traffic:

```
config wanopt profile
  edit Custom-wan-opt-pro
    config cifs
      set status enable
    end
    config http
      set status enable
    end
    config ftp
      set status enable
    end
  next
end
```

4. Add an active WAN optimization firewall policy:

```
config firewall policy
  edit 0
    set srcintf port2
    set dstintf port3
    set srcaddr all
    set dstaddr all
    set action accept
```

```
        set service HTTP FTP SMB
        set schedule always
        set inspection-mode proxy
        set wanopt enable
        set wanopt-detection active
        set wanopt-profile Custom-wan-opt-pro
    next
end
```

To configure the server-side FortiGate unit:**1. Change the Host ID of the server-side FortiGate:**

```
config wanopt settings
    set host-id Server-Fgt
end
```

2. Add the Host ID of the client-side FortiGate:

```
config wanopt peer
    edit Client-Fgt
        set ip 172.30.120.1
    next
end
```

3. Add a passive WAN optimization firewall policy:

```
config firewall policy
    edit 0
        set srcintf port4
        set dstintf port5
        set srcaddr all
        set dstaddr all
        set action accept
        set service ALL
        set schedule always
        set inspection-mode proxy
        set wanopt enable
        set wanopt-detection passive
        set wanopt-passive-opt default
    next
end
```

4. Add a WAN optimization proxy policy:

```
config firewall proxy-policy
    edit 0
        set proxy wanopt
        set dstintf port5
        set srcaddr all
        set dstaddr all
        set action accept
        set schedule always
        set service ALL
    next
end
```

Secure tunneling configuration example

Please ensure that the [Prerequisites on page 3229](#) are met before proceeding with the configuration example.

See [Secure tunneling on page 3234](#) for conceptual information.

This example configuration includes a client-side FortiGate unit called Client-Fgt with a WAN IP address of 172.30.120.1. This unit is in front of a network with IP address 172.20.120.0. The server-side FortiGate unit is called Server-Fgt and has a WAN IP address of 192.168.20.1. This unit is in front of a web server network with IP address 192.168.10.0.

General configuration steps

This section breaks down the configuration for this example into smaller procedures:

1. Configure the client-side FortiGate unit:
 - Add peers.
 - Add an authentication group.
 - Add an active WAN optimization firewall policy.
2. Configure the server-side FortiGate unit:
 - Add peers.
 - Add the same authentication group.
 - Add a passive WAN optimization firewall policy.
 - Add a WAN optimization proxy policy.

Configuring WAN optimization with secure tunneling from the GUI

Use the following steps to configure the example configuration from the GUI.

To configure the client-side FortiGate unit:

1. Go to *WAN Opt. & Cache > Peers* and change the *Host ID* of the client-side FortiGate unit:
 - a. Click *Change*. The *Host ID* pane opens.
 - b. Enter a new *Host ID*:

Host ID	Client-Fgt
----------------	------------

- c. Click *OK*.
2. Create the server-side FortiGate unit peer:
 - a. Select *Create New*. The *New WAN Optimization Peer* opens.
 - b. Configure the following settings:

Peer Host ID	Server-Fgt
IP address	192.168.20.1

- c. Click *OK*.
3. Go to *WAN Opt. & Cache > Authentication Groups* to add the authentication group to be used for secure tunneling:
 - a. Click *Create New* and configure the following settings:

Name	Auth-Secure-Tunnel
Authentication Method	Pre-shared key
Pre-shared key	*****
Accept peer(s)	Defined Peers Only

- b. Click *OK*.
4. Go to *WAN Opt. & Cache > Profiles* to add a WAN optimization profile that enables secure tunneling and includes the authentication group:
 - a. Click *Create New*.
 - b. Enter a *Name*:

Name	Secure-wan-opt-pro
-------------	--------------------

- c. Enable *Authentication group*:

Authentication group	Auth-Secure-Tunnel
-----------------------------	--------------------

- d. In the *Protocol Options* section, edit *HTTP*:
 - i. Set *Status* to *Enable*.
 - ii. Click *Apply*.
 - iii. Set *SSL Secure Tunneling* to *Enable*.
 - iv. Click *Apply*.
 - e. Click *OK*.
5. Go to *Policy & Objects > Firewall Policy* to add an active WAN optimization firewall policy:
 - a. Click *Create New*.
 - b. Enter a *Name* and configure the following settings:

Incoming Interface	port2
Outgoing Interface	port3
Source	all
Destination	all
Schedule	always
Service	HTTP
Action	ACCEPT

- c. Set *Inspection Mode* to *Proxy-based*.
- d. Enable *WAN Optimization* and configure the following settings:

WAN Optimization	Active
Profile	Secure-wan-opt-pro

- e. Click *OK*.

To configure the server-side FortiGate unit:

1. Go to *WAN Opt. & Cache > Peers* and change the *Host ID* of the server-side FortiGate unit:
 - a. Click *Change*. The *Host ID* pane opens.
 - b. Enter a new *Host ID*:

Host ID	Server-Fgt
----------------	------------

- c. Click *OK*.
2. Create the client-side FortiGate unit peer:
 - a. Select *Create New*. The *New WAN Optimization Peer* opens.
 - b. Configure the following settings:

Peer Host ID	Client-Fgt
IP address	172.30.120.1

- c. Click *OK*.
3. Go to *WAN Opt. & Cache > Authentication Groups* to add the authentication group to be used for secure tunneling:
 - a. Click *Create New* and configure the following settings:

Name	Auth-Secure-Tunnel
Authentication Method	Pre-shared key
Pre-shared key	*****
Accept peer(s)	Defined Peers Only

- b. Click *OK*.
4. Go to *Policy & Objects > Firewall Policy* to add an passive WAN optimization firewall policy:

- a. Click *Create New*.
- b. Enter a *Name* and configure the following settings:

Incoming Interface	port4
Outgoing Interface	port5
Source	all
Destination	all
Schedule	always
Service	ALL
Action	ACCEPT

- c. Set *Inspection Mode* to *Proxy-based*.
- d. Enable *WAN Optimization* and configure the following settings:

WAN Optimization	Passive
Passive Option	Default

- e. Click *OK*.

5. Add a WAN optimization proxy policy from the CLI:

```
config firewall proxy-policy
  edit 0
    set proxy wanopt
    set dstintf port5
    set srcaddr all
    set dstaddr all
    set action accept
    set schedule always
    set service ALL
  next
end
```

Configuring WAN optimization with secure tunneling from the CLI

Use the following steps to configure the example configuration from the CLI.

To configure the client-side FortiGate unit:

1. Change the Host ID of the client-side FortiGate:

```
config wanopt settings
  set host-id Client-Fgt
end
```

2. Add the Host ID of the server-side FortiGate:

```
config wanopt peer
  edit Server-Fgt
    set ip 192.168.20.1
```

```
    next
end
```

3. Add a new authentication group to be used for secure tunneling:

```
config wanopt auth-group
    edit Auth-Secure-Tunnel
        set auth-method psk
        set peer-accept defined
        set psk *****
    next
end
```

4. Add a WAN optimization profile that enabled secure tunneling and includes the authentication group, enables HTTP protocol optimization, and enables secure tunneling for HTTP traffic:

```
config wanopt profile
    edit Secure-wan-opt-pro
        set auth-group Auth-Secure-Tunnel
        config http
            set status enable
            set secure-tunnel enable
        end
    next
end
```

5. Add an active WAN optimization firewall policy that enables secure tunneling:

```
config firewall policy
    edit 0
        set srcintf port2
        set dstintf port3
        set srcaddr all
        set dstaddr all
        set action accept
        set service HTTP
        set schedule always
        set inspection-mode proxy
        set wanopt enable
        set wanopt-detection active
        set wanopt-profile Secure-wan-opt-pro
    next
end
```

To configure the server-side FortiGate unit:

1. Change the Host ID of the server-side FortiGate:

```
config wanopt settings
    set host-id Server-Fgt
end
```

2. Add the Host ID of the client-side FortiGate:

```
config wanopt peer
    edit Client-Fgt
        set ip 172.30.120.1
    next
end
```

3. Add an authentication group to be used for secure tunneling:

```
config wanopt auth-group
    edit Auth-Secure-Tunnel
        set auth-method psk
        set peer-accept defined
        set psk *****
    next
end
```

4. Add a passive WAN optimization firewall policy:

```
config firewall policy
    edit 0
        set srcintf port4
        set dstintf port5
        set srcaddr all
        set dstaddr all
        set action accept
        set service ALL
        set schedule always
        set inspection-mode proxy
        set wanopt enable
        set wanopt-detection passive
        set wanopt-passive-opt default
    next
end
```

5. Add a WAN optimization proxy policy:

```
config firewall proxy-policy
    edit 0
        set proxy wanopt
        set dstintf port5
        set srcaddr all
        set dstaddr all
        set action accept
        set schedule always
        set service ALL
    next
end
```

Testing and troubleshooting the configuration

To test the configuration attempt, start a web browsing session between the client network and the web server network. For example, from a PC on the client network browse to the IP address of a web server on the web server network, for example <http://192.168.10.13>. Even though this address is not on the client network, you should be able to connect to this web server over the WAN optimization tunnel.

If you can connect, the *WAN Opt. Monitor* widget should show the protocol that has been optimized (in this case HTTP) and the *Peer Monitor* widget displays the *Peer* information. To add the *WAN Opt. Monitor* and the *Peer Monitor*, go to *Dashboard > Status > Add Widget > WAN Opt. & Cache* and add *WAN Opt. Monitor* and *Peer Monitor*. See [Monitoring performance on page 3239](#) for more information.

If you cannot connect, try the following to diagnose the problem:

- Review your configuration and make sure all details such as address ranges, peer names, and IP addresses are correct.
- Check routing on the FortiGate units and on the client and web server networks to make sure packets can be forwarded as required. The FortiGate units must be able to communicate with each other, routing on the client network must allow packets destined for the web server network to be received by the client-side FortiGate unit, and packets from the server-side FortiGate unit must be able to reach the web servers. See [Routing concepts on page 404](#) for more information.

You can use `get` and `diagnose` commands to display information about how WAN optimization is operating.

Example output

The command output for the client-side FortiGate unit shows 10 tunnels all created by the manual WAN optimization configuration:

```
# diagnose wad tunnel list
```

```
Tunnel: id=100 type=manual  
vd=0 shared=no uses=0 state=2  
peer name=Server-Fgt id=100 ip=192.168.30.12  
SSL-secured-tunnel=no auth-grp=  
bytes_in=348 bytes_out=384
```

```
Tunnel: id=99 type=manual  
vd=0 shared=no uses=0 state=2  
peer name=Server-Fgt id=99 ip=192.168.30.12  
SSL-secured-tunnel=no auth-grp=  
bytes_in=348 bytes_out=384
```

```
Tunnel: id=98 type=manual  
vd=0 shared=no uses=0 state=2  
peer name=Server-Fgt id=98 ip=192.168.30.12  
SSL-secured-tunnel=no auth-grp=  
bytes_in=348 bytes_out=384
```

```
Tunnel: id=39 type=manual  
vd=0 shared=no uses=0 state=2  
peer name=Server-Fgt id=39 ip=192.168.30.12  
SSL-secured-tunnel=no auth-grp=  
bytes_in=1068 bytes_out=1104
```

```
Tunnel: id=7 type=manual  
vd=0 shared=no uses=0 state=2  
peer name=Server-Fgt id=7 ip=192.168.30.12  
SSL-secured-tunnel=no auth-grp=  
bytes_in=1228 bytes_out=1264
```

```
Tunnel: id=8 type=manual  
vd=0 shared=no uses=0 state=2  
peer name=Server-Fgt id=8 ip=192.168.30.12  
SSL-secured-tunnel=no auth-grp=  
bytes_in=1228 bytes_out=1264
```

```
Tunnel: id=5 type=manual  
vd=0 shared=no uses=0 state=2
```

```
peer name=Server-Fgt id=5 ip=192.168.30.12
SSL-secured-tunnel=no auth-grp=
bytes_in=1228 bytes_out=1264
```

```
Tunnel: id=4 type=manual
vd=0 shared=no uses=0 state=2
peer name=Server-Fgt id=4 ip=192.168.30.12
SSL-secured-tunnel=no auth-grp=
bytes_in=1228 bytes_out=1264
```

```
Tunnel: id=1 type=manual
vd=0 shared=no uses=0 state=2
peer name=Server-Fgt id=1 ip=192.168.30.12
SSL-secured-tunnel=no auth-grp=
bytes_in=1228 bytes_out=1264
```

```
Tunnel: id=2 type=manual
vd=0 shared=no uses=0 state=2
peer name=Server-Fgt id=2 ip=192.168.30.12
SSL-secured-tunnel=no auth-grp=
bytes_in=1228 bytes_out=1264
```

```
Tunnels total=10 manual=10 auto=0
```

The command output shows three tunnels all created by the active-passive WAN optimization configuration:

```
# diagnose wad tunnel list
```

```
Tunnel: id=22 type=auto
vd=0 shared=no uses=1 state=2
peer name=Server-Fgt id=42 ip=192.168.20.1 (best guess)
SSL-secured-tunnel=no auth-grp=
bytes_in=56693 bytes_out=10831
```

```
Tunnel: id=24 type=auto
vd=0 shared=no uses=1 state=2
peer name=Server-Fgt id=44 ip=192.168.20.1 (best guess)
SSL-secured-tunnel=no auth-grp=
bytes_in=14833 bytes_out=3896
```

```
Tunnel: id=26 type=auto
vd=0 shared=no uses=1 state=2
peer name=Server-Fgt id=46 ip=192.168.20.1 (best guess)
SSL-secured-tunnel=no auth-grp=
bytes_in=481 bytes_out=176
```

```
Tunnels total=3 manual=0 auto=3
```

The command output shows a tunnel created by active passive WAN optimization configuration with secure tunneling:

```
# diagnose wad tunnel list
```

```
Tunnel: id=3 type=auto
vd=0 shared=no uses=1 state=2
peer name=Server-Fgt id=49 ip=192.168.20.1 (best guess)
SSL-secured-tunnel=yes auth-grp=Auth-Secure-Tunnel
bytes_in=95810 bytes_out=39597
```

Tunnels total=1 manual=0 **auto=1**

Unlike manual mode, for active-passive configurations, each session will negotiate an active-passive tunnel so an open session is required to display the corresponding output above.

For example, continuous data transfer such as uploading or downloading will display tunnel output in the active-passive configuration, which is in contrast to manual mode where tunnels are always open and ready to use.

VM

This section contains topics on deploying FortiGate-VM:

- [Amazon Web Services on page 3264](#)
- [Microsoft Azure on page 3264](#)
- [Google Cloud Platform on page 3264](#)

Private cloud

See [FortiGate Private Cloud](#) in the document library.

VM license

You can access the *FortiGate VM License* page from the *Dashboard > Status* page in the *Virtual Machine* widget. Click the device license and select *FortiGate VM License*.

The *FortiGate VM License* page displays the following information:

Field	Description
License status	<p>Displays one of the following statuses:</p> <ul style="list-style-type: none">Valid: VM can connect and validate the license against a FortiManager or FortiGuard server. All features are available.Warning: VM cannot connect and validate against a FortiManager or FortiGuard server. A check is made against how many days the warning status is continuous. If the number is less than 30 days, the status does not change.Invalid: VM cannot connect and validate against a FortiManager or FortiGuard server. A check is made against how many days the warning status is continuous. If the number is 30 days or more, the status changes to invalid. GUI access is restricted until a valid license is uploaded. Firewall policies do not work. FortiGuard downloads are unavailable.Pending: temporary state where the VM attempts to validate its license. <p>Reasons for having a warning or invalid status include:</p> <ul style="list-style-type: none">The network environment does not allow FortiGate-VM to connect to the FortiGuard server.The license may be expired. Check the expiration date for evaluation or term-based licenses.Another VM has been already validated with FortiGuard using the same license. See VM license activation for details about duplicated VM instances.
Allocated vCPUs	Number of allocated and total allowable vCPUs
Allocated RAM	Amount of allocated RAM. There are no RAM restrictions.
Expires on	Expiry date (value depends on the type of license)

This information is visible in the CLI by running `get system status` (see [CLI troubleshooting](#)).

Uploading a license file

After you submit an order for a FortiGate-VM, Fortinet sends a license registration code to the email address that you entered in the order form. Use this code on the FortiCloud portal to register the FortiGate-VM.

Once the VM is registered, you can download the license file in .LIC format. On the *FortiGate VM License* page, click *Upload*. The system prompts you to reboot and validate the license with the FortiGuard server. Once validated, your FortiGate-VM is fully functional.

The VM license window may also appear immediately after logging in if you are running a VM with an evaluation license that has expired.

In cases where the GUI is not accessible, you can upload the license using secure copy (SCP).

To upload the license using SCP:

1. Enable SCP:

```
config system global
    set admin-scp enable
end
```

2. Enable SSH in the administrative access for the interface where the transfer will take place:

```
config system interface
    edit <interface>
        append allowaccess ssh
    next
end
```

3. On your computer, upload the VM license. This example is for Linux:

```
scp <filename> <admin-user>@<FortiGate_IP>:vmlicense
```

VM license types

FortiGate-VM offers perpetual licensing (normal series and V-series) and annual subscription licensing (S-series). SKUs are based on the number of vCPUs (1, 2, 4, 8, 16, 32, or unlimited).

FortiOS 7.2.1 introduces a new permanent trial license, and moves away from the 15-day trial license. See [Permanent trial mode for FortiGate-VM on page 3270](#).

The FortiFlex program allows qualified enterprise and MSSP customers to create as many VM entitlements as required. Resource consumption is based upon predefined points that are calculated on a daily basis.

Feature	Normal series	Trial	V-series	S-series	FortiFlex
Licensing and support	The VM base is perpetual. You must separately contract support services on an annual basis. See the price list for details.	Hardware configuration restrictions apply. Support is not available.	The VM base is perpetual. You must separately contract support services on an annual basis. See the price list for details.	Single annually contracted SKU that contains a VM base and a FortiCare service bundle. Four support service bundle types are available: <ul style="list-style-type: none"> • Only FortiCare • UTM • Enterprise • ATP 	An annually contracted program to create multiple sets of a single entitlement per VM. Entitlements contain a VM base and FortiCare bundle. Four support service bundle types are available: <ul style="list-style-type: none"> • Only FortiCare • UTM • Enterprise • ATP
vCPU number upgrade during contracted term	Not supported.			Supported. You can also upgrade the support service bundle. Contact a Fortinet sales representative to upgrade.	Supported. You can apply different VM entitlement configurations in the FortiFlex portal. API is not supported at this time.
vCPU number downgrade during contracted term	Not supported.				
VDOM support	By default, each CPU level supports up to a certain number of VDOMs. Refer to the FortiGate-VM data sheet for default limits.	VDOMs are supported, but restricted by the CPU allowance for the trial license.	By default, all CPU levels do not support adding VDOMs.	By default, all CPU levels do not support adding VDOMs. S-series VM instances support the subscription VDOM license.	

Consuming a new vCPU

In 7.2.4 and later versions, FortiGate-VM supports automatic vCPU hot-add/hot-remove to the limit of the license entitlement after activating an S-series license or a FortiFlex license. This enhancement removes the requirement for the CLI command `execute cpu add` to be run or a reboot to be performed when the FortiGate-VM has a lower number of vCPUs allocated than the licensed number of vCPUs.

CLI troubleshooting

In some cases, you can view more information from the CLI to diagnose issues with VM licensing. This is also useful when the GUI is inaccessible due to an invalid contract.

Before you begin, ensure your FortiGate has the proper routes to connect to the internet. Run all following debug commands for a full picture of the issue.

To view the license status, expiration date, and VM resources:

```
# get system status
Version: FortiGate-VM64-KVM v6.4.2,build1723,200730 (GA)
...
Serial-Number: FGVM08*****
....
License Status: Valid
License Expiration Date: 2020-12-10
VM Resources: 1 CPU/8 allowed, 2010 MB RAM
...
```

To display license details:

```
# diagnose debug vm-print-license
SerialNumber: FGVM08*****
CreateDate: Tue Dec 10 00:57:32 2019
License expires: Thu Dec 10 00:00:00 2020
Expiry: 366
Key: yes
Cert: yes
Key2: yes
Cert2: yes
Model: 08 (11)
CPU: 8
MEM: 2147483647
```

To display license information from FortiGuard:

```
# diagnose hardware sysinfo vm full
UUID:      abbe*****
valid:     1
status:    1
code:      200
warn:      0
copy:      0
received:  4604955037
warning:   4600905081
```

```
recv:      202009152207
dup:
```

Field	Value and description
Valid	0 – Invalid 1 – Valid
Status	0 – Startup 1 – Success 2 – Warning 3 – Error 4 – Invalid Copy 5 – Eval Expired 6 - Grace Period. For FortiFlex, there is a two-hour grace period to begin passing traffic upon retrieving the license from FortiCare.
Code	2xx, 3xx – Success 200 – Valid 202 – Accepted (treated as correct response code) 4xx - Error 400 – Expired 401 – Duplicate 5xx – Warning 500 - Warning 502 – Invalid. Cannot connect to FortiGuard Distribution Servers 6xx – Evaluation license expired Other codes - Error

The following are examples of common combinations:

This combination indicates the license is valid and functioning normally:

```
valid: 1
status: 1
code: 200
```

This combination indicates the license itself is valid, but is running on a duplicate instance:

```
valid: 1
status: 4
code: 401
```

This combination indicates the system cannot connect to FortiGuard:

```
valid: 0
status: 2
code: 502
```

This combination indicates the license is expired and invalid:

```
valid: 0
status: 3
code: 400
```

This combination indicates the VM is unlicensed:

```
valid: 0
status: 3
code: 0
```

For FortiFlex licenses, the following command allows you to enter the license token and proxy information:

```
# execute vm-license <token> https://<username>:<password>@<proxy IP address>:<proxy port>
```

FortiOS can receive the following error codes from the FortiCare server:

```
1 - Runtime error (server unhandled error on FortiCare sever)
57 - License Token is invalid
58 - License Token is already used and cannot be used again to retrieve license key
```

The FortiGate can generate the following error code:

```
60 - Failed to request forticare license. Failed to download VM license.
```

Contact [Fortinet Support](#) for assistance if your licensing issue persists.

Permanent trial mode for FortiGate-VM

A permanent evaluation VM license replaces the 15 day evaluation period for FortiGate-VM. The evaluation VM license applies to all private cloud (VMware ESXi, KVM, and so on) and all bring your own license (BYOL) public cloud instances.

When spinning up a new FortiGate-VM, you choose to log in to FortiCare to activate the VM trial or upload a new license.

Limitations of the evaluation VM license include the following:

- Maximum of one free evaluation copy per FortiCare account
- Support for low encryption operation only, except for GUI management access and FortiManager communications
- Maximum of 1 CPU and 2 GB of memory
- Maximum of three interfaces, firewall policies, and routes
- No FortiCare support
- No FortiGuard support
- Support for a maximum of two virtual domains (VDM). When using multi-VDM mode, the root VDM must be an admin type and the other can be a traffic VDM. See [VDM types on page 2476](#).

To obtain the permanent VM trial license from FortiCare using the CLI:

1. A newly deployed FortiGate-VM no longer has a valid evaluation license, even if the instance has only 1 CPU and 2 GB of memory. Run `get sys stat`. The following output is expected:

```
Version: FortiGate-VM64 v7.2.1,build1242,220715 (interim)
...
Serial-Number: FGVMEVNXFLTGKOBK
License Status: Invalid
VM Resources: 1 CPU/1 allowed, 2007 MB RAM/2048 MB allowed
```

2. Obtain the permanent VM trial license from FortiCare:

```
execute vm-license-options account-id xxxx@fortinet.com
execute vm-license-options account-password xxxxxxxx
execute vm-license
This VM is using the evaluation license. This license does not expire.
Limitations of the Evaluation VM license include:
  1.Support for low encryption operation only
  2.Maximum of 1 CPU and 2GiB of memory
  3.Maximum of three interfaces, firewall policies, and routes each
  4.No FortiCare Support
This operation will reboot the system !
Do you want to continue? (y/n)y

Connection to 10.6.30.74 closed.
```

3. You can run the following commands to check that the permanent VM trial license is valid:

- **get sys stat.** The following output is expected:

```
Version: FortiGate-VM64 v7.2.1,build1242,220715 (interim)
...
Serial-Number: FGVMEVNXFLTGKOBBC
License Status: Valid
VM Resources: 1 CPU/1 allowed, 2007 MB RAM/2048 MB allowed
```

- **diagnose hardware sysinfo vm full.** The following output is expected:

```
UUID:      4213dbbc94f2520b0d75eeafe1b319c7
valid:      1
status:     1
code:       0
warn:       0
copy:       0
received:   4294939472
warning:    4294939472
recv:      202207162014
dup:
```

- **diagnose debug vm-print-license.** The following output is expected:

```
SerialNumber: FGVMEVNXFLTGKOBBC
CreateDate: Sat Jul 16 20:11:15 2022
UUID: 4213dbbc94f2520b0d75eeafe1b319c7
Key: yes
Cert: yes
Key2: yes
Cert2: yes
Model: EVAL (1)
CPU: 1
MEM: 2048
VDOM license:
  permanent: 2
```

subscription: 0

To obtain the permanent VM trial license from FortiCare using the GUI:

1. When unlicensed, the FortiOS GUI allows you to download the permanent VM trial license from FortiCare with your FortiCare account credentials. In the FortiGate VM License page, for *How will you license this VM?*, select *Evaluation License*.

FortiGate VM License

! VM is not licensed or license is invalid for current VM configuration.
Upload a new license or reconfigure the VM.

How will you license this VM? ☐ Full License

☒ Evaluation License

This license can only be used once per FortiCare account and has several restrictions:

- Support for low encryption operation only
- Maximum of 1 CPU and 2GiB of memory
- Maximum of three interfaces, firewall policies, and routes each
- No FortiCare Support

[Learn more about the Evaluation VM License](#)

Login to FortiCare to activate VM Trial

Email

Password

Are you a government user? ☐

2. In the *Email* field, enter your FortiCare account email address.
3. In the *Password* field, enter your FortiCare account password.
4. Click **OK**. When a permanent VM trial license is applied, the FortiOS, the GUI shows a summary of the license

limitations and allows you to upload a paid VM license.

FortiGate VM License

This VM is using the evaluation license. This license does not expire. Limitations of the Evaluation VM License include:

- Support for low encryption operation only
- Maximum of 1 CPU and 2GiB of memory
- Maximum of three interfaces, firewall policies, and routes each
- No FortiCare Support

[Learn more about the Evaluation VM License](#)

Allocated vCPUs 100% 1 / 1

Allocated RAM 98% 2 GiB / 2 GiB

Upload License File

Select file ➕ Upload

OK Cancel

To allow FortiManager to apply a license to an unlicensed FortiGate-VM instance:

1. Confirm that the FortiGate is unlicensed by running `get system status` in the FortiOS CLI. The following shows expected output for this command:

```
Version: FortiGate-VM64-AZURE v7.2.1,build1252,220728 (interim)
...
Serial-Number: FGVMEVTN8UP4KIA6
License Status: Invalid
VM Resources: 1 CPU/1 allowed, 1945 MB RAM/2048 MB allowed
```

2. In the FortiOS CLI, configure the FortiManager as central management:

```
config system central-management
    set type fortimanager
    set fmg "<FortiManager IP address>"
end
```

3. In FortiManager, configure the VM license as [Installing VM licenses](#) describes.

Adding VDOMs with FortiGate v-series

Each FortiGate-VM base license type allows a default number of virtual domains (VDOM). This topic provides sample procedures to add VDOMs beyond the default number using separately purchased VDOM licenses.

This topic consists of the following steps:

1. [Activate the FortiGate-VM with the base license.](#)
2. [Add more VDOMs to the FortiGate-VM.](#)

To activate the FortiGate-VM with the base license:

1. Purchase and register the FortiGate-VM base license in FortiCare:
 - a. Purchase the FortiGate-VM base license from Fortinet or a Fortinet reseller.
 - b. You receive a license certification with a registration code. Open the certification.
 - c. Log in to [Fortinet Customer Service & Support](#).
 - d. Go to *Register Now* and enter the provided registration code.
 - e. Follow the registration process. The serial number generates and displays on the *Registration Completion* page.
 - f. Go to *Asset > Manage/View Products*. Click the serial number to download the license file.
2. Upload the FortiGate-VM base license file to FortiOS:
 - a. Log in to the FortiGate-VM GUI.
 - b. In *Dashboard > Status*, in the *Virtual Machine* widget, click *FortiGate VM License*.
 - c. Click the *Upload* button.
 - d. Select the FortiGate-VM base license file, then click *OK*. The FortiGate-VM reboots after applying the base license.
3. Verify the FortiGate-VM base license status and VDOM information:
 - a. Log in to the FortiGate-VM GUI.
 - b. In *Dashboard > Status*, in the *Virtual Machine* widget, ensure that there is a checkmark in front of the FortiGate-VM base license name. The checkmark indicates that the base license is valid.
 - c. You can check VDOM information using the CLI. The following output shows that the maximum number of VDOMs is currently one. This is correct since the FortiGate-VM base license only supports the default root VDOM that the system uses.

To add more VDOMs to the FortiGate-VM:

You can repeat this procedure multiple times to stack multiple VDOM licenses on the same FortiGate-VM.

1. Purchase and register the FortiGate-VM upgrade license in FortiCare. This example adds 15 VDOMs:
 - a. Purchase the FortiGate-VM upgrade license from Fortinet or a Fortinet reseller.
 - b. You receive a license certification with a registration code. Open the certification.
 - c. Log in to [Fortinet Customer Service & Support](#).
 - d. Go to *Asset > Register/Activate* and enter the provided registration code.
 - e. On the *Specify License Confirmation Information* screen, enter the FortiGate-VM serial number to apply the VDOM upgrade license to the FortiGate-VM. In this example, the FortiGate-VM serial number is *FGVM4VTM19000476*.

- f. Follow the registration process.
- g. Go to *Asset > Manage/View Products > .* Select the desired product, then click *License & Key*. The VDOM upgrade license displays under *Registered License(s)*, and a key for adding 15 VDOMs (in this example

M6JSD-8EE32-VHIJB-N) displays under *Available Key(s)*.

Registered License(s)

License Type	License Number	Registration Date
VDOM Upgrade	VDOM4713241427	2018-04-13
Virtual Domain License Add 15		
FortiGateVM	FGVM4713410408	2019-04-29
FortiGate-VM for all supported platforms. 4 x vCPU core and up to 6GB RAM		

Available Key(s)

Key	License Number	Description
Get The License File	FGVM4713410408	FortiGate-VM for all supported platforms. 4 x vCPU core and up to 6GB RAM
M6JSD-8EE32-VHIJB-N	VDOM4713241427	Virtual Domain License for 15

- Apply the FortiGate-VM upgrade license key to FortiOS:
 - Log in to the FortiGate-VM CLI in the local console or using SSH.
 - Apply the VDOM upgrade license key:

```
FGVM4VTM19000476 # execute upd-vd-license M6JSD-8EE32-VHIJB-N
```

```
update vdom license succeeded
```
- Verify the FortiGate-VM VDOM information:
 - Log in to the FortiGate-VM CLI in the local console or using SSH.
 - Check VDOM information using the CLI. The following output shows that the maximum number of VDOMs is currently 15. When you add VDOMs for the first time on a FortiGate-VM v-series instance, FortiOS does not count the default VDOM, as the default VDOM is the so-called root VDOM that the system uses and FortiOS does not treat it as a countable VDOM in terms of VDOM addition. Therefore, as in this example, if your FortiGate-VM had the default VDOM configuration, then you add 15 VDOMs, FortiOS displays the maximum VDOM number as 15, not 16.

```

```

Terraform: FortiOS as a provider

Fortinet's Terraform support provides customers with more ways to efficiently deploy, manage, and automate security across physical FortiGate appliances and virtual environments. You can use Terraform to automate various IT infrastructure needs, thereby diminishing mistakes from repetitive manual configurations.

For example, if Fortinet is releasing a new FortiOS version, your organization may require you to test a new functionality to determine how it may impact the environment before globally deploying the new version. In this case, the ability to rapidly stand up environments and test these functions prior to production environment integration provides a resource-efficient and fault-tolerant approach.

The following example demonstrates how to use the Terraform FortiOS provider to perform simple configuration changes on a FortiGate unit. It requires the following:

- FortiOS 6.0 or later
- **FortiOS Provider:** This example uses terraform-provider-fortios 1.0.0.
- **Terraform:** This example uses Terraform 0.11.14.
- REST API administrator created on the FortiGate with the API key

For more information, see the Terraform FortiOS Provider at <https://www.terraform.io/docs/providers/fortios/index.html>.

To create a REST API administrator:

1. On the FortiGate, go to *System > Administrators* and click *Create New > REST API Admin*.
2. Enter the *Username* and, optionally, enter *Comments*.
3. Select an *Administrator Profile*.
4. We recommend that you create a new profile with minimal privileges for this terraform script:
 - a. In the *Administrator Profile* drop down click *Create New*.
 - b. Enter a name for the profile.
 - c. Configure the *Access Permissions*:
 - *None*: The REST API is not permitted access to the resource.
 - *Read*: The REST API can send read requests (HTTP GET) to the resource.
 - *Read/Write*: The REST API can send read and write requests (HTTP GET/POST/PUT/DELETE) to the resource.
 - d. Click *OK*.
5. Enter *Trusted Hosts* to specify the devices that are allowed to access this FortiGate.
6. Click *OK*.

An API key is displayed. This key is only shown once, so you must copy and store it securely.

To configure FortiGate with Terraform Provider module support:

1. Download the terraform-provider-fortios file to a directory on the management computer.

2. Create a new file with the .tf extension for configuring your FortiGate:

```
root@mail:/home/terraform# ls
terraform-provider-fortios_v1.0.0_x4 test.tf
```

3. Edit the test.tf Terraform configuration file:

In this example, the FortiGate's IP address is 10.6.30.5, and the API user token is 17b*****63ck. Your provider information must also be changed.

```
# Configure the FortiOS Provider
provider "fortios" {
  hostname = "10.6.30.5"
  token = "17b*****63ck"
}
```

4. Create the resources for configuring your DNS object and adding a static route:

```
resource "fortios_system_setting_dns" "test1" {
  primary = "172.16.95.16"
  secondary = "8.8.8.8"
}
resource "fortios_networking_route_static" "test1" {
  dst = "110.2.2.122/32"
  gateway = "2.2.2.2"
  blackhole = "disable"
  distance = "22"
  weight = "3"
  priority = "3"
  device = "port2"
  comment = "Terraform test"
}
```

5. Save your Terraform configuration file.

6. In the terminal, enter terraform init to initialize the working directory.

It reads the provider if the name follows the convention terraform-provider-[name]:

```
root@mail:/home/terraform# terraform init
Initializing the backend...
Terraform has been successfully initialized!
You may now begin working with Terraform. Try running "terraform plan" to see
any changes that are required for your infrastructure. All Terraform commands
should now work.
If you ever set or change modules or backend configuration for Terraform,
rerun this command to reinitialize your working directory. If you forget, other
commands will detect it and remind you to do so if necessary.
```

7. Run terraform -v to verify the version of loaded provider module:

```
root@mail:/home/terraform# terraform -v
Terraform v0.11.14
+ provider.fortios v1.0.0
```

8. Enter terraform plan to parse the configuration file and read from the FortiGate configuration to see what Terraform changes:

This example create a static route and updates the DNS address. You can see that Terraform reads the DNS addresses from the FortiGate and then lists them.

```

root@mail:/home/terraform# terraform plan
Refreshing Terraform state in-memory prior to plan...
The refreshed state will be used to calculate this plan, but will not be
persisted to local or remote state storage.
fortios_networking_route_static.test1: Refreshing state... (ID: 2)
fortios_system_setting_dns.test1: Refreshing state... (ID: 96.45.45.45)
-----
An execution plan has been generated and is shown below.
Resource actions are indicated with the following symbols:
+ create
~ update in-place
Terraform will perform the following actions:
+ fortios_networking_route_static.test1
id: <computed>
blackhole: "disable"
comment: "Terraform test"
device: "port2"
distance: "22"
dst: "110.2.2.122/32"
gateway: "2.2.2.2"
priority: "3"
weight: "3"
~ fortios_system_setting_dns.test1
primary: "96.45.45.45" => "172.16.95.16"
secondary: "208.91.112.22" => "8.8.8.8"
Plan: 1 to add, 1 to change, 0 to destroy.
-----
Note: You didn't specify an "-out" parameter to save this plan, so Terraform
can't guarantee that exactly these actions will be performed if
"terraform apply" is subsequently run.

```

If you are running terraform-provider-fortios 1.1.0, you may see the following error:

```
Error: Error getting CA Bundle, CA Bundle should be set when
insecure is false.
```

In this case, add the following line to the FortiOS provider configuration in the test.tf file:

```
insecure = "true"
```

9. Enter terraform apply to continue the configuration:

```

root@mail:/home/terraform# terraform apply
fortios_system_setting_dns.test1: Refreshing state... (ID: 96.45.45.45)
fortios_networking_route_static.test1: Refreshing state... (ID: 2)
An execution plan has been generated and is shown below.
Resource actions are indicated with the following symbols:
+ create
~ update in-place
Terraform will perform the following actions:
+ fortios_networking_route_static.test1
id: <computed>
blackhole: "disable"
comment: "Terraform test"
device: "port2"
distance: "22"
dst: "110.2.2.122/32"
gateway: "2.2.2.2"

```

```

priority: "3"
weight: "3"
~ fortios_system_setting_dns.test1
primary: "96.45.45.45" => "172.16.95.16"
secondary: "208.91.112.22" => "8.8.8.8"
Plan: 1 to add, 1 to change, 0 to destroy.
Do you want to perform these actions?
Terraform will perform the actions described above.
Only 'yes' will be accepted to approve.
Enter a value: yes
fortios_networking_route_static.test1: Creating...
blackhole: "" => "disable"
comment: "" => "Terraform test"
device: "" => "port2"
distance: "" => "22"
dst: "" => "110.2.2.122/32"
gateway: "" => "2.2.2.2"
priority: "" => "3"
weight: "" => "3"
fortios_system_setting_dns.test1: Modifying... (ID: 96.45.45.45)
primary: "96.45.45.45" => "172.16.95.16"
secondary: "208.91.112.22" => "8.8.8.8"
fortios_networking_route_static.test1: Creation complete after 0s (ID: 2)
fortios_system_setting_dns.test1: Modifications complete after 0s (ID: 172.16.95.16)
Apply complete! Resources: 1 added, 1 changed, 0 destroyed.

```

The FortiGate is now configured according to the configuration file.

10. To change or delete something in the future, edit the configuration file and then apply it again. In supported cases, it deletes, adds, or updates new entries as configured. For instance, in this example you can remove the static route and revert the DNS address to its original configuration by changing the .tf file:

a. Edit the configuration file:

```

# Configure the FortiOS Provider
provider "fortios" {
  hostname = "10.6.30.5"
  token = "17b*****63ck"
}
resource "fortios_system_setting_dns" "test1" {
  primary = "96.45.45.45"
  secondary = "208.91.112.22"
}
#resource "fortios_networking_route_static" "test1" {
#  dst = "110.2.2.122/32"
#  gateway = "2.2.2.2"
#  blackhole = "disable"
#  distance = "22"
#  weight = "3"
#  priority = "3"
#  device = "port2"
#  comment = "Terraform test"
#}

```

- b. Entering terraform apply deletes the static route that is commented out of the configuration file, and reverts the DNS address to the old address:**

```

root@mail:/home/terraform# terraform apply
fortios_system_setting_dns.test1: Refreshing state... (ID: 172.16.95.16)

```

```
fortios_networking_route_static.test1: Refreshing state... (ID: 2)
An execution plan has been generated and is shown below.
Resource actions are indicated with the following symbols:
~ update in-place
- destroy
Terraform will perform the following actions:
- fortios_networking_route_static.test1
~ fortios_system_setting_dns.test1
primary: "172.16.95.16" => "96.45.45.45"
secondary: "8.8.8.8" => "208.91.112.22"
Plan: 0 to add, 1 to change, 1 to destroy.
Do you want to perform these actions?
Terraform will perform the actions described above.
Only 'yes' will be accepted to approve.
Enter a value: yes
fortios_networking_route_static.test1: Destroying... (ID: 2)
fortios_system_setting_dns.test1: Modifying... (ID: 172.16.95.16)
primary: "172.16.95.16" => "96.45.45.45"
secondary: "8.8.8.8" => "208.91.112.22"
fortios_networking_route_static.test1: Destruction complete after 0s
fortios_system_setting_dns.test1: Modifications complete after 0s (ID: 96.45.45.45)
Apply complete! Resources: 0 added, 1 changed, 1 destroyed.
```

Troubleshooting

Use the HTTPS daemon debug to begin troubleshooting why a configuration was not accepted:

```
# diagnose debug enable
# diagnose debug application httpsd -1
```

The REST API 403 error means that your administrator profile does not have sufficient permissions.

The REST API 401 error means that you do not have the correct token or trusted host.

PF and VF SR-IOV driver and virtual SPU support

Physical Function (PF) and Virtual Function (VF) PCI Passthrough and SR-IOV drivers in FortiGate guest VM are supported.

PF provides the ability for PCI Passthrough, but requires an entire Network Interface Card (NIC) for a VM. It can usually achieve greater performance than a Virtual Function (VF) based SR-IOV. PF is also expensive. While VF allows one NIC to be shared among multiple guests VMs, PF is allocated to one port on a VM.

The supported driver versions are:

Driver	Version	Hypervisor	PCI-Passthrough/SR-IOV	vSPU (In-guest DPDK)	Note
ixgbe	5.6.5	ESXi, KVM	Yes	Yes	
lxgbevf	4.6.3	ESXi, KVM	Yes		
i40e	2.10.19.82	ESXi, KVM	Yes	Yes	
i40evf	3.6.15	ESXi, KVM	Yes	Yes	Available in FortiOS 6.4.0 and earlier versions.
lavf	4.1.1	ESXi, KVM	Yes	Yes	Replaces i40evf in FortiOS 6.4.1 and later versions. Supports Intel E810-C 100G adapters.
mlx5	4.6-1.0.1	ESXi, KVM	Yes	Yes	Supports Nvidia ConnectX-5 and ConnectX-6 100G adapters.
Bnxt_en	1.10.1-216.0.416.1	ESXi, KVM	Yes	Yes	Available in FortiOS 6.4.3 and later versions. Supports Broadcom P2100G 100G adapters.
Vmxnet3	1.4.a.0-k-NAPI	ESXi		Yes	The combination of VMware ESXi and NSX-T does not support virtual SPU (vSPU).

Other hypervisors, such as Xen or Microsoft Hyper-V, may work with vSPU, although they are unverified.

All tools and software utilities for UEFI 1.X have been removed from 6.2.0 and later releases. Update to UEFI 2.x to use the UEFI tools or software utilities.

You perform the configuration to use PF or VF on the hypervisor, and do not configure it on the FortiGate.

To check what driver is being used on the FortiGate:

```
# diagnose hardware deviceinfo nic port2
Name:      port2
Driver:    i40e
Version:   2.4.10
Bus:       0000:03:00.0
Hwaddr:    3c:fd:fe:1e:98:02
```

```

Permanent Hwaddr:3c:fd:fe:1e:98:02
State:      up
Link:       up
Mtu:        1500
Supported:  auto 1000full 10000full
Advertised: auto 1000full 10000full

Rx bytes:   0
Rx compressed: 0
...

```

Using OCI IMDSv2

OCI IMDSv2 offers increased security for accessing instance metadata compared to IMDSv1. IMDSv2 is used in OCI SDN connectors and on instance deployments with bootstrap metadata. When upgrading from previous FortiOS builds with legacy IMDSv1 endpoints, the endpoints will be updated to IMDSv2, and the same calls can be made.

The following use cases illustrate IMDSv2 support on the FortiGate-VM.

To configure the Oracle OCI instance to use IMDSv2:

1. In OCI, deploy an instance using IMDSv2 with bootstrap metadata. There are two methods to enable IMDSv2 :

- Use the OCI command line to deploy an instance using `user-data`. This example uses a MIME file that contains the license and configuration, as well as a JSON file that specifies to disable V1 metadata.

```

oci compute instance launch
--availability-domain ww1:US-ASHBURN-AD-1
--compartment-id
ocidl.tenancy.oc1..aaaaaaaa3aaaaaaaaaaaaaaaa7xxxxxx54aaaaaa4xxxxxxxxx55xxxa
--display-name fos-byol-v6.4.6-b2290-emulated
--image-id
ocidl.image.oc1.iad.aaaaaaa6xxx43xxxxxxxxx7aaaaaaaaaaaaaaaa3xxxxxxxxxxxxxx
--subnet-id
ocidl.subnet.oc1.iad.aaaaaaaaxxxxxxxxxx2xxxxxxxxxxxxxxxxxxxxx5aaa4xxxxxxxxxx42aaa
--shape VM.Standard1.4
--assign-public-ip true
--user-data-file /home/oci/userdata/mime.txt
--ssh-authorized-keys-file /home/oci/userdata/myfirstkeypair.pub
--instance-options file://home/oci/scripts/metadatav2.json

root@mail:/home/oci/scripts# cat metadatav2.json
{
  "areLegacyImdsEndpointsDisabled": true
}

```

- While the instance is running, edit the instance metadata service version in the GUI ,and change the allowed

IMDS version to **VERSION 2 ONLY** (see [Getting Instance Metadata](#) in the OCI documentation).

Edit Instance Metadata Service Version [Help](#) [Close](#)

When enabled, applications that rely on the [instance metadata service \(IMDS\)](#) must use the IMDSv2 endpoint and provide an authorization header. All requests to IMDSv1 are denied. Enable this setting only if the image supports IMDSv2.

ALLOWED IMDS VERSION

☐ VERSION 1 AND VERSION 2
Allows requests to IMDSv1 and IMDSv2 to succeed. This setting is backwards compatible.

☒ **VERSION 2 ONLY**
Denies all requests to the IMDSv1 endpoint. All requests must use the IMDSv2 endpoint and provide an authorization header. Enable this setting only if the image supports IMDSv2.

[Save Changes](#) [Cancel](#)

- The FortiGate will use the metadata v2 endpoints to get the metadata bootstrap information. In FortiOS, verify this by running the following after bootup:

```
# diagnose debug cloudinit show
```

To configure an SDN connector with meta-IAM enabled and firewall addresses to obtain dynamic addresses:

- Configure an IAM policy and dynamic group (see [How Policies Work](#) and [Managing Dynamic Groups](#) in the OCI documentation).

thomasscriptpolicy

- In FortiOS, configure the OCI Fabric connector (see [OCI SDN connector using certificates on page 3062](#) for detailed instructions):

- a. Create the SDN connector.
- b. Verify that the OCI connector comes up (*Security Fabric > External Connectors* page indicates the status is up).
- c. Configure a dynamic firewall address with a filter.
- d. Verify the dynamic firewall address is resolved by the SDN connector.

To manually update the external IP:

```
# execute update-eip
instance: fos-byol-v6.4.6-b2290-emulated
  vnic0: fos-byol-v6.4.6-b2290-emulated
        10.0.0.58 (129.213.138.192)
port1: 10.0.0.58, eip: 129.213.138.192
EIP is updated successfully
```

To verify the OCI daemon debugs related to metadata:

```
# diagnose test application ocid 4
instance: fos-byol-v6.4.6-b2290-emulated
  vnic0: fos-byol-v6.4.6-b2290-emulated
        10.0.0.58

# diagnose test application ocid 5
Compartment
Id:ocid1.tenancy.oc1..aaaaaaaaa3aaaaaaaaaaaaaaaa7xxxxxx54aaaaaa4xxxxxxx55xxxa
Instance Id:ocid1.instance.oc1.iad.aaaaaaaaaaaaaaaa4aaaaa5aaaaaaaa4xxxxxxx2aaaaaaa
Instance Name:fos-byol-v6.4.6-b2290-emulated
OCI Regarxiehlion:us-ashburn-1

# diagnose test application ocid 6
Instance Principal Token has been refreshed
```

FIPS cipher mode for AWS, Azure, OCI, and GCP FortiGate-VMs

AWS, Azure, OCI, and GCP FortiGate-VMs support FIPS cipher mode. You must remove all VPN configurations before you can enable FIPS CC mode.

FIPS cipher mode only allows a restricted set of ciphers for features that require encryption, such as SSH, IPsec and SSL VPN, and HTTPS. You cannot use insecure protocols such as Telnet, TFTP, and HTTP to access the FortiGate-VM.

You must perform a factory reset to disable `fips-ciphers` mode.

To enable fips-cipher mode:

```
config system fips-cc
  set status fips-ciphers
end
Warning: entering fips-ciphers mode. To exit this mode, factory reset is required.
Do you want to continue? (y/n) y
```

The following behavior occurs when you enable FIPS cipher mode:

- You can restore a license, image, configuration, and so on from an FTP server.
- The following options are available:

- The FortiCare license is validated.
- FortiGuard databases and engines are updated.
- The DH-RSA-AES128-GCM-SHA256 and DH-RSA-AES256-GCM-SHA384 ciphers are not supported.

Hyperscale firewall

Hyperscale hardware and facilities can scale a distributed computing environment up to thousands of servers. It is about achieving massive scale in computing, typically for big data or cloud computing.

A hyperscale firewall secures hyperscale data centers and 5G networks.

See the [Hyperscale Firewall Guide](#).

Troubleshooting

This section is intended for administrators with super_admin permissions who require assistance with basic and advanced troubleshooting. Administrators with other types of permissions may not be able to perform all of the tasks in this section.

This section contains the following troubleshooting topics:

- [Troubleshooting methodologies on page 3289](#)
- [Troubleshooting scenarios on page 3292](#)
 - [Checking the system date and time on page 3293](#)

- [Additional resources on page 3339](#)

Troubleshooting methodologies

The sections in this topic provide an overview of how to prepare to troubleshoot problems in FortiGate. They include verifying your user permissions, establishing a baseline, defining the problem, and creating a plan.

Verify user permissions

Before you begin troubleshooting, verify the following:

- You have administrator privileges for the FortiGate.
- The FortiGate is integrated into your network.
- The operation mode is configured.
- The system time, DNS settings, administrator password, and network interfaces are configured.
- Firmware, FortiGuard AntiVirus, FortiGuard Application Control, and FortiGuard IPS are up to date.

If you are using a FortiGate that has virtual domains (VDOMs) enabled, you can often troubleshoot within your own VDOM. However, you should inform the super_admin for the FortiGate that you will be performing troubleshooting tasks.

You may also need access to other networking equipment, such as switches, routers, and servers to carry out tests. If you do not have access to this equipment, contact your network administrator for assistance.

Establish a baseline

FortiGate operates at all layers of the OSI model. For this reason, troubleshooting can be complex. Establishing baseline parameters for your system before a problem occurs helps to reduce the complexity when you need to troubleshoot.

A best practice is to establish and record the normal operating status. Regular operation data shows trends, and allows you to see where changes occur when problems arise. You can gather this data by using logs and SNMP tools to monitor the system performance or by regularly running information gathering commands and saving the output.

You should back up your FortiOS configuration on a regular basis even when you are not troubleshooting. You can restore the backed up configuration as needed to save time recreating it from the factory default settings.

Use the following CLI commands to obtain normal operating data for a FortiGate:

<code>get system status</code>	Displays firmware versions and FortiGuard engine versions, and other system information.
<code>get system performance status</code>	Displays CPU and memory states, average network usage, average sessions and session setup rate, viruses caught, IPS attacks blocked, and uptime.
<code>get hardware memory</code>	Displays information about memory.

<code>get system session status</code>	Displays total number of sessions.
<code>get router info routing-table all</code>	Displays all the routes in the routing table, including their type, source, and other useful data.
<code>get ips session</code>	Displays memory used and maximum amount available to IPS as well as counts
<code>get webfilter ftgd-statistics</code>	Displays a list of FortiGuard related counts of status, errors, and other data.
<code>diagnose sys session list</code>	Displays the list of current detailed sessions.
<code>show sys dns</code>	Displays the configured DNS servers.
<code>diagnose sys ntp status</code>	Displays information about NTP servers.

You can run any commands that apply to your system for information gathering. For example, if you have active VPN connections, use the `get vpn` series of commands to get more information about them.

Use `execute tac report` to get an extensive snapshot of your system. This command runs many diagnostic commands for specific configurations. It also records the current state of each feature regardless of the features deployed on your FortiGate. If you need to troubleshoot later, you can run the same command again and compare the differences to identify any suspicious output.

Define the problem

The following questions are intended to compare the current behavior of the FortiGate with normal operations to help you define the problem. Be specific with your answers. After you define the problem, search for a solution in the troubleshooting scenarios section, and then create a plan to resolve it.

What is the problem?	The problem being observed may not be the actual problem. You should determine where the problem lies before starting to troubleshoot the FortiGate.
Was the device working before?	If the device never worked, it might be defective. For more information, see Troubleshooting your installation on page 98 .
Can the problem be reproduced?	If the problem is intermittent, it may be dependent on system load. Intermittent problems are challenging to troubleshoot because they are difficult to reproduce.
What has changed?	Use the FortiGate event log to identify possible configuration changes. There may be changes in the operating environment. For example, there might be a gradual increase in load as more sites are forwarded through the firewall. If something has changed, roll back the change and assess the impact.
What is the scope of the problem?	After you isolate the problem, determine what applications, users, devices, and operating systems the problem affects. The following questions are intended to narrow the scope of the problem and identify what to check during troubleshooting. The more factors you can eliminate, the less you need to check. For this reason, be as specific and accurate as possible when gathering information. <ul style="list-style-type: none"> What is not working?

- Is more than one thing not working?
- Is it partly working? If so, what parts are working?
- Is it a connectivity issue for the entire device, or is there an application that isn't reaching the Internet?
- Where did the problem occur?
- When did the problem occur and to which users or groups of users?
- What components are involved?
- What applications are affected?
- Can you use a packet sniffer to trace the problem?
- Can you use system debugging or look in the session table to trace the problem?
- Do any of the log files indicate a failure has occurred?

Create a troubleshooting plan

After you define the problem and its scope, develop a troubleshooting plan.

Create checklist

Make a list all the possible causes of the problem and how you can test for each cause.

Create a checklist to keep track of what has been tried and what is left to test. Checklists are useful when more than one person is performing troubleshooting tasks.

Obtain the required equipment

Testing your solution may require additional networking equipment, computers, or other devices.

Network administrators usually have additional networking equipment available to loan you, or a lab where you can bring the FortiGate unit to test.

If you do not have access to equipment, check for shareware applications that can perform the same tasks. Often, there are software solutions you can use when hardware is too expensive.

Consult Fortinet troubleshooting resources

After the checklist is created, refer to the troubleshooting scenarios sections to assist with implementing your plan. See [Troubleshooting scenarios on page 3292](#).

Gather information for technical support

If you still require technical assistance after the plan is implemented, be prepared to provide Fortinet technical support with following information:

- Firmware build version (use the `get system status` command)
- Network topology diagram
- Recent configuration file
- Recent debug log (optional)
- Summary of troubleshooting steps you have taken and the results.

Do not provide the output from the `execute tac` report unless the support team requests it. The output from this command is very large and is not required in many cases.

Contact technical support

Before contacting technical support, ensure you have login access (preferably with full read/write privileges) to all networking devices that could be relevant to troubleshooting.

If you are using VMs, be prepared to have someone who can log in to the virtual hosting platform in case it is necessary to check and possibly modify resource allocation.

For information about contacting technical support, go to [FortiCare Support Service](#) page.

Troubleshooting scenarios

The following table is intended to help you diagnose common problems and provides links to the corresponding troubleshooting topics:

Problem	Probable cause	Recommended action
Hardware connections	<ul style="list-style-type: none"> Are all of the cables and interfaces connected properly? Is the LED for the interface green? 	Checking the hardware connections on page 3294
FortiOS network settings	<ul style="list-style-type: none"> If you are having problems connecting to the management interface, is your protocol enabled on the interface for administrative access? Does the interface have an IP address? 	Checking FortiOS network settings on page 3295
CPU and memory resources	<ul style="list-style-type: none"> Is the CPU running at almost 100 percent usage? Is your FortiGate running low on memory? 	Troubleshooting CPU and network resources on page 3298
Modem status	<ul style="list-style-type: none"> Is the modem connected? Are there PPP issues? 	Checking the modem status on page 3303
Ping and traceroute	Is the FortiGate experiencing complete packet loss?	Running ping and traceroute on page 3304
Logs	Do you need to identify a problem?	Checking the logs on page 3307
Contents of the routing table (in NAT mode)	<ul style="list-style-type: none"> Are there routes in the routing table for default and static routes? Do all connected subnets have a route in the routing table? Does a route have a higher priority than it should? 	Verifying routing table contents in NAT mode on page 3308
Traffic routes	Is the traffic routed correctly?	Verifying the correct route is being used on page 3309

Problem	Probable cause	Recommended action

FortiGuard connectivity	Is the FortiGate communicating properly with FortiGuard?	Verifying connectivity to FortiGuard on page 3335
Sniffer trace	<ul style="list-style-type: none"> Is traffic entering the FortiGate? Does the traffic arrive on the expected interface? Is the ARP resolution correct for the next-hop destination? Is the traffic exiting the FortiGate to the destination as expected? Is the FortiGate sending traffic back to the originator? 	Performing a sniffer trace or packet capture on page 3312
Packet flow	Is traffic entering or leaving the FortiGate as expected?	Debugging the packet flow on page 3314

Checking the system date and time

The system date and time are important for FortiGuard services, logging events, and sending alerts. The wrong time makes the log entries confusing and difficult to use.

When possible, use Network Time Protocol (NTP) to set the date and time. This is an automatic method that does not require manual intervention. However, you must ensure that the port is allowed through the firewalls on your network. FortiToken synchronization requires NTP in many situations.

For information about setting the system date and time, see [Setting the system time on page 2451](#).

To view and configure the date and time in the GUI:

1. Go to *Dashboard > Status*. The date and time are displayed in the *System Information* widget, next to *System Time*.
2. Go to *System > Settings*.
3. In the *System Time* section, select *NTP*, and then configure the *Time Zone*, and *Set Time* settings as required.

To view the date and time in the CLI:

```
execute date
execute time
```

To configure the date and time in the CLI:

Use the `set timezone ?` command to display a list of timezones and the integers that represent them.

```
config system global
    set timezone <integer>
end
config system ntp
    set type custom
    config ntpserver
        edit 1
            set server "ntp1.fortinet.net"
        next
        edit 2
            set server "ntp2.fortinet.net"
        next
    end
    set ntpsync enable
    set syncinterval 60
end
```

Checking the hardware connections

If traffic is not flowing from the FortiGate, there may be a problem with the hardware connection.

To check hardware connections:

1. Ensure the network cables are plugged into the interfaces.
2. Verify the LED connection lights for the network cables indicate there is a connection. The lights are typically green when there is a connection.
3. Change the cable when:
 - The cable or its connector are damaged.
 - You are unsure of the type or quality of the cable, such as straight through or crossover.
 - You see exposed wires at the connector.
4. Connect the FortiGate to different hardware.
5. Go to *Network > Interfaces* to ensure the link status for the interface is set to *Up*.
The link status is based on the physical connection and cannot be set in FortiOS.

To enable an interface in the GUI:

You should still perform basic software connectivity tests to ensure complete connectivity even if there was a problem with the hardware connection. The interface might also be disabled, or its *Status* might be set to *Down*. See [Interfaces on page 161](#).

1. Go to *Network > Interfaces*.
2. Select an interface, such as *Port1*, and click *Edit*.
3. In the *Miscellaneous* area, next to *Status*, click *Enabled*.
4. Click *OK*.

To enable an interface in the CLI:

```
config system interface
```

```
edit port1
    set status up
next
end
```

Checking FortiOS network settings

Check the FortiOS network settings if you have problems connecting to the management interface. FortiOS network settings include, interface settings, DNS Settings, and DHCP settings.

Interface settings

If you can access the FortiGate with the management cable only, you can view the interface settings in the GUI.

To view the interface settings in the GUI:

1. Go to *Network > Interfaces*.
2. Select an interface and click *Edit*.
3. Check the following interfaces to ensure they are not blocking traffic.

Setting	Description
Link Status	<p>The status is <i>Up</i> when a valid cable is plugged in. The status is <i>Down</i> when an invalid cable is plugged in.</p> <p>The Link Status is shown physically by the connection LED for the interface. If the LED is green, the connection is good. If Link Status is <i>Down</i>, the interface does not work.</p> <p>Link status also appears in the <i>Network > Interfaces</i> page by default.</p>
Addressing mode	Do not use <i>DHCP</i> if you do not have a DHCP server. You will not be able to log into an interface in DHCP mode as it will not have an IP address.
IP/Network Mask	An interface requires an IP address to connect to other devices. Ensure there is a valid IP address in this field. The one exception is when <i>DHCP</i> is enabled for this interface to get its IP address from an external DHCP server.
IPv6 address	The same protocol must be used by both ends to complete the connection. Ensure this interface and the remote connection are both using IPv4 or both are using IPv6 addresses.
Administrative access	If no protocols are selected, you will have to use the local management cable to connect to the unit. If you are using IPv6, configure the IPv6 administrative access protocols.
Status	Ensure the status is set to <i>Up</i> or the interface will not work.

To display the internal interface settings in the CLI:

```
FGT# show system interface <interface_name>
```

To view the list of possible interface settings:

```
config system interface
    edit <interface_name>
        get
    end
```

DNS settings

To view DNS settings in the GUI:

Go to *Network > DNS*.

You can trace many networking problems back to DNS issues. Check the following items:

1. Are there values for both the *Primary DNS server* and *Secondary DNS server* fields.
2. Is the *Local Domain Name* correct?
3. Are you using IPv6 addressing? If so, are the IPv6 DNS settings correct?
4. Are you using Dynamic DNS (DDNS)? If so, is it using the correct server, credentials, and interface?
5. Can you contact both DNS servers to verify the servers are operational?
6. If an interface addressing mode is set to DHCP and is set to override the internal DNS, is that interface receiving a valid DNS entry from the DHCP server? Is it a reasonable address and can it be contacted to verify it is operational?
7. Are there any DENY security policies that need to allow DNS?
8. Can any internal device perform a successful traceroute to a location using the FQDN?

DHCP server settings

DHCP servers are common on internal and wireless networks. The DHCP server will cause problems if it is not configured correctly.

To view DHCP server settings in the GUI:

1. Go to *Network > Interfaces*.
2. Select an interface, and click *Edit*.

Check the following items:

1. Is the DHCP server enabled?
2. Is the DHCP server entry set to *Relay*? If so, verify there is another DHCP server to which requests can be relayed. Otherwise, set it to *Server*.
3. Does the DHCP server use a valid IP address range? Are other devices using the addresses? If one or more devices are using IP addresses in this range, you can use the IP reservation feature to ensure the DHCP server does not use these addresses. See [DHCP servers and relays on page 384](#)
4. Is there a gateway entry? If not, add a gateway entry to ensure that the server's clients have a default route.
5. Is the system DNS setting being used? A best practice is to avoid confusion by using the system DNS whenever possible. However, you can specify up to three custom DNS servers, and you should use all three entries for redundancy.

There are some situations, such as a new wireless interface, or during the initial FortiGate configuration, where interfaces override the system DNS entries. When this happens, it often shows up as intermittent Internet connectivity.

To fix the problem, go to *Network > DNS*, and enable *Use FortiGuard Servers*.

Checking CPU and memory resources

Check the CPU and memory resources when the FortiGate is not working, the network is slow, or there is a reduced firewall session setup rate. All processes share the system resources in FortiOS, including CPU and memory.

To view system resources in the GUI:

Go to *Dashboard > Status*.

The resource information is located in the *CPU* and *Memory* widgets. For information, see [Dashboards and Monitors on page 101](#).

To view system resources in the CLI:

```
get system performance status
```

Sample output:

```
FGT# get system performance status
CPU states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
CPU0 states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
CPU1 states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
CPU2 states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
CPU3 states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
Memory: 4050332k total, 527148k used (13%), 3381312k free (83%), 141872k freeable (3%)
Average network usage: 41 / 28 kbps in 1 minute, 54 / 44 kbps in 10 minutes, 42 / 34 kbps
in 30 minutes
Average sessions: 33 sessions in 1 minute, 48 sessions in 10 minutes, 38 sessions in 30
minutes
Average session setup rate: 0 sessions per second in last 1 minute, 0 sessions per second
in last 10 minutes, 0 sessions per second in last 30 minutes
Virus caught: 0 total in 1 minute
IPS attacks blocked: 0 total in 1 minute
Uptime: 0 days, 22 hours, 59 minutes
```

The first line of the output shows the CPU usage by category:

```
CPU states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
```

The second line of the output shows the memory usage:

```
Memory: 4050332k total, 527148k used (13%), 3381312k free (83%), 141872k freeable (3%)
```

Memory usage should not exceed 90%. Using too much memory prevents some processes from functioning properly. For example, if the system is running low on memory, antivirus scanning enters into *failopen* mode where it drops connections or bypasses the antivirus system.

Other lines of output, such as average network usage, average session setup rate, viruses caught, and IPS attacks blocked, help determine why system resource usage is high.

For example:

- A high average network usage may indicate high traffic processing on the FortiGate,
- A very low or zero, average session setup rate may indicate the proxy is overloaded and unable to do its job.

Troubleshooting CPU and network resources

FortiGate has stopped working

If the FortiGate has stopped working, the first line of the output will look similar to this:

```
CPU states: 0% user 0% system 0% nice 100% idle
```

Network is slow

If your network is running slow, the first line of the output will look similar to this:

```
CPU states: 1% user 98% system 0% nice 1% idle
```

This example shows that all of the CPU is being used by system processes, and the FortiGate is overloaded. When overloading occurs, it is possible a process such as `scanunitid` is using all the resources to scan traffic. In this case you need to reduce the amount of traffic being scanned by blocking unwanted protocols, configuring more security policies to limit scanning to certain protocols, or similar actions.

It is also possible a hacker has accessed your network and is overloading it with malicious activity, such as running a spam server or using zombie PCs to attack other networks on the Internet.

You can use the following command to investigate the problem with the CPU:

```
get system performance top
```

This command shows all of the top processes that are running on the FortiGate and their CPU usage. The process names are on the left. If a process is using most of the CPU cycles, investigate it to determine whether the activity is normal.

Reduced firewall session setup rate

A reduced firewall session setup rate can be caused by a lack of system resources on the FortiGate, or reaching the session count limit for a VDOM.

As a best practice, administrators should record the session setup rate during normal operation to establish a baseline to help define a problem when you are troubleshooting.

The session setup rate appears in the `average sessions` section of the output.

A reduced firewall session setup rate will look similar to this:

```
Average sessions: 80 sessions in 1 minute, 30 sessions in 10 minutes, 42 sessions in 30
minutes
```

```
Average session setup rate: 3 sessions per second in last 1 minute, 0 sessions per second in
last 10 minutes, 0 sessions per second in last 30 minutes
```

In the example above, there were 80 sessions in 1 minute, or an average of 3 sessions per second.

The values for `10 minutes` and `30 minutes` allow you to take a longer average for a more reliable value if your FortiGate is working at maximum capacity. The smallest FortiGate can have 1,000 sessions established per second across the unit.

The session setup rate is a global command. If you have multiple VDOMs configured with many sessions in each VDOM, the session setup rate per VDOM will be slower than if there are no VDOMs configured.

High memory usage

As with any system, a FortiGate has limited hardware resources, such as memory, and all processes running on the FortiGate share the memory. Each process uses more or less memory, depending on its workload. For example, a process usually uses more memory in high traffic situations. If some processes use all of the available memory, other processes will not be able to run.

When high memory usage occurs, the services may freeze up, connections may be lost, or new connections may be refused.

If you see high memory usage in the *Memory* widget, the FortiGate may be handling high traffic volumes. Alternatively, the FortiGate may have problems with connection pool limits that are affecting a single proxy. If the FortiGate receives large volumes of traffic on a specific proxy, the unit may exceed the connection pool limit. If the number of free connections within a proxy connection pool reaches zero, issues may occur.

To view current memory usage information in the CLI:

```
diagnose hardware sysinfo memory
```

Sample output:

```
total: used: free: shared: buffers: cached: shm:
Mem: 2074185728 756936704 1317249024 0 20701184 194555904 161046528
Swap:      0      0      0
MemTotal:   2025572 kB
MemFree:    1286376 kB
MemShared:      0 kB
Buffers:     20216 kB
Cached:      189996 kB
SwapCached:      0 kB
Active:      56644 kB
Inactive:    153648 kB
HighTotal:      0 kB
HighFree:      0 kB
LowTotal:     2025572 kB
LowFree:      1286376 kB
SwapTotal:      0 kB
SwapFree:      0 kB
```

Troubleshooting high CPU usage

Connection-related problems may occur when FortiGate's CPU resources are over extended. This occurs when you deploy too many FortiOS features at the same time.

Examples of CPU intensive features:

- VPN high-level encryption
- Intensive scanning of all traffic
- Logging all traffic and packets
- Dashboard widgets that frequently perform data updates

For information on customizing the CPU use threshold, see [Execute a CLI script based on memory and CPU thresholds on page 2990](#).

Determining the current level of CPU usage

You can view CPU usage levels in the GUI or CLI. For precise usage values for both overall usage and specific processes, use the CLI.

To view CPU usage in the GUI:

Go to *Dashboard > Status*. Real-time CPU usage information is located in the *CPU* widget.

To view CPU usage in the CLI:

- Show top processes information:
`diagnose sys top`
- Show top threads information:
`diagnose sys top-all`

Sample output:

```
Run Time: 86 days, 0 hours and 10 minutes
OU, ON, OS, 100I, OWA, OHI, OSI, OST; 3040T, 2437F
bcm.user 93 S < 3.1 0.4
httpsd 18922 S 1.5 0.5
httpsd 19150 S 0.3 0.5
newcli 20195 R 0.1 0.1
cmdbsvr 115 S 0.0 0.8
pyfcgid 20107 S 0.0 0.6
forticron 146 S 0.0 0.5
httpsd 139 S 0.0 0.5
cw_acd 166 S 0.0 0.5
miglogd 136 S 0.0 0.5
pyfcgid 20110 S 0.0 0.4
pyfcgid 20111 S 0.0 0.4
pyfcgid 20109 S 0.0 0.4
httpsd 20192 S 0.0 0.4
miglogd 174 S 0.0 0.4
miglogd 175 S 0.0 0.4
fgfmd 165 S 0.0 0.3
newcli 20191 S 0.0 0.3
initXXXXXXXXXX 1 S 0.0 0.3
httpsd 184 s 0.0 0.3
```

The following table explains the codes in the second line of the output:

Code	Description
U	Percentage of user space applications that are currently using the CPU
N	Percentage of time that the CPU spent on low priority processes since the last shutdown
S	Percentage of system processes (or kernel processes) that are using the CPU
I	Percentage of idle CPU resources
WA	Percentage of time that the CPU spent waiting on IO peripherals since the last shutdown
HI	Percentage of time that the CPU spent handling hardware interrupt routines since the last shutdown
SI	Percentage of time that the CPU spent handling software interrupt routines since the last shutdown
ST	Steal time: Percentage of time a virtual CPU waits for the physical CPU when the hypervisor is servicing another virtual processor
T	Total FortiOS system memory in MB
F	Free memory in MB

Each additional line of the command output displays information specific to processes or threads that are running on the FortiGate unit. For example, the sixth line of the output is: `newcli 20195 R 0.1 0.1`

The following table describes the data in the sixth line of the output:

Item	Description
<code>newcli</code>	The process (or thread) name. Duplicate process or thread names indicate that separate instances of that process or thread are running.
<code>20195</code>	The process or thread ID, which can be any number.
<code>R</code>	Current state of the process or thread. The process or thread state can be: <ul style="list-style-type: none"> • R - running • S - sleep • Z - zombie • D- disk sleep
<code>0.1</code>	The percentage of CPU capacity that the process or thread is using. CPU usage can range from 0.0 for a process or thread that is sleeping to higher values for a process or thread that's taking a lot of CPU time.
<code>0.1</code>	The amount of memory that the process or thread is using. Memory usage can range from 0.1 to 5.5 and higher.

You can use the following single-key commands when running `diagnose sys top` or `diagnose sys top-all`:

- `q` to quit and return to the normal CLI prompt.
- `p` to sort the processes by the amount of CPU that the processes are using.
- `m` to sort the processes by the amount of memory that the processes are using.

The output only displays the top processes or threads that are running. For example, if 20 are listed, they are the top 20 currently running, sorted by either CPU or memory usage. You can configure the number of processes or threads displayed, using the following CLI commands:

```
diagnose sys top <integer_seconds> <integer_maximum_lines>
diagnose sys top-all <integer_seconds> <integer_maximum_lines>
```

Where:

- <integer_seconds> is the delay in seconds (default is 5)
- <integer_maximum_lines> is the maximum number of lines (or processes) to list (default is 20)

Determining which features are using the most CPU resources

You can use the CLI to view the top few processes that are currently running and using the most CPU resources.

To view processes using the most CPU resources:

```
get system performance top
```

The entries at the top are using the most CPU resources. The second column from the right shows CPU usage by percentage. Note which processes are using the most resources and try to reduce their CPU load.

Processes you will see include:

- `ipsengine`: the IPS engine that scans traffic for intrusions
- `scanunitd`: antivirus scanner
- `httpsd`: secure HTTP
- `iked`: internet key exchange (IKE) in use with IPsec VPN tunnels
- `newcli`: active whenever you're accessing the CLI
- `sshd`: there are active secure socket connections
- `cmdbsrv`: the command database server application

Go to the features that are at the top of the list and look for evidence of CPU overuse. Generally, the monitor for a feature is a good place to start.

Checking for unnecessary CPU “wasters”

These are some best practices that will reduce your CPU usage, even if the FortiGate is not experiencing high CPU usage. Note that if the following information instructs you to turn off a feature that you require, disregard that part of the instructions.

- Use hardware acceleration wherever possible to offload tasks from the CPU. Offloading tasks, such as encryption, frees up the CPU for other tasks.
- Schedule antivirus, IPS, and firmware updates during off-peak hours. These updates do not usually consume CPU resources but they can disrupt normal operation.
- Check the log levels and which events are being logged. This is the severity of the messages that are recorded. Consider going up one level to reduce the amount of logging. Also, if there are events you do not need to monitor, remove them from the list.
- Log to FortiCloud instead of logging to memory or disk. Logging to memory quickly uses up resources and logging to local disk impacts overall performance and reduces the lifetime of the unit. Fortinet recommends logging to FortiCloud to avoid using too much CPU.

- If the disk is almost full, transfer the logs or data off the disk to free up space. When a disk is almost full it consumes a lot of resources to find free space and organize the files.
- If packet logging is enabled on the FortiGate, consider disabling it. When packet logging is enabled, it records every packet that comes through that policy.
- Halt all sniffers and traces.
- Ensure the FortiGate isn't scanning traffic twice. Traffic does not need to be rescanned if it enters the FortiGate on one interface, goes out another, and then comes back in again. Doing so is a waste of resources. However, ensure that traffic truly is being scanned once.
- Reduce the session timers to close unused sessions faster. Enter the following CLI commands, which reduce the default values. Note that, by default, the system adds 10 seconds to `tcp-timewait`.

```
config system global
    set tcp-halfclose-timer 30
    set tcp-halfopen-timer 30
    set tcp-timewait-timer 0
    set udp-idle-timer 60
end
```

- Go to *System > Feature Visibility*, and enable only features that you need.

SNMP monitoring

When CPU usage is under control, use SNMP to monitor CPU usage. Alternatively, use logging to record CPU and memory usage every 5 minutes.

Once the system is back to normal, you should set up a warning system that sends alerts when CPU resources are used excessively. A common method to do this is using SNMP. SNMP monitors many values in FortiOS and allows you to set high water marks that generate events. You can run an application on your computer to watch for and record these events.

To enable SNMP:

1. Go to *System > SNMP*.
2. Configure an SNMP community.

See [SNMP on page 2661](#).

You can use the *System Resources* widget to record CPU usage if SNMP is too complicated. However, the widget only records problems as they happen and will not send you alerts for problems.

Checking the modem status

You can use the CLI to troubleshoot a modem that is not working properly, or troubleshoot a FortiGate that does not detect the modem.

To diagnose modem issues in the CLI:

```
diagnose sys modem {cmd | com | detect | history | external-modem | query| reset}
```

You should always run the following command after you connect a USB modem to FortiGate:

```
diagnose sys modem detect
```

Use the following command to view the modem's configuration, vendor and custom product identification number:

```
get system modem
```

Use the following commands to resolve connectivity issues:

- `diagnose debug enable`: Activates the debug on the console
- `diagnose debug application modemd`: Dumps communication between the modem and the unit.
- `diagnose debug application ppp`: Dumps the PPP negotiating messages.
- `execute modem dial`: Displays modem debug output.

The modem diagnose output should not contain errors when initializing. You should also verify the number used to dial into your ISP.

Running ping and traceroute

Ping and traceroute are useful tools in network troubleshooting. Alone, either tool can determine network connectivity between two points. However, ping can be used to generate simple network traffic that you can view using `diagnose` commands in FortiGate. This combination can be very powerful when you are trying to locate network problems.

Ping and traceroute can also tell you if your computer or network device has access to a domain name server (DNS). Both tools can use IP addresses or device domain names to determine why particular services, such as email or web browsing, may not work properly.

If ping does not work, it may be disabled on at least one of the interface settings and security policies for that interface.

Both ping and traceroute require particular ports to be open on firewalls to function. Since you typically use these tools to troubleshoot, you can allow them in the security policies and on interfaces only when you need them. Otherwise, keep the ports disabled for added security.

Ping

The ping command sends a very small packet to a destination, and waits for a response. The response has a timer that expires when the destination is unreachable.

Ping is part of layer 3 on the OSI Networking Model. Ping sends Internet Control Message Protocol (ICMP) "echo request" packets to the destination, and listens for "echo response" packets in reply. However, many public networks block ICMP packets because ping can be used in a denial of service (DoS) attack (such as Ping of Death or a smurf attack), or by an attacker to find active locations on the network. By default, FortiGate units have ping enabled while broadcast-forward is disabled on the external interface.

What ping can tell you

Beyond the basic connectivity information, ping can tell you the amount of packet loss (if any), how long it takes the packet to make the round trip, and the variation in that time from packet to packet.

If packet loss is detected, you should investigate the following:

- Possible ECMP, split horizon, or network loops.
- Cabling, to ensure there are no loose connections.

- Verify which security policy was used. To do this:
Go to *Policy & Objects > Firewall Policy* and view the packet count column.

If there is total packet loss, you should investigate the following:

1. Ensure cabling is correct, and all equipment between the two locations is accounted for.
2. Ensure all IP addresses and routing information along the route is configured as expected.
3. Ensure all firewalls, including FortiGate security policies allow PING to pass through.

How to use ping

Ping syntax is the same for nearly every type of system on a network.

To ping from a FortiGate unit:

1. Go to *Dashboard*, and connect to the CLI through either telnet or the CLI widget.
2. Enter `execute ping 10.11.101.101` to send 5 ping packets to the destination IP address. There are no options for this command.

```
Head_Office_620b # execute ping 10.11.101.101
PING 10.11.101.101 (10.11.101.101): 56 data bytes
64 bytes from 10.11.101.101: icmp_seq=0 ttl=255 time=0.3 ms
64 bytes from 10.11.101.101: icmp_seq=1 ttl=255 time=0.2 ms
64 bytes from 10.11.101.101: icmp_seq=2 ttl=255 time=0.2 ms
64 bytes from 10.11.101.101: icmp_seq=3 ttl=255 time=0.2 ms
64 bytes from 10.11.101.101: icmp_seq=4 ttl=255 time=0.2 ms
```

```
--- 10.11.101.101 ping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
round-trip min/avg/max = 0.2/0.2/0.3 ms
```

To ping from a Microsoft Windows PC:

1. Open a command window.
2. Enter `ping 10.11.101.100` to ping the default internal interface of the FortiGate with four packets.

Other options include:

- `-t` to send packets until you press `Ctrl+C`
- `-a` to resolve addresses to domain names where possible
- `-n X` to send X ping packets and stop

```
C:\>ping 10.11.101.101
```

```
Pinging 10.11.101.101 with 32 bytes of data:
Reply from 10.11.101.101: bytes=32 time=10ms TTL=255
Reply from 10.11.101.101: bytes=32 time<1ms TTL=255
Reply from 10.11.101.101: bytes=32 time=1ms TTL=255
Reply from 10.11.101.101: bytes=32 time=1ms TTL=255
```

```
Ping statistics for 10.11.101.101:
Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
Minimum = 0ms, Maximum = 10ms, Average = 3ms
```

To ping from a Linux PC:

1. Go to a shell prompt.
2. Enter `"ping 10.11.101.101"`.

Traceroute

Where ping will only tell you if it reached its destination and returned successfully, traceroute shows each step of the journey to its destination and how long each step takes. If ping finds an outage between two points, you can use traceroute to locate exactly where the problem is.

Traceroute works by sending ICMP packets to test each hop along the route. It sends three packets, and then increases the time to live (TTL) setting by one each time. This effectively allows the packets to go one hop farther along the route. This is why most traceroute commands display their maximum hop count before they start tracing the route, which is the maximum number of steps it takes before it declares the destination unreachable. Also, the TTL setting may result in steps along the route timing out due to slow responses. There are many possible reasons for this to occur.

By default, traceroute uses UDP datagrams with destination ports numbered from 33434 to 33534. The traceroute utility may also offer the option to select use of ICMP echo request (type 8) instead, which the Windows tracert utility uses. If you must, allow both protocols inbound through the FortiGate security policies (UDP with ports from 33434 to 33534 and ICMP type 8).

To track traceroute packets in the GUI:

Go to *Policy & Objects > Firewall Policy* and view the packet count column.

This allows you to verify the connection and confirm which security policy the traceroute packets are using.

What traceroute can tell you

Both ping and traceroute verify connectivity between two points. However, only traceroute shows you each step in the connection path. Also, ping and traceroute use different protocols and ports, so one may succeed where the other fails.

You can verify your DNS connection using traceroute. If you enter an FQDN instead of an IP address for the traceroute, DNS tries to resolve that domain name. If the name isn't resolved, you have DNS issues.

Using traceroute

The traceroute command varies slightly between operating systems. In Microsoft Windows, the command name is shortened to `"tracert"`. Also, your output lists different domain names and IP addresses along your route.

To use traceroute on a Microsoft Windows PC:

1. Open a command window.
2. Enter `tracert fortinet.com` to trace the route from the PC to the Fortinet web site.

```
C:\>tracert fortinet.com
Tracing route to fortinet.com [208.70.202.225]
over a maximum of 30 hops:
 1 <1 ms <1 ms <1 ms 172.20.120.2
 2 66 ms 24 ms 31 ms 209-87-254-xxx.storm.ca [209.87.254.221]
 3 52 ms 22 ms 18 ms core-2-g0-0-1104.storm.ca [209.87.239.129]
 4 43 ms 36 ms 27 ms core-3-g0-0-1185.storm.ca [209.87.239.222]
 5 46 ms 21 ms 16 ms te3-x.1156.mpd01.cogentco.com [38.104.158.69]
```

```

6 25 ms 45 ms 53 ms te8-7.mpd01.cogentco.com [154.54.27.249]
7 89 ms 70 ms 36 ms te3-x.mpd01.cogentco.com [154.54.6.206]
8 55 ms 77 ms 58 ms sl-st30-chi-.sprintlink.net [144.232.9.69]
9 53 ms 58 ms 46 ms sl-0-3-3-x.sprintlink.net [144.232.19.181]
10 82 ms 90 ms 75 ms sl-x-12-0-1.sprintlink.net [144.232.20.61]
11 122 ms 123 ms 132 ms sl-0-x-0-3.sprintlink.net [144.232.18.150]
12 129 ms 119 ms 139 ms 144.232.20.7
13 172 ms 164 ms 243 ms sl-321313-0.sprintlink.net [144.223.243.58]
14 99 ms 94 ms 93 ms 203.78.181.18
15 108 ms 102 ms 89 ms 203.78.176.2
16 98 ms 95 ms 97 ms 208.70.202.225

```

The first column on the left is the hop count, which cannot exceed 30 hops. When that number is reached, the traceroute ends.

The second, third, and fourth columns display how much time each of the three packets takes to reach this stage of the route. These values are in milliseconds and normally vary quite a bit. Typically a value of <1ms indicates a local connection.

The fifth column (farthest to the right) shows the domain name of the device and its IP address, or possibly only the IP address.

To perform a traceroute on a Linux PC:

1. Go to a command line prompt.
2. Enter "traceroute fortinet.com".

The Linux traceroute output is very similar to the Windows `tracert` output.

To trace a route from a FortiGate to a destination IP address in the CLI:

```

# execute traceroute www.fortinet.com

traceroute to www.fortinet.com (66.171.121.34), 32 hops max, 84 byte packets
1 172.20.120.2 0.637 ms 0.653 ms 0.279 ms
2 209.87.254.221 <static-209-87-254-221.storm.ca> 2.448 ms 2.519 ms 2.458 ms
3 209.87.239.129 <core-2-g0-2.storm.ca> 2.917 ms 2.828 ms 9.324 ms
4 209.87.239.199 <core-3-bdi1739.storm.ca> 13.248 ms 12.401 ms 13.009 ms
5 216.66.41.113 <v502.core1.tor1.he.net> 17.181 ms 12.422 ms 12.268 ms
6 184.105.80.9 <100ge1-2.core1.nyc4.he.net> 21.355 ms 21.518 ms 21.597 ms
7 198.32.118.41 <ny-paix-gni.twgate.net> 83.297 ms 84.416 ms 83.782 ms
8 203.160.228.217 <217-228-160-203.TWGATE-IP.twgate.net> 82.579 ms 82.187 ms 82.066 ms
9 203.160.228.229 <229-228-160-203.TWGATE-IP.twgate.net> 82.055 ms 82.455 ms 81.808 ms
10 203.78.181.2 82.262 ms 81.572 ms 82.015 ms
11 203.78.186.70 83.283 ms 83.243 ms 83.293 ms
12 66.171.127.177 84.030 ms 84.229 ms 83.550 ms
13 66.171.121.34 <www.fortinet.com> 84.023 ms 83.903 ms 84.032 ms
14 66.171.121.34 <www.fortinet.com> 83.874 ms 84.084 ms 83.810 ms

```

Checking the logs

A log message records the traffic passing through FortiGate to your network and the action FortiGate takes when it scans the traffic. You should log as much information as possible when you first configure FortiOS. If FortiGate logs are too large, you can turn off or scale back the logging for features that are not in use.

It is difficult to troubleshoot logs without a baseline. Before you can determine if the logs indicate a problem, you need to know what logs result from normal operation.

When troubleshooting with log files

- Compare current logs to a recorded baseline of normal operation.
- If you need to, increase the level of logging (such as from Warning to Information) to obtain more information. When increasing logging levels, ensure that you configure email alerts and select both disk usage and log quota. This ensures that you will be notified if the increase in logging causes problems.

To configure the log settings in the GUI:

Go to *Log & Report > Log Settings*.

Determine the activities that generate the most log entries:

- Check all logs to ensure important information is not overlooked.
- Filter or order log entries based on different fields, such as level, service, or IP address, to look for patterns that may indicate a specific problem, such as frequent blocked connections on a specific port for all IP addresses.

Logs can help identify and locate any problems, but they do not solve them. The purpose of logs is to speed up your problem solving and save you time and effort.

For more information about logging and log reports, see [Log and Report on page 3149](#).

Verifying routing table contents in NAT mode

Verify the contents of the routing table when a FortiGate has limited or no connectivity.

The routing table stores the routes currently in use for both static and dynamic protocols. Storing a route in the routing table saves time and resources performing a lookup. To ensure the most recently used routes remain in the table, old routes are bumped to make room for new ones. You cannot perform this task when FortiGate is in transparent mode.

If FortiGate is running in NAT mode, verify that all desired routes are in the routing table, including local subnets, default routes, specific static routes, and dynamic routing protocols.

To view the routing table in the CLI:

```
get router info routing-table all
```

Sample output:

```
FGT# get router info routing-table all
Codes:
  K - kernel, C - connected, S - static, R - RIP, B - BGP
  O - OSPF, IA - OSPF inter area
  N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
  E1 - OSPF external type 1, E2 - OSPF external type 2
  i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
  * - candidate default
S* 0.0.0.0/0 [10/0] via 172.20.120.2, wan1
C 10.31.101.0/24 is directly connected, internal
C 172.20.120.0/24 is directly connected, wan1
```

Verifying the correct route is being used

Run a trace route from a machine in the local area network (LAN) to ensure traffic is flowing as expected through the correct route when there is more than one default route.

In the following example output:

- The first hop contains the IP address 10.10.1.99, which is the internal interface of the FortiGate.
- The second hop contains the IP address 172.20.120.2, to which the wan1 interface of the FortiGate is connected.

This means the route through the wan1 interface is being used for this traffic.

```
C:\>tracert www.fortinet.com
Tracing route to www.fortinet.com [66.171.121.34]
over a maximum of 30 hops:
 1 <1 ms <1 ms <1 ms 10.10.1.99
 2 1 ms <1 ms <1 ms 172.20.120.2
 3 3 ms 3 ms 3 ms static-209-87-254-221.storm.ca [209.87.254.221]
 4 3 ms 3 ms 3 ms core-2-g0-2.storm.ca [209.87.239.129]
 5 13 ms 13 ms 13 ms core-3-bdi1739.storm.ca [209.87.239.199]
 6 12 ms 19 ms 11 ms v502.core1.tor1.he.net [216.66.41.113]
 7 22 ms 22 ms 21 ms 100ge1-2.core1.nyc4.he.net [184.105.80.9]
 8 84 ms 84 ms 84 ms ny-paix-gni.twgate.net [198.32.118.41]
 9 82 ms 84 ms 82 ms 217-228-160-203.TWGATE-IP.twgate.net [203.160.22
8.217]
10 82 ms 81 ms 82 ms 229-228-160-203.TWGATE-IP.twgate.net [203.160.22
8.229]
11 82 ms 82 ms 82 ms 203.78.181.2
12 84 ms 83 ms 83 ms 203.78.186.70
13 84 ms * 85 ms 66.171.127.177
14 84 ms 84 ms 84 ms fortinet.com [66.171.121.34]
15 84 ms 84 ms 83 ms fortinet.com [66.171.121.34]
```

You can also see the route taken for each session by debugging the packet flow in the CLI. For more information, see [Debugging the packet flow on page 3314](#).

Verifying the correct firewall policy is being used

If you have more than one firewall policy, you can check which policy is being used in the *Policy & Objects* module in the GUI.

To verify the firewall policy in the GUI:

1. Go to *Policy & Objects > Firewall Policy*.
2. Look in the *Count* column to see which policy is being used. The count must show traffic increasing.

Debugging the packet flow in the CLI shows the policy ID that's allowing the traffic. For information, see [Debugging the packet flow on page 3314](#).

Checking the bridging information in transparent mode

Checking the bridging information is useful when you are experiencing connectivity problems. When FortiGate is set to transparent mode, it acts like a bridge and sends all incoming traffic out on the other interfaces. Each bridge is a link between interfaces.

When traffic is flowing between the interfaces, you can see the bridges listed in the CLI. If no bridges are listed, this is the likely cause of the connectivity issue. When investigating bridging information, check for the MAC address of the interface or device in question.

How to check the bridging information

To view the list of bridge instances in the CLI:

```
diagnose netlink brctl list
```

Sample output:

```
#diagnose netlink brctl list
list bridge information
1. root.b fdb: size=256 used=6 num=7 depth=2 simple=no
Total 1 bridges
```

How to display forwarding domain information

You can use forwarding domains, or collision domains, in routing to limit where packets are forwarded on the network. Layer 2 broadcasts are limited to the same group. By default, all interfaces are in group 0. For example, if the FortiGate has 12 interfaces, only two may be in the same forwarding domain, which limits packets that are broadcast to those two interfaces. This reduces traffic on the rest of the network.

Collision domains prevent the forwarding of ARP packets to all VLANs on an interface. Without collision domains, duplicate MAC addresses on VLANs may cause ARP packets to be duplicated. Duplicate ARP packets can cause some switches to reset. It's important to know what interfaces are part of which forwarding domains because this determines which interfaces can communicate with each other.

To manually configure forwarding domains in transparent mode in the CLI:

```
config system interface
  edit <interface_name>
    set forward-domain <integer>
  end
```

To display the forward domains information in the CLI:

```
diagnose netlink brctl domain <name> <id>
```

Where <name> is the name of the forwarding domain to display and <id> is the domain ID.

Sample output:

```
diagnose netlink brctl domain ione 101
show bridge root.b ione forward domain.
```

```
id=101 dev=trunk_1 6
```

To list the existing bridge MAC table in the CLI:

```
diagnose netlink brctl name host <name>
```

Sample output:

```
show bridge control interface root.b host.
fdb: size=256, used=6, num=7, depth=2, simple=no
Bridge root.b host table
```

port no	device	devname	mac addr	tth	attributes
2	7	wan2	02:09:0f:78:69:00	0	Local Static
5	6	vlan_1	02:09:0f:78:69:01	0	Local Static
3	8	dmz	02:09:0f:78:69:01	0	Local Static
4	9	internal	02:09:0f:78:69:02	0	Local Static
3	8	dmz	00:80:c8:39:87:5a	194	
4	9	internal	02:09:0f:78:67:68	8	
1	3	wan1	00:09:0f:78:69:fe	0	Local Static

To list the existing bridge port list in the CLI:

```
diagnose netlink brctl name port <name>
```

Sample output:

```
show bridge root.b data port.
trunk_1 peer_dev=0
internal peer_dev=0
dmz peer_dev=0
wan2 peer_dev=0
wan1 peer_dev=0
```

Checking wireless information

Check wireless connections, stations, and interfaces when the problem is not caused by a physical interface.

Troubleshooting station connection issues

To check if a station entry is created on access control in the CLI:

```
FG600B3909600253 # diagnose wireless-controller wla -d sta
* vf=0 wtp=70 rId=2 wlan=open ip=0.0.0.0 mac=00:09:0f:db:c4:03 rssi=0 idle=148 bw=0 use=2
vf=0 wtp=70 rId=2 wlan=open ip=172.30.32.122 mac=00:25:9c:e0:47:88 rssi=-40 idle=0 bw=9
use=2
```

Enabling diagnostics for a specific station

This example uses the station MAC address to find where it is failing:

```
FG600B3909600253 # diagnose wireless-controller wlacl sta_filter 00:25:9c:e0:47:88 1
Set filter sta 00:25:9c:e0:47:88 level 1
FG600B3909600253 # 71419.245 <ih> IEEE 802.11 mgmt::disassoc <== 00:25:9c:e0:47:88 vap open
rId 1 wId 0 00:09:0f:db:c4:03
71419.246 <dc> STA del 00:25:9c:e0:47:88 vap open rId 1 wId 0
71419.246 <cc> STA_CFG_REQ(34) sta 00:25:9c:e0:47:88 del ==> ws (0-192.168.35.1:5246) rId 1
wId 0
71419.246 <cc> STA del 00:25:9c:e0:47:88 vap open ws (0-192.168.35.1:5246) rId 1 wId 0
00:09:0f:db:c4:03 sec open reason I2C_STA_DEL
71419.247 <cc> STA_CFG_RESP(34) 00:25:9c:e0:47:88 <== ws (0-192.168.35.1:5246) rc 0
(Success).
```

Performing a sniffer trace or packet capture

When you troubleshoot networks and routing in particular, it helps to look inside the headers of packets to determine if they are traveling the route that you expect them to take. Packet sniffing is also known as network tap, packet capture, or logic analyzing.

For FortiGates with NP2, NP4, or NP6 interfaces that are offloading traffic, disable offloading on these interfaces before you perform a trace or it will change the sniffer trace.

Sniffing packets

To perform a sniffer trace in the CLI:

Before you start sniffing packets, you should prepare to capture the output to a file. A large amount of data may scroll by and you will not be able to see it without saving it first. One method is to use a terminal program like PuTTY to connect to the FortiGate CLI. Once the packet sniffing count is reached, you can end the session and analyze the output in the file.

The general form of the internal FortiOS packet sniffer command is:

```
# diagnose sniffer packet <interface_name> <'filter'> <verbose> <count> <tsformat>
```

To stop the sniffer, type CTRL+C.

<interface_name>	The name of the interface to sniff, such as <code>port1</code> or <code>internal</code> . This can also be <code>any</code> to sniff all interfaces.
<'filter'>	What to look for in the information the sniffer reads. <code>none</code> indicates no filtering, and all packets are displayed as the other arguments indicate. The filter must be inside single quotes (').
<verbose>	The level of verbosity as one of: <ul style="list-style-type: none"> • 1 - print header of packets • 2 - print header and data from IP of packets • 3 - print header and data from Ethernet of packets • 4 - print header of packets with interface name • 5 - print header and data from IP of packets with interface name • 6 - print header and data from Ethernet of packets with interface name

<count>	The number of packets the sniffer reads before stopping. If you don't put a number here, the sniffer will run until you stop it with <CTRL+C>.
<tsformat>	The timestamp format. <ul style="list-style-type: none"> • a: absolute UTC time, yyyy-mm-dd hh:mm:ss.ms • l: absolute LOCAL time, yyyy-mm-dd hh:mm:ss.ms • otherwise: relative to the start of sniffing, ss.ms

Simple sniffing example:

```
# diagnose sniffer packet port1 none 1 3.
```

This displays the next three packets on the port1 interface using no filtering, and verbose level 1. At this verbosity level, you can see the source IP and port, the destination IP and port, action (such as ack), and sequence numbers.

In the output below, port 443 indicates these are HTTPS packets and that 172.20.120.17 is both sending and receiving traffic.

```
Head_Office_620b # diagnose sniffer packet port1 none 1 3
interfaces=[port1]
filters=[none]
0.545306 172.20.120.17.52989 -> 172.20.120.141.443: psh 3177924955 ack 1854307757
0.545963 172.20.120.141.443 -> 172.20.120.17.52989: psh 1854307757 ack 3177925808
0.562409 172.20.120.17.52988 -> 172.20.120.141.443: psh 4225311614 ack 3314279933
```

Using packet capture in a firewall policy

FortiGate can capture packets matching a firewall policy. You can enable `capture-packet` in the firewall policy.

To use packet capture, the FortiGate must have a disk and logging must be enabled in the firewall policy.

For information about using the packet capture tool in the GUI, see [Using the packet capture tool on page 690](#).

To enable packet capture in a policy in the GUI:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. Enter a name for the policy and configure the required settings.
3. Enable *Log Allowed Traffic* and select *Security Events* or *All Sessions*.
4. Enable *Capture Packets*.
5. Click *OK*.

To enable packet capture in a policy in the CLI:

```
config firewall policy
    edit <id>
        set action accept
        set logtraffic {all | utm}
        set capture-packet enable
    next
end
```

To view the packet capture:

1. Go to *Log & Report > Forward Traffic* and select the log that matches the firewall policy.
2. Select *Details > Archived Data* and click on the download button.

3. Open the downloaded PCAP file in a packet analyzer tool, such as Wireshark.

Debugging the packet flow

Debug the packet flow when network traffic is not entering and leaving the FortiGate as expected. When debugging the packet flow in the CLI, each command configures a part of the debug action. The final command starts the debug.

For information about using the debug flow tool in the GUI, see [Using the debug flow tool on page 696](#).

To trace the packet flow in the CLI:

```
# diagnose debug flow trace start
```

To follow packet flow by setting a flow filter:

```
# diagnose debug flow {filter | filter6} <option>
```

- Enter *filter* if your network uses IPv4.
- Enter *filter6* if your network uses IPv6.

Replace *<option>* with one of the following variables:

Variable	Description
<i>addr</i>	IPv4 or IPv6 address
<i>clear</i>	clear filter
<i>daddr</i>	destination IPv4 or IPv6 address
<i>dport</i>	destination port
<i>negate</i>	inverse IPv4 or IPv6 filter
<i>port</i>	port
<i>proto</i>	protocol number
<i>saddr</i>	source address
<i>sport</i>	source port
<i>vd</i>	index of virtual domain; -1 matches all

If FortiGate is connected to FortiAnalyzer or FortiCloud, the diagnose debug flow output will be recorded as event log messages and then sent to the devices. Do not run this command longer than necessary, as it generates a significant amount of data.

Flow monitoring does not work for traffic offloaded to NP6 or NP7 processors. To use the diagnose debug flow commands with sessions offloaded to NP6 or NP7 processors you can test the traffic flow using ICMP (ICMP traffic is not offloaded) or you can disable NP6 or NP7 offloading.

You can use the following command to temporarily disable NP6 offloading of all traffic:

```
diagnose npu {np6 | np6xlite | np6lite} fastpath disable
```

You must disable NP7 offloading in the firewall policy that accepts the traffic that you are tracing, see [Tracing packet flow on FortiGates with NP7 processors](#).

You can also use the NP7 packet sniffer to sniff NP7 offloaded traffic without disabling NP7 offloading, see [NP7 packet sniffer](#).

To start flow monitoring with a specific number of packets:

```
# diagnose debug flow trace start <N>
```

To stop flow tracing at any time:

```
# diagnose debug flow trace stop
```

The following example shows the flow trace for a device with an IP address of 203.160.224.97:

```
# diagnose debug enable
# diagnose debug flow filter addr 203.160.224.97
# diagnose debug flow show function-name enable
# diagnose debug flow trace start 100
```

Sample output: HTTP

To observe the debug flow trace, connect to the website at the following address:

```
https://www.fortinet.com
```

Comment: SYN packet received:

```
id=20085 trace_id=209 func=resolve_ip_tuple_fast
line=2700 msg="vd-root received a packet(proto=6,
192.168.3.221:1487->203.160.224.97:80) from port5."
```

SYN sent and a new session is allocated:

```

```

Testing a proxy operation

To monitor proxy operations in the CLI:

```
diagnose test application <application> <option>
```

To display a list of available application values:

```
diagnose test application ?
```

To display a list of available option values:

```
diagnose test application <application> ?
```

The <option> value will depend on the application value used in the command.

For example, if the application is `http`, the CLI command that displays the <option> values is:

```
diagnose test application http ?
```

Displaying detail Hardware NIC information

Monitoring the hardware NIC is important because interface errors indicate data link or physical layer issues which may impact the performance of the FortiGate.

To monitor hardware network operations in the CLI:

```
diagnose hardware deviceinfo nic <interface>
```

or

```
diagnose netlink interface list <interface>
```

Sample output:

The following is sample output when the <interface> is set to port1:

```
# diagnose netlink interface list port1

if=port1 family=00 type=1 index=3 mtu=1500 link=0 master=0
flags=up broadcast run multicast
Qdisc=mq hw_addr=00:0c:29:fc:18:54 broadcast_addr=ff:ff:ff:ff:ff:ff
stat: rxp=61149 txp=81109 rxb=5839308 txb=52396373 rx=0 txe=0 rxd=0 txd=0 mc=95 collision=0
@ time=1678486883
re: rxl=0 rxo=0 rxc=0 rxf=0 rxfi=0 rxm=0
te: txa=0 txc=0 txfi=0 txh=0 txw=0
misc rxc=0 txc=0
```

Field descriptions

The `diagnose hardware deviceinfo nic` and `diagnose netlink interface list` commands display lists of error names and values that are related to hardware.

The following table describes possible hardware errors:

Field	Description
Rx packets (rxp)	Number of received packets.
Tx packets (txp)	Number of transmitted packets.
Rx bytes (rxb)	Number of received bytes.
Tx bytes (txb)	Number of transmitted bytes.
Rx_Errors (rx) = rx error count	Bad frame was marked as error by PHY.
Tx_Errors (txe) = Tx_Aborted_Errors	ECOL (Excessive Collisions Count); only valid in half-duplex mode.
Rx_CRC_Errors + Rx_Length_Errors - Rx_Align_Errors	This error is only valid in 10/100M mode.
Rx_Dropped (rxd) or	Running out of buffer space.

Field	Description
Rx_No_Buffer_Count	
Tx_Dropped (txd)	Number of dropped packet.
Multicast (mc)	Number of multicast packets received.
Collisions	Total number of collisions experienced by the transmitter; valid in half-duplex mode.
Rx_Length_Errors (rxl)	Number of packets dropped due to invalid length.
Rx_Over_Errors (rxo)	Receive FIFO overflow event counter.
Rx_CRC_Errors (rxc)	Number of received packets with Frame CRC error.
Rx_Frame_Errors (rxf)	Same as Rx_Align_Errors. This error is only valid in 10/100M mode.
Rx_FIFO_Errors (rxfi)	Same as Rx_Missed_Errors - a missed packet count
Rx_Missed_Errors (rxm)	Equals Rx_FIFO_Errors + CEXTERR (Carrier Extension Error Count). Only valid in 1000M mode, which is marked by PHY.
Tx_Aborted_Errors (txa)	See Tx_Errors.
Tx_Carrier_Errors (txc)	The PHY should assert the internal carrier sense signal during every transmission. Failure to do so may indicate that the link has failed or the PHY has an incorrect link configuration. This register only increments if transmits are enabled. This register isn't valid in internal SerDes 1 mode (TBI mode for the 82544GC/EI) and is valid only when the Ethernet controller is operating at full duplex.
Tx_FIFO_Errors (txfi)	Number of Frame transmission error due to underflow.
Tx_Heartbeat_Errors (txh)	Number of heartbeat error.
Tx_Window_Errors (txw)	Late Collisions (LATECOL) Count Late collisions are collisions that occur after 64-byte time into the transmission of the packet while working in 10 to 100 Mb/s data rate and 512-byte time into the transmission of the packet while working in the 1,000 Mb/s data rate. This register only increments if transmits are enabled and the device is in half-duplex mode.
Rx compressed (misc rxc)	Number of received compressed packets.
Tx compressed (misc txc)	Number of transmitted compressed packets.
Tx_Single_Collision_Frames	Counts the number of times that a successfully transmitted packet encountered a single collision.

Field	Description
	The value increments only if transmits are enabled and the Ethernet controller is in half-duplex mode.
Tx_Multiple_Collision_Frames	A Multiple Collision Count which indicates the number of times that a transmit encountered more than one collision, but less than 16. The value increments only if transmits are enabled and the Ethernet controller is in half-duplex mode.
Tx_Deferred	<p>Counts defer events.</p> <p>A deferred event occurs when the transmitter cannot immediately send a packet due to:</p> <ul style="list-style-type: none"> • The medium being busy because another device is transmitting. • The IPG timer has not expired. • Half-duplex deferral events are occurring. • XOFF frames are being received . • The link is not up. <p>This register only increments if transmits are enabled. This counter does not increment for streaming transmits that are deferred due to TX IPG.</p>
Rx_Frame_Too_Long	The Rx frame is oversized.
Rx_Frame_Too_Short	The Rx frame is too short.
Rx_Align_Errors	This error is only valid in 10/100M mode.
Symbol Error Count	<p>Counts the number of symbol errors (SYMERRS) between reads.</p> <p>The count increases for every bad symbol that's received, whether or not a packet is currently being received and whether or not the link is up. This register increments only in internal SerDes mode.</p>

Performing a traffic trace

Traffic tracing allows you to follow a specific packet stream. This is useful when you want to confirm that packets are using the route you expect them to take on your network.

To view traffic sessions:

Use this command to view the characteristics of a traffic session through specific security policies.

```
diagnose sys session
```

To trace per-packet operations for flow tracing:

```
diagnose debug flow
```

To trace per-Ethernet frame:

```
diagnose sniffer packet
```

To trace a route from a FortiGate to a destination IP address:

```
# execute traceroute www.fortinet.com
traceroute to www.fortinet.com (66.171.121.34), 32 hops max, 84 byte packets
 1 172.20.120.2 0.637 ms 0.653 ms 0.279 ms
 2 209.87.254.221 <static-209-87-254-221.storm.ca> 2.448 ms 2.519 ms 2.458 ms

14 66.171.121.34 <www.fortinet.com> 83.874 ms 84.084 ms 83.810 ms
```

Using a session table

A session is a communication channel between two devices or applications across the network. Sessions allow FortiOS to inspect and act on a sequential group of packets in a session all at once instead of inspecting each packet individually. Each session has an entry in the session table that includes important information about the session.

You can view FortiGate session tables from the FortiGate GUI or CLI. The most useful troubleshooting data comes from the CLI. The session table in the GUI also provides useful summary information, particularly the current policy number that the session is using.

When to use a session table

Session tables are useful when verifying open connections. For example, if you have a web browser open to browse the Fortinet website, you would expect a session entry from your computer on port 80 to the IP address for the Fortinet website.

You can also use a session table to investigate why there are too many sessions for FortiOS to process.

GUI

To view session information in the GUI:

1. Go to *Security Fabric > Physical Topology*.
2. From the *Metrics* dropdown, select *Sessions*.

Finding the security policy for a specific connection

Every program and device on your network must have an open communication channel or session to pass information. FortiGate manages these sessions with features such as traffic shaping, antivirus scanning, and blocking known bad websites. Each session will have an entry in the session table.

If a secure web browser session is not working properly, you can check the session table to ensure the session is still active and going to the proper address. The session table can also tell you the security policy number it matches, so you can check what is happening in that policy.

1. Get the connection information.

You need to be able to identify the session you want. To do this, you will need:

- The source IP address (usually your computer)
- The destination IP address (if you have it)
- The port number which is determined by the program you are using. Common ports are:
 - Port 80 (HTTP for web browsing)
 - Port 443 (HTTPS for SSL encrypted web browsing)
 - Port 22 (SSH for Secure Shell)
 - Port 25 (SMTP for Mail Transfer)

2. Find the session and policy ID

Go to *Security Fabric > Physical Topology*. From the *Metrics* dropdown, select *Sessions*.

To find your session, search for your source IP address, destination IP address (if you have it), and port number. The policy ID is listed after the destination information.

3. Use filters to find a session

If there are multiple pages of sessions, you can use a filter to hide the sessions you do not need. To filter the sessions in the table, click *Add Filter*, and select an option from the list. You can filter the table by *Destination IP*, *Source IP*, or *Source Port*.

CLI

The session table output in the CLI is very large. The CLI command supports filters to show only the data you need.

To view session data in the CLI:

```
diagnose sys session list
```

An entry is placed in the session table for each traffic session passing through a security policy

To filter session data:

```
diagnose sys session filter <option>
```

The values for <option> include the following:

Value	Definition
clear	Clear session filter
dintf	Destination interface
dport	Destination port

Value	Definition
dst	Destination IP address
duration	Duration of the session
expire	Expire
negate	Inverse filter
nport	NAT'd source port
nsrc	NAT'd source ip address
policy	Policy ID
proto	Protocol number
proto-state	Protocol state
session-state1	Session state1
session-state2	Session state2
sintf	Source interface
sport	Source port
src	Source IP address
vd	Index of virtual domain, -1 matches all

Even though UDP is a sessionless protocol, FortiGate keeps track of the following states:

- When UDP reply does not have a value of 0
- When UDP reply has a value of 1

The following table displays firewall session states from the session table:

State	Description
log	Session is being logged
local	Session is originated from or destined for local stack
ext	Session is created by a firewall session helper
may_dirty	Session is created by a policy For example, the session for <code>ftp control channel</code> will have this state but <code>ftp data channel</code> won't. This is also seen when NAT is enabled.
ndr	Session will be checked by IPS signature
nds	Session will be checked by IPS anomaly
br	Session is being bridged (TP) mode

Examining the firewall session list

The firewall session list displays all open sessions in FortiGate. Examine the list for strange patterns, such as no sessions apart from the internal network, or all sessions are only to one IP address.

When you examine the firewall session list in the CLI, you can use filters to reduce the output.

To examine the firewall session list in the CLI:

You can use a filter to limit the sessions displayed by source, destination address, port, or NAT'd address. To use more than one filter, enter a separate line for each value.

The following example filters the session list based on a source address of 10.11.101.112:

```
FGT# diagnose sys session filter src 10.11.101.112
FGT# diagnose sys session list
```

The following example filters the session list based on a destination address of 172.20.120.222.

```
FGT# diagnose sys session filter dst 172.20.120.222
FGT# diagnose sys session list
```

To clear all sessions corresponding to a filter:

```
FGT# diagnose sys session filter dst 172.20.120.222
FGT# diagnose sys session clear
```

Checking source NAT information

Checking source NAT is important when you are troubleshooting from the remote end of the connection outside the firewall.

To check the source NAT information in the CLI:

When you display the session list in the CLI, you can match the NAT'd source address (`nsrc`) and port (`nport`). This is useful when multiple internal IP addresses are NAT'd to a common external-facing source IP address.

```
FGT# diagnose sys session filter nsrc 172.20.120.122
FGT# diagnose sys session filter nport 8888
FGT# diagnose sys session list
```

Finding object dependencies

You may be prevented from deleting a configuration object when other configuration objects depend on it. You can use the GUI or CLI to identify objects which depend on, or make reference to the configuration you are trying to delete. Additionally, if you have a virtual interface with dependent objects, you will need to find and remove those dependencies before deleting the interface.

To remove interface object dependencies in the GUI:

1. Go to *Network > Interfaces*. The *Ref.* column displays the number of objects that reference this interface.
2. Select the number in the *Ref.* column for the interface. A window listing the dependencies appears.
3. Use these detailed entries to locate and remove object references to this interface. The trash can icon is enabled

after all the object dependencies are removed.

4. Remove the interface by selecting the check box for the interface, and select *Delete*.

To find object dependencies in the CLI:

When running multiple VDOMs, use the following command in the global configuration only.

```
diagnose sys cmdb refcnt show <path.object.mkey>
```

The command searches for the named object in both the most recently used global and VDOM configurations.

Examples

To verify which objects a security policy with an ID of 1 refers to:

```
diagnose sys cmdb refcnt show firewall.policy.policyid 1
```

To check what is referred to by interface port1:

```
diagnose sys cmdb refcnt show system.interface.name port1
```

To show all dependencies for an interface:

```
diagnose sys cmdb refcnt show system.interface.name <interface name>
```

Sample output:

In this example, the interface has dependent objects, including four address objects, one VIP, and three security policies.

```
entry used by table firewall.address:name '10.98.23.23_host'
entry used by table firewall.address:name 'NAS'
entry used by table firewall.address:name 'all'
entry used by table firewall.address:name 'fortinet.com'
entry used by table firewall.vip:name 'TORRENT_10.0.0.70:6883'
entry used by table firewall.policy:policyid '21'
entry used by table firewall.policy:policyid '14'
entry used by table firewall.policy:policyid '19'
```

Diagnosing NPU-based interfaces

Some Fortinet products contain network processors, such as NP4, NP6Lite, or NP6. Offloading requirements will vary depending on the model.

To view the initial session setup for NPU-based interfaces:

```
diagnose debug flow
```

- If the session is programmed into the ASIC (fastpath) correctly, the command will not detect the packets that arrive at the CPU.
- If the NPU functionality is disabled, the CPU detects all the packets. However, you should only disable the NPU functionality for troubleshooting purposes.

To diagnose NPU-based interfaces:

1. Get the NPx or NPU ID and port numbers.

```
diagnose npu <processor> list
```

The output will look like this:

```
ID Model Slot Interface
0 On-board port1 fabric1 fabric3 fabric5
1 On-board fabric2 port2 base2 fabric4
```

2. Disable the NPU functionality.

```
diagnose npu <processor> fastpath disable <dev_id>
```

The `dev_id` is the NPx ID number.

3. Analyze the packets.

```
diagnose npu <processor> fastpath-sniffer enable port1
```

These commands only apply to NP4 and NP6 interfaces.

The output will look similar to:

```
NP4 Fast Path Sniffer on port1 enabled
```

This causes traffic on `port1` of the network processor to be sent to the CPU. This means you can perform a standard sniffer trace and use other diagnostic commands, if it is a standard CPU-driven port.

Identifying the XAUI link used for a specific traffic stream

The `diagnose npu np6 xaui-hash` command takes a 6-tuple input of the traffic stream to identify the NP6 XAUI link that the traffic passes through.

This command is only available on the 38xxD, 39xxD, 34xxE, 36xxE, and 5001E series devices.

Syntax

```
diagnose npu np6 xaui-hash <interface> <proto> <src_ip> <dst_ip> <src_port> <dst_port>
```

Variable	Description
<interface>	The network interface that the packets are coming from.
<proto>	The proto number, 6 for TCP or 17 for UDP.
<src_ip>	The source IP address.
<dst_ip>	The destination IP address.
<src_port>	The source port.
<dst_port>	The destination port.

Examples

```
# diagnose npu np6 xaui-hash port1 6 1.1.1.1 2.2.2.1 4567 80
NP6_ID: 0, XAUI_LINK: 2
```

```
# diagnose npu np6 xau-hash port1 6 1.1.1.1 2.2.2.1 4567 200
NP6_ID: 6, XAUI_LINK: 2

# diagnose npu np6 xau-hash port1 6 1.1.1.1 2.2.2.1 4567 20
NP6_ID: 1, XAUI_LINK: 2

# diagnose npu np6 xau-hash port1 6 1.1.1.1 2.2.2.1 4567 23
NP6_ID: 1, XAUI_LINK: 1
```

The `NP6_ID` is the NP index of the model that is being used. It can be found with the `diagnose npu np6 port-list` command.

Date and time settings

Fortinet support may ask you to check the date and time settings for log message timestamp synchronization and for certificates that have a time requirement to check for validity.

To check time settings:

```
execute time
```

To check date settings:

```
execute date
```

If all devices have the same time, it helps to correlate log entries from different devices.

```
execute time
current time is: 12:40:48
last ntp sync:Thu Mar 16 12:00:21 2006
execute date
current date is: 2006-03-16
```

To force synchronization with an NTP server:

```
config system ntp
    set ntpsync {enable | disable}
end
```

If all devices have the same time, it helps to correlate log entries from different devices.

Running the TAC report

The Technical Assistance Center (TAC) report runs an exhaustive series of diagnostic commands. Some of the commands are only needed if you are using features, such as HA, VPN tunnels, or a modem. Fortinet support may ask you to use the report output to provide information about the current state of your FortiGate.

Due to the amount of output generated, the report may take a few minutes to run. If you are logging CLI output to a file, you can run this command to familiarize yourself with the diagnostic commands.

To run the TAC report in the CLI:

```
execute tac report
```

Using the process monitor

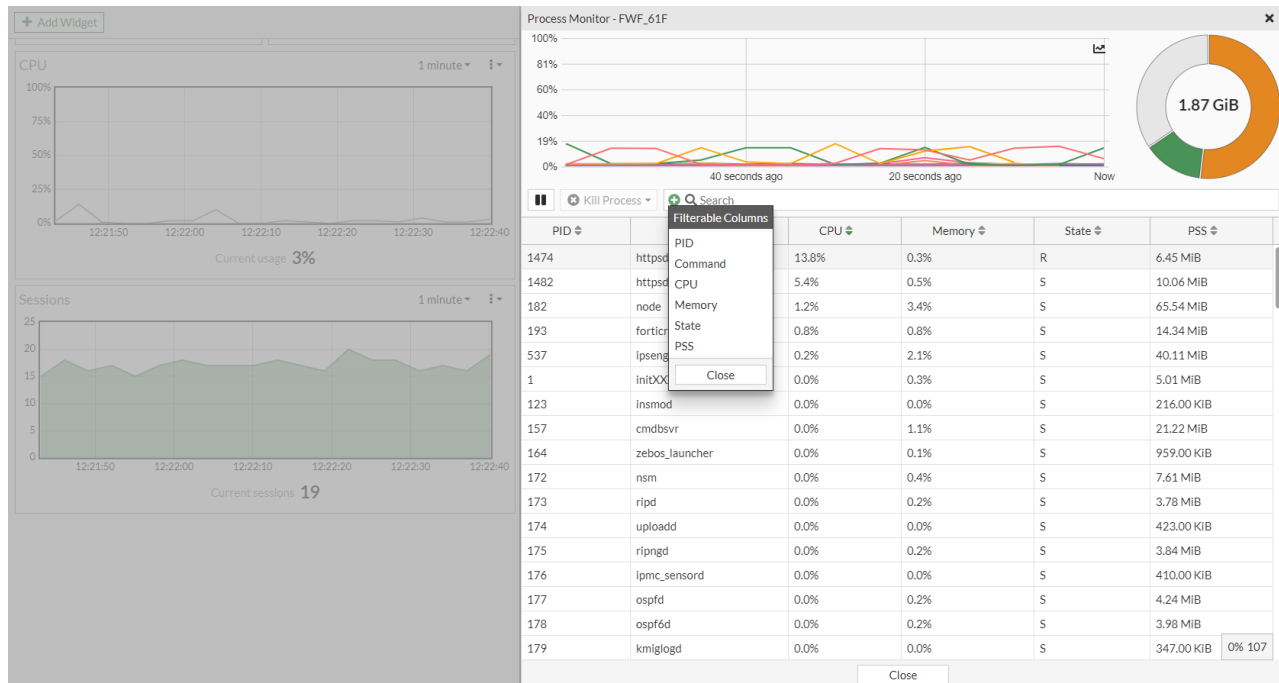

The *Process Monitor* displays running processes with their CPU and memory usage levels. Administrators can sort, filter, and terminate processes within the *Process Monitor* pane.

To access the process monitor:

1. Go to *Dashboard > Status*:
 - Left-click in the *CPU* or *Memory* widget and select *Process Monitor*.
 - Click the user name in the upper right-hand corner of the screen, then go to *System > Process Monitor*.

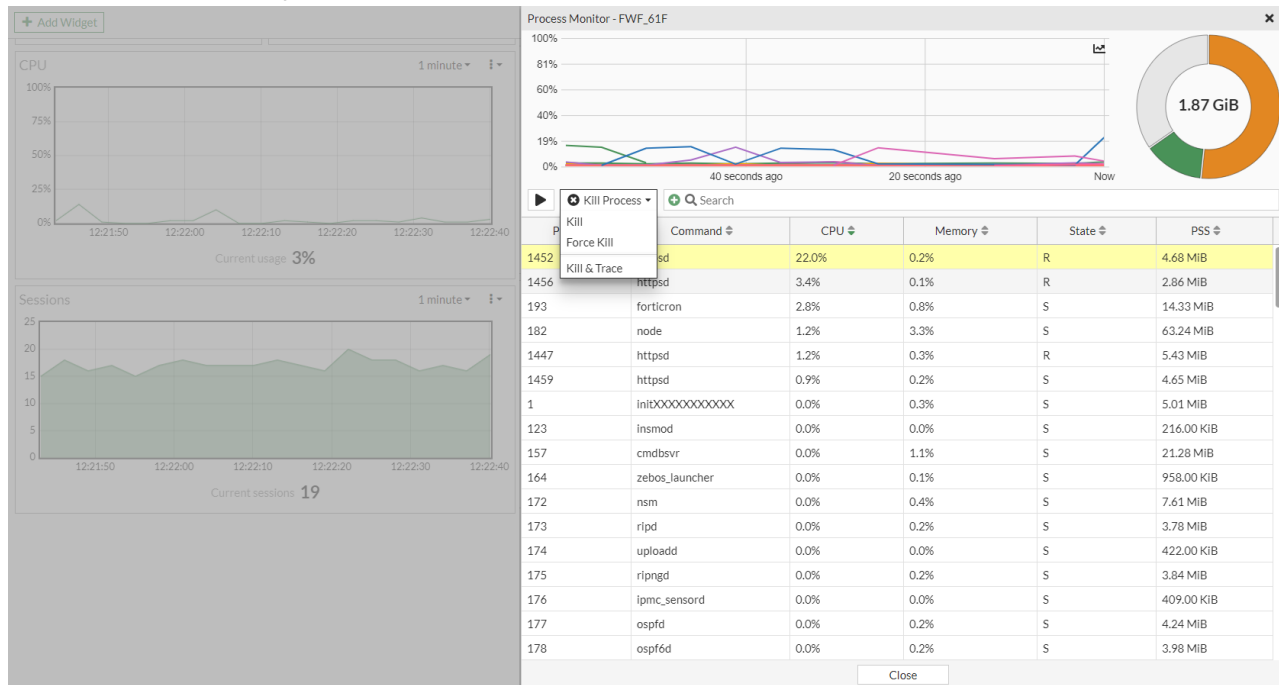

The *Process Monitor* appears, which includes a line graph, donut chart, and process list.

2. Click the + beside the search bar to view which columns can be filtered.

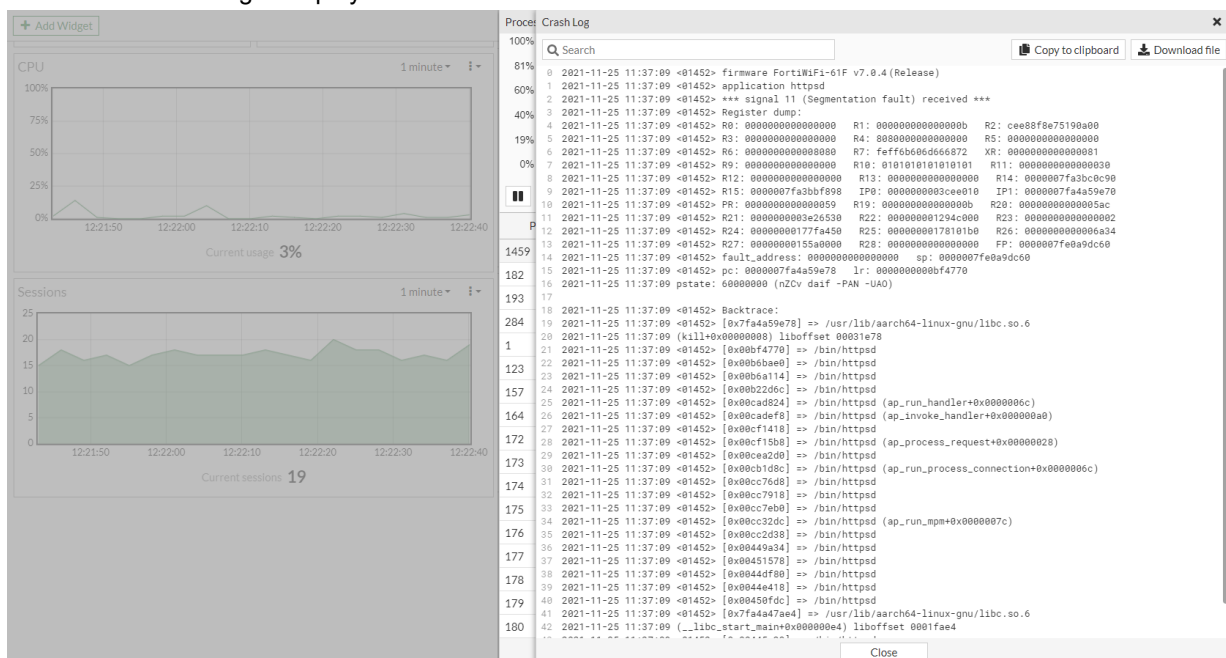

To kill a process within the process monitor:

1. Select a process.
2. Click the **Kill Process** dropdown.

3. Select one of the following options:

- **Kill**: the standard kill option that produces one line in the crash log (diagnose debug crashlog read).
- **Force Kill**: the equivalent to `diagnose sys kill 9 <pid>`. This can be viewed in the crash log.
- **Kill & Trace**: the equivalent to `diagnose sys kill 11 <pid>`. This generates a longer crash log and backtrace. A crash log is displayed afterwards.

Computing file hashes

The following command computes the SHA256 file hashes for all of the files in a directory or directories:

```
# diagnose sys filesystem hash <paths> -d [depth]
```

<paths>	Add up to 25 paths to show only the hash for the files at those paths.
-d [depth]	Specify the maximum depth of the traversal.

This command can be used for troubleshooting and debugging the system. The file hashes of system files can be compared against known good system files to help identify any compromises made on the system files.

To hash all filesystems:

```
# diagnose sys filesystem hash
Hash contents: /bin
5132b40a66fd4cf062adb42e2af43cb9aea0672cf885f12978e8de2f3137834b    /bin/syslogd ->
/bin/init
5132b40a66fd4cf062adb42e2af43cb9aea0672cf885f12978e8de2f3137834b    /bin/acd ->
/bin/init
5132b40a66fd4cf062adb42e2af43cb9aea0672cf885f12978e8de2f3137834b    /bin/httpsnifferd ->
/bin/init
5132b40a66fd4cf062adb42e2af43cb9aea0672cf885f12978e8de2f3137834b    /bin/merged_daemons
-> /bin/init
...
/bin/init
6e2e07782dc17b8693268989f8ba1a8858a73d5291fb521e315011731cefe412    /bin/setpci
5132b40a66fd4cf062adb42e2af43cb9aea0672cf885f12978e8de2f3137834b    /bin/wad_csvc_cs ->
/bin/init
5132b40a66fd4cf062adb42e2af43cb9aea0672cf885f12978e8de2f3137834b    /bin/fds_notify ->
/bin/init
...
Hash contents: /lib
3dae8f9c15da465ffda24cebc1328725e98ee7c94a20e54af6ead7eaada45d9d    /lib/libusb-1.0.so.0
e50c6b5cad36b200d4903e4d7d5e5eac1f5c618d27fd6961011e28a892ed8866
/lib/libk5crypto.so.3
b021ad6fb16cele881ca586036687c1b2ae9555805817ef394284528d9e71612    /lib/libgomp.so.1
...
```

To hash specific filesystem, add the name of the filesystem:

```
# diagnose sys filesystem hash /sbin
Hash contents: /sbin
c1f81e67a53bcf70720748fe31c2380e95b4c3dfdb96957fd116fcf702bd797b    /sbin/init
Filesystem hash complete. Hashed 1 files.
```

To hash multiple filesystems, add the names of the filesystems:

Up to 25 file systems can be added.

```
# diagnose sys filesystem hash /sbin /bin
Hash contents: /sbin
c1f81e67a53bcf70720748fe31c2380e95b4c3dfdb96957fd116fcf702bd797b    /sbin/init
Hash contents: /bin
```

```
5132b40a66fd4cf062adb42e2af43cb9aea0672cf885f12978e8de2f3137834b /bin/syslogd ->
/bin/init
5132b40a66fd4cf062adb42e2af43cb9aea0672cf885f12978e8de2f3137834b /bin/acd ->
/bin/init
5132b40a66fd4cf062adb42e2af43cb9aea0672cf885f12978e8de2f3137834b /bin/httpsnifferd ->
/bin/init
5132b40a66fd4cf062adb42e2af43cb9aea0672cf885f12978e8de2f3137834b /bin/merged_daemons
-> /bin/init
```

To specify the maximum depth of the traversal:

```
# diagnose sys filesystem hash /data2 -d 1
Hash contents: /data2
a0166e804dc3d9a68fcc8015cb2d214ec40f0609e8e2aecc0eb2e5bdffc45524 /data2/new_alert_msg

Filesystem hash complete. Hashed 25 files.
```

An error message is shown if an incorrect value is entered:

```
# diagnose sys filesystem hash /test-path
ERROR: Could not fetch info for path /test-path (No such file or directory)
Filesystem hash complete. Hashed 0 files.

# diagnose sys filesystem hash /bin -d 0
ERROR: depth must be greater than zero. (0)
Command fail. Return code -651
```

Other commands

You may be asked to provide the following information when you contact Fortinet support.

- [ARP table on page 3332](#)
- [IP address on page 3335](#)

ARP table

The ARP table is used to determine the destination MAC addresses of the network nodes, as well as the VLANs and ports from where the nodes are reached.

To view the ARP table:

```
# get system arp
```

Address	Age (min)	Hardware Addr	Interface
10.10.1.3	1	50:b7:c3:75:ea:dd	internal7
192.168.0.190	0	28:f1:0e:03:2a:97	wan1
192.168.0.97	0	f4:f2:6d:37:b0:99	wan1

To view the ARP cache in the system:

```
# diagnose ip arp list

index=14 ifname=internal7 10.10.1.3 50:b7:c3:75:ea:dd state=00000004 use=2494 confirm=1995
update=374 ref=3
index=5 ifname=wan1 192.168.0.190 28:f1:0e:03:2a:97 state=00000002 use=88 confirm=86
update=977639 ref=2
index=22 ifname=internal 192.168.1.111 00:0c:29:c6:79:3d state=00000004 use=3724
confirm=9724 update=3724 ref=0
index=5 ifname=wan1 224.0.1.140 01:00:5e:00:01:8c state=00000040 use=924202 confirm=930202
update=924202 ref=1
index=5 ifname=wan1 192.168.0.97 f4:f2:6d:37:b0:99 state=00000002 use=78 confirm=486
update=614 ref=26
index=14 ifname=internal7 10.10.1.11 state=00000020 use=172 confirm=1037790 update=78 ref=2
```

ARP request and cache

The FortiGate must make an ARP request when it tries to reach a new destination. The base ARP reachable value determines how often an ARP request it sent; the default is 30 seconds. The actual ARP reachable time is a random number between half and three halves of the base reachable time, or 15 to 45 seconds. The random number is updated every five minutes.

ARP entries in the ARP cache are updated based on the state of the ARP entry and the objects that are using it, as highlighted in the following output sample:

```
index=5 ifname=wan1 224.0.1.140 01:00:5e:00:01:8c state=00000040 use=924202
confirm=930202 update=924202 ref=1
```

There are multiple possible states for an ARP entry, and the state-transition mechanism can be complex. Common states include the following:

State	Meaning	Description
00000002 or 0x02	REACHABLE	An ARP response was received
00000004 or 0x04	STALE	No ARP response within the expected time
00000008 or 0x08	DELAY	A transition state between STALE and REACHABLE before Probes are sent out
00000020 or 0x20	FAILED	Did not manage to resolve within the maximum configured number of probes
00000040 or 0x40	NOARP	Device does not support ARP, e.g. IPsec interface
00000080 or 0x80	PERMANENT	A statically defined ARP entry

An entry that is in the STALE (0x04) or FAILED (0x20) states with no references to it (ref=0) can be deleted. Many factors affect the state-transmit mechanism and if an entry is used by other subsystems. For example, ARP creation, ARP request/reply, neighbor lookup, routing, and others can cause an ARP entry to be in use or referenced.

The garbage collection mechanism runs every 30 seconds, and checks and removes stale and unreferenced entries if they have been stale for longer than 60 seconds. Garbage collection will also be triggered when the number of ARP entries exceeds the configured threshold. If the threshold is exceeded, no entries can be added to the ARP table.

To set the maximum number of ARP entries threshold:

```
config system global
    set arp-max-entry <integer>
end
```

arp-max-entry <integer>	The maximum number of dynamically learned MAC addresses that can be added to the ARP table (131072 to 2147483647, default = 131072).
--------------------------------------	--

To set the ARP reachable time on an interface:

```
config system interface
    edit port1
        set reachable-time <integer>
    next
end
```

reachable-time <integer>	The reachable time (30000 to 3600000, default = 30000).
---------------------------------------	---

To clear all of the entries in the ARP table:

```
execute clear system arp table
```

To delete a single ARP entry from the ARP table:

```
diagnose ip arp delete <interface name> <IP address>
```

To add static ARP entries:

```
config system arp-table
    edit 1
        set interface "internal"
        set ip 192.168.50.8
        set mac bc:14:01:e9:77:02
    next
end
```

To view a summary of the ARP table:

```
# diagnose sys device list root

list virtual firewall root info:
ip4 route_cache: table_size=65536 max_depth=2 used=31 total=34
arp: table_size=16 max_depth=2 used=5 total=6
proxy_arp: table_size=256 max_depth=0 used=0 total=0
arp6: table_size=32 max_depth=1 used=3 total=3
proxy_arp6: table_size=256 max_depth=0 used=0 total=0
local table version=00000000 main table version=0000002b
vf=root dev=root vrf=0
vf=root dev=ssl.root vrf=0
...
vf=root dev=internal5 vrf=0
ses=0/0 ses6=0/0 rt=0/0 rt6=0/0
```

IP address

You may want to verify the IP addresses assigned to the FortiGate interfaces are what you expect them to be.

To verify IP addresses:

```
diagnose ip address list
```

The output lists the:

- IP address and mask (if available)
- `index` of the interface (a type of ID number)
- `devname` (the interface name)

While physical interface names are set, virtual interface names can vary. A good way to use this command is to list all of the virtual interface names. For `vsys_ha` and `vsys_fgfm`, the IP addresses are the local host, which are virtual interfaces that are used internally.

Sample output:

```
# diagnose ip address list
IP=10.31.101.100->10.31.101.100/255.255.255.0 index=3 devname=internal
IP=172.20.120.122->172.20.120.122/255.255.255.0 index=5 devname=wan1
IP=127.0.0.1->127.0.0.1/255.0.0.0 index=8 devname=root
IP=127.0.0.1->127.0.0.1/255.0.0.0 index=11 devname=vsys_ha
IP=127.0.0.1->127.0.0.1/255.0.0.0 index=13 devname=vsys_fgfm
```

FortiGuard troubleshooting

The FortiGuard service provides updates to AntiVirus (AV), Antispam (AS), Intrusion Protection Services (IPS), Webfiltering (WF), and more. The FortiGuard Distribution System (FDS) consists of a number of servers across the world that provide updates to your FortiGate unit. Problems can occur with the connection to FDS and its configuration on your local FortiGate unit.

Some of the more common troubleshooting methods are listed here, including:

- [Troubleshooting process for FortiGuard updates on page 3336](#)
- [FortiGuard server settings on page 3337](#)
- [FortiGuard server settings on page 3337](#)

Verifying connectivity to FortiGuard

You can verify FortiGuard connectivity in the GUI and CLI.

To verify FortiGuard connectivity in the GUI:

1. Got to *Dashboard > Status*.
2. Check the *Licenses* widget. When FortiGate is connected to FortiGuard, a green check mark appears next to the available FortiGuard services.

To verify FortiGuard connectivity in the CLI:

```
execute ping service.fortiguard.net
execute ping update.fortiguard.net
```

Sample output:

```
FG100D# execute ping service.fortiguard.net
PING guard.fortinet.net (208.91.112.196): 56 data bytes
64 bytes from 208.91.112.196: icmp_seq=0 ttl=51 time=61.0 ms
64 bytes from 208.91.112.196: icmp_seq=1 ttl=51 time=60.0 ms
64 bytes from 208.91.112.196: icmp_seq=2 ttl=51 time=59.6 ms
64 bytes from 208.91.112.196: icmp_seq=3 ttl=51 time=58.9 ms
64 bytes from 208.91.112.196: icmp_seq=4 ttl=51 time=59.2 ms

--- guard.fortinet.net ping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
round-trip min/avg/max = 58.9/59.7/61.0 ms

FG100D# execute ping update.fortiguard.net
PING fdl.fortinet.com (208.91.112.68): 56 data bytes
64 bytes from 208.91.112.68: icmp_seq=0 ttl=53 time=62.0 ms
64 bytes from 208.91.112.68: icmp_seq=1 ttl=53 time=61.8 ms
64 bytes from 208.91.112.68: icmp_seq=2 ttl=53 time=61.3 ms
64 bytes from 208.91.112.68: icmp_seq=3 ttl=53 time=61.9 ms
64 bytes from 208.91.112.68: icmp_seq=4 ttl=53 time=61.8 ms
```

Troubleshooting process for FortiGuard updates

The following process shows the logical steps you should take when troubleshooting problems with FortiGuard updates:

- 1. Does the device have a valid license that includes these services?**
Each device requires a valid FortiGuard license to access updates for some or all of these services. You can verify the status of the support contract for your devices at the [Fortinet Support](#) website.
- 2. If the device is part of a high availability (HA) cluster, do all members of the cluster have the same level of support?**
You can verify the status of the support contract for all of the devices in your HA cluster at the [Fortinet Support](#) website.
- 3. Are services enabled on the device?**
To see the FortiGuard information and status for a device in the GUI, go to *System > FortiGuard*.
Use this page to verify the status of each component, and enable each service.
- 4. Can the device communicate with FortiGuard servers?**
Go to *System > FortiGuard* in the GUI, and try to update AntiVirus and IPS, or test the availability of Web Filtering and AS default and alternate ports.
- 5. Is there proper routing to reach the FortiGuard servers?**
Ensure there is a static or dynamic route that allows your FortiGate to reach the FortiGuard servers. Usually a generic default route to the internet is enough, but you may need to verify this if your network is complex.
- 6. Are there issues with DNS?**
An easy way to test this is to attempt a traceroute from behind the FortiGate to an external network using the Fully Qualified Domain Name (FQDN) for a location. If the traceroute FQDN name doesn't resolve, you have general

DNS problems.

7. Is there anything upstream that might be blocking FortiGuard traffic, either on the network or ISP side?

Many firewalls block all ports, by default, and ISPs often block ports that are low. There may be a firewall between the FortiGate and the FortiGuard servers that's blocking the traffic. By default, FortiGuard uses port 53. If that port is blocked you need to either open a hole for it or change the port it is using.

8. Is there an issue with source ports?

It is possible that ports that FortiGate uses to contact FortiGuard are being changed before they reach FortiGuard or on the return trip before they reach FortiGate. A possible solution for this is to use a fixed-port at NAT'd firewalls to ensure the port remains the same. You can use packet sniffing to find more information about what's happening with ports.

9. Are there security policies that include antivirus?

If none of the security policies include antivirus, the antivirus database will not be updated. If antivirus is included, only the database type that's used will be updated.

FortiGuard server settings

Your local FortiGate connects to remote FortiGuard servers to get updates to FortiGuard information, such as new viruses that may have been found or other new threats.

The default setting to reach FortiGuard is anycast. However, FortiGate can be configured to use unicast server. See [FortiGuard on page 2678](#) for more information.

This section provides methods to display FortiGuard server information on your FortiGate, and how to use that information and update it to fix potential problems.

Displaying the server list

To get a list of FDS servers FortiGate uses to send web filtering requests:

```
get webfilter status
```

or

```
diagnose debug rating
```

Rating requests are only sent to the server at the top of the list in normal operation. Each server is probed for Round Trip Time (RTT) every two minutes. Rating may not be enabled on your FortiGate.

Optionally, you can add a refresh rate to the end of the command to determine how often the server list is refreshed.

Sample output:

```
Locale           : English

Service          : Web-filter
Status           : Enable
License          : Contract

Service          : Antispam
Status           : Disable

Service          : Virus Outbreak Prevention
```

```
Status          : Disable

Num. of servers : 2
Protocol        : https
Port            : 443
Anycast         : Disable
Default servers : Included

-- Server List (Wed Nov 16 14:42:08 2022) --
IP              Weight  RTT  Flags  TZ  FortiGuard-requests
  Curr Lost Total Lost      Updated Time
140.174.22.68   30     866         -5
13              0         0 Wed Nov 16 14:41:35 2022
12.34.97.18     30     878 DI      -5
12              0         0 Wed Nov 16 14:41:35 2022
```

Output details

The server list includes the IP addresses of alternate servers if the first entry cannot be reached. In this example, the IP addresses are not public addresses.

The following flags in `get webfilter status` indicate the server status:

Flag	Description
D	The server was found through the DNS lookup of the hostname. If the hostname returns more than one IP address, all of them are flagged with D and are used first for INIT requests before falling back to the other servers.
I	The server to which the last INIT request was sent
F	The server hasn't responded to requests and is considered to have failed
T	The server is currently being timed
S	Rating requests can be sent to the server. The flag is set for a server only in two cases: <ul style="list-style-type: none"> The server exists in the servers list received from the FortiManager or any other INIT server. The server list received from the FortiManager is empty so the FortiManager is the only server that the FortiGate knows and it should be used as the rating server.

Please note that the example output displays `Anycast` as `Disable` because the CLI commands above work with the FortiGuard unicast server case and not with the FortiGuard anycast servers case.

Also, in the example output above, the server 12.34.97.18 was found through a DNS lookup (D flag) and was sent the last INIT request (I flag).

Sorting the server list

The server list is sorted first by weight. The server with the smallest RTT appears at the top of the list, regardless of weight. When a packet is lost (there has been no response in 2 seconds), it is re-sent to the next server in the list. Therefore, the top position in the list is selected based on RTT, while the other positions are based on weight.

Calculating weight

The weight for each server increases with failed packets and decreases with successful packets. To lower the possibility of using a remote server, the weight isn't allowed to dip below a base weight. The base weight is calculated as the difference in hours between the FortiGate and the server multiplied by 10. The farther away the server is, the higher its base weight is and the lower it appears in the list.

View open and in use ports

Traffic destined for the FortiGate itself, and not being passed through or dropped, is called local-in traffic. It can be from a variety of services, such as HTTPS for administrative access, or BGP for inter-router communication.

Local-in traffic is controlled by local-in policies. To enable viewing local-in policies in the GUI, go to *System > Feature Visibility* and enable *Local In Policy*.

The *Policy & Objects > Local In Policy* page shows a read-only list of the local policies, populated with default values, and values that are automatically enabled when the related service is enabled, for example, enabling BGP opens TCP port 179. For more information, see [Local-in policy on page 1208](#).

To view ports that are being listened on, and active connections and the services or processes using them:

```
# diagnose sys tcpsock | grep 0.0.0.0
0.0.0.0:10400->0.0.0.0:0->state=listen err=0 socktype=4 rma=0 wma=0 fma=0 tma=0 inode=10621
process=142/authd
...
0.0.0.0:53->0.0.0.0:0->state=listen err=0 socktype=1 rma=0 wma=0 fma=0 tma=0 inode=8067
process=177/dnsproxy
0.0.0.0:22->0.0.0.0:0->state=listen err=0 socktype=1 rma=0 wma=0 fma=0 tma=0 inode=13390
process=225/sshd
0.0.0.0:541->0.0.0.0:0->state=listen err=0 socktype=1 rma=0 wma=0 fma=0 tma=0 inode=13155
process=215/fgfmd
...
0.0.0.0:9980->0.0.0.0:0->state=listen err=0 socktype=1 rma=0 wma=0 fma=0 tma=0 inode=5063
process=129/httpsd
0.0.0.0:179->0.0.0.0:0->state=listen err=0 socktype=1 rma=0 wma=0 fma=0 tma=0 inode=10583
process=148/bgpd
...
```

For more information on incoming and outgoing ports, see the [FortiOS Ports](#) guide.

Additional resources

To learn more about FortiGate and FortiOS, and for information about technical issues, refer to the following resources.

Fortinet Document Library

Installation Guides, Administration Guides, Quick Start Guides, and other technical documents are available online at the [Fortinet Document Library](#).

Release notes

Issues that arise after the technical documentation has been published are often listed in the release notes. The release notes are available in the [Fortinet Document Library](#).

Fortinet Video Library

The [Fortinet Video Library](#) hosts a collection of videos that provide valuable information about Fortinet products.

Fortinet Community

The [Fortinet Community](#) provides a place to collaborate, share insights and experiences, and get answers to questions. It incorporates the Fortinet Knowledge Base and technical discussion forums. You can access the Fortinet Community at <https://community.fortinet.com>.

Knowledge Base

The [Fortinet Knowledge Base](#) provides access to a variety of articles, white papers, and other documentation that provides technical insight into a range of Fortinet products. You can access the Knowledge Base at <https://community.fortinet.com/t5/Knowledge-Base/ct-p/knowledgebase>.

Fortinet technical discussion forums

The [online technical forum](#) allows administrators to contribute to discussions about issues related to their Fortinet products. Searching the forum can help an administrator identify if an issue has been experienced by another user. You can access the support forum at <https://community.fortinet.com/t5/Fortinet-Forum/bd-p/fortinet-discussion>.

Fortinet Training Institute

The [Fortinet Training Institute](#) hosts a collection of tutorials and training materials that you can use to increase your knowledge of Fortinet products. You can access these training resources at <https://www.fortinet.com/training.html>.

Fortinet Support

You defined your problem, researched a solution, put together a plan to find the solution, and executed that plan. At this point, if the problem has not been solved, contact [Fortinet Support](#) for assistance.
